The U.S. West Coast groundfish fishery is the backbone of many fishing communities.

Consisting of more than 90 different species of flatfish, rockfish and roundfish caught in waters off of California, Oregon and Washington, the fishery is a true environmental success story. After being declared a federal disaster in 2000, this fishery has made dramatic improvements through full catch accountability, ecosystem protections, incentives to reduce bycatch and avoidance of overfished species. In 2014, the fishery received Marine Stewardship Council certification and Seafood Watch removed 21 species from “Avoid (red)” status and moved them to either “Good Alternative (yellow)” or “Best Choice (green).”

The abundance, variety, and quality of these fish are still under-appreciated in the marketplace, however, and more than half the fishing quota goes uncaught every year. This Groundfish Manual is your guide to some of the West Coast’s most prominent species. Inside, you will find photos of the fish whole and filleted, along with cooking suggestions, flavor profiles, and details on availability, sustainability and more.

We have chosen these 13 species to profile because they are among the best recognized and studied, but keep in mind that many lesser known species from this fishery, including a number of species of rockfish, are also managed sustainably and deserve a place on America’s table.

Help make U.S. West Coast Groundfish a success story for the ocean, American fishing communities and your business.

DOVER SOLE
Microstomus pacificus
MARKET NAMES:
slime sole, slippery sole

Dover sole is found from Baja California to the Bering Sea and eastern Aleutian Islands. The elongated body has very small scales and the top side of the fish coloration varies from grayish brown to brown and it may include darker spots. Dover sole can reach a maximum of 10 pounds (few are over 2 lbs.), 2.5 feet, and live more than 50 years.

**SELLING POINTS**
- Thin, firm fillets that hold well in many preparations
- Cooked meat is a clean, white color
- Forgiving texture and delicate taste makes it popular among American consumers

**SOURCING**
- Not to be confused with European Dover sole (Solea vulgaris), Dover sole from the Pacific has a delicate taste and firm-textured flesh, although it is not as mild as European Dover sole.
- Since flatfish quality can vary immensely, buyers recommend looking for Dover sole that has uniform color and lacks bruises.
- Yellow or gray color fillets indicate old age.
- Fresh fish can last up to 10 days on ice.
- U.S. West Coast fishery is open year-round, but stops when fishers redirect to other target species.
- Dover sole and English sole are often used interchangeably in the market.

**COOKING METHODS**
- BAKE
- POACH
- SAUTÉ
- FRY

7 | West Coast Groundfish Manual
**Pacific Sanddab**

Pacific Sanddab is found from Baja California to the Bering Sea and the Sea of Japan. The oval shaped body is light brown with brown, black, yellow or orange markings. Identification of this fish from other sanddabs requires gill raker (12 – 16) and lateral line (61 – 70) scale counts. One of the smallest flatfish, the fish can reach 16 inches and 2 lbs.

**Sourcing**

- Pacific sanddab are usually less than 1/2 pound in size and marketed pan-ready.
- Fresh fish can last up to 10 days on ice.
- U.S. West Coast fishery is open year-round, but stops when fishers redirect to other target species.
- Fresh fillets should have a translucent sheen giving the meat a wet appearance.
- Raw flesh should be very firm and smell like the sea, not fishy.

Pacific sanddab populations on the U.S. West Coast are currently healthy and have been increasing in recent years.

Most Pacific sanddab are caught using bottom trawl, however, the fishing occurs on sandy and gravel habitats minimizing gear impacts.

Bycatch in the U.S. West Coast groundfish fishery, which includes Pacific sanddab, is low, and is carefully managed through spatial and gear restrictions.

Pacific sanddab management on the U.S. West Coast is considered strong and management measures include: 100% observer coverage on trawlers, gear restrictions and a catch share program.

CHILIPEPPER ROCKFISH
Sebastes goodei
MARKET NAMES:
Pacific red snapper, chilipepper sea perch

Chilipepper Rockfish range from Baja California to British Columbia. The fish has an elongated head that lacks spines, a protruding lower jaw and a distinct bright red zone along its lateral line. Chilipepper rockfish differ from bocaccio rockfish with a smaller mouth and an upper jaw that extends to the center of the eye. This species can grow to 22 inches and live to be 16 years old.

SOURCING
• Rockfish skin should be shiny and bright and is stale if it appears yellow, orange or wrinkled.
• Fillets shouldn’t have signs of browning, graying or yellowing.
• Fillets hold together better with skin on.
• Whole fish should have shiny, bright, and clear eyes.
• Gills should be bright pink or red (not brick red) and scales should be shining and clinging to the skin.
• Flesh on fillets should be moist and when pressed, bounce back to original form.

Chilipepper rockfish have traits that make them less inherently vulnerable to fishing pressure than other rockfish species and U.S. West Coast populations are currently healthy according to the most recent stock assessments from 2006 and 2007.

Most chilipepper rockfish are caught using bottom trawl, however, spatial restrictions on fishing gear help reduce the impact.

Bycatch in the U.S. West Coast groundfish fishery, which includes chilipepper rockfish, is low, and is carefully managed through spatial and gear restrictions.

Chilipepper rockfish management on the U.S. West Coast is considered strong and management measures include: 100% observer coverage on trawlers, gear restrictions and a catch share program.

WIDOW ROCKFISH

Sebastes entomelas

MARKET NAMES: widowfish

Widow Rockfish range from Baja California to Kodiak Island, Alaska. When underwater, the fish varies in coloration from brown to orange. Widow rockfish have a short head with a small mouth and are distinguished by black pectoral fin membranes. This species can grow to 23 inches and live to 60 years old.

SOURCING

• Rockfish skin should be shiny and bright and is stale if it appears yellow, orange or wrinkled.
• Fillets shouldn't have signs of browning, graying or yellowing.
• Fillets hold together better with skin on.
• Whole fish should have shiny, bright, and clear eyes.
• Gills should be bright pink or red (not brick red) and scales should be shining and clinging to the skin.
• Flesh on fillets should be moist and when pressed, bounce back to original form.

YELLOWTAIL ROCKFISH
Sebastes flavidus

MARKET NAMES:
green rockfish,
yellowtail sea perch

Yellowtail Rockfish range from San Diego, California to Unalaska Island, Alaska. When landed the body turns a uniform olive brown with some reddish brown spots on the scales. Yellowtail rockfish have a long head with a protruding lower jaw and is distinguished from olive rockfish by the absence of spines on the head. This species can grow to 26 inches and live to 64 years old.

SOURCING
- Rockfish skin should be shiny and bright and is stale if it appears yellow, orange or wrinkled.
- Fillets shouldn’t have signs of browning, graying or yellowing.
- Fillets hold together better with skin on.
- Whole fish should have shiny, bright, and clear eyes.
- Gills should be bright pink or red (not brick red) and scales should be shining and clinging to the skin.
- Flesh on fillets should be moist and when pressed, bounce back to original form.

LINGCOD
_Ophiodon elongates_

MARKET NAMES:
greenling, buckethead, bluefish, green cod, buffalo cod

**LINGCOD**

**Lingcod** are actually not cod at all—they are in the same group of fishes as sablefish, Pacific rockfish and scorpionfish. This bottom-dwelling fish only occurs on the West Coast of North America. They grow quickly and mature within a few years, which has allowed them to recover quickly from overfishing. This species can reach 5 feet and 80 pounds and live for more than 20 years.

**SOURCING**

- Most lingcod is caught as bycatch in other fisheries, but there are some targeted fisheries, namely Southeast Alaska.
- Raw lingcod flesh can have a blue-green tint—this is perfectly normal, and when cooked it turns a snow white color.
- Look for a grayish flesh color and/or blood spots to signal mishandling.
- Dull eyes and faded gills on whole lingcod indicate a lack of freshness.

**PRODUCT FORMS**

<table>

LONGNOSE SKATE
*Raja Rhina*

**MARKET NAMES:**
skate

**SOURCING**
- The edible part of skate’s fins are referred to as “wings.”
- Skate can be purchased as skin-off wings, skin-on wings, fillets or whole.
- Due to California state regulations aimed at protecting sharks, longnose skate can only be purchased whole form, not as wings, in California. In other states both whole and wings are available.
- Longnose skate wings average 3 to 5 lbs. per wing.
- Raw meat is light beige to pink and turns off-white after cooking.
- Avoid buying any skate with an ammonia smell.
- Although similar in appearance to California and big skate, longnose skate is the dominant skate landed in California.

LONGNOSE SKATE: U.S. WEST COAST

U.S. WEST COAST SKATE SPP. LANDINGS

Longnose skate has characteristics that make them inherently vulnerable to fishing pressure. Although U.S. West Coast populations declined since the 1900s, current stocks remain above management targets.

Habitat Impacts
Longnose skates are caught using bottom longline and bottom trawl gear. Spatial management measures have helped mitigate gear impacts along the U.S. West Coast.

Bycatch
Bycatch in the U.S. West Coast groundfish fishery which longnose skate is low, and the multi-species nature of the fishery makes it difficult to clearly identify bycatch at times.

Management
Longnose skate management on the U.S. West Coast is considered strong and management measures include: gear restrictions, catch limits, and a catch share program.

AVG. PRICE PAID TO FISHERMEN 2011 – 2014 = 36¢ PER POUND

*U.S. West Coast lingcod fishery assessments include trawl, longline (“Best Choice”), and handline (“Good Alternative”) fisheries.

**STRENGTHS OF THE U.S. WEST COAST GROUNDFISH TRAWL FISHERY**

- The strong link between [stock] assessments and management actions
- The management plan establishes individual accountability on the part of fishermen and delivers more complete data for fishery managers
- Sensitive habitats are protected in areas of “essential fish habitat,” and additional areas deemed off-limits to bottom trawls
- The management system is transparent and open to the public
- The catch share program provides incentives for sustainable fishing

About Environmental Defense Fund

Environmental Defense Fund, a leading international nonprofit organization, creates transformational solutions to the most serious environmental problems. EDF links science, economics, law and innovative private-sector partnerships. For nearly two decades, EDF experts have worked with fishermen and fishery managers to restore US fisheries. Now, the number of federally managed overfished species is at an all-time low.

We are working for a future in which fishermen are better off because US fisheries are flourishing, providing a stable and healthy source of food and recreation, and a safe, profitable, and long-term means of making a living across the country.
