EPA requested comment on the effect this proposed rule may have on individual EPA programs. Each of the federal environmental statutes referenced by EPA as a source for its authority to propose this rule, was enacted and designed to achieve a specific environmental goal and purpose (e.g., TSCA regulates new and existing chemicals, CAA controls air pollution on a national level, and SDWA regulates public drinking water supplies across the nation). Each statute confers its unique authority upon the agency, requiring agency review according to different scientific standards; each has its own regulations designed to effectuate the specific corresponding program's mission; and, in many cases, each statute relies on different and variable scientific disciplines. As such, ACC believes that this rule, while applicable to all the statutes identified, should be implemented by regulations specific to the objectives and scientific disciplines of each statute. ACC believes that just as the Freedom of Information Act (FOIA), which is overseen by the US Department of Justice (DOJ), is implemented by each agency with specific and separate regulations relevant to the requirements of each statute, this policy rule should be implemented by each EPA program office charged with implementing a given statute in a manner consistent with the authorities granted and requirements unique to that statute.[18]

IX. The Proposed Rule Should Apply to Enforcement and Permit Proceedings

EPA should apply the final rule to both ". . . enforcement activities or permit proceedings (including site-specific permitting actions) . . ." 83 Fed. Reg. 18768, 18771. In both these areas, EPA staff routinely use scientific evidence to make case-specific policy decisions that raise the same type of problems that occur when EPA promulgates regulations; therefore, this proposed regulation should apply to those to ensure that decisions in those areas are made appropriately.

For example, in both administrative and civil judicial enforcement programs, EPA routinely makes discretionary decisions targeting cases to pursue on the basis of scientific data on exposure of humans and ecological resources to pollutants. To do so, EPA relies on data regarding the inherent hazards of the chemical pollutants, and then estimates exposure potential and risks in a manner essentially the same as the approach EPA used to craft the regulations under the applicable environmental statute. Then, on an enforcement case-specific basis, EPA enforcement staff routinely use exposure/risk information to determine whether violations of the law (for regulatory enforcement under the CAA, CWA, RCRA, FIFRA, etc.) or releases to the environment (CERCLA, RCRA corrective action, OPA) have occurred warranting enforcement and determining the extent of sanctions and relief EPA will seek in an enforcement proceeding.

---

[18] See, for example, the discussion of CWA criteria earlier in these comments under section VII. B., which is a good example of why it is important that EPA consider each statute it regulates when applying this proposed rule.

In CAA New Source Review enforcement cases, EPA must decide whether a violation of the program occurred by constructing a "major modification" to a source by assessing whether the pollutant-specific regulatory thresholds were exceeded; analyze emissions calculations using emission factors and/or test data collected from engineering studies; and then extrapolate to the specific plant. To identify the remedial action to impose, EPA must decide which Best Available Control Technology (BACT) limits are for the modifications and that decision, in turn, requires a complex analysis of data regarding costs and efficacies of various control technologies.

In a CWA enforcement case, EPA must decide whether a facility is subject to CWA jurisdiction by determining if a discharge into a jurisdictional "waters of the United States" is subject to the National Pollutant Discharge Elimination System (NPDES) permitting and then whether the discharge violates effluent discharge requirements. If so, EPA must analyze what remedial measures are necessary, including to the receiving waters. In both the CAA and CWA cases, EPA must also prepare proposed civil penalty and pollution "mitigation" assessments, each of which require the analysis of complex economic and environmental data. This policy will require EPA to be more transparent regarding its assessment and analysis of this complex data, which is much needed.

In a CERCLA enforcement case, EPA has to decide what the removal or remedial action should be, which necessitates among other things, a site-specific risk assessment and remedial technologies selection, using a wide variety of environmental and engineering data, which should be publicly available to be verified and replicated.

Similarly, for permitting purposes under environmental statutes, EPA must routinely analyze scientific studies to decide whether to grant a permit and, if so, what conditions to impose in the permit to mitigate environmental impacts to acceptable levels. For example, in a CWA NPDES permit review, EPA determines the level of each pollutant that would be discharged to waters of the United States, whether the proposed discharge will comply with effluent limits required by technology-based effluent guidelines and water-quality standards (including Total Maximum Daily Load programs), and whether control technologies will ensure that the effluent limits will be achieved consistently. Each of those decisions requires analyzing complex environmental/engineering data on a case-specific basis.

X. Incorporate Stronger Data and Model Access Requirements into Cooperative Agreements and Grants while Complying with Privacy and Confidentiality Requirements and Laws

EPA requested comment on how EPA can incorporate stronger data and model access requirements into the terms and conditions of Cooperative Agreements and Grants. ACC believes EPA can accomplish this by implementing requirements that all models and results developed under EPA Cooperative Agreements and Grants be open access and not proprietary. EPA should also require all grant proposal applicants to include as part of any

grant proposal a data management plan, similar to those required by the National Institutes of Health (NIH).[19] EPA may elect to exclude from these requirements grants/agreements of some specified annual amount, but that annual amount should be reasonable and ensure that the vast majority of models and results developed under grants/agreements is shared.

EPA should adopt model evaluation criteria to apply the greatest weight and credibility to models that are open access, describe the endpoint predicted clearly, are based on unambiguous open access computer algorithms, have a defined domain of applicability, have been transparently verified with publicly available datasets, and are shown to be robust and scientifically sound for the intended use.

In addition, EPA should develop common data templates and digital platforms for the most common types of research studies to be used by entities subject to Cooperative Agreements and Grants to facilitate public use and validation.

XI. The Rule Should Apply to all EPA Programs, including its IRIS Program

EPA established the Integrated Risk Information System (IRIS) in 1985 to develop and maintain a database of human health hazard assessments for chemicals. EPA's website states: "The goal of the IRIS Program was to foster consistency in the evaluation of chemical toxicity across the Agency."[20] However, the IRIS Program has been plagued for years by its slow pace generating IRIS assessments and lack of scientific transparency and reproducibility, among other deficiencies. The U.S. Government Accountability Office included IRIS in its High Risk Report, which noted that EPA has not "developed sufficient chemicals assessment information under these programs to limit exposure to many chemicals that may pose substantial health risks"[21] Although the IRIS Program has initiated changes to address some of these deficiencies, no final IRIS assessment to date reflects the full panoply of recommendations issued by the NAS in its review of the IRIS program in 2011.

Appendix C offers several specific examples of IRIS assessment that failed to reflect the best available science. We strongly recommend that the Agency apply this rule to any IRIS assessment that could be used as the basis for significant regulation.

XII. Methodologies and Technologies Providing Protected Access to Sensitive or Confidential Data

In circumstances where company CBI and other intellectual property may be implicated, EPA should confer with the CBI data owner to determine how to make that data available to the greatest extent possible without disclosing the CBI within that data, study, or model. How this is handled will likely be impacted by the type of

[19] https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm
[20] See https://www.epa.gov/iris/basic-information-about-integrated-risk-information-system
[21] https://www.gao.gov/highrisk/transforming_epa_and_toxic_chemicals/why_did_study#t=0

regulatory decision and statute involved.

For example, under TSCA, while the summarized study results, analysis, and final report may be publicly available, the underlying data in a health and safety study may qualify as CBI when the underlying data are not in the public domain and that data provides a commercial value to its owner.[22] In such circumstance, it is the availability of the underlying data that determines whether or not an unpublished study can be used by a competitor to support its notification or registration of a substance overseas without obtaining ownership or citation rights to use such data, depriving the data owner of the value of its investment in the underlying data. Current EPA regulations require chemical manufacturers to submit health and safety studies under some circumstances. However, it is noteworthy that none of these regulations routinely require study submitters to submit underlying data along with a final report. This indicates that the final report likely communicates sufficient information about the potential health and environmental effects to the public when a company has submitted health and safety studies in which it has a commercial interest in protecting.[23]

ACC believes that making a final study report publicly available where the underlying data are CBI would, in most circumstances, be an effective way to make relevant information publicly available about studies and data EPA may rely on, but which must be protected as CBI in circumstances triggering this policy. In these situations, EPA can access the underlying data to confirm the methods, models, and approaches are based on validated procedures, accessible data, etc. If necessary, when specialized expertise is needed, EPA could contract with an independent third-party science reviewer to confirm those findings, although we believe this would likely only be necessary in unusual circumstances. In addition, EPA might also consider an approach followed under FIFRA where Data Evaluation Records of studies are made publicly available, but not full studies.[24] Another approach is that of the European Union's REACH program, which makes Robust Study Summaries (RSS) publicly available, while protecting from disclosure the competitively sensitive underlying data of health and safety studies.

When protecting data while also promoting data access, NIH guidelines should be consulted.[25] ACC believes many of these guidelines could be applied in EPA's implementation of this proposed policy under each of the statutory programs EPA administers to ensure the guidelines adopted suit the specific needs of each statute.

---

[22] See, e.g., *Cohen v. Kessler*, No. 95-6140 (D.N.J. Nov. 25, 1996).

[23] 40 C.F.R. §720.50(a)(3)(i) requires that if data do not appear in the open scientific literature, the submitter must provide a full study report, including the experimental methods and materials, results, discussion and data analysis, conclusions, references, and the name and address of the laboratory that developed the data.

[24] See, e.g., https://archive.epa.gov/pesticides/chemicalsearch/chemical/foia/web/pdf/010501/010501-050.pdf

[25] See https://osp.od.nih.gov/2016/05/02/protecting-data-promoting-access-improving-our-toolbox/; https://www.niaid.nih.gov/research/data-security; and https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5302472/

EPA should ensure that it implements its final rule in a manner that enables it to use confidential health records that may exist with certain kinds of studies, such as long-term air pollution and workplace exposure studies that involve confidential health records. Several agencies and organizations, in addition to NIH, have successfully addressed the issue of data access while maintaining confidentiality that should be considered by EPA. For example:

- The existing rule requiring federally funded research to be made available to other researchers. This standard could be adopted and applied to third-party funded researchers.
- Health care claims and related data are now being made available to researchers in de-identified form by some health insurance companies, such as Optum, which offers a "proprietary research database of health care and administrative data that links patient, physician, and treatment attributes from millions of geographically diverse individuals in the U.S." Optum appears to have developed methods and procedures to appropriately address confidentiality concerns.
- Medicare claims data are already available to researchers in de-identified form. Algorithms and methods developed by the Center for Medical Services should be examined by the EPA.
- Several professional societies have guidance on the protection of health data and de-identification, such as the Institute of Electrical and Electronic Engineers and the International Association of Privacy Professionals. [26]

EPA should develop clear guidance on protecting privacy, de-identifying data, and settling disputes should a breach occur. It may also want to consider establishing an office similar to that of NIH's Office of Research Integrity to adjudicate any issues that may arise in the administration of its practices under this rule.[27]

XIII. The Rule Should Generally Apply Prospectively to EPA Decision Making

ACC does not support retrospective application of the final rule in cases where the Agency follows a periodic review schedule for updating regulations, which includes review of underlying scientific assessments. Retrospective application of any regulation (and its underlying scientific evaluations) is rife with complication, confusion, and significant ambiguity for EPA and stakeholders alike. For example, each NAAQs review under the CAA is based on a substantial amount of scientific and policy information used to inform EPA's determinations of appropriate levels for each standard. The retroactive application of this proposal to those administrative records would only serve to confuse, distress, and impede a NAAQS review process that is already severely overburdened. For example, it is unclear which administrative NAAQS records would be covered by the proposal and how far back it would apply.

[26] http://www.ehealthinformation.ca/wp-content/uploads/2014/08/2010-Risk-based-de-identification-of-health-data.pdf and https://iapp.org/media/pdf/knowledge_center/Perspectives_on_Health_Data_De-Identification_final.pdf

[27] https://ori.hhs.gov/

Without a clear statement, the proposal could potentially cover more than a decades' worth of NAAQS administrative records and scientific analyses. The value of such an application is similarly uncertain. While ACC remains supportive of increased transparency in significant regulatory actions in the future, we encourage EPA to avoid the creation of unnecessary ambiguity and burdens and refrain from the application of this proposal to previous administrative NAAQS records. ACC recommends the final rule be applied prospectively in a manner that integrates its application within the periodic review schedule established for each criteria air pollutant.

However, in cases where EPA has developed analytical tools and models, e.g., ECOSAR, in the past that incorporate dose response data, it may be valuable to apply this rule retrospectively. In other cases, such as IRIS assessments, where the Agency has yet to articulate a periodic review schedule for updating scientific assessments dating back 10-20 years or longer, EPA should develop appropriate mechanisms for application of the rule.[28]

XIV. Bias Should not be Presumed

EPA requested comment on how application of the proposal might inadvertently introduce bias regarding the timeliness and quality of the scientific information available. If EPA uses a weight-of-the-evidence approach (as required under TSCA)[29] and EPA has concerns about bias having been introduced, it can evaluate this using a sensitivity analysis by evaluating the impact of each study and/or model on the overall outcome of the analysis.[30] That said, bias should not be inferred if newer, more scientifically robust studies based on modern, up to date knowledge of biology and dose response are determined to be of better quality, relevance, and evidentiary value.

XV. EPA Should Work with Entities Where Scientific Data are not Publicly Available in a Manner Sufficient for Independent Evaluation

Where data are not available in a manner sufficient for independent evaluation, EPA should attempt to work with data owners to reach an agreement to make the information available to the public to the greatest extent practicable without

---

[28] In addition, stakeholders who seek to urge EPA to undertake a retrospective review do have options at their disposal, e.g., they can develop a voluntary new evaluation under TSCA, petition EPA, or file an Information Quality Request (IQA) requesting a correction.

[29] The TSCA Risk Evaluation rule provides an excellent definition of "weight-of-the-scientific-evidence" that should be adopted across the federal government, but certainly across EPA, at a minimum. That definition is: " a systematic review method, applied in a manner suited to the nature of the evidence or decision, that uses a pre-established protocol to comprehensively, objectively, transparently, and consistently identify and evaluate each stream of evidence, including strengths, limitations, and relevance of each study and to integrate evidence as necessary and appropriate based upon strengths, limitations, and relevance." See 82 Fed. Reg. 33726, 33733 (July 20, 2017).

[30] EPA's implementation and adherence to systematic review in the implementation of this proposal as it has committed under TSCA, will serve to guard against the introduction of bias. See EP's *Application of Systematic Review in TSCA Risk Evaluations* at https://www.epa.gov/sites/production/files/2018-06/documents/final_application_of_sr_in_tsca_05-31-18.pdf

jeopardizing the privacy, confidentiality, or the proprietary interests that deserve protection. In circumstances where there is significant difficulty making data available in a meaningful way, EPA should consider contracting with external experts in the scientific discipline at issue, have them sign confidentiality agreements, analyze the data, and prepare a confidential report with a non-confidential summary for EPA to share publicly.

APPENDIX A: Proposed Regulatory Text

Section 30.1 What is the purpose of this subpart?
This subpart directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.

Section 30.2 What definitions apply to this subpart?
As used in this subpart, all terms not defined herein shall have the meaning given them in the Act or in subpart A; and the following terms shall have the specific meaning given them.

- **Dose Response data and models** – the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a measured or predicted response or health or environmental impact.

  A dose response and concentration response can be empirical, e.g., it can describe the measured relationship from experimental measurements. A response can be just a response and not an actual "impact."

- **Material Regulatory Science** – specific scientific studies and analyses that represent the best available science that, based on weight-of-the-evidence, are material to and represent the scientific basis of the requirements and/or quantitative analyses of EPA final significant regulatory decisions.

- **Regulatory decisions** – final regulations determined to be "significant regulatory actions" by OMB per EO 12866, which is defined as any regulatory action that is likely to result in a rule that may:

  - Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health, or safety, or state, local, or tribal governments or communities;
  - Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;
  - Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
  - Raise novel legal or policy issues arising out of legal mandates, the president's priorities, or the principles set forth in the Executive Order 12866.

- **Regulatory science** – scientific information, including assessments, models, criteria documents, and regulatory impact analyses that provide the basis for EPA's policies, procedures, guidance, proposed and final significant regulatory decisions.

- **Research data** – as defined by UAR is: the recorded factual material commonly accepted in the scientific community as necessary to validate research findings, but not any of the following: preliminary analyses, drafts of scientific papers, plans for future research, peer reviews, or communications with colleagues. This ''recorded'' material excludes physical objects (e.g., laboratory samples).

  "Research data" do not include:

  (i) Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and
  (ii) Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.

Section 30.3 How do the provisions of this subpart apply?
"To dose response data and models underlying pivotal regulatory science that are used to justify significant regulatory decisions regardless of who funded it or the identity of the party conducting the regulatory science." These provisions do not apply to "physical objects (like laboratory samples), drafts, and preliminary analyses." Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of regulatory action, including enforcement actions and permit proceedings, etc.

Section 30.4 What requirements apply to EPA's use of studies when taking final action?
EPA shall clearly identify all studies or other regulatory science relied upon when it takes any agency action and make all studies available to the public to the "extent practicable."

Section 30.5 What requirements apply to use of dose response data and models?
When promulgating significant regulatory actions, the Agency shall ensure that the dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation, **verification,** and analysis.
This may include:

- Data (where necessary, could be subject to access and use restrictions)
- Associated protocols
- Computer algorithms and models[31]
- Recorded factual materials
- Detailed descriptions of how to access and use such information

But in a manner consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national and homeland security.

[31] We suggest substituting "algorithms" in place of "codes" because specific computer codes can be proprietary.

Information is "publicly available in a manner sufficient for independent evaluation" when it includes the information necessary for the public to "understand, assess, and replicate findings."

Section 30.6 What additional requirements pertain to the use of dose response and models underlying pivotal science?
EPA shall describe and document any assumptions and methods used and should describe variability and uncertainty. EPA shall evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold response, on a case-by-case basis. EPA shall clearly explain scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high-quality studies that explore: a broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models the incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

Section 30.7 What role does independent peer review [have] in this section?
EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions therein apply. EPA will ask peer reviewers to articulate the strengths/weaknesses of EPA's justification for assumptions applies and the implications of those assumptions for the results.

Section 30.8 How is EPA to account for cost under this subpart?
EPA shall implement the provisions of this subpart in a manner that minimizes costs.

Section 30.9 May the EPA Administrator grant exemptions to this subpart?
Yes. The Administrator may grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable because:
(a) It is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security; or
(b) It is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality Bulletin for Peer Review (70 FR 2664), Section IX.

Section 30.10 What other requirements apply under this subpart?
EPA shall implement the provisions of this section consistent with the definition of ''research data'' in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in Public Law 89–487, and other applicable federal laws. Where appropriate, data sharing agreements and state-of-the-art data-masking techniques may be employed to facilitate access to information.

ACC notes here its support for the text of Public Law 89-487, which is incorporated by reference in Section 30.10 provides the following exemptions are applicable to this proposed regulation:

1) Specifically required by Executive Order to be kept secret in the interest of national defense or foreign policy;
2) Related solely to the internal personnel rules and practices of any agency;
3) Specifically exempted from disclosure by statute;
4) Trade secrets and commercial or financial information obtained from any person and privileged or confidential;
5) Inter- or intra-agency memorandums or letters which would not be available by law to a private party in litigation with the agency;
6) Personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy;
7) Investigatory files compiled for law enforcement purposes except to the extent available by law to a private party;
8) Contained in or related to examination, operating, or condition reports prepared by, on behalf of, or for the use of any agency responsible for the regulation or supervision of financial institutions; and
9) Geological and geophysical information and data (including maps) concerning wells.

Where appropriate, data-sharing agreements and data-masking techniques may be used.

APPENDIX B: Definitions of NAS Principles

Definitions in NAS Principles and obstacles for sharing data from environmental health research: Workshop summary.
Definition: meta-analysis *Meta-analysis* is a way of quantitatively combining data from many different studies using a statistical process.
Definition: reanalysis The term "*reanalysis*" is defined as conducting further analyses of the exact same data to determine if the same results are obtained and may include use of the same programs and statistical methodologies that were originally used to analyze the data or may use alternative methodologies.
Definition: replication The term "*replication*" is the repetition of a scientific experiment or a trial using exactly the same protocols and statistical programs but with data from a different population to determine if consistent results are obtained with data from a different population.
Definitions: reproduction The term research "*reproduction*" refers to an experiment conducted to addresses the same research question as the original work, but examines the question from a different angle.
Definition: raw data The term "raw data" is defined as the unmodified or unprocessed data that is obtained directly from a survey or experiment (modified from NAS, 2016 P6)
Definition: cleaned-up data *Cleaned-up data* consist of the raw data modified to remove obvious errors.
Definition: processed data The term "processed data" refers to information that has been computed and analyzed to extract relevant information (NAS, 2016), and may include: • Aggregation – combining multiple pieces of data. • Analysis – collection, organization, analysis, interpretation and presentation of data • Classification – separation of data into various categories. • Reporting – list detail or summary data or computed information. • Sorting – the arrangement of items in some sequence and/or in different sets. • Summarization – reducing detail data to its main points. • Validation – Ensuring that supplied data is correct and relevant. (wiki https://en.wikipedia.org/wiki/Data_processing)
Definition: final clean data set

The term "*final clean data set*" is the information provided with a scientific publication (modified IOM, 2016 P6)
Definition: metadata *Metadata* is a set of data that describes other data

TABLE 2 – Data flow from NAS Report

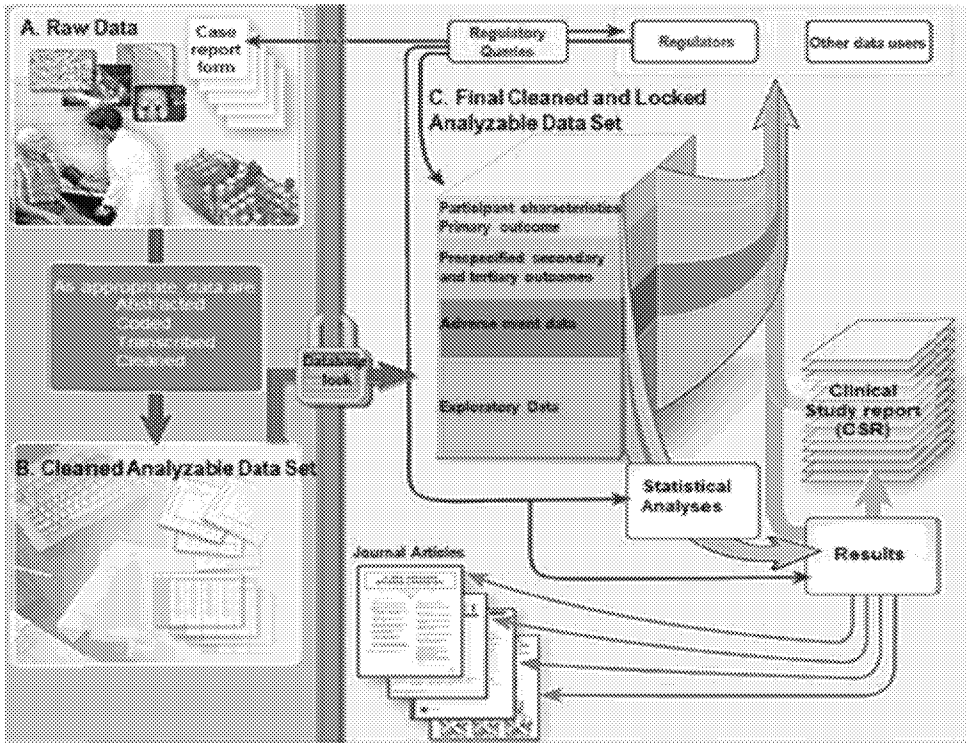

FIGURE 2-1 Data flow from participant to analyzed data and reporting.
SOURCE: IOM, 2014.

APPENDIX C: Chemical-Specific Case Studies

Case Study 1: Trimethylbenzenes (TMBs)

On September 9, 2016, EPA issued its final report on the IRIS assessment of Trimethylbenzenes (TMBs), which addresses the potential non-cancer and cancer human health effects from long-term exposure to TMBs. Humans are not exposed to individual TMB compounds, but to complex mixtures. According to EPA, the primary uses for TMBs are: as a blending agent in gasoline formulations (C9 aromatic fraction); solvents; and paint thinner.

In its review of TMBs, the EPA fell far short in meeting its obligations to improve its IRIS processes and assessment reports. Without explanation, EPA failed to respond to public comments on the draft TMBs assessment, even though the IRIS process for developing assessments explicitly includes a response to comments element.

The IRIS assessment of TMBs does not accurately represent the health effects associated with exposure to TMBs because it failed to utilize a consistent and transparent data evaluation procedure for evaluating and weighing the full body of evidence.
In particular, EPA failed to rely on available guideline studies on commercial complex C9 aromatic mixtures that industry conducted under EPA's TSCA program. The entire commercial C9 aromatic blend, which contains a high percentage of TMBs, has similar toxicological properties and health effects as the individual isomers of TMB. Thus, guideline studies on the commercial complex of aromatic mixtures are highly relevant to assessing the toxicology of TMBs.
EPA's Office of Pesticide Programs (OPP) has also reviewed the toxicology of TMBs and determined that the health effects of TMBs can be efficiently assessed by relying on C9 aromatic mixture studies. OPP reached different scientific conclusions, including different quantitative health effect numbers, than that of EPA's IRIS Program. EPA, however, did not resolve these differences during the IRIS assessment of TMBs.

Case Study 2: Formaldehyde

Formaldehyde occurs naturally in every living system – from plants to animals to humans – all of which produce formaldehyde as a normal part of metabolism. In addition, its unique and versatile chemical properties make it a common and beneficial part of modern life. Formaldehyde has been the subject of extensive and robust scientific inquiry. EPA has been involved in assessing the human health risk of formaldehyde since the late 1970s. Large numbers of epidemiology, toxicology and biomechanical studies have informed the science surrounding formaldehyde, so that there a rich body of data exists.

The most recent draft Integrated Risk Information System (IRIS) formaldehyde assessment (2010) proposed exposure limits so low that the trace levels of formaldehyde found in human breath would present a cancer risk. The 2010 draft assessment also noted that: *"Human epidemiological evidence is sufficient to conclude a causal association between formaldehyde exposure and nasopharyngeal cancer, nasal and paranasal cancer, all*

leukemias, myeloid leukemia and lymphohematopoietic (LPH) cancers as a group." The National Academy of Sciences (NAS) then conducted a peer review of this draft and issued its final report in April 2011. The NAS report was critical of the draft IRIS assessment---an assessment that the IRIS program took 12 years to develop.

The NAS stated that EPA's claims regarding all leukemias, myeloid leukemia or related hematopoietic cancers were not supported. It noted that EPA's preliminary conclusions appeared subjective and that no clear scientific framework had been used by EPA to reach its conclusion. The NAS recommended that EPA revisit its determination of causality for specific LHP cancers, using methodology that integrates lines of evidence and addresses the specific criticisms in the NAS report. The NAS also made numerous recommendations for the improving the overall process and application of science used in all assessments generated by the IRIS program. Now, seven years since that NAS report was published, EPA continues to revise its assessment while not disclosing how emerging scientific evidence or modern risk assessment methods are being employed.

Meanwhile, newly published research based on the recommendations in the NAS report has advanced the state of the science. Raw data (made available after multiple years of FOIA requests) from studies conducted by the Federal government ---and upon which EPA relied on for its previous assessment conclusions--- were re-analyzed and the findings contradicted the original study conclusions. Today our knowledge regarding formaldehyde is much greater; yet it does not appear that this new knowledge has been applied in the EPA's assessment of formaldehyde risk. Published research demonstrates that inhaled formaldehyde cannot reach the bone marrow where leukemia occurs and that safe thresholds for formaldehyde exposure exist. This formaldehyde case study is an example of the long-term problems with the lack of consistent, transparent application of modern scientific knowledge regarding chemical exposures and human health risk.

Case Study 3: Ethylene Oxide

The Integrated Risk Information System (IRIS) assessment of ethylene oxide (EO) originated with a carcinogenicity assessment in 1985. The first comprehensive draft was published in 1998. An external review draft was issued in 2006, followed by a Science Advisory Board (SAB) review in 2007. Revisions of the EO assessment were made in 2011 and 2013, and an additional SAB review was conducted in 2014-2015. The final IRIS assessment for EO was posted in December 2016.

Using unsupportable and un-reviewed conservative risk assessment modeling, the IRIS assessment concludes that the one-in-a-million lifetime cancer risk value associated with exposure to EO is less than 1 part per trillion (ppt). This value is far below both EO background levels in the environment and EO levels naturally converted from ethylene in humans through breathing. This conclusion is not plausible and not scientifically supportable. It is based on an inadequate evaluation of a body of evidence from human studies that include historical exposure levels to EO that are far higher than current occupational exposure limits. Other, more accurate data sources are available, and alternative scientific risk assessment modeling approaches could have been used, but the

IRIS Program did not systematically integrate all of the evidence. Public comments on the EO IRIS assessment can be found in Docket No. EPA-HQ-ORD-2006-0756.

EO has dozens of important applications, including the manufacture of ethylene glycol based antifreeze, aircraft deicers, and PET plastics. EO is also used to produce higher-value derivatives such as ethoxylates, ethanolamines, glycol ethers, and polyether polyols. A small but critical use of EO is for the sterilization of medical equipment.

EPA's SAB 2007 review concluded that substantial revisions were needed to the draft IRIS assessment including:

- Acquiring and using individual data for modeling rather than grouping populations, which results in overly conservative estimated cancer risks;
- Considering using both linear and non-linear approaches to estimate cancer risk due to the distribution of and questionable association with certain cancer types; and
- Providing more transparency and correcting flaws associated with inappropriately grouping lymphohematopoietic cancers and combining genders for the dose-response analysis.

Meeting materials, including public comments, can be found at https://yosemite.epa.gov/sab/sabproduct.nsf/MeetingCal/7E3E313F627541D78525711400470D01.

The 2015 SAB Committee that reviewed the revised 2013 EO draft IRIS assessment did not conduct an independent, unbiased review. Problems included:

- Several SAB members made inaccurate public statements indicating industry produced scientific studies should be not be considered due to potential industry influence, although no evidence of biased data sponsored by industry was ever presented.
- SAB members did not understand new evidence-based medicine concepts regarding mutagenicity of cancer cells and the contribution of naturally occurring EO in DNA repair mechanisms.
- The SAB recommended using epidemiology data sets with questionable or scientifically unsound characteristics to estimate cancer risk and rejected alternative data sets that are as or more robust than those selected.

EPA still did not use individual data for modeling as recommended by the SAB in 2007, and did not adequately explore alternatives to the linear low dose modeling approach.

Meeting materials, including public comments, can be found at https://yosemite.epa.gov/sab/sabproduct.nsf/MeetingCal/17F305EC43EB1A6585257E2D0050255F.

The IRIS Program used a spline approach (piecewise linear model that was not presented during either SAB review) for exposure-response analyses for each of the lymphoid and breast cancer endpoints and ultimately combined the results. This approach results in higher risk at lower exposure levels and leads to proposed regulatory levels that are orders of magnitude lower than what the epidemiologic and genotoxicity scientific evidence would support.

Further, the IRIS Program did not fully consider all available evidence in finalizing the EO assessment. Scientific evidence clearly indicates that EO is a weak mutagen and a unit risk factor of less than 1 ppt is not realistic or reliably measurable, and is orders of magnitude lower than levels of EO in ambient air and the normal, endogenous levels of EO present in human bodies. Moreover, the assessment fails to consider the difference between exposures to EO produced outside the human body and exposure to EO produced within the human body as a normal metabolic product.

Subject: strengthening transparency in science rulemaking

Hi Jerry,

As I mentioned on Friday on the call on the impacts to ORD of the science transparency rule, we are pulling together an internal team to address public comments submitted in response to the science issues raised in the proposed rule. One of the areas we need support on is the infrastructure for housing and accessing the raw data for studies considered to be "pivotal regulatory science". Could we get someone from OSIM to participate on this group? It would be helpful to have someone with a broad view.

This internal team will help us identify issues and draft responses to comments. This would be a collaborative effort with us in OSP and to some extent OGC. We would ask that if needed they participate in one or more Agency workgroup meetings. We are conscious of their time and would only ask them to participate in these meetings when necessary. The participation would start in mid-August and would continue for about 7 months.

Please let me know if you have any questions or need additional information.

Subject: Updated Tom Sinks Data Request Graph
Attachments: Tom Sinks Graph.docx; Tom_Sinks_Quarterly_Public_Access_Report.xlsx

Hi Jerry,

Here is the updated version of the graph we had that meeting about this morning. Let me know if you have any questions or want any changes made.

Thanks,

Nathan Dunn

1/1/2017	2/8/2017	Yes	FALSE	FALSE

8/1/2017	5/31/2017	Yes	TRUE	TRUE
12/1/2017	11/14/2017	No; This publication contains EPA generated data, however it was finalized and cleared for publication before the Science Hub workflow process was developed for studies that contain personally identifiable information and sensitive medical data. Per Dr. T	FALSE	FALSE
9/1/2017	9/8/2017	Yes	FALSE	FALSE

12/15/2016	11/2/2016	Yes	TRUE	TRUE
6/13/2017	3/14/2018	No; Data was generated by Lead Author at the University of Maryland. The EPA provided advice and data interpretat	FALSE	FALSE
2/1/2017	2/24/2017	No; A review/Database/analysis	FALSE	FALSE
7/1/2017	8/29/2017	Yes	FALSE	FALSE

9/21/2017	11/1/2017	Yes	TRUE	TRUE
3/1/2017	11/17/2017	Yes	TRUE	TRUE
2/15/2017	2/23/2017	Yes	TRUE	TRUE
12/8/2016	2/15/2017	No; All the data in this manuscript is generated by the Romanian couthors.	TRUE	TRUE
2/6/2018		No; publicaton cleared prior to Science Hub workflow process was developed for personally identifiable information	FALSE	FALSE

11/1/2017	1/3/2018	Yes	TRUE	TRUE
4/3/2017	5/9/2017	No; All data represented in this article is contained in the manuscript and/or its associated Supplemental Material.	FALSE	FALSE
6/12/2017	1/22/2018	No; No data associated with this article. This paper introduced GIFMod and provided some example applications.	FALSE	FALSE
3/1/2017	11/17/2017	Yes	TRUE	TRUE

9/1/2016	3/1/2017	No; All data is from University of Georgia	FALSE	FALSE
5/9/2017	5/10/2017	No; Data was gathered during a US Park Service led workshop	FALSE	FALSE
5/2/2017	5/10/2017	No; No data collected - paper is an intellectual application of FEGS to a problem	FALSE	FALSE
5/16/2017	9/29/2017	Yes	TRUE	TRUE
11/23/2016	2/23/2017	Yes	TRUE	TRUE

3/3/2017	6/15/2017	Yes	TRUE	TRUE
11/1/2017	11/6/2017	Yes	TRUE	TRUE
8/8/2017	8/9/2017	No; Data were collected as part of the National Birth Defects Prevention Study (NBDPS) through the CDC.	FALSE	FALSE
8/1/2017	8/1/2017	No; Review article, no data	FALSE	FALSE

3/1/2017	2/23/2017	No; This product is a literature review.	TRUE	TRUE
12/26/2017	2/9/2018	Yes	TRUE	TRUE
1/6/2017	8/23/2017	Yes	FALSE	FALSE
12/9/2016	12/12/2016	Yes	FALSE	FALSE

7/7/2017	8/16/2017	Yes	TRUE	TRUE
2/1/2018	2/26/2018	Yes	FALSE	FALSE
5/17/2017	6/8/2017	No; Journal article is a review of EPA documents and assessment processes and did not use EPA-generated data.	FALSE	FALSE
8/16/2017	9/6/2017	No; The paper focuses on an already existing model called EXP-HYDRO from Patil and Stieglitz (2014)	FALSE	FALSE

12/1/2017	12/1/2017	Yes	FALSE	FALSE
9/1/2017	12/19/2017	No; No data in article	FALSE	FALSE
2/10/2017	2/10/2017	Yes	FALSE	FALSE
12/22/2017	1/30/2018	No; Lead author developed and ran the model using published literature values and NOAA data.	FALSE	FALSE
9/5/2017	9/7/2017	Yes	TRUE	TRUE
6/15/2017	6/28/2017	Yes	FALSE	FALSE

12/1/2016	2/10/2017	Yes	FALSE	FALSE
3/1/2017	2/8/2018	No; Data were generated by USGS and are publically available through their process	FALSE	FALSE
2/1/2017	3/14/2017	Yes	TRUE	TRUE
9/5/2016	2/14/2017	Yes	FALSE	FALSE

6/20/2017	8/28/2017	Yes	FALSE	FALSE
1/10/2017	12/14/2017	No; Helped with writing, provided expertise in tree physiology that helped data be interpreted by Univ of Idaho	FALSE	FALSE
5/18/2017	5/18/2017	Yes	TRUE	TRUE
5/15/2017	5/9/2017	Yes	TRUE	TRUE
5/1/2017	12/18/2017	No; There was no EPA generated data for this article (data was taken from literature)	FALSE	FALSE

5/16/2017	5/16/2017	Yes	TRUE	TRUE
7/1/2017	7/7/2017	No; ORD-018108 was led by a graduate student and the data are hers as part of her dissertation.	FALSE	FALSE
5/2/2017	6/6/2017	Yes	TRUE	TRUE
11/17/2016	2/14/2017	Yes	FALSE	FALSE

12/1/2017	2/2/2018	Yes	FALSE	FALSE
5/26/2017	4/16/2018	No; revisiting for 2002 publication by same author	FALSE	FALSE
2/23/2017	5/31/2017	Yes	TRUE	TRUE
9/1/2016	3/12/2018	No; Data consisit of secondary data only	FALSE	FALSE
2/1/2017	6/23/2017	Yes	TRUE	TRUE

4/21/2017	5/8/2017	Yes	TRUE	TRUE
3/20/2017	5/5/2017	Yes	FALSE	FALSE
11/1/2017	9/21/2017	Yes	TRUE	TRUE
1/1/2017	11/17/2017	Yes	TRUE	TRUE

5/4/2017	4/24/2018	No; Review of previously published article results only	FALSE	FALSE
12/9/2016	12/12/2016	Yes	FALSE	FALSE
11/25/2016	9/27/2017	Yes	TRUE	TRUE
2/21/2017	2/24/2017	Yes	TRUE	TRUE

8/24/2017	9/27/2017	Yes	TRUE	TRUE
3/18/2018	4/16/2018	No; This is a literature review article. It contains no new data or analyses, either EPA-generated or otherwise	FALSE	FALSE
9/7/2016	4/14/2017	No; This journal article is observational based on analysis of existing population data.	FALSE	FALSE
4/17/2017	9/7/2017	Yes	FALSE	FALSE
10/1/2016	10/6/2016	No; Product is being cleared for completion-work prior to EPA	FALSE	FALSE

5/1/2017	4/23/2018	Yes	TRUE	TRUE
10/2/2017	11/28/2017	No; This is literature review.. No original data was generated. It used data from outside sources	FALSE	FALSE
12/16/2016	12/21/2016	Yes	TRUE	TRUE
4/1/2017	12/30/2016	Yes	TRUE	TRUE

4/17/2017	9/7/2017	Yes	TRUE	TRUE
11/1/2016	5/5/2017	No; All calculations were performed using published data on chemical manufacturing processes from the scientific literature.	FALSE	FALSE
1/15/2018	4/10/2018	No; Research data consisted of secondary data only.	FALSE	FALSE
5/25/2017	5/25/2017	No; The data was generated by researchers in Australia	FALSE	FALSE
12/1/2017	9/25/2017	Yes	TRUE	TRUE
12/22/2016	1/4/2017	No; Secondary data only	FALSE	FALSE

4/1/2017	7/7/2017	Yes	TRUE	TRUE
8/1/2017	5/10/2017	No; Paper describes the modeling enviornment.	FALSE	FALSE
6/1/2017	8/23/2017	No; The manuscript reviews existing available models, indicators, and metrics for climate event resilience.	FALSE	FALSE
5/15/2017	3/1/2017	Yes	TRUE	TRUE

6/29/2017	11/17/2017	No; Review paper, no data to report	TRUE	FALSE
4/1/2017	3/17/2017	Yes	FALSE	FALSE
6/1/2017	7/7/2017	Yes	TRUE	TRUE
2/1/2018	1/11/2018	Yes	TRUE	TRUE

4/2/2018	3/5/2018	Yes	FALSE	FALSE
2/6/2017	4/13/2017	Yes	TRUE	TRUE
2/23/2017	3/9/2018	Yes	TRUE	TRUE

7/12/2017	7/26/2017	No; Research data consisted of secondary data only	FALSE	FALSE
5/1/2017	7/28/2017	No; Publicly available datasets were reanalyzed They are identified and described appropriately within the article	FALSE	FALSE
2/13/2017	6/6/2017	Yes	TRUE	TRUE

4/1/2017	6/9/2017	No; This article proposes a new conceptual approach to modeling of ecotoxicological effects.	FALSE	FALSE
3/1/2017	6/9/2017	No; It does not have any data because it describes an outreach activity conducted in the Western Balkans	FALSE	FALSE
7/1/2017	2/8/2018	No; This is a review paper - no data, just summary and interpretation	TRUE	TRUE
11/8/2016	11/8/2016	No; Data does not belong to the EPA. Started prior to joining EPA	FALSE	FALSE
4/1/2018	4/16/2018	No; Data belongs to USDA-ARS	FALSE	FALSE

6/1/2017	9/25/2017	Yes	TRUE	TRUE
6/1/2017	6/9/2017	Yes	TRUE	TRUE
11/9/2017		Yes	TRUE	FALSE
8/24/2017	9/21/2017	Yes	TRUE	TRUE

2/2/2017	2/16/2017	Yes	TRUE	TRUE
11/1/2016	6/15/2017	No; Research data consisted of secondary data only	FALSE	FALSE
4/1/2017	6/12/2017	Yes	TRUE	TRUE
1/4/2017	3/15/2017	Yes	TRUE	TRUE

11/1/2017	9/7/2017	Yes	TRUE	TRUE
4/5/2017	5/31/2017	Yes	TRUE	TRUE
12/13/2016	2/6/2017	Yes	TRUE	TRUE
11/1/2017	8/22/2017	No; Article is a review/synthesis, presenting no EPA data or outside data whatsoever.	FALSE	FALSE

6/12/2017	6/12/2017	Yes	TRUE	TRUE
1/1/2017	5/10/2017	No; This is a news column of recent technology reports.	FALSE	FALSE
5/15/2017	5/9/2017	Yes	FALSE	FALSE
6/1/2017	9/11/2017	Yes	TRUE	TRUE

11/20/2017		Yes	TRUE	FALSE
8/1/2017	8/29/2017	No; Article is a review of published literature	FALSE	FALSE
3/1/2017	2/9/2017	No; Review article, utilizes secondary data from the literature	FALSE	FALSE
1/24/2018	12/13/2017	No; Research data consisted of secondary data only	FALSE	FALSE

10/1/2017	4/30/2018	Yes	TRUE	TRUE
12/16/2016	4/19/2017	Yes	TRUE	TRUE
4/1/2017	3/6/2017	No; Data was generated at Oregon State University. EPA was a collaborator.	FALSE	FALSE

7/31/2017	8/1/2017	Yes	TRUE	TRUE
2/1/2017	1/25/2017	No; Study by a laboratory in China	FALSE	FALSE
5/22/2017		Yes	TRUE	FALSE

11/9/2017	12/7/2017	Yes	TRUE	TRUE
8/16/2017	8/16/2017	No; USGS owns the datasets that were used to build the software.	FALSE	FALSE
5/2/2017	5/8/2017	No; This manuscript contains a small amount of methodological data that were only used to optimize** see comments	FALSE	FALSE

1/31/2017	2/8/2018	No; EPA did not generate any of the model inputs described in the journal article.	FALSE	FALSE
9/1/2017	6/6/2017	Yes	TRUE	TRUE
9/20/2017	8/28/2017	No; Research Consisted of secondary data only	FALSE	FALSE

5/27/2017	10/4/2017	Yes	TRUE	TRUE
6/7/2017	9/28/2017	Yes	TRUE	TRUE
12/1/2017	9/28/2017	Yes	TRUE	TRUE
6/12/2017	9/14/2017	Yes	TRUE	TRUE

7/1/2017	6/15/2017	Yes	TRUE	TRUE
1/15/2016	3/21/2017	No; This is a review article primarily by external non-EPA authors, and has no associated data.	FALSE	FALSE
10/20/2017	4/30/2018	No; Uses secondary data only, including some from EPA National Wetland Condition Assessment	FALSE	FALSE
12/1/2016	2/8/2017	Yes	FALSE	FALSE
11/28/2016	11/28/2016	No; Scientific meeting report	FALSE	FALSE

1/9/2017	1/12/2017	No; Scientific perspective	FALSE	FALSE
7/20/2017	12/7/2017	Yes	TRUE	TRUE
9/28/2017	9/28/2017	Yes	TRUE	TRUE
3/17/2017	4/19/2017	No; No EPA data	FALSE	FALSE

5/20/2017	8/29/2017	No; Data in this paper were generated by an Oregon State University student and not by EPA.	FALSE	FALSE
7/1/2017	11/21/2017	No; No primary data was generated. Secondary data from non-EPA LCA databases was used for this analysis.	TRUE	TRUE
2/1/2018	3/14/2018	No; DBP and health data came from state agencies in Massachusetts, and from individual public water utilities	FALSE	FALSE
4/2/2018	4/5/2018	No; This paper reviews the published literature; it contains no EPA-generated data.	FALSE	FALSE

5/1/2017	6/9/2017	No; Editorial only	FALSE	FALSE
10/24/2016	3/15/2017	No; All the data presented in the STICS entry ORD-019266 was generated by our European collaborators. EPA's contribution (me and Kellie Fay) was limited to generation of the biological material used to collect the data, technical guidance on performing th	FALSE	FALSE
4/13/2017	5/8/2017	Yes	FALSE	FALSE

4/13/2017	5/8/2017	No; The work was supported by a Cooperative Agreement; data was collected by participating instituions.	FALSE	FALSE
11/15/2017	11/3/2017	No; This work was conducted prior to my employment at the EPA, and it is composed of qualitative interviews.	FALSE	FALSE
12/1/2016	12/22/2016	No; Data was generated by Duke and analyzed at HMGU. EPA authors are part of Cathgen team and guide/provide advice	FALSE	FALSE
7/1/2017	6/21/2017	No; Review article	FALSE	FALSE
11/28/2016	11/28/2016	No; Review Article	FALSE	FALSE

10/20/2016	11/27/2017	No; This is a small abstract contained within a workshop report for SETAC.	FALSE	FALSE
9/10/2017	6/14/2017	No; Data was generatred by scientists in Chile.	FALSE	FALSE
2/2/2017	5/5/2017	No; Data was generated by the author(s); EPA provided financial support for data analysis and publication only.	FALSE	FALSE

11/2/2017	11/2/2017	Yes	TRUE	TRUE
4/1/2017	5/8/2017	No; The data was collected by universities as part of a cooperative agreement 83563201 to Univ. of Virginia.	FALSE	FALSE
3/1/2017	1/3/2018	No; No data used in article	FALSE	FALSE
9/24/2017	12/14/2017	No; Article includes insights from an investigation of the primary literature. No data was generated or analyzed.	FALSE	FALSE

7/14/2017	9/7/2017	Yes	TRUE	TRUE
2/23/2017	5/8/2017	Yes	TRUE	TRUE
9/1/2017	9/7/2017	No; Used data from the Korean National Environmental Health Survey and from published articles	FALSE	FALSE
10/1/2017	9/30/2017	No; PM samples collected by the EPA were sent to outside collaborators who used them to generate data	FALSE	FALSE

11/1/2017	11/13/2017	No; The data in this manuscript was gathered as part of my dissertation research at The Ohio State University.	FALSE	FALSE
5/2/2017	6/6/2017	Yes	TRUE	TRUE
7/1/2017	8/29/2017	No; Literature review article	FALSE	FALSE
4/1/2017	5/5/2017	No; This journal article was a review product of a workshop on ionizable organic chemicals, involving no new data generation.	FALSE	FALSE

2/22/2018	2/28/2018	Yes	TRUE	TRUE
8/1/2017	5/25/2017	No; Data gathering and analysis took place in China.	FALSE	FALSE
8/1/2017	10/30/2017	No; This is a workshop analysis/report that involved no generation of new data.	FALSE	FALSE
12/15/2017	11/6/2017	No; This is a review article.	FALSE	FALSE

9/1/2017	9/13/2017	No; Research data consisted of secondary data only	FALSE	FALSE
6/1/2017	8/18/2017	No; We provided samples (dosed rat urine) that contained the analytes to researchers	FALSE	FALSE
1/1/2018	11/7/2017	Yes	TRUE	TRUE
8/15/2017	9/11/2017	No; This was a collaborative study. I have provided selection of chemicals with doses & provided guidance	FALSE	FALSE

7/1/2017	6/6/2017	Yes	TRUE	TRUE
10/25/2017	10/25/2017	No; no EPA data was generated for this article	FALSE	FALSE
4/13/2017	4/19/2017	Yes	TRUE	TRUE
5/2/2017	11/17/2017	Yes	TRUE	TRUE

11/10/2017	11/21/2017	Yes; NAGE Exempt	FALSE	FALSE
5/24/2017	7/31/2017	Yes	TRUE	TRUE
4/7/2017	4/24/2017	No; It is a literature review and reflects peer reviewed literature external to EPA	FALSE	FALSE
3/14/2017	6/9/2017	Yes	TRUE	TRUE

3/8/2017	11/7/2017	No; This is a state-of-the-science literature review article.	FALSE	FALSE
1/15/2017	12/19/2016	No; This is a review article.	FALSE	FALSE
11/1/2017	11/16/2017	Yes	TRUE	TRUE
12/20/2016	1/11/2018	Yes	TRUE	TRUE

1/2/2018	1/10/2018	No; This work was done by NOAA led researchers as part of a REServ Program that started in 2011.	FALSE	FALSE
5/1/2017	6/29/2017	Yes	TRUE	TRUE
8/1/2017	5/16/2017	Yes	TRUE	TRUE
5/8/2017	3/12/2018	Yes	TRUE	TRUE

10/10/2017	1/11/2018	Yes	TRUE	TRUE
6/1/2017	9/29/2017	No; no EPA data; all the data generated by external organizations; EPA coauthors	FALSE	FALSE
2/10/2017	2/16/2017	No; This article from participation in an expert panel (no data collection or analysis)	TRUE	TRUE
2/26/2016	1/30/2017	Yes	TRUE	TRUE

12/1/2016	4/20/2018	No; review article	TRUE	TRUE
2/10/2017	2/15/2017	Yes	TRUE	TRUE
12/15/2017	5/4/2018	No; This is a literature review and includes officially available data from EPA.	FALSE	FALSE

10/1/2017	7/31/2017	Yes	TRUE	TRUE

7/1/2017	8/9/2017	Yes	FALSE	FALSE
3/1/2017	12/15/2017	No; review article	FALSE	FALSE
6/15/2017	6/15/2017	Yes	TRUE	TRUE
10/24/2017	2/15/2018	Yes	TRUE	TRUE
1/25/2018	3/9/2018	No; I am editing a special edition of a journal	FALSE	FALSE

2/1/2018	4/10/2018	Yes	TRUE	TRUE
6/1/2017	6/22/2017	No; Data generated at Stanford, used as part of a new analysis here.	FALSE	FALSE
1/29/2018		Yes; NAGE Exempt	FALSE	FALSE
4/7/2017	4/12/2017	Yes	TRUE	TRUE

9/1/2017	9/7/2017	Yes	TRUE	FALSE
3/1/2018	2/27/2018	Yes	TRUE	TRUE
4/2/2018	4/20/2018	No; review	FALSE	FALSE
8/1/2017	11/6/2017	No; Review paper	FALSE	FALSE

5/2/2017	10/27/2017	No; All sampling and chemical analyses published in the current paper were conducted by USGS personnel.	FALSE	FALSE
3/1/2017	4/2/2018	No; Data were generated by the USGS	FALSE	FALSE
4/1/2017	6/12/2017	No; This is a review article that contains no new EPA generated data.	FALSE	FALSE
1/1/2018	1/25/2018	Yes	TRUE	TRUE

6/1/2017	8/22/2017	No; Paper based on workshop discussions. No original data included.	FALSE	FALSE
11/1/2017	1/26/2018	No; Data were generated by Lead Author from Central Washington University.	FALSE	FALSE
5/1/2018	4/2/2018	Yes; GED exempt - paper cleared before 6/30/2017	FALSE	FALSE
8/31/2017	5/11/2017	Yes	TRUE	TRUE

3/30/2018	4/23/2018	Yes	TRUE	TRUE
4/1/2017	4/18/2017	Yes	TRUE	TRUE
5/2/2017	5/30/2017	Yes	TRUE	TRUE
8/30/2017	9/28/2017	Yes	TRUE	TRUE
3/1/2018	2/27/2018	Yes	TRUE	TRUE
11/1/2017	11/3/2017	Yes	TRUE	TRUE

8/4/2017		Yes	TRUE	FALSE
7/10/2017	8/2/2017	No; Data were from existing external published papers.	FALSE	FALSE
4/20/2017	9/27/2017	Yes	TRUE	TRUE
11/1/2016	10/16/2017	Yes	TRUE	TRUE

6/30/2017	2/22/2018	Yes	TRUE	TRUE
3/2/2018	4/23/2018	Yes	TRUE	TRUE
11/21/2017	11/22/2017	Yes	TRUE	TRUE
10/17/2017	3/21/2018	No; Human health data	FALSE	FALSE

2/1/2018	3/19/2018	Yes	TRUE	TRUE
9/1/2017	11/17/2017	Yes	TRUE	TRUE
3/28/2017	3/30/2017	No; It is a Letter to the Editor with no data presented.	FALSE	FALSE
7/14/2017	7/19/2017	No; Data analyses conducted by collaborator at SUNY-Binghamton. EPA contribution on interpretation and reporting.	FALSE	FALSE

1/18/2018	1/22/2018	Yes	TRUE	TRUE
9/10/2017	4/10/2018	No; This is a framework article	FALSE	FALSE
10/11/2017	3/19/2018	Yes	TRUE	TRUE
11/7/2017	1/3/2018	Yes	TRUE	FALSE
12/1/2017	12/8/2017	No; Research was a graduate research project conducted by the Univ of MN-Duluth with funding from MN Sea Grant.	FALSE	FALSE

11/27/2017	11/28/2017	No; The data was generated by Oregon State University	FALSE	FALSE
10/1/2017	7/19/2017	Yes	TRUE	TRUE
4/1/2018	3/22/2018	No; The article proposed a methodological approach and did not require data creation.	FALSE	FALSE
1/9/2017	9/27/2017	No; no EPA data; all the data generated by external organizations; EPA coauthors	FALSE	FALSE

9/7/2017	9/7/2017	No; Commentary	FALSE	FALSE
11/1/2017	11/20/2017	Yes	TRUE	TRUE
8/15/2017	6/28/2017	Yes	TRUE	TRUE
11/21/2017	1/22/2018	Yes	FALSE	FALSE

12/1/2017	12/5/2017	Yes	TRUE	TRUE
9/15/2017	1/10/2018	No; Work was conducted at University of Wisconsin.	TRUE	TRUE
9/15/2017	2/8/2018	No; ItÂ¿s a review and synthesis paper (only public domain data used)	FALSE	FALSE

7/12/2017	9/28/2017	Yes	TRUE	TRUE
2/21/2017	2/21/2017	Yes	TRUE	TRUE
1/1/2018	4/16/2018	Yes	TRUE	TRUE
7/1/2017	8/28/2017	No; EPA role was providing tecnical and scientific advice. All work performed in U. Georgia	FALSE	FALSE
1/31/2018	2/1/2018	Yes	TRUE	TRUE

4/17/2017	4/13/2017	Yes	TRUE	TRUE
8/16/2017		Yes	TRUE	TRUE
1/1/2017	3/1/2017	Yes	TRUE	TRUE
1/3/2018	11/28/2017	Yes	TRUE	TRUE

9/1/2017	12/13/2017	No; Article is an opinion piece containing no data.	FALSE	FALSE
9/1/2017	6/8/2017	Yes	TRUE	TRUE
11/7/2017	4/20/2018	No; main PIs at NKU	FALSE	FALSE
10/1/2017	8/25/2017	No; The research involved mining and synthesizing existing health, landcover, and census data.	TRUE	TRUE
12/1/2017	1/11/2018	Yes; GED exempt - paper cleared before June 30 2017	FALSE	FALSE

3/21/2017	5/9/2017	Yes	TRUE	TRUE
7/21/2017	11/8/2017	No; A Framework not research results	FALSE	FALSE
7/21/2017	11/8/2017	No; A Framework not research results	FALSE	FALSE
7/13/2017	12/19/2017	No; It uses some 2013 EPA data but they werent generated by us for the paper- we just used them	FALSE	FALSE
6/1/2017	5/30/2017	Yes	TRUE	TRUE

1/13/2018	2/8/2018	Yes	FALSE	FALSE
12/1/2017	12/7/2017	Yes	TRUE	TRUE
9/5/2017	9/19/2017	Yes	TRUE	TRUE

1/1/2018	11/30/2017	Yes	TRUE	TRUE
7/1/2017	9/30/2017	No; No data-Peer commentary on target article that is being published. Our article will be in the same issue.	FALSE	FALSE
11/15/2017	6/27/2017	No; All data was generated by the lead author with no funding from EPA.	FALSE	FALSE

5/4/2018	5/4/2018	No; Data collected collaboratively while on sabbatical in Australia (2011) at the University of South Australia	FALSE	FALSE
2/1/2018	12/18/2017	No; Used published data set	FALSE	FALSE
5/31/2017		No; This manuscript is about pre-existing publicly available protocols. No data collected, used, or analyzed.	FALSE	FALSE

12/2/2017	2/28/2018	Yes	TRUE	TRUE
2/26/2018	4/16/2018	Yes	TRUE	TRUE
5/5/2018	4/16/2018	No; Data created by primary author - UC postdoc & personnel generated the data	FALSE	FALSE

3/15/2018	4/10/2018	No; This article contains only previously published EPA data and publicly available information	FALSE	FALSE
3/1/2018	1/17/2018	No; N/A	FALSE	FALSE
12/15/2017	11/6/2017	Yes	TRUE	TRUE
1/1/2018	2/8/2018	Yes; GED exempt - paper cleared before June 30 2017	FALSE	FALSE

11/30/2017	12/7/2017	Yes	TRUE	TRUE
3/7/2018	3/29/2018	Yes	FALSE	FALSE
2/1/2018	2/2/2018	No; All pre-exisiting data from federal, state and local agencies	FALSE	FALSE
1/21/2018	1/22/2018	No; This is a review article, not a research article.	FALSE	FALSE
3/5/2018		Yes	TRUE	FALSE

1/1/2018	12/19/2017	Yes	TRUE	TRUE
3/28/2018	5/1/2018	Yes	TRUE	TRUE
1/1/2018	1/5/2018	No; This is an overview article without data	TRUE	TRUE
3/19/2018	4/23/2018	No; Review Article	FALSE	FALSE

5/8/2017	2/6/2018	No; Work involves modeling done at other organizations. Terry's role is overall interpretation.	FALSE	FALSE
8/2/2017	8/7/2017	No; CDC-generated data, SDP in ScienceHub outlines protocol for public access	FALSE	FALSE
11/6/2017	12/14/2017	No; This is an invited opinion paper with no associated data.	FALSE	FALSE
11/1/2017	9/7/2017	No; The survey and analysis of survey results were conducted by the lead author at JRC	FALSE	FALSE

11/15/2017	4/16/2018	Yes	TRUE	TRUE
7/12/2017	8/29/2017	Yes	TRUE	TRUE
11/3/2017	12/14/2017	No; Review article - EPA did not generate data	FALSE	FALSE
3/1/2018	1/22/2018	Yes	TRUE	TRUE
4/1/2018	5/3/2018	Yes	TRUE	TRUE

4/2/2018	1/29/2018	No; Publicly available data collected and QAÂ¿d by the Canadian Wood Buffalo Environmental Association	FALSE	FALSE
7/1/2017	9/1/2017	No; Conference proceeding	FALSE	FALSE
1/16/2018	2/20/2018	Yes	TRUE	TRUE
2/1/2018	5/1/2018	Yes	TRUE	TRUE

12/1/2017	12/28/2017	Yes	FALSE	FALSE
10/18/2017	5/3/2018	No; Data was generated and analyzed at the Helmholtz Institute. I have provided technial assistance and direction	FALSE	FALSE
10/17/2017		Yes	TRUE	FALSE
3/1/2018	12/11/2017	Yes	TRUE	TRUE
3/1/2018	5/2/2018	Yes	TRUE	TRUE

3/6/2018	2/13/2018	Yes	TRUE	TRUE
8/18/2017	8/25/2017	Yes	TRUE	TRUE
1/1/2018	1/17/2018	Yes	TRUE	TRUE
1/27/2018	2/28/2018	Yes	TRUE	TRUE

10/19/2017	11/6/2017	No; The data were generated by researchers from St Cloud State Univ	FALSE	FALSE
10/1/2017	11/6/2017	No; perspectives article	FALSE	FALSE
11/1/2017	11/6/2017	No; No data from EPA or anyone else.	FALSE	FALSE
1/18/2018	1/22/2018	No; EPA scientists provided their technical expertise in interpreting data collected and analyzed by co-authors	FALSE	FALSE
2/1/2018	11/6/2017	Yes	TRUE	TRUE
8/15/2017	7/26/2017	No; this research was done at an acedemic institution with no EPA support	FALSE	FALSE

3/19/2018	3/13/2018	No; This is an essay of EPA's perspective on benefit transfer challenges.	FALSE	FALSE
1/18/2018	2/6/2018	Yes	TRUE	TRUE
4/20/2018	4/27/2018	No; research lead and data owned by external authors	FALSE	FALSE
10/16/2017	11/30/2017	Yes	FALSE	FALSE
1/1/2018	1/3/2018	No; Data were generated by commercial lab.	FALSE	FALSE

1/12/2018	1/22/2018	Yes	TRUE	TRUE
3/14/2018	3/26/2018	No; This is work done by the University of Hawaii. EPA is only a co-author and did not generate any data.	FALSE	FALSE
2/1/2018		Yes	TRUE	FALSE
2/1/2018	2/15/2018	No; The article has no data.	FALSE	FALSE

2/1/2018	4/13/2018	Yes	TRUE	TRUE
10/24/2017	11/3/2017	No; Manuscript represents an introduction to special issue of journal WATER; only conceptual ideas and synthesis	FALSE	FALSE
2/12/2018	2/13/2018	No; All data were provided by the System Wide Monitoring Program of the Grand Bay National Estuarine Research Rese	FALSE	FALSE
4/2/2018	2/6/2018	Yes	TRUE	TRUE

10/25/2017	10/31/2017	Yes	TRUE	TRUE
10/11/2017	3/22/2018	No; Reg 2 RARE project QA/QC plan was prepared by Univ of Ottawa & reviewed by EPA. EPA did not provide any data.	TRUE	TRUE
11/21/2017	12/14/2017	Yes	FALSE	FALSE
2/1/2018	1/17/2018	Yes	TRUE	TRUE
2/20/2018	11/17/2017	No; This is a review only, no data are presented.	FALSE	FALSE

3/1/2018	4/24/2018	Yes	TRUE	TRUE
11/2/2017	11/3/2017	Yes; N/A	TRUE	TRUE
3/16/2018	4/11/2018	Yes	TRUE	TRUE
2/1/2018	2/9/2018	No; All measured values presented in article, were generated at the Univ. of WA. John Frew was a graduate student.	FALSE	FALSE

9/6/2017	1/22/2018	Yes	TRUE	TRUE
3/1/2018	2/5/2018	No; These data were generated by colleagues at Drexel University and the Nature Conservancy.	FALSE	FALSE
4/17/2018	4/17/2018	No; This article is a critical review of existing data.	FALSE	FALSE
1/1/2018	1/23/2018	Yes	TRUE	TRUE
1/1/2018	1/22/2018	Yes	TRUE	TRUE

5/1/2018	4/16/2018	No; This paper describes a methodological framework and does not use data	FALSE	FALSE
10/19/2017	11/28/2017	Yes	TRUE	TRUE
10/16/2017	11/30/2017	No; Review Article	FALSE	FALSE

10/1/2017	10/31/2017	No; This is the result of a study conducted by the University of Cincinnati.	FALSE	FALSE
3/1/2018	2/22/2018	Yes	TRUE	TRUE
4/1/2018	4/11/2018	Yes	TRUE	TRUE
3/6/2018	5/7/2018	Yes	TRUE	FALSE

4/1/2018	12/11/2017	Yes	TRUE	TRUE
1/1/2018	1/17/2018	Yes	FALSE	FALSE
3/1/2018	5/7/2018	Yes; NAGE EXEMPT	FALSE	FALSE
1/16/2018	1/22/2018	No; We assembled a multi-species dataset based on previously published studies.	TRUE	TRUE

12/14/2017	5/3/2018	Yes	TRUE	TRUE
2/1/2018	2/6/2018	Yes	TRUE	TRUE
2/6/2018	3/9/2018	Yes	TRUE	TRUE
8/14/2017	9/27/2017	Yes	FALSE	FALSE
4/1/2018	4/20/2018	No; This is a review article that discusses some challenges in applying a tool in risk assessment	FALSE	FALSE

4/1/2018	3/30/2018	Yes	TRUE	TRUE
9/7/2017	9/7/2017	No	FALSE	FALSE
11/1/2017	9/25/2017	No; The data were all supplied by USGS.	FALSE	FALSE
2/6/2018	2/6/2018	No; journal article is a commentary based on the authors' collective opinions. There are no data.	FALSE	FALSE

1/2/2017	11/20/2017	No; Commentary, no new data included	FALSE	FALSE
3/6/2018	4/16/2018	Yes	TRUE	TRUE
5/1/2018	5/3/2018	No; The data were all supplied by USGS.	FALSE	FALSE

4/2/2018	4/20/2018	Yes	TRUE	TRUE
3/1/2018	1/4/2018	Yes	TRUE	TRUE
3/1/2018	1/11/2018	Yes	TRUE	TRUE
12/15/2017	4/3/2018	Yes	FALSE	FALSE

4/1/2018	12/15/2017	No; Presenting a new concept-no data generated	FALSE	FALSE
1/1/2018	12/15/2017	No; No EPA-generated data are associated with this product.	FALSE	FALSE
12/6/2017	4/10/2018	No; All of the data presented in this journal article comes from outside references.	FALSE	FALSE
2/1/2018	4/10/2018	No; all data presented is publically available, and has already been published	FALSE	FALSE

1/18/2018	2/9/2018	No; All experimental work was done at Nanjing Univ. China group conducted the experiments/data collections.	FALSE	FALSE
4/3/2018	4/20/2018	Yes	TRUE	TRUE
3/1/2018	11/28/2017	No; Models were based on simulations using published values in literature.	FALSE	FALSE
11/1/2017	10/30/2017	No; This paper is a review and therefore summarizes only the major lessons and conclusions of other work.	FALSE	FALSE

4/10/2018	4/10/2018	No; Secondary data	TRUE	TRUE
2/6/2018	3/20/2018	No; Article uses data generated during my postdoctoral research to associate exposure to NO2 with DNA methylation	FALSE	FALSE
11/1/2017	12/15/2017	No; This is an opinion article, does not contain data.	FALSE	FALSE
9/5/2017	11/3/2017	No; The U.S. EPA author collaborated in the experimental design and analysis data generated by the study.	FALSE	FALSE

4/1/2018		No; experiments performed by IL Natural History Survey; EPA only provided input on expermntl design, data,ms prep	FALSE	FALSE
5/1/2017	3/21/2018	No; Data was generated by USGS colleagues. Experts within EPA assisted in interpreting data and authoring.	FALSE	FALSE
4/1/2018	4/13/2018	No; EPA acted as technical consultation for the paper and NCSU conducted the real-time sample collection and data	FALSE	FALSE
11/28/2017	3/19/2018	No; This manuscript is a descriptive white paper of a database website and does not contain EPA-generated data.	FALSE	FALSE

12/22/2017	1/22/2018	No; Summary of Webinars and Associated Workshop	FALSE	FALSE
4/9/2018	4/16/2018	Yes	TRUE	TRUE
2/14/2018	2/14/2018	Yes; NAGE Exempt	FALSE	FALSE

3/10/2018	1/10/2018	No; This study was performed in China.	FALSE	FALSE
2/7/2018		No; This is a review article	FALSE	FALSE
11/9/2017	4/2/2018	No; letter to the editor with no data	FALSE	FALSE
4/1/2018	5/3/2018	Yes	TRUE	TRUE

1/25/2018	1/25/2018	No; PI at the University of Cincinnati	FALSE	FALSE
1/2/2018	1/5/2018	No; no EPA generated data	FALSE	FALSE
3/30/2018		No; Commentary from a recent workshop.	FALSE	FALSE
1/1/2018	2/22/2018	No; the product is a white paper, it reviews the state of the science.	FALSE	FALSE
4/1/2018	2/12/2018	Yes	TRUE	TRUE

4/15/2018	2/26/2018	Yes	TRUE	TRUE
4/27/2018		No; Review article	FALSE	FALSE
1/22/2018	2/13/2018	Yes	TRUE	TRUE
3/5/2018	3/9/2018	No; no data used - meeting report based on workshop held at NASA Goddard	FALSE	FALSE
3/1/2018	4/9/2018	No; This is a concept paper, so there are no data generated by EPA or any other organizations	FALSE	FALSE

3/16/2018	3/26/2018	Yes	TRUE	TRUE
2/28/2018	2/22/2018	No; meeting report, no data	FALSE	FALSE
10/17/2017	3/26/2018	No; KreisÂ¿s review/consultation on work not related to any current milestones or deliverables in ORD RAPs.	FALSE	FALSE
3/14/2018	3/16/2018	No; there is no epa-generated data in this article	FALSE	FALSE
4/9/2018	4/16/2018	Yes	FALSE	FALSE

3/20/2018	5/4/2018	No; Inter-laboratory study - I particpated with a group located at a local university - no work performed at AED.	FALSE	FALSE
5/1/2018	5/4/2018	No; This is a review article. No new data is presented.	FALSE	FALSE

Title
EPA Method 1615. Measurement of Enterovirus and Norovirus Occurrence in Water by Culture and RT-qPCR. Part III. Viru
System learning approach to assess sustainability and forecast trends in regional dynamics: The San Luis Basin study, Colo
Evaluating the Accuracy of Common Runoff Estimation Methods for New Impervious Hot-Mix Asphalt
(REPRODUCTIVE TOXICOLOGY) Computational Modeling and Simulation of Genital Tubercle Development
Appropriateness of simulants for Bacillus anthracis in studying Multi-Generation Cross-contamiantion of Mail
Development of a Human Physiologically Based Pharmacokinetics (PBPK) Model For Dermal Permeability for Lindane
Internet-Based Approaches to Building Stakeholder Networks for Conservation and Natural Resource Management.
(Envir. Health Perspect.) Using ToxCast data to reconstruct dynamic cell state trajectories and estimate toxicological poi
Population Status of the Seaside Sparrow in Rhode Island: A 25-Year Assessment.
Effectiveness of a stream-restoration effort using natural material instream structures
Global Forest Area Trends Underestimate Threats from Forest Fragmentation
Using ecological stoichiometry as an indicator of ecological function of headwater streams
Stoichiometry of excreta in larval stream salamanders: implications regarding the ecological roles of salamanders
Eight river principles for navigating the science–policy interface
Genetic Variants in the Bone Morphogenic Protein Gene Family Modify the Association between Residential Exposure to
Redesign of Water Distribution Systems for Passive Containment of Contamination
Authorship Guidance in a Federal Research Laboratory: A Case Study
Factors that influence natural abundances of stable isotopes in headwater stream taxa located across urban and natural g
Part 2: Sensitivity comparisons of the insect Centroptilum triangulifer to Ceriodaphnia dubia and Daphnia magna using st
Weighing the relative potential impacts of climate change and land-use change on an endangered bird
Variation in bird-window collision mortality and scavenging rates within an urban landscape
Complex watersheds, collaborative teams: Assessing pollutant presence and effects in the San Francisco Delta
Effect of Microcystin-LR on human placental villous trophoblast differentiation in vitro
Controllability of complex networks for sustainable system dynamics
Genetic linkage map and comparative genome analysis for the estuarine Atlantic killifish (Fundulus heteroclitus)
Mercury exposure and omega-3 fatty acid intake in relation to renal disease risk in the US population: NHANES 2003-200
Estimating Green Net National Product for Puerto Rico: An Economic Measure of Sustainability (Journal article)
Hydrogeomorphic zones characterize riverbed sediment patterns within a river network
Episodic Impacts from California Wildfires Identified in Las Vegas Near-Road Air Quality Monitoring
Source emission and model evaluation of formaldehyde from composite and solid wood furniture in a full-scale chamber
Multivariate Condition Assessment of Watersheds with Linked Micromaps
Exposure to the elemental carbon, organic carbon, nitrate and sulfate fractions of fine particulate matter and risk of prete
Evaluating relative sensitivity of SWAT-simulated nitrogen discharge to projected climate and land cover changes for two
Statistical approaches to developing a multiplex immunoassay for determining human exposure to environmental patho
Preliminary Evidence for the Amplification of Global Warming in Shallow, Intertidal Estuarine Waters
Systems Biology and Biomarkers of Early Effects for Occupational Exposure Limit Setting
Rat Models of Cardiometabolic Diseases: Baseline Clinical Chemistries, and Rationale for their Use in Examining Air Pollu
Whole Body Plethysmography Reveals Differential Ventilatory Responses to Ozone in Rat Models of Cardiovascular Disea

EPA Data?/Justification
Yes
Yes
No; Research data consisted of secondary data only
No; data are from 2002-2006 spatially balanced probabilistic stream survey data from W VA Dept of EPA
Yes

Yes

Yes

Yes

Yes

Yes

Yes

No; Review article

Yes

No; Secondary data used

No; Data belongs to another entity

Yes

Yes

Yes

No; All data for this article was generated at the University of Texas.

No; Data belongs to another entity

Yes

Yes

No; Research conducted was a literature review

No; The article is a review article outlining and discussing the conceptual basis for managing climate refugia

No; Review article with one figure from NOAA and NASA.

Yes

Yes

Yes

No; None of the papers has data that was generated by EPA. AG

No; Research data consisted of secondary data only

Yes

No; no data, software

Yes

Yes

Yes

Yes

No; Review Articles

Yes

No; No EPA Data, this is a review article

Yes

Yes

No; The date was not generated by EPA, but had an EPA coauthor

Yes

Yes

Yes

No; Review Articles

No; Review Articles

Yes

No; Manuscript describes a software package developed to retrieve, organize, and analyze estuary monitoring data

No; *

Yes

No; We helped with design, supplies, and writing but did not generate data

No; Used literature data

No; Based on summary of literature information and interviews, no lab or field gathering of data.

Yes

Yes

No; Data belongs to another entity
Yes
No; .

Yes; n/a

No; Used literature data only

Yes
Yes

No; Used publicly available data (non-EPA)

Yes

Yes

Yes

No; Used publicly available data (non-EPA)

No; Used publicly available data (non-EPA)

Yes

Yes

Yes

No; data belongs to Finnish Government

No; No EPA data, review only

Yes

Yes

Yes

Yes

Yes

Yes

Yes

Yes

Yes; Primary data collected was classified as CBI. All other data used was secondary data.

Yes

No; Research data consisted of secondary data only.

Yes

No; This manuscript utilized previously published data.

Yes

No; No EPA Data, this is a review article

Yes

Yes

Yes

No; Data belongs to another entity

No; Review Articles

No; Review Articles

No; All data published in this manuscript were generated at the Medical College of Wisconsin

Yes

No; 2)No EPA data

Yes

No; This is a review article

No; Review Articles

Yes

Yes

Yes

Yes

Yes

No; No EPA Data, analysis of research methods

Yes

Yes

Yes

Yes

Yes

Yes

No; the lead author is not EPA and the data was not created by EPA, but is an analysis of publicly available data

No; Literature review

Yes

No; Review Articles

No; Review article

No; Review article

No; Review Articles

Yes

Yes

No; No EPA Data, this is a review article

No; *

Yes

No; Review Articles
Yes
No; Review Articles

No; Authorship granted only due to samples provided
No; introduction to special issue - no data

No; Information gathered by NIH, Univ. of Calif, and Harvard University.
Yes
Yes
Yes

Yes

No; highlights from a conference
Yes

No; I was intellectual contributor - not data contributor. I helpied primary author interpret data & gave advice.
Yes
No; All data is from University of Georgia
Yes
No; Data consisit of secondary data only
No; This journal article is observational based on analysis of existing population data.
No; This is a review article primarily by external non-EPA authors, and has no associated data.
Yes
No; Literature review only

Title
Estimation of pyrethroid pesticide intake using regression modeling of food groups based on composite dietary samples.
A modified eco-efficiency framework and methodology for advancing the state of practice of sustainability analysis as ap
Approaches for predicting effects of unintended environmental exposure to an endocrine active pharmaceutical, tamoxif
Retrospective Surveillance of Wastewater To Examine Seasonal Dynamics of Enterovirus Infections
Riparian Proper Functioning Condition (PFC) Assessment to Improve Water Quality
Analysis of Emissions Reduction Strategies for Power Boilers in the U.S. Pulp and Paper Industry.
Harvested rainwater quality before and after treatment in six full-scale residential systems
Nationwide reconnaissance of contaminants of emerging concern in source and treated drinking waters of the United Sta
Aquatic concentrations of chemical analytes compared to ecotoxicity estimates
Effects of chronic alcohol consumption on neuronal function in the non-human primate BNST
Remediation of Methamphetamine in Clandestine Laboratories.A Literature Review
Improved method for calibration of exchange flows for a physical transport box model of Tampa Bay, FL USA
Field studies measuring the aerosolization of endotoxin during the land application of Class B biosolids
Physiology of ionoregulation and osmoregulation of major ions by freshwater animals: Teleost fish, Crustacea, aquatic in
The Emergy Perspective of Sustainable Trends in Puerto Rico From 1960 to 2013 -
Holistic impact assessment and cost savings of rainwater harvesting at the watershed scale
Development and Multi-laboratory Verification of US EPA Method 543 for the Analysis of Drinking Water Contaminants b
An integrated ecological modeling system for assessing impacts of multiple stressors on stream and riverine ecosystem s
A Climate Change Adaptation Strategy for Management of Coastal Marsh Systems
Impact of Leaching Conditions on Constituents Release from Flue Gas Desulfurization Gypsum (FGDG) and FGDG-Soil Mix
Translating crustacean biological responses from CO2 bubbling experiments into population-level predictions
Universal industrial sectors integrated solutions modulefor the pulp and paper industry
The importance of quality control in validating concentrations of contaminants of emerging concern in source and treate
Ecosystem services in risk assessment and management.
(Journal of Statistical Software) HTTK: R Package for High-Throughput Toxicokinetics
Development of the larval amphibian growth and development assay: Effects of chronic 4-tert-octylphenol or 17ß-t
Effects of the anti-microbial contaminant triclocarban and co-exposure with the androgen 17â-trenbolone, on repr
Medication Use Associated with Exposure to Manganese in Two Ohio Towns
Source identification of coarse particles in the Desert Southwest, USA using Positive Matrix Factorization
Genetic basis for rapidly evolved tolerance in the wild: adaptation to toxic pollutants by an estuarine fish species
Journal Article-"Estimating Inorganic Arsenic Exposure fromU.S.Rice and Total Water Intakes"
Future Needs and Recommendations in the Development of Species Sensitivity Distributions: Estimating Toxicity Thresho
Community Air Sensor Network Project: Lower Cost, Continuous Ambient Monitoring Methods
Multi-scale quantitative precipitation forecasting using nonlinear and nonstationary teleconnection signals and artificial r
Effects of Louisiana crude oil on the sheepshead minnow (Cyprinodon variegatus) during a life-cycle exposure to laborato
Linking ecosystem service supply to stakeholder concerns on both land and sea: An example from Guánica Bay w
Climate change impacts on projections of excess mortality at 2030 using spatially varying ozone-temperature
Comparison of fipronil sources in North Carolina surface water and identification of a novel fipronil transformation produ
Assessment of the vitro dermal irritation of cerium silver and titanium nanoparticles in a human skin equivalent model
Multi-scale Quantitative Precipitation Forecasting Using Nonlinear and Nonstationary Teleconnection Signals and Artifici
Review of pathogen treatment reductions for onsite non-potable reuse of alternative source waters
Prior knowledge-based approach for associating contaminants with biological effects: A case study in the St. Croix river b
Probabilistic estimation of residential air exchange rates for population-based human exposure modeling
A North American and global survey of perfluoroalkyl substances in surface soils: Distribution patterns and mode of occu
Development of the larval amphibian growth and development assay: Effects of benzophenone-2 exposure in Xenopus la
Role of natural gas in meeting an electric sector emissions reduction strategy and effects on greenhouse gas emissions

Anaerobic Biodegradation of soybean biodiesel and diesel blends under sulfate-reducing conditions
Using ecological production functions to link ecological processes to ecosystem services.
Uranium fate in wetland mesocosms: Effects of plants at two iron loadings with different pH values
Advancing the Next Generation of Risk Assessment Multi-Year Study-Highlights of Findings, Applications to Risk Assessm
A physiologically based pharmacokinetic model of vitamin D
Decontamination of Bacillus spores adhered to iron and cement-mortar drinking water infrastructure in a model system
Comparing Measures of Estuarine Ecosystem Production in a Temperate New England Estuary
Wetland Loss Patterns and Inundation-Productivity Relationships Prognosticate Widespread Salt Marsh Loss for Southerr
Soot, organics and ultrafine ash from air- and oxy-fired coal combustion
pCO2 effects on species composition and growth of an estuarine phytoplankton community.
The Association between Dust Storms and Daily Non-Accidental Mortality in the United States, 1993-2005.
Evaluation of the scientific underpinnings for identifying estrogenic chemicals in non-mammalian taxa using mammalian
Demographic analysis demonstrates contrasting abiotic and biotic stressors across a species range
Greenhouse Gas Emissions from Reservoir Water Surfaces: A New Global Synthesis - journal
Water Recreation and Illness Severity
Habitat restoration from an ecosystem goods and services perspective: Application of a spatially explicit individual-basec
A Random Forest Approach to Predict the Spatial Distribution of Sediment Pollution in an Estuarine System
Acrolein inhalation alters myocardial synchrony and performance at and below exposure concentrations that cause venti
Genetic factors in Threatened Species Recovery Plans on three continents
(Carcinogenesis) Bisphenol A activates EGFR and ERK promoting proliferation, tumor spheroid formation and resistance t

EPA Data?/Justification
Yes
Yes
Yes; n/a
Yes
Yes
Yes
Yes
Yes
Yes
No; No EPA data used in this analysis/paper
Yes
No; Data from swfwmd and other published sources
Yes
No; This is a literature review.
No; -
Yes
Yes
Yes
No; Research was the development of a management framework which was not data driven
Yes
Yes; n/a
Yes
Yes
Yes; N/A
Yes
Yes
Yes
Yes
No; EPA did not collect the data nor did EPA direclty fund the research effort described in the paper.
Yes; N/A
Yes
No; No data generated for this review paper discussing future research directions for ecological risk assessment
Yes
Yes
Yes
No; Analysis is all based on secondary data (publicly available GIS files obtained from other agencies/lit review)
No; Reveiw of existing NMMAPS data
Yes
Yes
Yes
No; literature review
Yes
Yes
Yes
Yes

Yes
No; SETAC lit review from workshop to set practical guidance for the application of the ecosystem services

No; A perspective article, utilizing publically available data for illustrating a point. No data generated.
No; the modeling was already published and the human data came directly from the published dissertation
Yes
No; Based on pre-esisting datasets collected by others. All data available publically, refs & links in the text.
Yes
Yes
Yes
Yes
No; Primary Review Article
Yes
No; Graduate students led research.
Yes
No; Manuscript describes model-based analysis that used secondary data only.Original results are model output
Yes
Yes
No; Secondary data
No; this research was not done at EPA and does not contain data generated by EPA. There is one EPA coauthor.
No; Oak Ridge Institute for Science and Education completed the research.
Yes
Yes
Yes
Yes
Yes
Yes
Yes
Yes
Yes
Yes; n/a

Yes
Yes
Yes
Yes
No; No the paper doesn't have EPA data, and for that matter it doesn't have any data at all ahjond
No

No; All of the data were generated as part of the National Birth Defects Prevention Study (NBDPS) led by CDC.
No; No EPA data was used in this analysis, see SciHub entry for more info
Yes
Yes
Yes
Yes
Yes
No; no EPA data; all the data generated by external organizations; EPA coauthors

Yes
Yes
Yes
No; Data produced by UNC not EPA
Yes
Yes
No; The data was generated by researchers at the Univeristy of Michigan.
Yes
Yes

Yes; n/a
Yes
No; Data and analyses were generated and retained by the PI (Univ. S. Alabama)
No; The journal article builds upon a conceptual model developed in a 2000 Pellston Workshop.
No; Research done independently by Brazilian coauthors using EPA methods/designs but no EPA funding or agreement
No; used published EPA health values
No; Papers do not have any data in them.
Yes
No; 2)No EPA data
Yes
No; State Health Department Data
No; A discussion section - no data provided.
Yes
Yes
Yes
No; Review Article
Yes
No; Lead authorship from another federal agency.
Yes; n/a
No; all data is Oregon State University data.
No; Only data analyzed are from the Bureau of Water, South Carolina Department of Health and Environmental Control
Yes
No; This publication was a review article and did not generate new data
Yes

Yes
Yes; n/a
Yes
Yes
No; Review article, no data
No; Non EPA data - Data generated by Zhejiang University, China
Yes
No; this paper uses EPA public data to build new datasets and analysis by non-EPA authors
No; Data collected/interpreted by Brazilian universities using designs, field & analytical procedures adapted from
No; this paper uses EPA public data to build new datasets and analysis by non-EPA authors
Yes
No; Assisted in the data interpretation and the writing of the manuscript.

No; review of existing data
No; No data, a review article
Yes
No; All work, including data analysis, was done outside of EPA
No; This paper is a review article.
Yes
Yes
No; No new data presented. Paper presents consensus views about advances that could improve risk assess. & mgmt.
Yes
Yes
Yes
Yes
Yes
Yes
No; Study relied on data collected by CDCÂ¿s NBDPS. All data variables were collected as part of the NBDPS' CATI.
Yes
Yes
No; Using existing data.
Yes
No; No, this is a literature review article with no EPA-generated or other data or analysis associated with it.
Yes
No; UNC hospital created data that were used in the publication but EPA did not.
Yes
No; EPA did not collect the data nor did EPA directly fund the research effort described in the paper.
Yes
Yes
Yes
No; *
Yes
Yes
Yes
No; contains literature data
Yes
Yes
Yes
Yes
Yes
Yes
Yes
No; The manuscript describes a computational model.

Yes
Yes
Yes
Yes
No; no EPA generated data is associated with this article.

Yes
No; it is a review
Yes
No; No EPA-generated data was used; project is exempted from Science Hub because of personally identifiable info
Yes
Yes
No; Review article - no new data.
No; EPA did not collect the data nor did EPA directly fund the research effort described in the paper.
Yes
Yes
No; EPA author provided technical expertise and interpretation of existing data.
Yes; n/a
Yes
No; Papers do not have any data in them.

No; This is a review article.
Yes
Yes
Yes; n/a
No; This is a review article that is synthesizing the results of previously published analyses.
Yes
Yes
No; all work and anaylsis performed at UNC
Yes
No; There are not data associated with the paper
Yes
No; Papers do not have any data in them.
Yes
Yes
Yes
Yes
No; Study evaluated 2 methods for analysis of water quality trends. We used monitoring data from existing programs
Yes
No; Review Article
Yes
No; All experiments and data generation were conducted by collaborators at Nanjing University.
No; This is a review article.
No; The article does not contain any new U.S. EPA data, only data is cited from the literature.
Yes
No; this is a review of already published data
Yes
No; .
No; Concept only, no EPA dataset created
No
Yes
Yes
Yes

No; Data belongs to UNC
Yes
Yes
Yes
Yes
No; all analysis was based on USGS data
No; This paper resulted from some university collaboration and advisement. The university scientist generated all of the
Yes
Yes
Yes
No; this is a non-EPA workshop summary and review paper. There is no EPA data associated with the paper.
Yes
No; EPA did not collect the data nor did EPA direclty fund the research effort described in the paper.
Yes
No; The article is a review paper which has no data associated with it.
No; Data generated by DISL
Yes
Yes
Yes
No; Rsrch led by Rep of Tajikistan scientists, w/ EPA tech overview. All data generated/owned by Tajik scientists
No; The research which produced this data was not funded by EPA. The EPA coauthor helped write the manuscript.
Yes
Yes
No; Graduate student was lead for this article.
No; SETAC Workshop summary
No; No EPA Data, review article.
Yes
Yes
No; Papers do not have any data in them.
No; Papers do not have any data in them.
No; published before requirement
Yes
Yes
No; A review of published literature
Yes

No; No data was collected; all data are from analysis of textual statements in published reports and articles
Yes
Yes
No; The papers contribute to research being conducted through an agreement between the Chinese Ministry of Science a
No; The papers contribute to research being conducted through an agreement between the Chinese Ministry of Science a
Yes
No; The paper has data generated by NIH and the EPA coauthors provided input into the prepartion of the manuscript
Yes
No; review only
Yes

Yes
Yes
Yes
No; All data generated by Oregon State University
Yes
Yes
No; No. This is a methods paper. There is no data - it is all secondary data.
Yes
Yes
Yes
Yes
No; This manuscript is a commentary, and it does not use EPA generated data.
Yes
Yes
No; Workshop that did not employ any EPA data.
No; Workshop that did not employ any EPA data.
Yes
Yes
No; opinion of outcomes of NIH-Bethesda, MD workshop
Yes
Yes
Yes
Yes
Yes
No; Data is from drinking water pland and the Baltimore long term ecological research site
Yes
No; Review Article
Yes
Yes
No; Book Review in a Journal
Yes
No; Published ocean data (Hemsley et al. 2015) is used in the journal article.
Yes
No
Yes
Yes
No; workshop summary manuscript presented as journal Forum article with no EPA generaged data
Yes
Yes
No; Data was generated by Stanford University, Stanford, California.
Yes
Yes
Yes
Yes
Yes
Yes
Yes

No; Data collected by Brazilian coauthors in Brazil using published guidance cited in text and references
Yes
No; .
Yes
No; This paper is a workshop review and contains no EPA data and therefore needs no SDM plan or associated QAPP.
Yes
Yes
Yes
Yes
No; Math Tutorial
Yes
Yes
Yes
No; Secondary data only
Yes
Yes
Yes
Yes
Yes
Yes
No; -
No; Review article
Yes
Yes
Yes
No; Review paper on integrated modeling systems.
Yes
Yes
Yes
Yes
Yes
No; Data was generated by Lead Author at the University of Maryland. The EPA provided advice and data interpretat
No; A review/Database/analysis
Yes
Yes
Yes
Yes
No; All the data in this manuscript is generated by the Romanian couthors.
No; All data represented in this article is contained in the manuscript and/or its associated Supplemental Material.
No; No data associated with this article. This paper introduced GIFMod and provided some example applications.
Yes
No; Data was gathered during a US Park Service led workshop
No; No data collected - paper is an intellectual application of FEGS to a problem
Yes
Yes
Yes
No; Data were collected as part of the National Birth Defects Prevention Study (NBDPS) through the CDC.

No; Review article, no data
No; This product is a literature review.
Yes
Yes
Yes
No; Journal article is a review of EPA documents and assessment processes and did not use EPA-generated data.
No; The paper focuses on an already existing model called EXP-HYDRO from Patil and Stieglitz (2014)
No; No data in article
Yes
Yes
Yes
Yes
No; Data were generated by USGS and are publically available through their process
Yes
Yes
No; Helped with writing, provided expertise in tree physiology that helped data be interpreted by Univ of Idaho
Yes
Yes
No; There was no EPA generated data for this article (data was taken from literature)
Yes
No; ORD-018108 was led by a graduate student and the data are hers as part of her dissertation.
Yes
Yes
No; revisiting for 2002 publication by same author
Yes
Yes
Yes
Yes
Yes
No; Review of previously published article results only
Yes
Yes
Yes
Yes
Yes
No; Product is being cleared for completion-work prior to EPA
Yes
Yes
Yes
Yes
No; All calculations were performed using published data on chemical manufacturing processes from the scientific literat
No; The data was generated by researchers in Australia
No; Secondary data only
Yes
No; Paper describes the modeling enviornment.
No; The manuscript reviews existing available models, indicators, and metrics for climate event resilience.
Yes

No; Review paper, no data to report
Yes
Yes
Yes
Yes
No; Research data consisted of secondary data only
No; Publicly available datasets were reanalyzed They are identified and described appropriately within the article
Yes
No; This article proposes a new conceptual approach to modeling of ecotoxicological effects.
No; It does not have any data because it describes an outreach activity conducted in the Western Balkans
No; This is a review paper - no data, just summary and interpretation
No; Data does not belong to the EPA. Started prior to joining EPA
Yes
Yes
Yes
Yes
No; Research data consisted of secondary data only
Yes
Yes
Yes
Yes
Yes
No; This is a news column of recent technology reports.
Yes
Yes
No; Article is a review of published literature
No; Review article, utilizes secondary data from the literature
Yes
No; Data was generated at Oregon State University. EPA was a collaborator.
Yes
No; Study by a laboratory in China
Yes
No; USGS owns the datasets that were used to build the software.
No; This manuscript contains a small amount of methodological data that were only used to optimize** see comments
No; EPA did not generate any of the model inputs described in the journal article.
Yes
No; Research Consisted of secondary data only
Yes
Yes
Yes
Yes
Yes
No; Scientific meeting report
No; Scientific perspective
Yes
Yes
No; No EPA data

No; Data in this paper were generated by an Oregon State University student and not by EPA.
No; No primary data was generated. Secondary data from non-EPA LCA databases was used for this analysis.
No; Editorial only
No; All the data presented in the STICS entry ORD-019266 was generated by our European collaborators. EPA's contributi
Yes
No; The work was supported by a Cooperative Agreement; data was collected by participating instituions.
No; Data was generated by Duke and analyzed at HMGU. EPA authors are part of Cathgen team and guide/provide advic
No; Review article
No; Review Article
No; This is a small abstract contained within a workshop report for SETAC.
No; Data was generatred by scientists in Chile.
No; Data was generated by the author(s); EPA provided financial support for data analysis and publication only.
No; The data was collected by universities as part of a cooperative agreement 83563201 to Univ. of Virginia.
No; No data used in article
No; Article includes insights from an investigation of the primary literature. No data was generated or analyzed.
Yes
Yes
No; Used data from the Korean National Environmental Health Survey and from published articles
Yes
No; Literature review article
No; This journal article was a review product of a workshop on ionizable organic chemicals, involving no new data genera
No; Data gathering and analysis took place in China.
No; This is a workshop analysis/report that involved no generation of new data.
No; Research data consisted of secondary data only
No; We provided samples (dosed rat urine) that contained the analytes to researchers
No; This was a collaborative study. I have provided selection of chemicals with doses & provided guidance
Yes
Yes
Yes
Yes
No; It is a literature review and reflects peer reviewed literature external to EPA
Yes
No; This is a state-of-the-science literature review article.
No; This is a review article.
Yes
Yes
Yes
Yes
No; no EPA data; all the data generated by external organizations; EPA coauthors
No; This article from participation in an expert panel (no data collection or analysis)
No; review article
Yes
Yes
Yes
Yes
Yes
Yes

Yes
Yes
Yes
No; review article
Yes
No; Data generated at Stanford, used as part of a new analysis here.
Yes
Yes
No; Review paper
No; All sampling and chemical analyses published in the current paper were conducted by USGS personnel.
No; Data were generated by the USGS
No; This is a review article that contains no new EPA generated data.
No; Paper based on workshop discussions. No original data included.
Yes
Yes
Yes
Yes
Yes
No; Data were from existing external published papers.
Yes
Yes
Yes
Yes
No; It is a Letter to the Editor with no data presented.
No; Data analyses conducted by collaborator at SUNY-Binghamton. EPA contribution on interpretation and reporting.
No; This is a framework article
No; no EPA data; all the data generated by external organizations; EPA coauthors
No; Commentary
Yes
No; Work was conducted at University of Wisconsin.
No; ItÂ¿s a review and synthesis paper (only public domain data used)
Yes
Yes
No; EPA role was providing tecnical and scientific advice. All work performed in U. Georgia
Yes
Yes
Yes
No; Article is an opinion piece containing no data.
Yes
Yes
No; A Framework not research results
No; A Framework not research results
No; It uses some 2013 EPA data but they werent generated by us for the paper- we just used them
Yes
Yes
Yes
Yes

No; This is a review type of article.
No; Data were generated by the University of Idaho. I contributed to the project prior to joining EPA.
Yes
No; all coauthor data
Yes
Yes
Yes
No; Author's section is a review of current research as it relates to climate change
No; Editorial article - no data involved
No; no new data collected
No; Article presents conceptual framework resulting from multi-collaborative workshop
Yes
Yes
Yes
No; Research led and data archiving done by senior university author. ICE data is public domain
Yes
Yes
Yes
No; These data were generated by a student at the University of Delaware and have been subject to QA/QC and will b
Yes
Yes
Yes
Yes
Yes
No; Scientific meeting report
Yes
No; Research led and records maintained by non-EPA authors; data obtained from public sources and modeling tools
No; No data-Peer commentary on target article that is being published. Our article will be in the same issue.
No; This manuscript is about pre-existing publicly available protocols. No data collected, used, or analyzed.
No; Work involves modeling done at other organizations. Terry's role is overall interpretation.
No; CDC-generated data, SDP in ScienceHub outlines protocol for public access
Yes
No; Conference proceeding
Yes
No; this research was done at an acedemic institution with no EPA support
Yes
Yes
No
No; Commentary, no new data included
No; The U.S. EPA author collaborated in the experimental design and analysis data generated by the study.
No; Data was generated by USGS colleagues. Experts within EPA assisted in interpreting data and authoring.

Title
The effect of a loss of model structural detail due to network skeletonization on contamination warning system design: c
Associations Between Residential Proximity to Traffic and Vascular Disease in a Cardiac Catheterization Cohort
Evaluation of Traffic Density Parameters as an Indicator of Vehicle Emission-Related Near-Road Air Pollution: A Case Stud
Tools to minimize interlaboratory variability in vitellogenin gene expression monitoring programs
Adaptive Management of Urban Ecosystem Restoration: Learning From Restoration Managers in Rhode Island, USA
Metabolomic effects of CeO2, SiO2 and CuO metal oxide nanomaterials on HepG2 cells
Total and Bioaccessible Soil Arsenic and Lead Levels and Plant Uptake in Three Urban Community Gardens in Puerto Rico
Disentangling the pathways of land use impacts on the functional structure of fish assemblages in Amazon streams
Identifying and structuring objectives for a coral reef protection plan at the U.S. Environmental Protection Agency
Sensitivities of Summertime Mesoscale Circulations in the Coastal Carolinas to Modifications of the Kain–Fritsch C
Evaluating weathering of food packaging polyethylene-nano-clay composites: Release of nanoparticles and their impacts
Flow intermittence and ecosystem services in rivers of the Anthropocene
Optimal Groundwater Extraction under Uncertainty and a Spatial Stock Externality
A likelihood-based time series modeling approach for application in dendrochronology to examine the growth-climate re
Enhancing protection for vulnerable waters
Factors Influencing Farmers’ Adoption of Best Management Practices: A Review and Synthesis
Effects of source and seasonal variations of natural organic matters on the fate and transport of CeO2 nanoparticles in th
Quantifying seagrass light requirements using an algorithm to spatially resolve depth of colonization_
An inventory of continental U.S. terrestrial candidate ecological restoration areas based on landscape context
Swine exposure and methicillin-resistant Staphylococcus aureus infection and colonization among hospitalized patients v
Near-Port Air Quality Assessment Utilizing a Mobile Monitoring Approach
Evaluation and development of tools to quantify the impacts of roadside vegetation barriers on near-road air quality.
Estimating virus occurrence using Bayesian modeling in multiple drinking water systems of the United States
The Application and Usefulness of Economic Analyses for Water Quality Management in Coastal Areas
Validity of Self-Reported Concentration and Memory Problems: Relationship with Neuropsychological Assessment and D
A synoptic survey of microbial respiration, organic matter decomposition, and carbon efflux in U.S. streams and rivers
Mapping watershed integrity for the conterminous United States..
Predictive Mapping of the Biotic Condition of Conterminous-USA Rivers and Streams
Simulated juvenile salmon growth and phenology respond to altered thermal regimes and stream network shape
Regional patterns of increasing Swiss needle cast impacts on Douglas-fir growth with warming temperatures.
Critical factors affecting life cycle assessments of material choice for vehicle mass reduction
Calcification continues in Caribbean reef-building corals at high pCO2 levels in a recirculating ocean acidification exposur
Energy and greenhouse gas life cycle assessment and cost analysis of aerobic and anaerobic membrane bioreactor syster
Early detection monitoring for aquatic non-indigenous species: optimizing surveillance, incorporating advanced technolo
Spatially-explicit modelling model for assessing wild dog control strategies in Western Australia
Rapid effects of the aromatase inhibitor fadrozole on steroid production and gene expression in the ovary of female fath
People and water: Exploring the social-ecological condition of watersheds of the United States
Model application niche analysis: Assessing the transferability and generalizability of ecological models
Associations Between Disinfection By-Product Exposures and Craniofacial Birth Defects
Using diverse expertise to advance climate change fisheries science
12 Community structures of phytoplankton with emphasis of toxic cyanobacteria in an Ohio inland lake during bloom se
A mangrove creek restoration plan utilizing hydraulic modeling
Southeast Atmosphere Studies: learning from model-observation syntheses
An overview of geophysical technologies appropriate for characterization and monitoring at fractured-rock sites
Capturing microbial sources distributed in a mixed-use watershed within an integrated environmental modeling workflo
When evolution is the solution to pollution: Key principles, and lessons from rapid repeated adaptation of killifish (Fundu

Performance of Anaerobic Biotrickling Filter and Its Microbial Diversity for the Removal of Stripped Disinfection By-produ
The Role of Shellfish Aquaculture in Reduction of Eutrophication in an Urban Estuary
Effect of Green Macroalgal Blooms on the Behavior, Growth, and Survival of Cockles (Clinocardium nuttallii) in Pacific NW
Vegetated land cover near residence is associated with reduced allostatic load and improved biomarkers of neuroendocr
Chromatography related performance of the Monitor for Aerosols and Gases in Ambient Air (MARGA): laboratory and fie
A Farewell to Harms: The Audacity to Design Safer Products
Using extirpation to evaluate ionic tolerance of freshwater fish
Organism Detection in Permeable Pavement Parking Lot Infiltrates at the Edison Environmental Center, NJ
Seasonal Oxygen Dynamics in a Warm Temperate Estuary: Effects of Hydrologic Variability on Measurements of Primary
Investigating Mitochondrial Dysfunction in Human Lung Cells Exposed to Redox-Active PM Components
Linking terrestrial phosphorus inputs to riverine export across the United States
Ozone exposure is associated with acute changes in inflammation, fibrinolysis, and endothelial cell function in coronary a
Extreme Precipitation and Emergency Room Visits for Influenza in Massachusetts: A Case-Crossover Analysis
(Archives of Toxicology) Predicting In Vivo Effect Levels for Repeat Dose Systemic Toxicity using Chemical, Biological, Kine
Eco-Health Linkages: Assessing the Role of Ecosystem Goods and Services on Human Health Using Causal Criteria Analysi
Characterization of Emissions from Liquid Fuel and Propane Open Burns
Testicular oocytes in smallmouth bass in Northeastern Minnesota in relation to presumed exposure to endocrine disrupt
A sprinkling experiment to quantify celerity-velocity differences at the hillslope scale
The creation, management, and use of data quality information for life cycle assessment
Impaired swim bladder inflation in early-life stage fathead minnows exposed to a deiodinase inhibitor, iopanoic acid (arti
Factors associated with NO2 and NOx concentration gradients near a highway
Summary of the development the US Environmental Protection Agency’s Medaka Extended One Generation Repr
Oxidative C-H activation of amines using protuberant lychee-like goethite
Measuring and Modeling Surface Sorption Dynamics of Organophosphate Flame Retardants in Chambers
Modeled Full-Flight Aircraft Emissions Impacts on Air Quality and Their Sensitivity to Grid Resolution
First generation annotations for the fathead minnow (Pimephales promelas) genome
Improving the simulation of convective dust storms in regional-to-global models
Effects of microtopographic variation and macroalgal cover on morphometrics and survival of the annual form of eelgras
Inactivation of Bacillus anthracis spores to decontaminate subway railcar and related materials via the fogging of peracet
Situating Green Infrastructure in Context: A Framework for Adaptive Socio-Hydrology in Cities
High reduction of ozone and particulate matter during the 2016 G-20 summit in Hangzhou by forced emission controls of
Integrating watershed hydrology and economics to establish a local market for water quality improvement: A field exper
Macrophyte Community Response to Nitrogen Loading and Thermal Stressors in Rapidly Flushed Mesocosm Systems
Basin-wide impacts of climate change on ecosystem services in the Lower Mekong Basin
A Comparison of Simulated and Field-Derived Leaf Area Index (LAI) and Canopy Height Values from Four Forest Complex
Spatial Patterns of NLCD Land Cover Change Thematic Accuracy (2001 - 2011)
Genomic effects of androstenedione and sex-specific liver cancer susceptibility in mice
A Marketing Plan for Scientists: Building Effective Products and Connecting with Stakeholders in Meaningful Ways
Recommendations for developing and applying genetic tools to assess and manage biological invasions in marine ecosys

EPA Data?/Justification
Yes
No; Data used for this manuscript was generated and owned by Duke Univ Med. Center part of CATHGEN cohort
Yes
Yes
Yes; NAGE Exempt
Yes
Yes
No; Data is generated by Generated using EPA methods
No; Article focuses on problem formulation phase of enviro prot plan & does not include quantitative data analyses
Yes
Yes
Yes
No; Data came from graduate school work.
Yes
No; commentary article
No; This is a review article
Yes
No; Article is based on secondary data from sources like satellite remote sensing and state environmntl agencies
Yes
No; Data analysis of human subjects with individual-level data that is potentially sensitive and not shareable.
Yes
Yes
Yes
No; The article is an overview of the findings of qualitative interviews with coastal managers.
No; This publication contains EPA generated data, however it was finalized and cleared for publication before the Science
Yes
Yes
Yes
No; Lead author developed and ran the model using published literature values and NOAA data.
Yes
No; This is literature review.. No original data was generated. It used data from outside sources
Yes
Yes
No; Article is a review/synthesis, presenting no EPA data or outside data whatsoever.
No; Research data consisted of secondary data only
Yes
Yes
No; Uses secondary data only, including some from EPA National Wetland Condition Assessment
No; DBP and health data came from state agencies in Massachusetts, and from individual public water utilities
No; This work was conducted prior to my employment at the EPA, and it is composed of qualitative interviews.
Yes
No; The data in this manuscript was gathered as part of my dissertation research at The Ohio State University.
Yes
No; This is a review article.
Yes
Yes; NAGE Exempt

Yes
No; This work was done by NOAA led researchers as part of a REServ Program that started in 2011.
Yes
Yes
Yes
No; I am editing a special edition of a journal
Yes
Yes
Yes; GED exempt - paper cleared before 6/30/2017
Yes
Yes
Yes
No; Human health data
Yes
Yes
Yes
No; Research was a graduate research project conducted by the Univ of MN-Duluth with funding from MN Sea Grant.
No; The data was generated by Oregon State University
No; The article proposed a methodological approach and did not require data creation.
Yes
Yes
Yes
Yes
Yes
Yes
Yes
Yes
Yes
Yes
No; review type-article no data
No; Data belongs to Zhejiang University
No; This was work done at URI before my hire at EPA
Yes
No; Johnston provided modeling training, guidance and oversight to MRC staff, while did modeling & GIS analyses
Yes
Yes
Yes
No; Research data consisted of secondary data only
No; This was a review article.
No; no EPA data is involved with this article
No; data from Kansas State when author was a grad student there
No; EPA coauthor, no data generated here
Yes
Yes
No; Lead author (NOAA) and other co-authors (USGS and UW) provided data.
Yes; N/A
Yes

Yes
Yes
No; This is a synthesis paper that reviews the literature.
No; Used published data set
Yes
No; This article contains only previously published EPA data and publicly available information
Yes
Yes; GED exempt - paper cleared before June 30 2017
Yes
Yes
No; All pre-exisiting data from federal, state and local agencies
No; This is a review article, not a research article.
Yes
Yes
No; This is an overview article without data
No; This is an invited opinion paper with no associated data.
No; Review article - EPA did not generate data
Yes
No; Publicly available data collected and QAÂ¿d by the Canadian Wood Buffalo Environmental Association
Yes
Yes
No; Data was generated and analyzed at the Helmholtz Institute. I have provided technial assistance and direction
Yes
Yes
Yes
No; EPA scientists provided their technical expertise in interpreting data collected and analyzed by co-authors
No; research lead and data owned by external authors
Yes
Yes
No; The article has no data.
No; Manuscript represents an introduction to special issue of journal WATER; only conceptual ideas and synthesis
Yes
Yes
Yes
No; This is a review only, no data are presented.
Yes; N/A
Yes
No; All measured values presented in article, were generated at the Univ. of WA. John Frew was a graduate student.
No; These data were generated by colleagues at Drexel University and the Nature Conservancy.
No; This article is a critical review of existing data.
Yes
No; This paper describes a methodological framework and does not use data
No; This is the result of a study conducted by the University of Cincinnati.
Yes
Yes
Yes
Yes

Yes; NAGE EXEMPT
No; We assembled a multi-species dataset based on previously published studies.
Yes
Yes
No; The data were all supplied by USGS.
No; No EPA-generated data are associated with this product.
No; All of the data presented in this journal article comes from outside references.
No; all data presented is publically available, and has already been published
No; All experimental work was done at Nanjing Univ. China group conducted the experiments/data collections.
Yes
No; Models were based on simulations using published values in literature.
No; Article uses data generated during my postdoctoral research to associate exposure to NO2 with DNA methylation
No; EPA acted as technical consultation for the paper and NCSU conducted the real-time sample collection and data
No; This manuscript is a descriptive white paper of a database website and does not contain EPA-generated data.
No; Summary of Webinars and Associated Workshop
Yes; NAGE Exempt
No; This study was performed in China.
Yes
No; PI at the University of Cincinnati
No; the product is a white paper, it reviews the state of the science.
Yes
Yes
Yes
No; This is a concept paper, so there are no data generated by EPA or any other organizations
Yes
No; there is no epa-generated data in this article
No; Inter-laboratory study - I particpated with a group located at a local university - no work performed at AED.
No; This is a review article. No new data is presented.
Yes
No; This is a literature review and does not contain any analysis of data.
Yes
No; Journal article is a review paper and no EPA data was generated for this manuscript.
Yes
Yes
Yes
Yes
Yes
Yes
Yes
No; This is a literature review article. It contains no new data or analyses, either EPA-generated or otherwise
No; Research data consisted of secondary data only.
No; Data belongs to USDA-ARS
No; This paper reviews the published literature; it contains no EPA-generated data.
Yes
No; This is a literature review and includes officially available data from EPA.

Subject: RE: strengthening transparency in science rulemaking

Maria,

Yes of course. Thank you for asking…

Before I give you a name let me discuss with staff on time and commitments. We have a few folks that would be good… just want to see where and on whose plate we make some room. But this important so we'll get one of our folks on it.

Let me get back to you early next week if that is not too late.

Jerry

Subject: strengthening transparency in science rulemaking

Hi Jerry,

As I mentioned on Friday on the call on the impacts to ORD of the science transparency rule, we are pulling together an internal team to address public comments submitted in response to the science issues raised in the proposed rule. One of the areas we need support on is the infrastructure for housing and accessing the raw data for studies considered to be "pivotal regulatory science". Could we get someone from OSIM to participate on this group? It would be helpful to have someone with a broad view.

This internal team will help us identify issues and draft responses to comments. This would be a collaborative effort with us in OSP and to some extent OGC. We would ask that if needed they participate in one or more Agency workgroup meetings. We are conscious of their time and would only ask them to participate in these meetings when necessary. The participation would start in mid-August and would continue for about 7 months.

Please let me know if you have any questions or need additional information.

Status of ORD's OIG Audits

Start Date	Audit Title/ #	Objectives	NPD/LCO	Subject Matter Experts (SMEs)	Current Status
Gathering Data Phase					
7/2/2018	***ORD Support of and Alignment with Regional Science Programs*** / OA&E-FY18-0247	To determine whether the ORD's support of regional science programs helps accomplish the EPA's mission, and whether results of regional science initiatives impact the agency's decision-making.	OSP, NPDs, Regions 4,5,7, and 8.	Sarah Mazur, Michelle Latham, Fred Hauchman, Maggie LaVay, Kacee Deener, Valerie, Blank	OIG sent notification on 7/2/18. OSP lead efforts to respond to OIG's data request prior to kick-off meeting on 7/23; OSP, SHC, OPARM, and regions attended. Data gathering /interviews.
6/7/2018	***Review of EPA's Office of Research and Development Grants to Universities*** / OAE-FY18-0248	To determine whether (1) ORD oversees and monitors grants awarded to universities in accordance with applicable laws, regulations, policies and procedures; and (2) university grantees are completing agreed-upon work that meets the defined purpose of the grant.	ORD-OPARM, NCER	James Gentry, Lisa Doucet, John Nanartowicz	OIG sent notification letter on 6/7/18, OPARM and NCER responded to data request. The OIG kick-off meeting on June 28th. OIG requested ORD contact info of staff who oversee grants - for future interviews. OPARM provided contact list on 7/13. OIG conducting interviews with NCER, NRMRL, NHEERL, OARS, and OARM/OGD management and staff. Data gathering /interviews.
5/17/2018	***EPA's Processes for Preserving Emails and Text Messages, and Responding to Freedom of Information Act Requests*** / OAE-FY18-0217	To determine whether the EPA took action to complete OIG recommendations regarding the preservation of email and text messages, and the improvement of the agency's Freedom of Information Act (FOIA) process.	OEI & AO (lead)	ORD- Christiane Routt, Norm Adkins	OIG sent notification letter on 5/17/2018. Kick-off meeting will be w/ OEI and AO, other offices may be invited (TBD). Data gathering /interviews.

August 2018

Status of ORD's OIG Audits

Start Date	Audit Title/ #	Objectives	NPD/LCO	Subject Matter Experts (SMEs)	Current Status
2/20/2018	***EPA's Management of Counter Terrorism and Emergency Response Equipment*** /OAE-FY18-0109	To determine whether the EPA has the needed and required counter terrorism and emergency response equipment and whether the equipment is efficiently managed, tracked and available for potential counter terrorism or emergency response incidents.	Agency-wide: OA/OHS (lead), ORD/HSRP	Greg Sayles	OIG sent notification letter on 2/20/2018. Entrance conference was held on 3/8/18. On 3/21/18, OIG held a meeting with HSRP staff. On April 12th, the OIG provided a written status update regarding the audit. **Data gathering /interviews.**
2/2/2017	***Audit of EPA File Server Security*** / OA-FY17-0138	To determine whether the EPA is implementing security controls around the agency's file servers. OEI will be the lead office for this audit, with support from program offices and the regions.	Agency-wide: OEI (lead), ORD/OSIM	Jerry Blancato, David Updike, Rebecca Clausen, Craig Hammel	OIG sent prelim analysis notification memo on 2/2/17 which includes a survey to EPA's IT offices re file server security due by 2/16/17. Kick-off meeting on 2/8/17 with OSIM and OPARM in attendance. OSIM sent completed survey to OIG on 2/16. OIG meeting on 3/28 with OSIM and OU server administrators. 11/6/17 OIG issued audit notification with updated audit objective. **Data gathering / interviews.**

If edits are necessary or there are any suggestions, please contact ORD's audit coordinator, Maureen Hingeley at hingeley.maureen@epa.gov. Also, if the OIG or GAO has contacted you or staff directly, please contact Maureen.

August 2018

Status of ORD's OIG Audits

Tracking #	Audit/Report Title	NPD/LCO	Subject Matter Experts (SMEs)	Current Status
Initial Reporting Phase: Responding to Discussion Document / Statement of Facts				
Responding to OIG Draft Report Phase				
OPE-FY18-0002	**OIG Report:** ***EPA Needs a Vision and Strategy for Citizen Science that Aligns with Its Strategic Objectives on Public Participation***	OSA	Jay Benforado, Tom Sinks, Deb Szaro (Reg 1)	On 7/3/18, the OIG issued a draft report with 4 recommendations to address (2 ORD and 2 OA). **ORD received an extension to submit a response by 8/16/18. IOAA reviewed/concurred on response on 8/9/18. Response under review by OA. Once OA signs response, OPARM will work w/ IOAA for Jennifer's signature.**
Responding to OIG Final Report Phase				
OA-FY17-0156	**OIG Report:** ***EPA's Laboratory Fellowship Cooperative Agreements Funded Foreign Nationals***	NCER, OARS, & OPARM/RPAD, and OGD, OITA, OGC	Jayne Michaud, Gelena Constantine, Patti Palmer, Mary Sue McNeil, Eric Burman	On 5/14/18, the OIG issued a draft report with 3 recs addressed to OARM related to limiting fellowships to US citizens. ORD meeting w/ OGC and OGD on 5/29 to discuss the OIG report and recs. On 6/12, OPARM, NCER, and OARS' management provided comments and sent to IOAA for review. OIG granted an extension to submit agency response to June 27th. OARM submitted agency response, including revised ORD memo, to OIG on 6/28/18. ORD must address OARM corrective actions by 12/31/18. OIG exit meeting on 7/23/18 to discuss agency response and next steps. **Final report to follow.**

If edits are necessary or there are any suggestions, please contact ORD's audit Liaison, Maureen Hingeley, at hingeley.maureen@gao.gov. Also, if the OIG or GAO has contacted you or staff directly, please contact Maureen.

Tracking ORD's Corrective Actions to OIG's Report Recommendation(s)			
Report Title/No	**Recommendation(s)**	**Corrective Action(s) / Due Date**	**NPD/LCO**
Management Alert: EPA Should Promptly Reassess Community Risk Screening Tool/ 17-P-0378 (OIG Hotline Complaint) **(2 of 4 recommendations)**	**Rec 1:** Review the Community-Focused Exposure and Risk Screening Tool and develop an action plan with timeframes to address issues identified, including considerations on whether to retain the tool. **a)** Develop metrics for measuring the tool's performance and establish a regular schedule for performance evaluations. **b)** Survey users to obtain feedback on tool utilization and any needed improvements. **Rec 2:** Develop policies and procedures for planning, developing, implementing and monitoring the performance of web-based research tools. Policies and procedures could build on the draft guidance for web-based tools developed by NERL, and should ensure that any new ORD research tool stems from a clear project proposal that includes ongoing monitoring metrics and outcome measures, and vetting to ensure there is a need and no overlap with other tools.	**CA#1:** ORD does intend to retain this tool, we have provided responses to the additional recommendations below. **a)** ORD agrees. ORD has already initiated the development of performance metrics for C-FERST and other tools. ORD intended to have this be the topic for discussion and review by the BOSC which is now on hold pending appointment of new BOSC members. A completion date is therefore pending when the BOSC is formed and is able to advise ORD on recommendations for appropriate metrics. **b)** ORD agrees and as was mentioned in previous discussions with OIG, is partnering with ECOS and ASTHO as part of an MOA established with EPA April 2016 to survey state agencies. This survey is targeted for FY2018. **(Sept 30, 2018). CA#2:** ORD will work with OEI and the Chief Information Officer to develop criteria to determine when a research tool should be subject to the agency's information technology requirements. ORD will use the criteria to review its new and existing major public interface research tools to determine the applicability of the agency's IT requirements. In addition, ORD will continue improving its investment portfolio review process for IT investments as required under various laws, policies, and regulations including FITARA. ORD will expand its application development roadmap and checklist to require informing OSIM before such projects are started and to report progress and expenditures on such development projects on a regular basis (at least annually or more frequent). OSIM will review and help the developers through the appropriate Life Cycle reviews throughout the project duration and ORD will regularly monitor performance of these web-based tools. This process is being developed and will be implemented starting FY 2018 and will be continuous. **(Sept 30, 2018).**	NERL, SHC, OSIM

Green Background **= ORD only**
Orange **= EPA-wide**
Yellow **= Gov't-wide**

***Management Alert: EPA Should Promptly Reassess Community Risk Screening Tool* /** 17-P-0378 (OIG Hotline Complaint) **(4 of 4 recs)**	**Rec 3:** Review new and existing Office of Research and Development research tools to determine the applicability of the agency's information technology requirements. **Rec 4:** Work with agency offices responsible for other geospatial analysis tools to develop a decision support matrix for when to use certain tools and for what purposes.	**CA#3:** ORD agrees and as stated in the response to recommendation #2: ORD will work with OEI and the Chief Information Officer to develop criteria to determine when a research tool should be subject to the agency's information technology requirements. ORD will use the criteria to review its new and major existing public interface research tools to determine the applicability of the agency's information technology requirements. **(Sept 30, 2019). CA #4:** While ORD agrees that such a decision matrix is valuable and will work other offices, predominantly OEI, ORD will cede the lead to other parts of the Agency on this cross-agency effort. ORD does not own most of those applications and thus is not well positioned to develop such a matrix. **(Sept 30, 2019).**	NERL, SHC, OSIM
***EPA Needs to Provide Leadership and Better Guidance to Improve Fish Advisory Risk Communications* /** 17-P-0174	Conduct an assessment for methylmercury to determine whether the reference dose requires updating, as indicated by the Integrated Risk Information System, and as proposed in the system's 2012 and 2015 agendas.	Within the broader IRIS assessment development process, identification of whether a specific toxicity value (such as the reference dose) requires updating is accomplished following scoping and problem formulation. The IRIS Program will complete scoping and problem formulation for methylmercury and determine whether the reference dose needs to be updated **(12/31/2018)**.	NCEA
EPA Achieved Scientific Benefits When Using Reimbursable Research Agreements, but Better Estimating of In-Kind Costs Is Needed / 16-P-0279	Direct ORD project managers and staff to use guidance developed and issued by the OGD for estimating in-kind contributions, and provide training.	ORD will direct its project managers and staff to use this new procedure to estimate the costs for CRADAs and CAIAs. In a related action, ORD will work with OGD, OCFO, and OGC to provide training to ORD staff on the new procedure **(COMPLETED on 6/12/18). OPARM to work with OARS to prepare certification of completed corrective actions memo for AA signature.**	OARS, OPARM & OGD
EPA Has Not Met Statutory Requirements to Identify Environmental Impacts of Renewable Fuel Standard / 16-P-0275	Provide triennial reports to Congress on the impacts of biofuels as required by the Energy Independence and Security Act.	ORD agrees to provide triennial reports to Congress on the impacts of biofuels as required by the Energy Independence and Security Act. Planned completion date: 12/31/17. **(COMPLETED on 6/29/18) OPARM to work with ACE to prepare certification of completed corrective actions memo for AA signature.**	IOAA/ ACE & OAR

Status of ORD's GAO Audits

Start Date / Tracking #	*Audit Title* / Congressional Requester(s)	Objectives	NPD/LCO	Subject Matter Experts (SMEs)	Current Status
Gathering Data Phase					
7/5/18 - JC 102874	***Alternatives to Animal Research*** / Based on a congressional request by the House Subcommittee on Interior, Environment and the Senate Subcommittee on Commerce, Justice, Science.	To determine: 1) What efforts have federal agencies made to develop, validate, and promote alternatives to the use of animals in research, testing, or training? 2) What challenges do agencies face in their efforts to develop, validate, and promote alternatives to the use of animals in research, testing, or training?	NCCT, NHEERL, NERL and OCSPP	Rusty Thomas, Monica Linninbrink, Maureen Gwinn, Reeder Sams, Ron Hines, Tim Shafer	Notification memo sent on 7/5/18. GAO entrance meeting with OCSPP and ORD on 8/8/18. GAO sent discussion questions on 7/26/18. **Internal ORD prep meeting to review questions on 8/1/18; pre-briefing for IOAA on 8/8 re the discussion questions. Gathering data/interviews**
6/14/18 - JC 102689	***Agencies' Implementation of Scientific Integrity Poilcies*** / Based on a congressional request by Senator Bill Nelson of the Committee on Commerce, Science, and Transportation	To determine: (1) what are the main components of selected agencies' scientific integrity policies? (2) To what extent do selected agencies have processes in place to reasonably ensure that the objectives of their scientific integrity policies are achieved? (3) To what extent have agencies established processes for reporting and investigating allegations of misconduct of their scientific integrity policies?	IOAA, OSA, & OEI	Francesca Grifo, Vince Cogliano, Tom Sinks, and Mary Greene	Notification memo sent on 6/14/18. ORD issued Transmittal on 6/15/18 announcing audit and requesting SMEs. GAO entrance meeting on July 19th. **Follow up interview on 8/8. Gathering data/interviews**
5/17/18 - JC 102767	***Small Business R&D Venture Capital*** / Based on a congressional mandate under PL 112-81	To determine: (1) the extent to which agencies elected to include majority-owned portfolio companies in their SBIR programs from fiscal years 2015 through fiscal years 2017 and (2) the results of allowing majority-owned portfolio companies to participate in the SBIR program.	NCER	April Richards	Notification memo sent to ORD on 5/17/18. NCER and OPARM met w/ GAO for an entrance conference on 6/5/18. **Based on this meeting, it does not appear this review will be relevant to ORD.**

Status of ORD's GAO Audits

2/27/18 - JC 102673	***EPA's Chemical Management Strategies*** / Based on GAO's own initiative pursuant to its authority under 31 U.S.C. 717.	To determine: 1) To what extent has EPA demonstrated progress assessing chemicals through the Integrated Risk Information System (IRIS) program and how have recent changes to the program addressed underlying challenges? 2) To what extent has EPA demonstrated progress implementing the Toxic Substances Control Act (TSCA), as amended by the Lautenberg Act, and ensured that EPA has the resources necessary?	NCEA and OCSPP	Tina Bahadori, Samantha Jones, Lou D'mico, Mary Ross, James Avery (lead), and Kris Thayer	On 3/27/18, GAO issued notification letter. OPARM and NCEA attended entrance conference on 4/17/18. OPARM and NCEA participated in a followup meeting on 5/9/18. Follow up meetings w/ GAO to address discussion questions on 6/12, 6/13, and 7/9. GAO to interview OW, OAR, R10, and OP. On 8/7/18, NCEA briefed IOAA on GAO's feedback regarding ORD progress to address GAO's IRIS open recommendations. **Gathering data/interviews**
2/22/18 - JC 102451	***Access to Federally Funded Research and Data*** / Based on a request by Representative Bernice Johnson of the House Committee on Science, Space and Technology and Representative Sensenbrenner; and Chairman Thune and Senator Nelson of the Senate Committee on Commerce, Science and Transportation	To determine (1) How are agencies implementing the Office of Science and Technology Policy (OSTP) memorandum directing federal agencies with over $100 million in annual research and development expenditures to develop a plan to support increased access to federally funded research results? (2) What are selected agency officials' and stakeholders' views on the extent to which implementation of agencies' plans has achieved the OSTP memorandum objectives and any challenges faced? (3) What steps have selected agencies taken to work with stakeholders to implement plans, and what options exist to improve implementation and address any challenges identified?	OSA, OSIM, NCER; OEI	Tom Sinks, Kevin Teichman, Cheryl Hawkins, Jerry Blancato, James Gentry	Notification memo sent on 2/22/18. Entrance conference has been scheduled for March 14th. ORD responded to GAO's first data call on 3/13/2018; GAO's data call included a request for a copy of EPA's public access plan, and any associated implementing guidance/documents. **GAO sent questionnaire for ORD to complete. ORD's completed questionnaire sent to GAO on 7/31/18. ORD responded to follow up questions on 8/10/18. Gathering data/interviews**
2/22/18 - JC 102601	***Asbestos in Federal Buildings*** / Based on a request by Ranking Member Donald S. Beyer Jr. of the Committee on Science, Space and Technology's Subcommittee on Oversight.	To determine: 1) What are the current government efforts to maintain an up-to-date inventory of federal buildings containing asbestos and are the data readily available to the public? 2) Are there technologies that could be deployed to ensure the rapid detection of asbestos fibers? 3) Does the government have guidelines or policies to inform federal workers if they have been exposed-or potentially exposed-to asbestos, and have those policies been followed?			Notification memo sent to EPA on 2/22/18. OPARM is still working to find out how/whether this review would impact ORD, and who from the L/C/Os may be appropriate subject matter experts. On April 5th, OPARM called into the entrance conference. Based on this meeting, it does not appear this review will be relevant to ORD.

1/17/18 - JC 102517	***Potential Health and Environmental Effects of Leaks from Natural Gas Storage Sites*** / Based on request from Representative Eddie Bernice Johnson of the House Committee on Science, Space, and Technology, and Representatives Suzanne Bonamici and Donald S. Beyer	To examine issues regarding natural gas storage safety. Specifically, what is known about the extent of natural gas storage leaks? What is known about the risks to human health and the environment from natural gas storage leaks? To what extent has the federal government established human exposure limits for the components of natural gas? What progress has DOT made in implementing its safety enforcement program and what factors have affected DOT's progress?	NHEERL; OAR (lead), OLEM, and OP	Mark Higuchi	Notification memo sent on 1/17/18, GAO entrance conference on 1/30/18 at 3p. OPARM and NHEERL to attend. **Gathering data/interviews**
11/22/17 - JC 102380	***EPA Advisory Committees*** / Based on a request from request from Senators Thomas Carper and Sheldon Whitehouse of the Senate Environment and Public Works Committee, as well as Senators Edward Markey, Brian Schatz, Bernard Sanders, Jeanne Shaheen, Mazie Hirono, Gary Peters, Michael Bennet, Sherrod Brown, and Al Franken.	To determine 1) what are the legal requirements and policies for ensuring the balance and independence of EPA advisory committee members? 2. To what extent is EPA following these requirements and policies? 3. How, if at all, has the composition of EPA's advisory committees changed over time?	OARM (lead), OSA and OSP, agency-wide	Tom Tracey, Tom O'Farrell	Notification memo sent on 11/22/17. GAO sent data request for FACA membership documents. OSP prepared docs and sent to GAO by March 16, 2018. **Gathering data/interviews**

Tracking ORD's Corrective Actions to GAO's Report Recommendation(s)		
Report Title/No	**Recommendation(s)**	**Corrective Actions**
2017 High-Risk Report - IRIS (3 GAO Reports, 7 open recommendations) GAO-08-440; GAO-12-42; GAO-13-369	GAO published the 2017 High Risk Report on 2/15/17 (biennial report) **ORD provided GAO status updates on the (7) open IRIS recommendations on June 5, 2018.	

Green Background = ORD only
Orange = EPA-wide
Yellow = Gov't-wide

Red = Recent Edits

GAO-08-440, Chemical Assessments: Low Productivity and New Interagency Review Process Limit the Usefulness and Credibility of EPA's Integrated Risk Information System - 1 open recommendation	GAO-08-440, report rec #5: To develop timely chemical risk information that EPA needs to effectively conduct its mission, the Administrator, EPA, should require ORD to re-evaluate its draft proposed changes to the IRIS assessment process in light of the issues raised in this report and ensure that any revised process periodically assesses the level of resources that should be dedicated to this significant program to meet user needs and maintain a viable IRIS database.	**GAO-08-440 Report status: June 2018 Update:** In light of the release of the EPA's Strategic Plan (https://www.epa.gov/sites/production/files/2018-02/documents/fy-2018-2022-epa-strategic-plan.pdf), the IRIS Program further enhanced and augmented its engagement strategy with program and regional offices. This included engaging these offices to affirmatively evaluate their continued need for and interest in existing assessment products in the IRIS pipeline, their priority or urgency, and additional considerations for the development of the assessment, including the specific form or focus of the product (portfolio approach), and its timeline. New priority areas of interest were also identified. Results of this evaluation were summarized through a Program Management effort in IRIS which was used to calibrate resource commitments for the next 12 months. To ensure that the work in IRIS remains tethered to the needs of the program/region, during monthly EPA-wide calls, the offices are provided routine updates. This provides real-time information on EPA program priorities and allows the IRIS Program management to be aware of changes in priorities that occur as a result of high priority regulatory developments, such as under TSCA implementation or addressing OAR's court-mandated Risk Technology Review regulations. Additionally, NCEA's Assistant Center Director for Scientific Support works with the IRIS Program to provide frequent chemical-specific micro-updates to the offices around critical milestones in assessment development. The EPA Science Advisory Board met on August 29-30, 2017 to review the progress of the IRIS program. In their letter following that meeting (https://yosemite.epa.gov/sab/sabproduct.nsf/A9A9ACCE42B6AA0E8525818E004CC597/$File/EPA-SAB-17-008.pdf) the SAB recognized the great progress made by the IRIS program: "The Board was particularly impressed and pleased with the rapid progress that the Agency has made in responding to recommendations from the National Research Council of the National Academies of Sciences (NAS) and the SAB, with particularly notable improvements in the program over the past year." April 2017 Update - As indicated in the preamble, in addition to the Multi-Year Agenda, we will ground-truth program and regional office priority needs annually, evaluate the continued responsiveness of the Agenda for that fiscal year, and realign resources and priorities as needed. We started this ground-truthing informally in 2017, and depending on feedback from the offices and the SAB-CAAC, we will formalize this process starting in 2018.

Green Background = **ORD only**
Orange = **EPA-wide**
Yellow = **Gov't-wide**

Red = Recent Edits

GAO-12-42, Chemical Assessments: Challenges Remain with EPA's Integrated Risk Information System Program (1 of 5 open recommendations)	GAO-12-42, report rec #1: To better ensure the credibility of IRIS assessments by enhancing their timeliness and certainty, the EPA Administrator should require ORD to assess the feasibility and appropriateness of the established time frames for each step in the IRIS assessment process and determine whether different time frames should be established, based on complexity or other criteria, for different types of IRIS assessments.	**GAO-12-42, Rec #1 status: June 2018 Update:** As part of an IRIS program and project management initiative and broader Agency commitment to LEAN management, the IRIS Program has been evaluating resources and priorities throughout 2017 and into 2018. These activities include the implementation of project and program management to optimize resource utilization and establish assessment timelines, reaffirming Agency stakeholder interest in assessments under development, and sharing new assessment plans and protocols to provide stakeholders and the public greater transparency. Management practices include frequent engagement with EPA partners per chemical assessment to monitor any changes in priority status. IRIS staff allocation is monitored multiple times a month at standing meetings of the IRIS Management Council. See update on recommendation [2008 Rec #5] for additional information. April 2017 Update: In 2017, we furthered this concept. NCEA assessments that support policy and regulatory decisions are being consolidated into a 'portfolio' of Chemical Evaluation products that optimize the application of best available science and technology. The workflow will be reoriented and timelines and resources will be tailored to flexibly fit the intended purpose of the assessment as described in the Assessment Plan (see preamble). Examples of other products incorporated in the portfolio may derive from the Updated Health Assessments pilot described in the preamble. This approach will be presented to the EPA's Science and Technology Policy Council in June and the SAB CAAC in Sept 2017 for their consideration and evaluation. In FY 2017, NCEA has also deployed program and project management (PM) for the assessments. These include working with chemical managers to develop timelines and a system that tracks the portfolio of products in development, allowing the IRIS Program to more effectively and efficiently utilize human resources across assessment projects and ensure timely delivery of products. NCEA has developed tools for tracking decisions and actions taken, and has ongoing training for staff and managers in the use of PM tools and systems.

Red = Recent Edits

GAO-12-42, Chemical Assessments: Challenges Remain with EPA's Integrated Risk Information System Program (2 of 5 open recommendations)	GAO-12-42, report rec #2: To better ensure the credibility of IRIS assessments by enhancing their timeliness and certainty, the EPA Administrator should require ORD, should different time frames be necessary, to establish a written policy that clearly describes the applicability of the time frames for each type of IRIS assessment and ensures that the time frames are realistic and provide greater predictability to stakeholders.	**GAO-12-42, Rec #2 status: June 2018 Update:** In the last year, IRIS has moved away from one-size-fits-all assessments to a mixed portfolio of chemical evaluation products, with the following objectives: Targeted assessments with laser-sharp focus on the science specific to decision needs; Optimize the application of best practices and automation tools to promote greater throughput and higher productivity overall; Increase opportunities for public engagement, thereby mitigating later stage controversies; Develop a nimble, flexible and efficient way to draw on new data streams and create a continuum of risk assessment products to better meet the needs of stakeholders and decision makers; When possible, build on existing assessments developed by other authoritative government agencies; Significantly increase the speed, transparency, and access to assessment products and democratize the process for all stakeholders impacted by decisions. This portfolio approach is a fundamental departure from the previous approach to assessment development within the IRIS Program, which had generated the GAO recommendation. The portfolio approach will allow IRIS to remain flexible and responsive to customers within EPA, as well as the diverse stakeholders beyond EPA, including states, tribal nations, and other Federal agencies. The 2018 report of National Academy of Sciences (NAS), Progress Toward Transforming the Integrated Risk Information System (IRIS) Program, indicated: "The move toward a portfolio approach appears to add need-based and context-based flexibility to the IRIS program. . . Overall, the portfolio approach is expected to conserve agency resources, and it is consistent with the recommendations of the National Academies report, Science and Decisions: Advancing Risk Assessment (NRC 2009)." See update for recommendation [2008 Rec #5] for additional information. April 2017 Update: After receiving feedback from the EPA SAB CAAC (expected, September 2017), such a public statement will be developed. We expect the statement to emphasize the portfolio approach to chemical evaluation and reflect that the timelines and milestones will be commensurate to the scale and type of assessment product. This will also provide an opportunity to evaluate whether the program and project management training has provided the consistency in planning and delivery that was expected.

Green Background **= ORD only**
Orange **= EPA-wide**
Yellow **= Gov't-wide**

Red = Recent Edits

GAO-12-42, Chemical Assessments: Challenges Remain with EPA's Integrated Risk Information System Program (3 of 5 open recommendations)	GAO-12-42, report rec #4: To ensure that current and accurate information on chemicals that EPA plans to assess through IRIS is available to IRIS users--including stakeholders such as EPA program and regional offices, other federal agencies, and the public--the EPA Administrator should direct ORD to annually publish the IRIS agenda in the Federal Register each fiscal year.	**GAO-12-42, Rec #4 status: June 2018 Update:** In 2017, the IRIS Program reconfirmed with Agency stakeholders that information in the multi-year Agenda was consistent with broad Agency needs. Additionally, new priorities such as perfluorinated compounds emerged with some urgency, and were assigned the highest priority by the EPA Administrator. As described in the update for [2008 Rec #4] to reflect this reconfirmation and accommodate the urgent need for assessment of perfluorinated compounds, the IRIS Program recalibrated resources. The IRIS website will be updated shortly to summarize this workflow and resource commitment as planned for the next 12 months. This process will be formalized in 2018. Updates to the Agenda will be published on the IRIS website and disseminated appropriately. In addition, as part of full implantation of systematic review, there will be increased opportunity for early engagement with stakeholders. April 2017 Update: As described in the preamble, starting in 2017, the IRIS Program will ground-truth the information in the Multi-Year Agenda annually to ensure that it remains responsive. An informal process implemented in 2017, will be formalized starting in 2018. Updates to the Agenda will be published on the IRIS website and disseminated appropriately.
GAO-12-42, Chemical Assessments: Challenges Remain with EPA's Integrated Risk Information System Program (4 of 5 open recommendations)	GAO-12-42, report rec #5: To ensure that current and accurate information on chemicals that EPA plans to assess through IRIS is available to IRIS users--including stakeholders such as EPA program and regional offices, other federal agencies, and the public--the EPA Administrator should direct ORD to indicate in published IRIS agendas which chemicals EPA is actively assessing and when EPA plans to start assessments of the other listed chemicals.	**GAO-12-42, Rec #5 status: June 2018 Update**: The update to the IRIS Program agenda described for [2011 Rec #4] includes information on current assessments underway and on the assessment products that are planned for the future. **April 2017 Update:** As described in the preamble, starting in 2017, the IRIS Program will ground-truth the information in the Multi-Year Agenda annually to ensure that it remains responsive. An informal process implemented in 2017, will be formalized starting in 2018. Updates to the Agenda will be published on the IRIS website and disseminated appropriately. The Program and Project Management tools deployed in FY 2017 are expected to facilitate estimation and adherence to the projected timelines. Following SAB-CAAC evaluation of proposed approaches to ground-truth and update the Multi-Year Agenda (expected, September 2017), an updated agenda will be published that will list which chemicals EPA is actively assessing and when EPA plans to start assessments of the other listed chemicals.

GAO-12-42, Chemical Assessments: Challenges Remain with EPA's Integrated Risk Information System Program (5 of 5 open recommendations)	GAO-12-42, report rec #6: To ensure that current and accurate information on chemicals that EPA plans to assess through IRIS is available to IRIS users--including stakeholders such as EPA program and regional offices, other federal agencies, and the public--the EPA Administrator should direct ORD to update the IRIS Substance Assessment Tracking System (IRISTrack) to display all current information on the status of assessments of chemicals on the IRIS agenda, including projected and actual start dates, and projected and actual dates for completion of steps in the IRIS process, and keep this information current.	**GAO-12-42, Rec #6 status: June 2018 Update:** As stated in our responses on Recs 2011 #4 and #5, the IRIS Program has begun to update the IRIS Program agenda on an annual basis, and is providing information on current and planned assessments on the website. The IRIS Program is also implementing program and project management to effectively plan, track and maintain resources and timelines for assessments. April 2017 Update: Following SAB-CAAC evaluation of proposed approaches to ground-truth and update the Multi-Year Agenda (expected, September 2017), the IRIS website will be updated with this information.

GAO-13-369, Chemical Assessments: An Agency wide Strategy May Help EPA Address Unmet Needs for Integrated Risk Information System Assessments - 1 open recommendation	GAO-13-369 report rec #3: To ensure that EPA maximizes its limited resources and addresses the statutory, regulatory, and programmatic needs of EPA program offices and regions when IRIS toxicity assessments are not available, and once demand for the IRIS Program is determined, the EPA Administrator should direct the Deputy Administrator, in coordination with EPA's Science Advisor, to develop an agency-wide strategy to address the unmet needs of EPA program offices and regions that includes, at a minimum: (1) coordination across EPA offices and with other federal research agencies to help identify and fill data gaps that preclude the agency from conducting IRIS toxicity assessments, and (2) guidance that describes alternative sources of toxicity information and when it would be appropriate to use them when IRIS values are not available, applicable, or current.	**GAO-13-369 Report status: June 2018 Update:** The IRIS Program has moved away from one-size-fits all assessments to a mixed portfolio of chemical evaluation products. Targeted assessments bring laser-sharp focus on the science specific to decision needs. These products are being shaped for use by several partners, including the states, tribes, other federal agencies, and EPA's national and regional program offices. During FY18, the IRIS Program has posted assessment plans for Uranium and Ammonia that provide examples of targeted assessments underway. IRIS Program portfolio development has been recognized in two recent reviews. In the SAB letter regarding their review of the IRIS program, the SAB recognized the progress made in implementing a portfolio approach in the IRIS program: "The changes are so extensive and positive that they constitute a virtual reinvention of IRIS. . . Finally, the IRIS documents are now more modular and structured to enhance transparency and readability." In addition, NAS met in February 2018 to review the progress made by the IRIS Program in addressing previous NAS report recommendations. In their report, Progress Toward Transforming IRIS, the NAS stated: "The move toward a portfolio approach appears to add need-based and context-based flexibility to the IRIS program. . . . Overall, the portfolio approach is expected to conserve agency resources, and it is consistent with the recommendations of the National Academies report, Science and Decisions: Advancing Risk Assessment (NRC 2009)."While this recommendation highlights the need for Agency level coordination, steps taken by the IRIS Program should significantly to addressing this recommendation. For example: The new portfolio of chemical evaluation products is being developed with input from EPA program and regional offices to ensure the scope of an assessment is appropriate for user needs. The goal will be to produce more assessments in a timely fashion. Additional discussions are being held with EPA partners and others in the federal community to ensure that the products developed with the portfolio approach meet their statutory needs or decisional requirements. Collaboration between the NCEA and NCCT is ongoing to evaluate how the emerging data, models, and tools will inform assessment development and fill gaps in assessments, especially for data poor chemicals. IRIS has increased its coordination with other Federal agencies and states with an aim of reducing duplication of effort and collaborating on assessments of mutual interest (when feasible) to promote the development of more toxicity values. The increasing embrace of systematic review practices across agencies helps create clear and transparent venues for data and knowledge exchange. These activities were presented to the NAS at their

GAO-17-453, Small Business Research Programs: Most Agencies Met Spending Requirements, but DOD and EPA Need to Improve Data Reporting - 1 recommendation	**GAO-17-453, report rec #2:** To ensure full compliance with SBIR and STTR spending and reporting requirements, the Secretary of Defense and the EPA Administrator should establish procedures to collect and submit obligations data or--through SBA, independently, or through a working group of agencies participating in the SBIR and STTR programs--propose to Congress an alternative methodology for calculating spending requirements for their agencies.	**GAO Comments:** In its comments on the draft report, EPA concurred with the recommendation and stated that EPA will work with SBA to develop an alternative methodology for calculating spending requirements. **June 2018 Update:** EPA has initiated discussion with SBA and held a meeting on 1/23/18. **Nov 2017 Update:** EPA will start discussions with the SBA in Nov 2017, so there is no update at this time.
GAO-18-207, Small Business Research Programs: Agencies Need to Take Steps to Assess Progress Toward Commercializing Technologies - 1 recommendation	**GAO-18-207, report rec #10:** The Small Business Innovation Research (SBIR) Program Manager within the EPA should update the agency's SBIR project solicitation to accurately reflect how the consequences of not meeting the benchmarks are to be implemented.	**June 2018 Update:** EPA has drafted its 2019 solicitation which is scheduled to open in June 2018 and has included the updated language on the transition benchmarks. **EPA Response (Feb 2018):** EPA concurs with this recommendation. EPA will update the next SBIR solicitation (which will be released in 2018) to provide information to small businesses on the consequences of not meeting the benchmarks (i.e., from ineligibility to receive certain awards to ineligibility to submit certain proposals). EPA will also plan on referencing the SBA website on performance benchmarks (https://www.sbir.gov/performance-benchmarks) to ensure consistency with SBA guidance.

If edits are necessary or there are any suggestions, please contact ORD's audit coordinator, Maureen Hingeley, at hingeley.maureen@epa.gov. Also, if the OIG or GAO has contacted you or staff directly, please contact Maureen.

Citation: Ioannidis JPA (2018) All science should inform policy and regulation. PLoS Med 15(5): e1002576. https://doi.org/10.1371/journal.pmed.1002576

Published: May 3, 2018

Funding: The Meta-Research Innovation Center at Stanford has been funded by the Laura and John Arnold Foundation. The funders had no role in the study design, data collection and analysis, decision to publish, or preparation of the manuscript.

Competing interests: I have read the journal's policy and the author of this manuscript have the following competing interests: JPAI serves on the Editorial Board of *PLOS Medicine*.

Provenance: Commissioned; not externally peer reviewed.

Not all scientific information is created equal. Large differences exist across topics on how much is known, and with what degree of certainty. Some questions are more difficult to answer, and some research tools are more reliable than others. Not all methods can be applied to answer every question. Credibility depends [1] on how large and rigorous studies are, how well researchers have contained conflicts of interest (financial or other), and how successfully the study design and analysis have limited bias, properly accounting for the complexity inherent in each scientific question. Coordinated efforts among scientists instead of furtive competition help improve the odds of success. Transparency with full sharing of data, protocols and computer codes improves trust in research findings. Re-analysis of data by independent teams adds to that trust and replication in new studies further enhances it.

Scientific findings vary in their credibility. Some findings are beyond reasonable doubt. For example, we have extremely strong evidence that the tobacco pandemic is devastating; that the MMR vaccine is generally safe; that climate change is happening; and that air pollution is a major health hazard. Conversely, our evidence base is notoriously weak on most dietary advice one might hope to give about specific nutrients [2]. Within a given discipline, evidence may be strong for some findings but weak for others. E.g., we have strong evidence for some medical interventions, modest evidence for others, and dismally biased evidence for many.

Our society will benefit from using the best available science for governmental regulation and policy. One can only applaud when governments want to support the best possible science, invest in it, find ways to reduce biases, and provide incentives that bolster transparency, reproducibility, and the application of best methods to address questions that matter. However, perceived perfection is not a characteristic of science, but of dogma. Even the strongest science may have imperfections. In using scientific information for decision-making, it is essential to examine evidence in its totality, recognize its relative strengths and weaknesses, and make the best judgment based on what is available.

Making scientific data, methods, protocols, software, and scripts widely available is an exciting, worthy aspiration [3–5]. Government-based regulatory and funding incentives can be instrumental in making this happen at large scale. However, we should recognize that most of the raw data from past studies are not publicly available. In a random sample of the biomedical literature (2000–2014) [6], none of 268 papers shared all of their raw data. Only one shared a full research protocol. The proportion of studies that have had all their raw data independently re-analyzed is probably less than one in a thousand. The number of studies that have been exactly replicated in new investigations is quite larger, but still a minority in most fields. A new

standard currently proposed for the Environmental Protection Agency [7] aims to ban the use of scientific studies for regulatory purposes unless all their raw data are widely available in public and can be reproduced. If the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim.

Past collected and analyzed information can and should still be used for decision-making, taking into account any relevant imperfections. While fully transparent and reproducible information should certainly be valued more highly, studies with weaknesses can still offer insights. Some deficiencies may be unavoidable. For example, researchers cannot ethically randomize people to harmful exposures in order to tackle confounding, nor violate informed consent agreements that prohibit open sharing of private data from past studies. Instead of violating ethics, we should focus more on future efforts, informed by what we have learned in the past. When avoidable weaknesses are identified, we can improve rigor, transparency and reproducibility (and, eventually, credibility) for future studies.

Successful examples of rigorous, reproducible research can be used as templates for other fields that are struggling with suboptimal research practices. For example, the pivotal research on the health effects of air pollution is particularly strong. The Six Cities [8] and American Cancer Society [9] studies are exemplary large-scale investigations, with careful application of methods, detailed scrutiny of measurements, replication of findings, and, importantly, detailed re-analysis of results and assessment of their robustness by entirely independent investigators [10]. The re-analysis and sensitivity analyses were conducted by the Health Effects Institute that was funded by stakeholders some of whom may have desired to see opposite conclusions. It would be wonderful, if in the future the same rigorous re-analysis and replication standards could become the standard for all important areas of research that can inform policy.

In the USA and elsewhere, governments are major funders of research and their regulatory mandates provide powerful incentives for best science. Making widely applicable, reproducible research practices and sharing the default option for research (with sparse exceptions, when appropriately justified) will strengthen scientific investigation and maximize its benefits to society at large. Governments can bolster their legacy through such initiatives and scientists would be broadly supportive of such a transformative vision to promote a standard of openness in science.

The opposite scenario, of simply ignoring science that has not yet attained such standards, is a nightmare. On the one hand, we would see governments discarding science at massive scale because of perceived imperfections and impurities. Perhaps worse, we would see scientists respond by becoming politically entrenched dogmatic advocates, falsely believing that they defend science. Even well-intentioned academics, perceiving an attack on science, may be tempted to take an unproductive, hand-waving defensive position: "we have no problem with reproducibility", "everything is fine", "science is making progress". Certainly, science is making progress; with 20 million smart people working in and co-authoring scientific work and with major funding investment, it would be horrible if no progress were made. The issue is how we can accelerate progress. To do this, instead of hiding trash under the carpet, we should make the best use of past work and materialize bigger and better plans for the future. Science is facing a major transformation nowadays, with exponentially more data and far more scientists working on them than ever. Financial and other conflicts are major threats. Many analyses are becoming black boxes and reproducibility problems are widely documented across many fields. Most of the effects pursued by current investigations are of modest size, nowhere close to the huge harms of tobacco or the huge benefits of childhood vaccinations. Many fields lack the high reproducibility standards that are already used in fields such as air pollution and climate change. The scientific enterprise faces great challenges and great opportunities and we need the best research practices in order to succeed [11].

While scientists can work to improve science, governments and regulators can also do better. Most governments around the world have largely neglected the need to support reproducible research practices. Moreover, they have not used science as much as they should. This is particularly worrisome when the evidence is strong, yet governments have not acted forcefully enough. It is a scandal that we continue to allow companies to make money from selling tobacco products, despite expecting about 1 billion tobacco-related deaths in the next 100 years, a Holocaust equivalent of lost lives repeated every year. It is a scandal that the response of governments to climate change and pollution has not been more decisive. It is a scandal that we don't have higher standards for drugs, biologics, and devices. It is a scandal that people die from measles in the 21st century. Current governments have plenty of room to improve over the mediocre performance of their predecessors. They can do this by using, not discarding, science.

Docket ID No. EPA-HQ-OA-2018-0259

Re: COMMENTS ON PROPOSED RULE, STRENGTHENING TRANSPARENCY IN REGULATORY SCIENCE, 83 FED. REG. 18,768 (Apr. 30, 2018)

Dear Acting Administrator Wheeler:

The Emmett Environmental Law & Policy Clinic at Harvard Law School submits this letter on behalf of a distinguished group of experts committed to the advancement of research to improve the health and safety of Americans and people around the world. The signatories include the President of Harvard University, the Presidents and a number of Department Chairs and Chiefs of four of the world's foremost research and teaching hospitals (Beth Israel Deaconess Medical Center, Brigham and Women's Hospital, Massachusetts Eye and Ear, and Massachusetts General Hospital), the Deans of Harvard's T.H. Chan School of Public Health and Harvard Medical School, preeminent faculty at the Harvard T.H. Chan School of Public Health, the Harvard Medical School, and the Harvard School of Engineering and Applied Sciences, and numerous esteemed research and clinical doctors affiliated with Harvard and its research hospitals. Work done by the signatories and/or their institutions addresses a broad spectrum of health impacts on infants, children, and adults from exposures to chemicals and activities that are regulated by the U.S. Environmental Protection Agency ("EPA") under various statutes including the Safe Drinking Water Act, the Toxic Substances Control Act, the Comprehensive Environmental Response, Compensation, and Liability Act, the Resource Conservation and Recovery Act, the Clean Water Act, and the Clean Air Act, collectively referred to herein as "the Statutes."

Specifically, signatories of this letter have conducted research to determine whether and how exposures to chemical substances such as lead and mercury in food, water, soil, and air affects the development of fetuses, infant mortality, children's development, and children's educational performance. They have also studied the health effects of indoor and outdoor chemical exposures on adult health and safety, including worker productivity and well-being.

Some of the signatories' research is used to develop vaccines and cures for cancer, improve the medical care of infants, children and adults, improve public and private building design, and plan responses to emergencies. The results are also used to demonstrate the benefits of proposed regulatory actions in accordance with statutory and regulatory requirements.[1]

Their research is routinely relied upon by international, federal, and state agencies—including EPA—when they set standards and establish rules and best practices for the protection of human health, safety, and the environment. As explained below, the proposed rule would—for no rational reason—prevent EPA from relying on much of the research that the signatories, their institutions, and other public health and environmental exposure researchers have conducted and continue to conduct. The rule will cripple EPA's ability to implement the aforementioned Statutes and will jeopardize the health and safety of infants, children, and adults in the United States and beyond.[2]

Without the ability to protect and respect patient/human subject privacy and confidentiality, signatories and other researchers would not be able to conduct the studies that are pivotal to their work and to EPA's ability to fulfill its statutory duty to protect public health. The proposed rule ignores a host of existing methods and best practices already established—and adhered to—by the research community to ensure the transparency, reproducibility, replicability, objectivity, and validity of studies, analyses, models, and reports.[3] The proposed rule thus does not serve its stated purpose to ensure that regulatory decisions are based on "valid" science.[4]

---

[1] Signatories' research—which analyzes the human health and environmental impacts of the presence of chemicals in air, soil, drinking water, food, and consumer products—is relevant to EPA's required determinations under the Statutes that its regulations provide societal benefits by reducing harm to human health and the environment. Such research is also critically important to identifying the benefits of EPA regulations when the agency is required by the Statutes or Executive Order to conduct a formal cost-benefit analysis. *See* Exec. Order No. 13783, 82 Fed. Reg. 16,093, §1(e) (Mar. 31, 2017) ("It is also the policy of the United States that necessary and appropriate environmental regulations comply with the law, are of greater benefit than cost, when permissible, achieve environmental improvements for the American people, and are developed through transparent processes that employ the best available peer-reviewed science and economics.").

[2] David Cutler & Francesca Dominici, *A Breath of Bad Air: Cost of the Trump Environmental Agenda May Lead to 80 000 Extra Deaths per Decade*, JAMA NETWORK (June 12, 2018), https://jamanetwork.com/journals/jama/fullarticle/2684596 (copy attached for inclusion in the administrative record, Attachment 1).

[3] *See* Section IV, below, for a discussion of best practices. EPA already has detailed policy and procedural guidance for ensuring and maximizing the quality of information the agency disseminates. *See* EPA, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by the Environmental Protection Agency* (Oct. 2002), https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf. Note further that the proposed rule incorrectly uses the terms "reproducibility" and "replicability" as though they are interchangeable. In fact, they have different meanings. Typically, in the scientific community, "*reproducibility* refers to the ability of a researcher to duplicate the results of a prior study using the same materials as were used by the original investigator." Steven N. Goodman, et al., *What does research reproducibility mean?*, 8 SCIENCE TRANSLATIONAL MEDICINE 341ps12 (2016). By contrast, "replicability" refers to the ability of a researcher to duplicate the results of a prior study following the same procedures but collecting new data. *Id.*

[4] *See* 83 Fed. Reg. 18,768, 18,773 (Apr. 30, 2018) (stated purpose "to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation"); *see also id.* at 18,770 ("It is the charge of regulators to ensure that key findings [of science that informs regulatory actions] are valid and credible.").

Signatories teach graduate and undergraduate students and doctors-in-training about best practices in the conduct of public health, medical, and scientific research. They publish their research results in the most reliable, highest-quality, peer-reviewed medical and scientific journals, including Lancet, Nature, Science, New England Journal of Medicine, Journal of the American Medical Association, Cell, and Environmental Health Perspectives. They conduct peer reviews of the work of other researchers. The approach advocated in the proposed rule is inconsistent with professional best practices in their respective disciplines for conducting, reviewing, and confirming the results/findings of studies, especially those based on confidential personal health data of study participants. As will be shown below, the proposed rule will wreak havoc on public health, medical, and scientific research and undermine the protection of public health and safety.

Accordingly, the signatories strenuously object to the proposed rule and urge EPA to withdraw it.

I. THE PROPOSED RULE WOULD PREVENT EPA FROM RELYING ON THE BEST AVAILABLE INFORMATION AND SCIENCE

In the proposed rule, EPA acknowledges that it must use the "best available science" in all of its regulatory actions.[5] The signatories agree that is the correct starting point for EPA. They disagree, however, with EPA's new position in this proposed rule that science is not the "best" unless the associated raw data are released to the public.[6] As an initial matter, releasing raw data will not improve the quality of the resulting report/study/analysis, and therefore will do nothing to render any individual study "better." EPA itself affirmed this point as recently as 2016.[7] Moreover, while it might be helpful in some situations to make raw data publicly available, it is neither practical nor desirable to impose this requirement as a one-size-fits-all approach.

Instead, there are a variety of other best practices that already exist to test and ensure the rigor, quality, and validity of research. These include the peer review process, which evaluates whether the work is based on the best available scientific understanding, and scientists' detailed description of their research methods, code and non-confidential data in their published articles. That detail allows other researchers not only to challenge the study results, but also to reproduce or validate them using the original data, and/or replicate them via other studies using different data sets. The scientific community considers results valid if they are or can be replicated by other researchers conducting studies using new data, but the same method.[8]

---

[5] 83 Fed. Reg. at 18,769 (citing Exec. Order No. 13563, 76 Fed. Reg. 8,321 (Jan. 21, 2011)).

[6] *See* 83 Fed. Reg. at 18,772 (rule would require that "dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation.").

[7] EPA, *Plan to Increase Access to Results of EPA-Funded Scientific Research*, at 4-5 (2016), https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf ("Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.").

[8] *See, e.g.*, Memorandum from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration of the Underlying Science to Members of the Chartered SAB and SAB Liaisons, *Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory*

Contrary to EPA's stated goal of improving the basis for its regulatory decisions, requiring the public availability of all raw data will instead undermine EPA's ability to make reasonable decisions. This requirement will effectively prohibit EPA from considering studies that by design are based on data that *cannot* be made publicly available due to laws and contracts designed to protect patient and human subject privacy and ensure willingness of people to participate in research by sharing their private information with researchers. The proposed rule precludes consideration of studies based on confidential data, even when those results have been confirmed by other studies.[9] Hence, the proposal would in many instances *prohibit* EPA from relying on the best available science relevant to many of the regulatory issues that the agency faces.

Moreover, this proposed requirement contravenes five decades of EPA practice. EPA has repeatedly affirmed that its mission requires it to rely on the best available scientific evidence, without ever asserting that it should exclude from consideration studies for which the underlying data were not publicly available. For example, in its 1997 strategic plan, EPA declared one of its seven overall purposes was to ensure that "efforts to reduce environmental risk are based on the best available scientific information."[10] In 2002, EPA issued Information Quality Guidelines in which it took the position that the standard set forth in the Safe Drinking Water Act — "the best available, peer-reviewed science"[11] — should apply to all of the agency's risk assessments.[12]

Science RIN (2080-AA14) 4 (May 12, 2018), https://perma.cc/MM3J-CHEA [hereinafter "SAB Memo"]; Bernard Goldstein, Op-Ed., *This is Why EPA's "Secret Science" Proposal Alarms Public Health Experts*, THE CONVERSATION (May 18, 2018), https://theconversation.com/why-the-epas-secret-science-proposal-alarms-public-health-experts-96000.

[9] One example is the Six Cities Study, Douglas W. Dockery, et al., *An Association between Air Pollution and Mortality in Six U.S. Cities*, 329 NEW ENGLAND J. MED. 1753 (1993), whose results were subsequently confirmed by independent reanalysis, Health Effects Institute, *Reanalysis of the Harvard Six Cities Study and the American Cancer Society Study of Particulate Air Pollution and Mortality* (2000), https://www.healtheffects.org/system/files/HEI-Reanalysis-2000.pdf. Indeed, both the Six Cities Study and the American Cancer Study of Particulate Air Pollution and Mortality have each been reproduced and replicated. The findings are consistent with the original studies. *See, e.g.*, Qian Di, Francesca Dominici, Joel D. Schwartz, et al., *Air Pollution and Mortality in the Medicare Population*, 376 NEW ENGLAND J. MED. 2513-2522 (2017) (copy attached for inclusion in the administrative record, Attachment 2).

[10] EPA, EPA/190-R-97-002, *EPA Strategic Plan*, at 16 (1997), https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=40000 9JX.PDF. Earlier, in a March 1992 report titled *Safeguarding the Future: Credible Science, Credible Decisions*, an independent committee convened by EPA declared that "science is one of the soundest investments the nation can make for the future. Strong science provides the foundation for credible environmental decision making. With a better understanding of environmental risks to people and ecosystems, EPA can target the hazards that pose the greatest risks, anticipate environmental problems before they reach a critical level, and develop strategies that use the nation's, and the world's, environmental protection dollars wisely." EPA, *Safeguarding the Future: Credible Science, Credible Decisions*, at 15 (Mar. 1992), https://nepis.epa.gov/Exe/ZyPDF.cgi/30001ZWJ.PDF?Dockey=30001ZWJ.PDF.

[12] EPA, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency*, at 21-23 (2005), https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf.

EPA's historic position is consistent with the Statutes. For example, one of EPA's core duties under the Clean Air Act is to set and periodically review the National Ambient Air Quality Standards ("NAAQS") for six common air pollutants. In carrying out this responsibility, Congress commanded EPA to use "the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects [of air pollution] on public health or welfare."[13] Similarly, the Safe Drinking Water Act commands EPA in general to use "the best available, peer-reviewed science" and when deciding whether to regulate a particular contaminant to consider the "best available public health information."[14] The Toxic Substances Control Act requires that regulation of chemical substances be "consistent with the best available science" and that EPA make decisions "based on the weight of the scientific evidence."[15] The water quality criteria that EPA develops under the Clean Water Act must "accurately reflect[] the latest scientific knowledge" on a variety of factors.[16]

Furthermore, because EPA is required under the Statutes to assess the public health benefits of its regulations, it must take into account all relevant science and cannot arbitrarily exclude certain studies demonstrating those benefits. Under the Clean Air Act, EPA must set the NAAQS at a level "requisite to protect the public health."[17] Under the Safe Drinking Water Act, EPA must determine whether a contaminant "may have an adverse effect on the health of persons" before deciding to regulate it.[18]

Many of the fundamental public health studies on which EPA has based key rules and standards under the Statutes are studies for which the raw data were not or could not have been released. Attachment 3 to this letter contains a partial list of studies that likely contain confidential data; these are all studies on which EPA has relied and cited as the basis for its actions under some of the Statutes. Until now, release of the underlying raw data was not an EPA criterion for determining the "best available" reports, studies, analyses, or models. Indeed, none of the Statutes invoked by EPA as support for the proposed rule limits EPA in this fashion; none of the Statutes requires EPA to make raw data publicly available.[19]

---

[13] 42 U.S.C. § 7408(a)(2).

[14] 42 U.S.C. §§ 300g-1(b)(3)(A)(i), 300g-1(b)(1)(B)(ii)(II).

[15] 15 U.S.C. § 2625(h), (i).

[16] 33 U.S.C. § 1314(a)(1).

[17] 42 U.S.C. § 7409(b).

[18] 42 U.S.C. § 300g-1(b)(1)(A)(i).

[19] When litigants in the past argued that EPA could not rely on studies for which the raw data had not been publicly available, the D.C. Circuit soundly rejected their argument. As the court explained in one case:

> Claiming neither that they were unable to obtain the studies, nor that the studies were improperly published or peer reviewed, Petitioners instead urge us to impose a general requirement that EPA obtain and publicize the data underlying published studies on which the Agency relies. The Clean Air Act imposes no such obligation. . . . More generally, we agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely "would be impractical and unnecessary."
>
> [...]

EPA's proposed new approach, which conflicts with the agency's obligations and curtails its authority, is irrational at best and detrimental to public health and safety at worst.

II. THE PROPOSED RULE WOULD EXCLUDE CRITICAL STUDIES FROM CONSIDERATION IN FUTURE EPA RULEMAKING

There are at least two categories of critically-important, health-based studies for which it will be impractical or illegal to make the underlying data publicly available. Within each category are studies that have already formed the basis for decades of EPA regulatory actions producing enormous public health and safety benefits. The proposal would require that EPA stop relying on these studies and prohibit automatic consideration of, or reliance on, others like them in the future for no other reason than that the raw data cannot be released to the public.[20] This result would be extremely harmful to human health, safety, and the environment.

A. THE PROPOSAL WOULD PREVENT EPA FROM RELYING ON STUDIES BASED ON CONFIDENTIAL HUMAN HEALTH DATA

For many studies, disclosure of the raw data would violate researchers' statutory or contractual duties to protect patient or human research participant confidentiality. Many types of crucial health impact studies cannot be conducted without human participants. For any research carried out by healthcare providers that involves the handling of individually identifiable health information, the Health Insurance Portability and Accountability Act of 1996 ("HIPAA")

As EPA persuasively stated in denying Petitioners' original request for information:

> If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. . . . Such data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].

Am. Trucking Associations, Inc. v. E.P.A., 283 F.3d 355, 372 (D.C. Cir. 2002) (quoting Particulate Matter NAAQS, 62 Fed. Reg. 38,652, 38,689 (July 18, 1997)). The court reiterated this holding six years later in a challenge to the 2008 lead NAAQS. *Coal. of Battery Recyclers Ass'n v. E.P.A.*, 604 F.3d 613, 622 (D.C. Cir. 2010). In that case, the litigants had sought access to the raw data underlying Bruce P. Lanphear, et al., *Low-Level Environmental Lead Exposure and Children's Intellectual Function: An International Pooled Analysis*, 113 ENVTL. HEALTH PERSP. 894 (2005).

[20] The proposal allows EPA to decide to consider such studies on a case-by-case basis. *See* 83 Fed. Reg. at 18,772. The factors EPA identifies for providing individual exemptions—that such disclosure cannot be done "in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security"—merely reiterates the main reasons that data are not currently made publicly available. *Id.* at 18,773. If EPA always allows data to be withheld for those reasons, the rule is meaningless and has no effect. On the other hand, if EPA instead picks and chooses when to allow data to be withheld for those reasons, it will be doing so based on no meaningful standards. *Cf. Pearson v. Shalala*, 164 F.3d 650, 660 (D.C. Cir. 1999) ("It simply will not do for a government agency to declare—without explanation—that a proposed course of private action is not approved. To refuse to define the criteria it is applying is equivalent to simply saying no without explanation.").

Privacy Rule imposes strict confidentiality requirements.[21] Federally-funded research involving human subjects is governed by the Federal Policy for the Protection of Human Subjects, also known as the Common Rule.[22] The Common Rule requires that researchers obtain Institutional Review Board ("IRB") approval and informed consent of research subjects, during which process the researcher will typically need to make promises regarding confidentiality.[23] Most institutions have committed to comply with the Common Rule for all of their research,[24] even when it is not federally-funded.[25]

EPA's suggestion in the proposed rule that "simple data masking, coding, and de-identification," 83 Fed. Reg. at 18,771, will be able to overcome these confidentiality concerns is incorrect. As explained by the EPA's own Science Advisory Board ("SAB"), "[i]n some cases, the data cannot be released simply by redacting portions of it. For example, data may have been collected with an assurance to the participating individuals that their data would be kept confidential."[26] Researchers cannot violate those promises after the fact, particularly if they want to be able to continue to find participants for their studies. In addition, "[i]n the case of clinical trials, there are studies in which removal of all identifying data negates its scientific value."[27]

The understanding of what counts as identifying data is continually expanding: true de-identification of the data may not be possible for some studies, such as those in which the participants come from a small geographical area and/or a specific profession. One study found that the researchers could re-identify approximately one-quarter of the records in a subset of a

---

[21] 45 C.F.R. Part 160 and Subparts A and E of Part 164.

[22] 45 C.F.R. 46 subpart A is the U.S. Department of Health and Human Services ("HHS") citation for the Common Rule. A total of 18 federal agencies have adopted it; each agency has its own separate entry in the Code of Federal Regulations. This federal rule governs ethical constraints that federally funded studies must follow, including academic research, responding to earlier concerns of ethical lapses in medical research. *See, e.g.*, Jerry Menikoff, *Could Tuskegee Happen Today?*, 1 ST. LOUIS U. J. HEALTH L. & POL'Y 311, 312-16 (2008) (describing the Congressional response to public outcry when the details of the Tuskegee experiment were brought to light). The thrust of the Common Rule is to address such matters of research ethics as informed consent, informational risk, and institutional oversight when research involves human subjects. *See* 82 Fed. Reg. 7,149-7,274.

[23] For example, under its "Basic elements of informed consent" provisions, the Common Rule provides that "in seeking informed consent the following information shall be provided to each subject: . . . A statement describing the extent, if any, to which confidentiality of records identifying the subject will be maintained." 45 C.F.R. § 46.116(b)(5). The Common Rule also requires that the IRB ensure that the researchers make "adequate provisions to protect the privacy of subjects and to maintain the confidentiality of data." 45 C.F.R. § 46.111(a)(7).

[24] *See Federalwide Assurance (FWA) for the Protection of Human Subjects*, HHS, https://www.hhs.gov/ohrp/register-irbs-and-obtain-fwas/fwas/fwa-protection-of-human-subjecct/index.html (describing Common Rule policy for institutions performing government-funded human subject research) (last visited August 3, 2018).

[25] Harvard University, for example, has established policies for all university research that go beyond the requirements of the Common Rule. *Statement of Policies and Procedures Governing the Use of Human Subjects in Research at Harvard University*, HARVARD UNIVERSITY, https://provost.harvard.edu/use-human-subjects-research (last visited August 3, 2018).

[26] SAB Memo, *supra* note 8, at 4.

[27] Lynn R. Goldman & Ellen K. Silbergeld, *Assuring Access to Data for Chemical Evaluations*, 121 ENVTL. HEALTH PERSPECTIVES 149, 150 (2013).

HIPAA-compliant environmental health data set.[28] For some studies, it may not be possible to de-identify the data set while still protecting patient or research subject confidentiality.

The proposed rule would prohibit the continued and future use of these studies by EPA thereby obstructing EPA's statutory duty to consider the "best," "reasonably" available information in its decision-making processes. The resulting information vacuum would occur for no other reason than that the underlying human subject data is private and cannot be publicly disseminated.[29]

The proposed rule would also impede EPA's ability to address new and emerging public health risks in future rulemakings. For example, former Administrator Pruitt announced on May 22, 2018, that EPA will begin to develop maximum contaminant levels under the Safe Drinking Water Act for two fluorochemicals, perfluorooctanoic acid ("PFOA") and perfluorooctane sulfonate ("PFOS").[30] EPA also plans to designate PFOA and PFOS as hazardous chemicals, potentially under the Comprehensive Environmental Response, Compensation, and Liability Act.[31] If finalized, however, the proposed rule would prevent these EPA actions.[32]

When EPA issued health advisories for these two chemicals in 2016, the Health Effects Support Documents relied extensively on epidemiological studies generated by the C8 Health Project.[33] A key component of the evidence for the harmfulness of these chemicals consists of epidemiological studies based on data that are not publicly available. Researchers published more than three dozen papers based on these data, identifying probable links between PFOA

[31] Press Release, EPA, *Administrator Pruitt Kicks Off National Leadership Summit on PFAS* (May 22, 2018), https://www.epa.gov/newsreleases/administrator-pruitt-kicks-national-leadership-summit-pfas.

[32] Epidemiological studies, which were essential to discovering the immunotoxicity of perfluorinated alkylate substances, including PFOA and PFOS, were based on confidential human health data. *See* Philippe Grandjean, *Delayed discovery, dissemination, and decisions on intervention in environmental health: a case study on immunotoxicity of perfluorinated alkylate substances*, 17:62 ENVTL. HEALTH 1 (2018) (copy attached for inclusion in the administrative record, Attachment 4).

[33] EPA, EPA 822-R-16-003, *Health Effects Support Document for Perfluorooctanoic Acid (PFOA)*, at 3-1 to 3-60 (May 2016), https://www.epa.gov/sites/production/files/2016-05/documents/pfoa_hesd_final-plain.pdf; EPA, EPA 822-R-16-002, *Health Effects Support Document for Perfluorooctane Sulfonate (PFOS)*, at 3-1 to 3-49 (May 2016), https://www.epa.gov/sites/production/files/2016-05/documents/pfos_hesd_final_508.pdf. The C8 Health Project was funded through the settlement agreement in a lawsuit brought over drinking water contaminated by PFOA from the DuPont Washington Works facility near Parkersburg, West Virginia. The study involved close to 70,000 participants, for each of whom "demographic data, medical diagnoses (both self-report and medical records review), clinical laboratory testing, and determination of serum concentrations of 10 perfluorocarbons (PFCs)" were collected. Stephanie J. Frisbee et al., *The C8 Health Project: Design, Methods, and Participants*, 117 ENVTL. HEALTH PERSP. 1873, 1876 (2009) ("To protect participant privacy, the presiding judge subsequently sealed the data set.").

(also known as C8) exposure and "diagnosed high cholesterol, ulcerative colitis, thyroid disease, testicular cancer, kidney cancer, and pregnancy-induced hypertension."[34]

This situation underlines the arbitrariness and irrationality of the proposed rule. On the one hand, EPA is proposing to take regulatory action to protect the American people from emerging health threats. On the other—through the proposed rule—it is simultaneously undermining its own ability to follow through on those proposals.

B. THE PROPOSAL WOULD PREVENT EPA FROM RELYING ON STUDIES CONDUCTED MANY YEARS AGO FOR WHICH DATA ARE NO LONGER AVAILABLE

Many key EPA regulatory decisions in effect today were based on studies conducted decades ago. Due to the passage of time, the raw data from these studies may no longer be available. Records may have been lost; researchers may have retired or passed away. Or, the data may have been stored in electronic media such as tapes that are no longer compatible with existing systems or otherwise difficult to access.[35] As noted by John Ioannidis, who is a strong advocate of data transparency,[36] "we should recognize that most of the raw data from past studies are not publicly available. . . . If the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim."[37]

C. STUDIES THAT EPA WILL BE PROHIBITED FROM CONSIDERING UNDER THE PROPOSAL HAVE SERVED AS THE BASIS FOR MULTIPLE RULEMAKINGS BY EPA AND OTHER AGENCIES

Studies that would be excluded from EPA consideration under the proposal form the basis for multiple regulatory actions that EPA and other agencies have taken over the course of many years. Consider, for example, early studies on the neurological effects of low-dose exposure to lead such as Herbert Needleman's 1979 paper finding a negative relationship between the level of lead in children's teeth and IQ scores.[38] EPA relied on this study in its 1986 Air Quality

Criteria document for lead.[39] EPA's Lead and Copper Rule, which established the federal regulations for lead under the Safe Drinking Water Act, in turn relied on that Air Quality Criteria document to identify blood lead levels of concern.[40] EPA relied on both the 1986 Air Quality Criteria and on Needleman's research directly in establishing standards for lead-based paint hazards under the Toxic Substances Control Act.[41] Needleman's work, and subsequent studies building upon it, also supported EPA's decision to revise the NAAQS for lead in 2008.[42] The D.C. Circuit specifically ruled that the underlying data from one of the studies on which EPA relied in this rulemaking did not need to be publicly available for EPA to rely on the study.[43]

After 40 years, and with the principal investigator no longer alive, it is not clear that the raw data from the Needleman study is available. Even if the data were, they could not be made publicly available without invading the privacy of the study participants. Importantly, it would not be possible to conduct that same study at this time, because children no longer have blood or dental lead levels as high as they did in the 1970s as a result of EPA's implementation of the Statutes.

EPA's drinking water standard for arsenic under the Safe Drinking Water Act is similarly dependent on studies that the agency would now be compelled to ignore under the proposed rule. EPA established a drinking water standard of 10 ppb for arsenic in 2001.[44] The Food and Drug Administration ("FDA") then relied on EPA's determination.[45] In setting this standard, EPA relied on a National Research Council review of the scientific evidence, which "concluded that [certain epidemiological] studies from Taiwan provided the current best available data for the risk assessment of inorganic arsenic-induced cancer."[46] The Taiwanese papers looked at rates of skin cancer and blackfoot disease in villagers from southwestern Taiwan who were exposed to

high levels of arsenic in their drinking water.[47] These studies were based on data from clinical examinations of the research subjects and therefore included confidential patient data that likely cannot be released to the public. In addition, given that the first data were collected more than 50 years ago, the studies are based on data that may no longer be available.

Even though the proposed rule "is intended to apply prospectively," it will also have a retroactive impact. Some of the Statutes require EPA to periodically review its prior regulatory decisions. For example, EPA must reconsider the lead NAAQS every five years.[48] EPA is also in the process of reconsidering the Lead and Copper Rule under the Safe Drinking Water Act.[49] The proposed rule would prohibit EPA from continuing to rely on Needleman's critically-important study in future reconsiderations of the lead NAAQS and revisions to the Lead and Copper Rule.

Other future rulemakings would also be undermined by the proposed rule. In 2011, EPA decided to regulate perchlorate as a contaminant under the Safe Drinking Water Act.[50] "Perchlorate is commonly used as an oxidizer in rocket propellants, munitions, fireworks, airbag initiators for vehicles, matches, and signal flares" and is also present in some fertilizers.[51] It is known to disrupt thyroid function by competitively inhibiting the uptake of iodide by the thyroid, and EPA in 2011 concluded "that there is a substantial likelihood that perchlorate will occur in public water systems with a frequency and at levels of public health concern."[52] Late in 2017, EPA issued a draft report identifying potential approaches to deriving a maximum contaminant level goal for perchlorate.[53] To develop these approaches, EPA focused on five epidemiological studies.[54] All five studies relied on confidential patient data. In addition, all five studies were

carried out in Europe, where scientists may be subject to different data confidentiality requirements than in the United States. As a result, the proposed rule risks undermining the scientific basis for this EPA action as well.

Many other EPA rulemakings and decisions have relied on studies that cannot be replicated and whose data likely could not be made publicly available. For example:

- **PCBs**: EPA's regulations establishing water quality standards for polychlorinated biphenyls ("PCBs") under the Clean Water Act were based in part on long-term epidemiological studies of cancer rates in workers exposed to PCBs.[55]

- **Radionuclides**: EPA's Safe Drinking Water Act regulation for radionuclides relied on epidemiological studies of survivors from the Hiroshima and Nagasaki atomic bomb attacks.[56]

- **Particulate matter**: EPA's 1997, 2006, and 2012 NAAQS for fine particulate matter all relied on studies using confidential data, such as the Six Cities Study.[57]

- **Methylmercury**: EPA's reference dose for methylmercury in fish that will be consumed by humans relied on data from human exposures in the Faroe Islands.[58]

Precluding reliance on these and other studies for the sole reason that the underlying raw data has not been or cannot be released to the public is arbitrary, capricious, contrary to professional best practices, and antithetical to protection of public health and safety as required by the Statutes. The proposed rule will prevent EPA from relying on the "best available science."

III. "TRANSPARENCY" IN SCIENCE DOES NOT REQUIRE RELEASE OF PRIVATE INFORMATION; IT REQUIRES A CLEAR STATEMENT AND DETAILED DESCRIPTION OF THE METHODOLOGY USED BY THE RESEARCHER

Transparency is valuable and important. As used in the draft rule, however, transparency is a guise for excluding large bodies of valid—and best available—science. The concept of

transparency promoted by the draft rule is harmful to good decision-making, to implementation of the Statutes, and, most of all, to protection of public health and safety.

In the professional scientific and medical research community, "transparency" means clear and detailed disclosure of all methods, data, assumptions, and uncertainties. Studies are considered "transparent" when the study design and methodology are clear enough to allow other scientists to challenge assumptions, test hypotheses, and either reproduce or replicate the study to determine whether the results obtained are consistent with the original study. Having the raw data associated with the original study is not usually necessary to validate a study.[59]

Transparency does *not* mean violating the confidentiality of study participants or making all raw data publicly available. The proposed rule does not comport with the fundamental approach to conducting scientific and medical research that is the standard practice for experienced, advanced scholars and researchers.

Nor is it necessary to reproduce[60] a study to validate it. The proposal provides that "[i]nformation is considered 'publicly available in a manner sufficient for independent validation' when it includes the information necessary for the public to understand, assess, and *replicate* [sic] findings."[61] Neither reproducing nor replicating studies is always possible. Indeed in some circumstances it would be inhumane, immoral, or physically impossible to do so. Some studies involve natural disasters, other one-time events, or exposures and conditions that no longer exist and cannot be reproduced or replicated. Those studies are valid but would be excluded by the proposed rule. Examples include:

- Studies of Hiroshima and Nagasaki survivors that underlie Safe Drinking Water Act radionuclides regulation;
- Studies of the effects of lead from 1970s, when blood lead levels were higher than they are now;
- Studies of worker exposure to polychlorinated biphenyls before PCBs were banned; these studies formed the basis of water quality standards for PCBs under the Clean Water Act;
- Long-term cohort studies of benzene exposure in workers which formed the basis of EPA's 2007 Clean Air Act regulation for emissions of hazardous air pollutants from mobile sources; and

---

[59] *See supra* notes 3, 7, 8. In the rare instance when the raw data is needed to validate a study, EPA already has the ability to request it. This should be the exception, not the default as it has become in the proposed rule. If, ultimately, EPA is unable to obtain the raw data to verify the study results, it is within the agency's discretion to categorize such data as "qualitative," and taking into consideration inherent uncertainties, weigh the study relative to other evidence. *See* EPA, *Guidance for Considering and Using Open Literature Toxicity Studies to Support Human Health Risk Assessments* 9 (Aug. 28, 2012), https://www.epa.gov/sites/production/files/2015-07/documents/lit-studies.pdf.

[60] In the proposed rule, EPA incorrectly uses the term "replicate." *See* note 3, above.

- Studies based on the massive oil leak at Deepwater Horizon.

IV. THE PROPOSED RULE IGNORES MECHANISMS THAT ALREADY EXIST TO DEAL WITH CONCERNS ABOUT ACCESS TO RAW DATA

The proposed rule fails to acknowledge numerous federal laws, regulations, and guidance that regulate the quality of and access to raw data. These include: the Information Quality Act, Office of Management and Budget ("OMB") Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards ("OMB Uniform Guidance"),[62] and EPA's own Information Quality Guidelines. These already address the data access concerns that EPA raises in the proposed rule. Moreover, the proposed rule is inconsistent with some aspects of these other requirements. For example, OMB Uniform Guidance exempts from its definition of "research data" subject to disclosure any "medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study."[63] In contrast, the proposed rule would generally prohibit EPA from relying on studies based on data not disclosed to the public, even when disclosure would be a clearly unwarranted invasion of personal privacy. Any decision to consider the study while allowing the data to remain confidential is left to the whim of the EPA Administrator. This standardless, case-by-case approach is inconsistent with OMB's uniform privacy protections.

In the proposed rule, EPA ignores a variety of commonly-used mechanisms for assessing and ensuring the validity of studies without requiring public disclosure of the raw data. These mechanisms include peer reviews, pre-registration of study methodology, corroboration of results by subsequent studies, and in some instances special agreements that enable an independent third party, such as the Health Effects Institute ("HEI"), to re-analyze the raw data. As explained by the Science Advisory Board, the HEI's reanalysis of the Six Cities Study, through "an unusually rigorous form of peer review and independent reanalysis, coupled with many follow-up studies, has accomplished a measure of confidence in findings without public access to data and analytic methods."[64]

For these reasons, the public health, medical, and scientific research community does not regard the public disclosure of all raw data as necessary. For example, the Committee on Publication Ethics ("COPE"), which has over 12,100 member journals and editors covering all areas of scholarly inquiry, has established 10 core practices. COPE's core practice #5 on data and reproducibility provides that "[j]ournals should include policies on data availability and encourage the use of reporting guidelines and registration of clinical trials and other study

---

[64] SAB Memo, *supra* note 8, at 4.

designs according to standard practice in their discipline."[65] The simplicity and generality of this core practice statement signals that the question of standards for data transparency, data access, data sharing, data peer review, and replication and reproducibility practices are far from settled. There is no one-size-fits-all approach to the critical questions of data transparency, data sharing, and reproducibility.

The proposed rule was announced by EPA without any meaningful consultation with the broad research community despite the fact that it addresses a complex and contentious issue that is not yet ripe for regulatory action. There are ample and adequate safeguards in place at the leading journals to ensure "transparency" – the ability of other researchers to question, challenge, and validate the results of published studies. This would include the journals' policies on treatment of data from research published years and even decades ago. It is contrary to good scientific study and practice and the advancement of knowledge for EPA to arrogate to itself the determination of what constitutes useable research and data, and to grant sweeping discretion to the Administrator—who may not even be a scientist—to make those determinations.

In a rare joint statement, the editors of the journals *Science*, *Nature*, *PLOS One*, *Proceedings of the National Academy of Sciences*, and *Cell* explained:

> It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.[66]

As has long been recognized by the professional public health, medical, and scientific research community—and by EPA itself until now[67] —whether or not the raw data underlying a study is released does not determine the quality of the study. Rather, it is the scientific method that is determinative. The proposed rule fails to take into account the fact that studies are reliable and constitute the best available science when they comply with professionally-established best practices for describing the methodology, sampling size, sampling procedure and assumptions utilized and the results are consistent with those of other studies.

[67] *See supra* note 7.

V. THE PROPOSAL WOULD IMPOSE AN IMMENSE AND UNNECESSARY COST AND PAPERWORK BURDEN ON EPA, OTHER FEDERAL AGENCIES, AND THE RESEARCH COMMUNITY

EPA has not established a legitimate need for the proposed rule. EPA has made thousands of regulatory decisions over the last 50 years. The Congressional Budget Office estimates that EPA "relies on about 50,000 scientific studies annually to perform its mission."[68] The proposed rule fails to identify a single regulatory action based on faulty science.[69] The rule is not needed or warranted. It will do far more harm than good.

Although OMB did not have a meaningful opportunity to review the proposed rule before former Administrator Pruitt signed and released it (OMB had a mere five days) and presumably did not intend to allow EPA's new definitions to modify OMB's Uniform Guidance, one might argue that that is an effect of the proposed rule. If so, its radical and erroneous "transparency" requirements would extend to all federal agencies, wreaking chaos.

The CBO estimates that it will cost between $10,000 and $30,000 per study to make the raw data available.[70] If EPA continues to rely on roughly the same number of studies, it could cost hundreds of millions of dollars a year to implement the proposal. Imposing these costs on all federal agencies would be a staggering burden. Given the cost and the impracticality of releasing all raw data to the public, EPA will have effectively but wrongly undermined public health and safety.[71]

Even if EPA or the researchers do spend this money and considerable time to de-identify data to comply with the proposed rule, that effort will not necessarily protect patient or research subject confidentiality. As mentioned above, it is frequently possible to re-identify individuals from supposedly de-identified datasets. For example, one study found that the researchers could re-

---

[68] Congressional Budget Office ("CBO"), *Cost Estimate: H.R. 1030, Secret Science Reform Act of 2015* 2 (Mar. 11, 2015), https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf.

[69] Importantly, this proposed rule shifts the presumption of validity away from non-biased, peer-reviewed studies conducted by professional and academic researchers to non-peer reviewed studies conducted by the interested, regulated enterprises. In fact, if there is a problem anywhere in the science on which EPA relies, it is in the industry studies submitted for licensing and permitting—yet these actions are excluded from the coverage of the rule by the definition of "regulatory decisions." *See* Thomas O. McGarity, *Beyond Buckman: Wrongful Manipulation of the Regulatory Process in the Law of Torts*, 41 WASHBURN L.J. 549, 559-63 (2002) (detailing incidents in which data required to be submitted by manufacturers or their contractors under the Federal Fungicide, Insecticide, and Rodenticide Act ("FIFRA") and the Food, Drug, and Cosmetic Act ("FDCA") were either withheld or were misleading or fraudulent); *cf.* SHELDON KRIMSKY, SCIENCE IN THE PRIVATE INTEREST: HAS THE LURE OF PROFITS CORRUPTED THE VIRTURE OF BIOMEDICAL RESEARCH? (2003) (discussing this problem throughout the book and providing considerable support).

[70] CBO, *supra* note 68, at 2.

[71] In the proposal, EPA cites a paper prepared by Randall Lutter and David Zorn for the Mercatus Center, which arrives at a lower cost estimate than the CBO, to support its conclusion that "the benefits of this proposed rule justify the costs." 83 Fed. Reg. at 18,772 & n.24. EPA cannot abdicate its responsibility to conduct its own analysis of the costs and benefits of this regulation by relying on this paper.

identify approximately one-quarter of the records in a subset of a HIPAA-compliant environmental health dataset.[72]

Relatedly, for some studies (e.g. prospective cohort studies that include extensive personal data; environmental health effects studies), it is impossible to de-identify the data without negating its scientific value. To protect against re-identification, it would be necessary to remove so much demographic information from the dataset that other scientists would not be able to perform meaningful re-analyses of the data.

VI. THE PROPOSED RULE WOULD CREATE CONFUSION AND CHAOS DETRIMENTAL TO THE PROTECTION OF PUBLIC HEALTH

The proposal, as drafted, contains significant ambiguities. As a result, it is entirely unclear what the effect of the proposed rule will be on studies that have already formed the basis of existing rules but as to which the underlying raw data has not been and cannot be made available for various reasons. These studies are considered by professionals to be the "best" available science.

The following crucial questions are not addressed by the proposed rule:

1. Will EPA continue to rely on those studies or will they now arbitrarily be excluded from consideration?

2. Will EPA implement the new rule by ensuring that raw data are made available (very costly) or simply by ignoring existing, valid studies as to which the data cannot be made available or would be extremely expensive to de-identify?

3. How will EPA implement its exemption authority? What are the governing standards for when the Administrator will exercise this authority?

4. Will the proposed rule apply to old studies or only new ones and to past regulatory decisions or only new ones? The latter point is especially a concern under statutes that require EPA to revise standards periodically. Will previously-established standards be abandoned because the data from the studies underlying those decisions (in many cases decades old) is no longer available?

5. How will the proposal affect the actions of other agencies that rely on EPA's findings or decisions or that provide information to EPA? For example, what will the effect be on Agency for Toxic Substances and Disease Registry ("ATSDR") analyses that EPA is required to consider pursuant to the Comprehensive Environmental Response, Compensation, and Liability Act?

6. How will EPA's re-interpretation of OMB's Uniform Guidance and other rules that apply uniformly to the entire federal government be administered? For example, how will the Food and Drug Administration's review of applications for new drugs be affected?

---

[72] Sweeney, et al., *supra* note 28.

In addition, EPA has not included any analysis of the impact of the proposed rule on its existing or future regulations.

Many of the signatories conduct studies, reports, analyses, and models that are used to support the work of numerous state and federal agencies. The proposed rule will interfere with the ability of these agencies to work together as required by some statutes to develop joint approaches to protection of public health and safety due to the restrictions in the proposed rule. Specifically, the rule will impede EPA's ability to work effectively with the Food and Drug Administration, ATSDR, the Department of Agriculture, and other agencies whose mission is to protect public health.

VII. THE PROPOSED NEW APPROACH TO DOSE-RESPONSE MODELING IS ANTITHETICAL TO PROPER SCIENTIFIC METHODOLOGY AND CONTRAVENES THE ADVICE OF EXPERTS IN THE FIELD, INCLUDING THE NATIONAL ACADEMIES OF SCIENCES, ENGINEERING, AND MEDICINE

EPA proposes to use "default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis....When available, EPA shall give explicit consideration to high quality studies that explore: a broad class of parametric dose-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity."[73] This proposed new approach allows for assuming a safe threshold below which humans can be exposed to chemicals in circumstances where data may be sparse. This approach runs counter to EPA's own historic practice and to the best practice employed by the scientific community when conducting risk assessments. Specifically, the National Research Council has recommended that linear and conceptual models be used "unless data is sufficient to reject low-dose linearity."[74] The scientific research and risk assessment community have also reached a consensus that cancer and non-cancer risk assessment should be unified so that all compounds, not just carcinogens, should be subjected to benchmark dose modeling.[75] This means that researchers should not assume a safe threshold of exposure even for non-carcinogens such as lead and mercury.[76]

---

[73] 83 Fed. Reg. at 18,774.

[74] This has also been the position of the federal government since 1983. Eileen Abt, et al. *Science and Decisions: Advancing Risk Assessment*, 30 RISK ANALYSIS 1028 (2010); Committee on the Institutional Means for Assessment of Risks to Public Health, Commission on Life Sciences and National Research Center, *Risk Assessment in the Federal Government: Managing the Process* (1983), http://www.nap.edu/catalog/366/risk-assessment-in-the-federal-government-managing-the-process.

[75] EPA, Risk Assessment Forum, *Benchmark Dose Technical Guidance* (June 2012), https://www.epa.gov/sites/production/files/2015-01/documents/benchmark_dose_guidance.pdf; Eileen Abt, et al. *Science and Decisions: Advancing Risk Assessment*, 30 RISK ANALYSIS 1028 (2010).

[76] EPA, *supra* note 75; Eileen Abt, et al., *supra* note 75.

The approach EPA proposes also conflicts with the advice of EPA's own Science Advisory Board as well as the advice of the National Academies of Sciences, Engineering, and Medicine.[77] And, EPA's proposed new approach directly conflicts with the statutory mandates that it must protect develop rules that protect human health "with an adequate margin of safety."[78]

EPA's assertion in the proposed rule that there is "growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects" is dangerous and unsupported by scientific evidence.[79] In recent years, several toxicants such as lead and particulate matter air pollution have been shown to have either superlinear responses at low dose or no threshold.[80] The consensus of the academic scientific community has been for over a decade that threshold effects should not be presumed in the absence of robust concentration-response data.[81] Accordingly, this comment letter endorses and incorporates by reference the comments on this point that have been submitted by: The National Academies of Sciences, Engineering, and Medicine dated July 16, 2018, and the Center for Science in the Public Interest dated July 17, 2018.

VIII. THE RULE SHOULD BE WITHDRAWN

The proposed rule will undermine EPA's ability to fulfill its mission to protect human health, safety, and the environment by using the best available information and science. First, the proposed rule would exclude from EPA's consideration any reports, studies, analyses, and models that rely on confidential, inaccessible, or unavailable data but that historically have been considered the best available science and therefore used to support regulations and standards designed to protect public health and safety. Second, in so doing, the rule also eliminates EPA's access to fundamental information necessary for identifying and calculating the "health benefits" of rules and standards needed to protect public health. Finally, it threatens to impose significant costs on both the federal government and independent scientists. Worst of all, the proposed rule creates these multiple problems without providing any significant countervailing benefits.

A Breath of Bad Air: Cost of the Trump Environmental Agenda May Lead to 80 000 Extra Deaths per Decade

David Cutler, PhD; Francesca Dominici, PhD

President Donald Trump and Environmental Protection Agency (EPA) Administrator Scott Pruitt have pledged to reexamine landmark environmental policies and to repeal regulations. In their view, excessive regulations are harming US industry, and thus reducing regulation will be good for business. As Donald Trump has said, seemingly without irony, "We are going to get rid of the regulations that are just destroying us. You can't breathe—you cannot breathe."

Stockbyte/Thinkstock

As has become apparent, however, it is the changes Trump is proposing that are likely to make breathing more difficult. A central feature of his agenda is environmental damage: making the air dirtier and exposing people to more toxic chemicals. The beneficiaries, in contrast, will be a relatively few well-connected companies.

The Trump Agenda

In pursuit of its wide-ranging environmental agenda, the administration has already reversed or proposed to reverse more than 60 environmental rules. The full extent of the effects on health has not been tabulated and is hard to quantify, but guesses can be made for some of the larger ones (see the Table).

The largest health consequences are likely to come through changes in air quality. The Trump administration has announced its intention to repeal the Clean Power Plan rule, President Barack Obama's signature policy on climate change. The rule provides for the EPA to assign each state a goal for limiting emissions from existing power plants and gives the states latitude in meeting those goals, such as switching from coal to natural gas or building new wind or solar farms. Based on the regulatory impact analysis done by the EPA when the rule was implemented (as well as other analyses), repealing the rule would lead to an estimated 36 000 deaths each decade and nearly 630 000 cases of respiratory infection in children alone.

The administration is also targeting the control of air pollution from motor vehicles, indicating a desire to weaken greenhouse gas and fuel economy targets for automobiles. Nothing formal has been proposed, but Trump has spoken about rolling back new rules put in place by the Obama administration. Based on the regulatory impact analysis performed when those rules were proposed, it was estimated that they would lead to a reduction of 5500 deaths and 140 000 cases of respiratory ailments in children over a decade—benefits that would be lost if the rules are rolled back. Repealing these rules will also have negative effects on certain types of jobs, the environment (global warming pollution), and consumer savings. The administration is also planning to repeal the emission requirements for glider vehicles—rebuilt trucks that do not meet current environmental standards—a loophole that could lead to as many as 41 000 premature deaths per decade and 900 000 cases of respiratory tract symptoms.

Other elements of the administration's environmental agenda will also affect health, though it is hard to know by how much. Withdrawing from the Paris agreement on global warming, imposing tariffs on solar panels, and rolling back the "once in, always in" rule for industrial plants will all lead to increases in fine particulate matter and additional exposure to pollutants such as sulfur dioxide, nitrogen oxides, mercury, and others that adversely affect respiratory and cardiovascular health.

Water quality is also being targeted. The Trump EPA has proposed to rescind the Waters of the United States rule published in 2015, which brought more US streams and wetlands areas under the Clean Water Act. Rivers and streams are sources of drinking water for more than 130 million people and if polluted, might pose major health risks. The rule itself does not mandate any specific changes in water cleanliness, so we do not estimate a specific health consequence of repealing this rule.

Finally, the administration is proposing to withdraw or not implement regulatory actions affecting particular chemicals shown to be harmful to health, including lead, agricultural pesticides, and coal ash waste. Exposure to these hazardous substances will affect fewer people than the number of individuals affected by air pollution, but each will affect a concentrated number. As Christine Todd Whitman, head of the EPA under President George W. Bush, said: "You stop enforcing those regulations and [deaths] will go way up."

Overall, an extremely conservative estimate is that the Trump environmental agenda is likely to cost the lives of over 80 000 US residents per decade and lead to respiratory problems for many more than 1 million people. This sobering statistic captures only a small fraction of the cumulative public health damages associated with the full range of rollbacks and systemic actions proposed by the Trump administration.

An Attack on Science

One might imagine that the science that supported enactment of these rules would make repealing them difficult. But that is not the case. Even as it is targeting environmental rules, the Trump administration is taking aim at the use of science that supports public policy.

Scott Pruitt recently signed a controversial rule stipulating that policy can be based only on research for which the underlying data have been made accessible to the general public. The idea is to

Proposed Changes in Environmental Protections and Possible Effects

Area	Actions	Projected Effects
Air Quality	Repeal of Clean Power Plan	• Increases exposure to small atmospheric particulate matter • An estimated 36 000 deaths over a decade • An estimated 630 000 cases of respiratory ailments in children over a decade
	Rollback of CAFE[a] standards for automobiles	• Increases exposure to small atmospheric particulate matter and ozone • An estimated 5500 deaths over a decade • An estimated 140 000 cases of respiratory ailments in children over a decade
	Repeal of emission requirements for glider vehicles	• Allows noncompliant diesel trucks on the roads • An estimated 41 000 premature deaths over a decade • An estimated 900 000 cases of respiratory ailments over a decade
	Loosening of other air pollution rules (eg, power plants, solar power tariffs)	• Potential for industrial plants to increase emissions by 4 times • Endangering those living near power plants (areas of high poverty)
Water Quality	Repeal of Waters of the United States rule	• Exposes water sources for approximately 117 million US residents • At least 1 million people in each of 21 different states depend on small streams for their drinking water
Chemicals	Scale back of lead-risk reduction program	• Leaves an estimated 4 million households with children at risk of exposure to high levels of lead • Approximately 500 000 children currently have elevated blood lead levels
	Delay or reduction of chemical bans	• Exposes toddlers and older children to 11 to 15 times the recommended levels of chlorpyrifos (because of denial of ban on use in agriculture) • Exposes public to 3 carcinogens (methylene chloride, trichloroethylene, and N-Methylpyrrolidone) used in furniture stripping, grease removal, and dry cleaning (action delayed)
	Weakening of rules on coal ash waste	• More than 100 million tons of coal ash are produced annually, resulting in more than 100 documented cases of coal ash poison contamination in the drinking water, wetlands, creeks, and rivers between 1948 and 2008

[a] There is substantial uncertainty with respect to the extent of the rollback of the Corporate Average Fuel Economy (CAFE) rules. Projected health effects are calculated based on the assumption of full achievement of CAFE standards vs rollback of those standards.

remove most observational studies of health effects of air pollution exposure from being considered in regulatory settings, unless the individual health records are made publicly available. This is a nearly impossible task because the health data are collected under the agreement to maintain patient confidentiality. With no evidence of harms (because of constraints on presenting the available evidence), regulations cannot be sustained. On April 23, 985 scientists sent him a letter urging him to abandon the proposal.

Fortunately for those interested in public health, the regulatory process will take many years. Whoever is sworn in as President in January 2021 will have a large effect on whether the Trump administration's full environmental agenda goes into effect.

Implications for Physicians and Policy

For physicians, the manifestation of these changes is likely to be an increase in disease and number of deaths. Respiratory and cardiovascular problems are most likely, but a wide variety of conditions are likely to be seen. Poor, black, or elderly populations are likely to be affected the most. People working with chemicals in industrial settings will also be affected, as will people who live in areas with high concentrations of power plants such as the Ohio River Valley from Indiana to Pennsylvania, and in the southeast from Alabama and Georgia to Maryland.

One could debate the merits of these tradeoffs if there were a large number of people who would benefit economically from these changes. In practice, however, any economic benefits are not likely to accrue to those most in need. Employment is down in many fossil fuel industries because technology has made workers less necessary for production, not because of environmental regulations. And even if a large number of coal jobs were restored, it would come at the expense of employment in new industries such as wind and solar, which are already being hurt by the Trump administration policies. Not having to comply with environmental rules will increase corporate profits, but not worker bank accounts.

Overall, the ultimate effects of the Trump administration's policies seem clear, even through the haze they will create. ■

Air Pollution and Mortality in the Medicare Population

Qian Di, M.S., Yan Wang, M.S., Antonella Zanobetti, Ph.D., Yun Wang, Ph.D., Petros Koutrakis, Ph.D., Christine Choirat, Ph.D., Francesca Dominici, Ph.D., and Joel D. Schwartz, Ph.D.

ABSTRACT

BACKGROUND

Studies have shown that long-term exposure to air pollution increases mortality. However, evidence is limited for air-pollution levels below the most recent National Ambient Air Quality Standards. Previous studies involved predominantly urban populations and did not have the statistical power to estimate the health effects in underrepresented groups.

METHODS

We constructed an open cohort of all Medicare beneficiaries (60,925,443 persons) in the continental United States from the years 2000 through 2012, with 460,310,521 person-years of follow-up. Annual averages of fine particulate matter (particles with a mass median aerodynamic diameter of less than 2.5 μm [$PM_{2.5}$]) and ozone were estimated according to the ZIP Code of residence for each enrollee with the use of previously validated prediction models. We estimated the risk of death associated with exposure to increases of 10 μg per cubic meter for $PM_{2.5}$ and 10 parts per billion (ppb) for ozone using a two-pollutant Cox proportional-hazards model that controlled for demographic characteristics, Medicaid eligibility, and area-level covariates.

RESULTS

Increases of 10 μg per cubic meter in $PM_{2.5}$ and of 10 ppb in ozone were associated with increases in all-cause mortality of 7.3% (95% confidence interval [CI], 7.1 to 7.5) and 1.1% (95% CI, 1.0 to 1.2), respectively. When the analysis was restricted to person-years with exposure to $PM_{2.5}$ of less than 12 μg per cubic meter and ozone of less than 50 ppb, the same increases in $PM_{2.5}$ and ozone were associated with increases in the risk of death of 13.6% (95% CI, 13.1 to 14.1) and 1.0% (95% CI, 0.9 to 1.1), respectively. For $PM_{2.5}$, the risk of death among men, blacks, and people with Medicaid eligibility was higher than that in the rest of the population.

CONCLUSIONS

In the entire Medicare population, there was significant evidence of adverse effects related to exposure to $PM_{2.5}$ and ozone at concentrations below current national standards. This effect was most pronounced among self-identified racial minorities and people with low income. (Supported by the Health Effects Institute and others.)

N Engl J Med 2017;376:2513-22.
DOI: 10.1056/NEJMoa1702747

A Quick Take is available at NEJM.org

The adverse health effects associated with long-term exposure to air pollution are well documented.[1,2] Studies suggest that fine particles (particles with a mass median aerodynamic diameter of less than 2.5 μm [$PM_{2.5}$]) are a public health concern,[3] with exposure linked to decreased life expectancy.[4-6] Long-term exposure to ozone has also been associated with reduced survival in several recent studies, although evidence is sparse.[4,7-9]

Studies with large cohorts have investigated the relationship between long-term exposures to $PM_{2.5}$ and ozone and mortality[4,9-13]; others have estimated the health effects of fine particles at low concentrations (e.g., below 12 μg per cubic meter for $PM_{2.5}$).[14-18] However, most of these studies have included populations whose socioeconomic status is higher than the national average and who reside in well-monitored urban areas. Consequently, these studies provide limited information on the health effects of long-term exposure to low levels of air pollution in smaller cities and rural areas or among minorities or persons with low socioeconomic status.

To address these gaps in knowledge, we conducted a nationwide cohort study involving all Medicare beneficiaries from 2000 through 2012, a population of 61 million, with 460 million person-years of follow-up. We used a survival analysis to estimate the risk of death from any cause associated with long-term exposure (yearly average) to $PM_{2.5}$ concentrations lower than the current annual National Ambient Air Quality Standard (NAAQS) of 12 μg per cubic meter and to ozone concentrations below 50 parts per billion (ppb). Subgroup analyses were conducted to identify populations with a higher or lower level of pollution-associated risk of death from any cause.

METHODS

MORTALITY DATA

We obtained the Medicare beneficiary denominator file from the Centers for Medicare and Medicaid Services, which contains information on all persons in the United States covered by Medicare and more than 96% of the population 65 years of age or older. We constructed an open cohort consisting of all beneficiaries in this age group in the continental United States from 2000 through 2012, with all-cause mortality as the outcome. For each beneficiary, we extracted the date of death (up to December 31, 2012), age at year of Medicare entry, year of entry, sex, race, ZIP Code of residence, and Medicaid eligibility (a proxy for low socioeconomic status). Persons who were alive on January 1 of the year following their enrollment in Medicare were entered into the open cohort for the survival analysis. Follow-up periods were defined according to calendar years.

ASSESSMENT OF EXPOSURE TO AIR POLLUTION

Ambient levels of ozone and $PM_{2.5}$ were estimated and validated on the basis of previously published prediction models.[19,20] Briefly, we used an artificial neural network that incorporated satellite-based measurements, simulation outputs from a chemical transport model, land-use terms, meteorologic data, and other data to predict daily concentrations of $PM_{2.5}$ and ozone at unmonitored locations. We fit the neural network with monitoring data from the Environmental Protection Agency (EPA) Air Quality System (AQS) (in which there are 1928 monitoring stations for $PM_{2.5}$ and 1877 monitoring stations for ozone). We then predicted daily $PM_{2.5}$ and ozone concentrations for nationwide grids that were 1 km by 1 km. Cross-validation indicated that predictions were good across the entire study area. The coefficients of determination (R^2) for $PM_{2.5}$ and ozone were 0.83 and 0.80, respectively; the mean square errors between the target and forecasting values for $PM_{2.5}$ and ozone were 1.29 μg per cubic meter and 2.91 ppb, respectively. Data on daily air temperature and relative humidity were retrieved from North American Regional Reanalysis with grids that were approximately 32 km by 32 km; data were averaged annually.[21]

For each calendar year during which a person was at risk of death, we assigned to that person a value for the annual average $PM_{2.5}$ concentration, a value for average ozone level during the warm season (April 1 through September 30), and values for annual average temperature and humidity according to the ZIP Code of the person's residence. The warm-season ozone concentration was used to compare our results with those of previous studies.[10] In this study, "ozone concentration" refers to the average concentration during the warm season, unless specified otherwise.

As part of a sensitivity analysis, we also obtained data on $PM_{2.5}$ and ozone concentrations from the EPA AQS and matched that data with

each person in our study on the basis of the nearest monitoring site within a distance of 50 km. (Details are provided in Section 1 in the Supplementary Appendix, available with the full text of this article at NEJM.org.)

STATISTICAL ANALYSIS

We fit a two-pollutant Cox proportional-hazards model with a generalized estimating equation to account for the correlation between ZIP Codes.[22] In this way, the risk of death from any cause associated with long-term exposure to $PM_{2.5}$ was always adjusted for long-term exposure to ozone, and the risk of death from any cause associated with long-term exposure to ozone was always adjusted for long-term exposure to $PM_{2.5}$, unless noted otherwise. We also conducted single-pollutant analyses for comparability. We allowed baseline mortality rates to differ according to sex, race, Medicaid eligibility, and 5-year categories of age at study entry. To adjust for potential confounding, we also obtained 15 ZIP-Code or county-level variables from various sources and a regional dummy variable to account for compositional differences in $PM_{2.5}$ across the United States (Table 1, and Section 1 in the Supplementary Appendix). We conducted this same statistical analysis but restricted it to person-years with $PM_{2.5}$ exposures lower than 12 μg per cubic meter and ozone exposures lower than 50 ppb (low-exposure analysis) (Table 1, and Section 1 in the Supplementary Appendix).

To identify populations at a higher or lower pollution-associated risk of death from any cause, we refit the same two-pollutant Cox model for some subgroups (e.g., male vs. female, white vs. black, and Medicaid eligible vs. Medicaid ineligible). To estimate the concentration-response function of air pollution and mortality, we fit a log-linear model with a thin-plate spline of both $PM_{2.5}$ and ozone and controlled for all the individual and ecologic variables used in our main analysis model (Section 7 in the Supplementary Appendix). To examine the robustness of our results, we conducted sensitivity analyses and compared the extent to which estimates of risk changed with respect to differences in confounding adjustment and estimation approaches (Sections S2 through S4 in the Supplementary Appendix).

Data on some important individual-level covariates were not available for the Medicare cohort, including data on smoking status, body-mass index (BMI), and income. We obtained data from the Medicare Current Beneficiary Survey (MCBS), a representative subsample of Medicare enrollees (133,964 records and 57,154 enrollees for the period 2000 through 2012), with individual-level data on smoking, BMI, income, and many other variables collected by means of telephone survey. Using MCBS data, we investigated how the lack of adjustment for these risk factors could have affected our calculated risk estimates in the Medicare cohort (Section 5 in the Supplementary Appendix). The computations in this article were run on the Odyssey cluster, which is supported by the FAS Division of Science, Research Computing Group, and on the Research Computing Environment, which is supported by the Institute for Quantitative Social Science in the Faculty of Arts and Sciences, both at Harvard University. We used R software, version 3.3.2 (R Project for Statistical Computing), and SAS software, version 9.4 (SAS Institute).

RESULTS

COHORT ANALYSES

The full cohort included 60,925,443 persons living in 39,716 different ZIP Codes with 460,310,521 person-years of follow-up. The median follow-up was 7 years. The total number of deaths was 22,567,924. There were 11,908,888 deaths and 247,682,367 person-years of follow-up when the $PM_{2.5}$ concentration was below 12 μg per cubic meter and 17,470,128 deaths and 353,831,836 person-years of follow-up when the ozone concentration was below 50 ppb. These data provided excellent power to estimate the risk of death at air-pollution levels below the current annual NAAQS for $PM_{2.5}$ and at low concentrations for ozone (Table 1).

Annual average $PM_{2.5}$ concentrations across the continental United States during the study period ranged from 6.21 to 15.64 μg per cubic meter (5th and 95th percentiles, respectively), and the warm-season average ozone concentrations ranged from 36.27 to 55.86 ppb (5th and 95th percentiles, respectively). The highest $PM_{2.5}$ concentrations were in California and the eastern and southeastern United States. The Mountain region and California had the highest ozone concentrations; the eastern states had lower ozone concentrations (Fig. 1).

Table 1. **Cohort Characteristics and Ecologic and Meteorologic Variables.**

* Summary statistics were calculated separately for persons residing in ZIP Codes where average ozone levels were below or above 50 ppb and where $PM_{2.5}$ levels were below or above 12 μg per cubic meter. The value 12 μg per cubic meter was chosen as the current annual National Ambient Air Quality Standard (NAAQS) (e.g., the "safe" level) for $PM_{2.5}$. BMI denotes body-mass index (the weight in kilograms divided by the square of the height in meters) and ppb parts per billion.

† The number for total person-years of follow-up indicates the sum of individual units of time that the persons in the study population were at risk of death from 2000 through 2012.

‡ The average values for air pollution levels and for ecologic and meteorologic variables were computed by averaging values over all ZIP Codes from 2000 through 2012.

§ Data on race and ethnic group were obtained from Medicare beneficiary files.

¶ The variable for ambulatory visits refers to the average annual percentage of Medicare enrollees who had at least one ambulatory visit to a primary care physician.

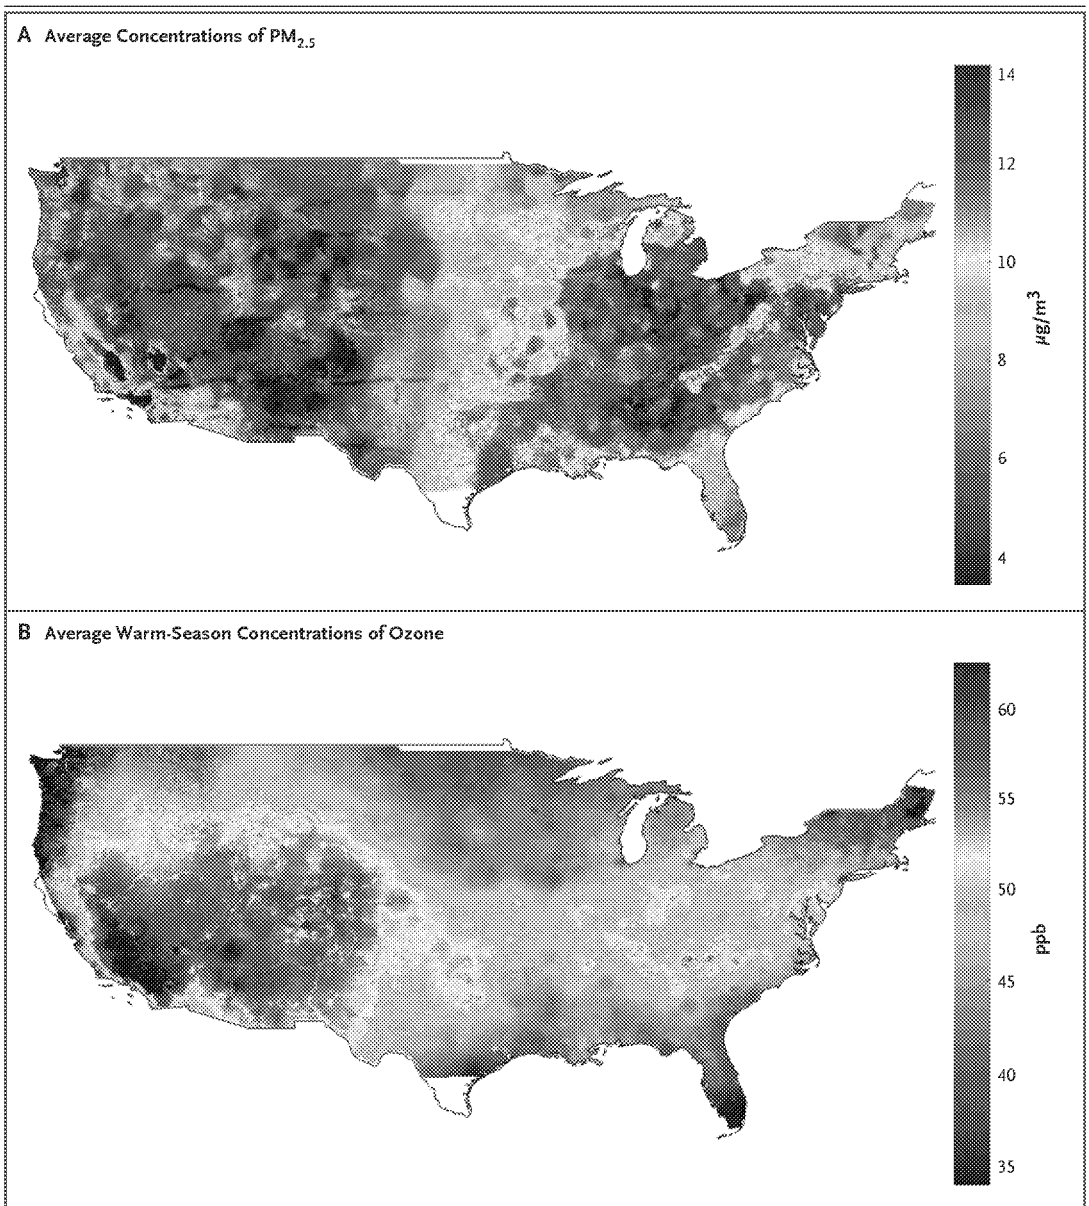

Figure 1. **Average $PM_{2.5}$ and Ozone Concentrations in the Continental United States, 2000 through 2012.**
Panel A shows the average concentrations of fine particulate matter (particles with a mass median aerodynamic diameter of less than 2.5 μm [$PM_{2.5}$]) in micrograms per cubic meter, as estimated on the basis of all daily predictions during the study period. Panel B shows the concentration of ozone levels in parts per billion as averaged from April 1 through September 30 throughout the study period.

In a two-pollutant analysis, each increase of 10 μg per cubic meter in annual exposure to $PM_{2.5}$ (estimated independently of ozone) and each increase of 10 ppb in warm-season exposure to ozone (estimated independently of $PM_{2.5}$) was associated with an increase in all-cause mortality of 7.3% (95% confidence interval [CI], 7.1 to 7.5) and 1.1% (95% CI, 1.0 to 1.2), respectively. Estimates of risk based on predictive, ZIP-Code–specific assessments of exposure were slightly higher than those provided by the nearest data-monitoring site (Table 2). When we restricted the $PM_{2.5}$ and ozone analyses to location-years with low concentrations, we continued to see significant associations between exposure and mortality (Table 2). Analysis of the MCBS

Table 2. **Risk of Death Associated with an Increase of 10 μg per Cubic Meter in $PM_{2.5}$ or an Increase of 10 ppb in Ozone Concentration.***

Model	$PM_{2.5}$	Ozone
	hazard ratio (95% CI)	
Two-pollutant analysis		
Main analysis	1.073 (1.071–1.075)	1.011 (1.010–1.012)
Low-exposure analysis	1.136 (1.131–1.141)	1.010 (1.009–1.011)
Analysis based on data from nearest monitoring site (nearest-monitor analysis)†	1.061 (1.059–1.063)	1.001 (1.000–1.002)
Single-pollutant analysis‡	1.084 (1.081–1.086)	1.023 (1.022–1.024)

* Hazard ratios and 95% confidence intervals were calculated on the basis of an increase of 10 μg per cubic meter in exposure to $PM_{2.5}$ and an increase of 10 ppb in exposure to ozone.

† Daily average monitoring data on $PM_{2.5}$ and ozone were obtained from the Environmental Protection Agency Air Quality System. Daily ozone concentrations were averaged from April 1 through September 30 for the computation of warm-season averages. Data on $PM_{2.5}$ and ozone levels were obtained from the nearest monitoring site within 50 km. If there was more than one monitoring site within 50 km, the nearest site was chosen. Persons who lived more than 50 km from a monitoring site were excluded.

‡ For the single-pollutant analysis, model specifications were the same as those used in the main analysis, except that ozone was not included in the model when the main effect of $PM_{2.5}$ was estimated and $PM_{2.5}$ was not included in the model when the main effect of ozone was estimated.

subsample provided strong evidence that smoking and income are not likely to be confounders because they do not have a significant association with $PM_{2.5}$ or ozone (Section 5 in the Supplementary Appendix).

SUBGROUP ANALYSES

Subgroup analyses revealed that men; black, Asian, and Hispanic persons; and persons who were eligible for Medicaid (i.e., those who had low socioeconomic status) had a higher estimated risk of death from any cause in association with $PM_{2.5}$ exposure than the general population. The risk of death associated with ozone exposure was higher among white, Medicaid-eligible persons and was significantly below 1 in some racial subgroups (Fig. 2). Among black persons, the effect estimate for $PM_{2.5}$ was three times as high as that for the overall population (Table S3 in the Supplementary Appendix). Overall, the risk of death associated with ozone exposure was smaller and somewhat less robust than that associated with $PM_{2.5}$ exposure. We also detected a small but significant interaction between ozone exposure and $PM_{2.5}$ exposure (Table S8 in the Supplementary Appendix). Our thin-plate–spline fit indicated a relationship between $PM_{2.5}$, ozone, and all-cause mortality that was almost linear, with no signal of threshold down to 5 μg per cubic meter and 30 ppb, respectively (Fig. 3, and Fig. S8 in the Supplementary Appendix).

DISCUSSION

This study involving an open cohort of all persons receiving Medicare, including those from small cities and rural areas, showed that long-term exposures to $PM_{2.5}$ and ozone were associated with an increased risk of death, even at levels below the current annual NAAQS for $PM_{2.5}$. Furthermore, the study showed that black men and persons eligible to receive Medicaid had a much higher risk of death associated with exposure to air pollution than other subgroups. These findings suggest that lowering the annual NAAQS may produce important public health benefits overall, especially among self-identified racial minorities and people with low income.

The strengths of this study include the assessment of exposure with high spatial and temporal resolution, the use of a cohort of almost 61 million Medicare beneficiaries across the entire continental United States followed for up to 13 consecutive years, and the ability to perform subgroup analyses of the health effects of air pollution on groups of disadvantaged persons. However, Medicare claims do not include extensive individual-level data on behavioral risk fac-

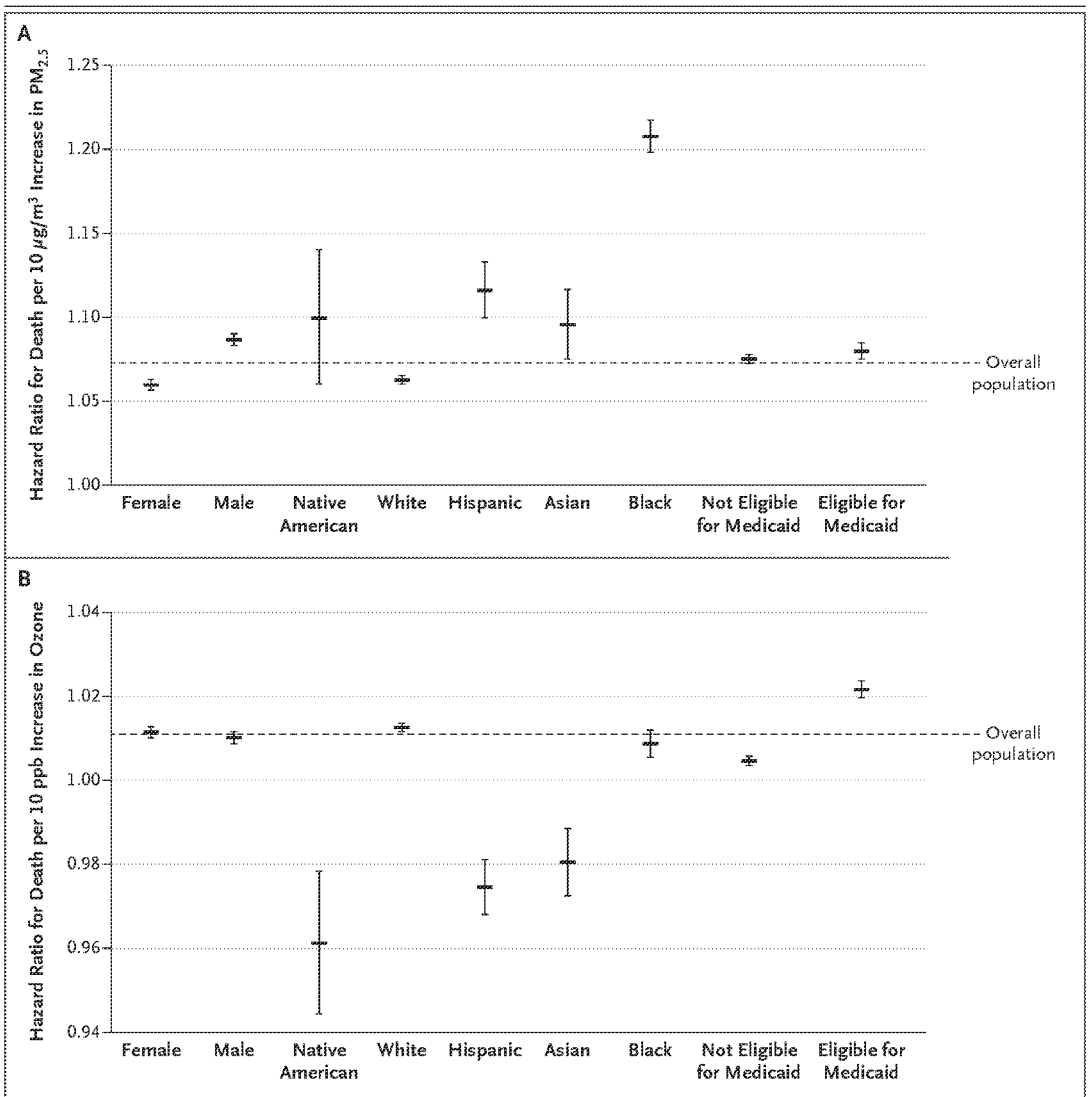

Figure 2. Risk of Death Associated with an Increase of 10 μg per Cubic Meter in $PM_{2.5}$ Concentrations and an Increase of 10 ppb in Ozone Exposure, According to Study Subgroups.

Hazard ratios and 95% confidence intervals are shown for an increase of 10 μg per cubic meter in $PM_{2.5}$ and an increase of 10 parts per billion (ppb) in ozone. Subgroup analyses were conducted by first restricting the population (e.g., considering only male enrollees). The same two-pollutant analysis (the main analysis) was then applied to each subgroup. Numeric results are presented in Tables S3 and S4 in the Supplementary Appendix. Dashed lines indicate the estimated hazard ratio for the overall population.

tors, such as smoking and income, which could be important confounders. Still, our analysis of the MCBS subsample (Table S6 in the Supplementary Appendix) increased our level of confidence that the inability to adjust for these individual-level risk factors in the Medicare cohort did not lead to biased results (Section 5 in the Supplementary Appendix). In another study, we analyzed a similar Medicare subsample with detailed individual-level data on smoking, BMI, and many other potential confounders linked to Medicare claims.[23] In that analysis, we found that for mortality and hospitalization, the risks of exposure to $PM_{2.5}$ were not sensitive to the additional control of individual-level variables that were not available in the whole Medicare population.

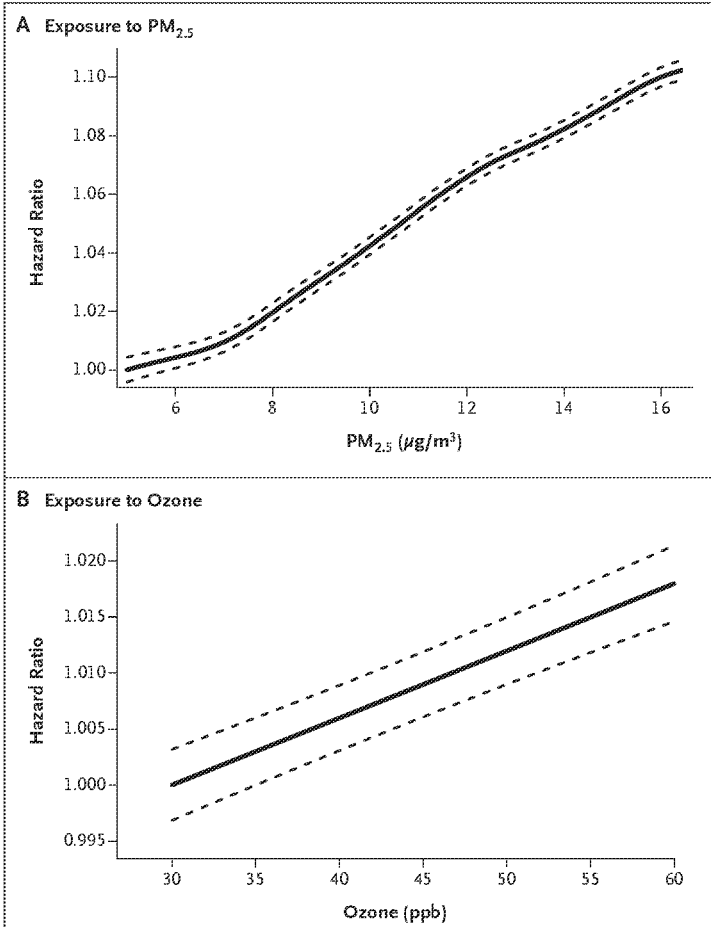

Figure 3. Concentration–Response Function of the Joint Effects of Exposure to $PM_{2.5}$ and Ozone on All-Cause Mortality.

A log-linear model with a thin-plate spline was fit for both $PM_{2.5}$ and ozone, and the shape of the concentration-response surface was estimated (Fig. S8 in the Supplementary Appendix). The concentration–response curve in Panel A was plotted for an ozone concentration equal to 45 ppb. The concentration–response curve in Panel B was plotted for a $PM_{2.5}$ concentration equal to 10 μg per cubic meter. These estimated curves were plotted at the 5th and 95th percentiles of the concentrations of $PM_{2.5}$ and ozone, respectively. The complete concentration–response three-dimensional surface is plotted in Fig. S8 in the Supplementary Appendix.

We also found that our results were robust when we excluded individual and ecologic covariates from the main analysis (Fig. S2 and Table S2 in the Supplementary Appendix), when we stratified age at entry into 3-year and 4-year categories rather than the 5 years used in the main analysis (Fig. S3 in the Supplementary Appendix), when we varied the estimation procedure (by means of a generalized estimating equation as opposed to mixed effects) (Tables S3 and S4 in the Supplementary Appendix), and when we used different types of statistical software (R, version 3.3.2, vs. SAS, version 9.4). Finally, we found that our results were consistent with others published in the literature (Section 6 in the Supplementary Appendix).[5,17,24-28]

There was a significant association between $PM_{2.5}$ exposure and mortality when the analysis was restricted to concentrations below 12 μg per cubic meter, with a steeper slope below that level. This association indicated that the health-benefit-per-unit decrease in the concentration of $PM_{2.5}$ is larger for $PM_{2.5}$ concentrations that are below the current annual NAAQS than the health benefit of decreases in $PM_{2.5}$ concentrations that are above that level. Similar, steeper concentration-response curves at low concentrations have been observed in previous studies.[29] Moreover, we found no evidence of a threshold value — the concentration at which $PM_{2.5}$ exposure does not affect mortality — at concentrations as low as approximately 5 μg per cubic meter (Fig. 3); this finding is similar to those of other studies.[18,30]

The current ozone standard for daily exposure is 70 ppb; there is no annual or seasonal standard. Our results strengthen the argument for establishing seasonal or annual standards. Moreover, whereas time-series studies have shown the short-term effects of ozone exposure, our results indicate that there are larger effect sizes for longer-term ozone exposure, including in locations where ozone concentrations never exceed 70 ppb. Unlike the American Cancer Society Cancer Prevention Study II,[9,10] our study reported a linear connection between ozone concentration and mortality. This finding is probably the result of the interaction between $PM_{2.5}$ and ozone (Section 7 in the Supplementary Appendix). The significant, linear relationship between seasonal ozone levels and all-cause mortality indicates that current risk assessments,[31-33] which incorporate only the acute effects of ozone exposure on deaths each day from respiratory mortality, may be substantially underestimating the contribution of ozone exposure to the total burden of disease.

The enormous sample size in this study, which includes the entire Medicare cohort, allowed for unprecedented accuracy in the estimation of risks among racial minorities and disadvantaged subgroups. The estimate of effect size for $PM_{2.5}$ expo-

sure was greatest among male, black, and Medicaid-eligible persons. We also estimated risks in subgroups of persons who were eligible for Medicaid and in whites and blacks alone to ascertain whether the effect modifications according to race and Medicaid status were independent. We found that black persons who were not eligible for Medicaid (e.g., because of higher income) continued to have an increased risk of death from exposure to $PM_{2.5}$ (Fig. S4 in the Supplementary Appendix). In addition, we found that there was a difference in the health effects of $PM_{2.5}$ exposure between urban and rural populations, a finding that may be due to compositional differences in the particulates (Table S3 Supplementary Appendix).

Although the Medicare cohort includes only the population of persons 65 years of age or older, two thirds of all deaths in the United States occur in people in that age group. Although our exposure models had excellent out-of-sample predictive power on held-out monitors, they do have limitations. Error in exposure assessment remains an issue in this type of analysis and could attenuate effect estimates for air pollution.[34]

The overall association between air pollution and human health has been well documented since the publication of the landmark Harvard Six Cities Study in 1993.[25] With air pollution declining, it is critical to estimate the health effects of low levels of air pollution — below the current NAAQS — to determine whether these levels are adequate to minimize the risk of death. Since the Clean Air Act requires the EPA to set air-quality standards that protect sensitive populations, it is also important to focus more effort on estimating effect sizes in potentially sensitive populations in order to inform regulatory policy going forward.

Delayed discovery, dissemination, and decisions on intervention in environmental health: a case study on immunotoxicity of perfluorinated alkylate substances

Philippe Grandjean[1,2]

Abstract

Identification and characterization of environmental hazards that impact human health must rely on the best possible science to inform and inspire appropriate public health intervention. The perfluorinated alkylate substances (PFASs) are persistent emerging pollutants that are now being recognized as important human health hazards. Although the PFASs have been produced for over 60 years, academic research on environmental health aspects has appeared only in the most recent 10 years or so. In the meantime, these persistent chemicals accumulated in the global environment. Some early studies e.g., on population exposures and toxicity, were not released to the public until after year 2000. Still, the first PFAS risk assessments ignored these reports and relied on scant journal publications. The first guidelines and legal limits for PFAS exposure, e.g., from drinking water, were proposed 10 years ago. They have decreased substantially since then, but remain higher than suggested by data on human adverse effects, especially on the immune system, that occur at background exposure levels. By now, the best-known PFASs are being phased out, and related PFASs are being introduced as substitutes. Given the substantial delays in discovery of PFAS toxicity, in dissemination of findings, and in regulatory decisions, PFAS substitutes and other persistent industrial chemicals should be subjected to prior scrutiny before widespread usage.

Late emergence of early evidence

Industrial chemicals are often regarded inert or safe, unless proven otherwise, i.e., the so-called "untested chemicals assumption," although this belief is of course not logical [1, 2]. A high-priority group of environmental chemicals, the perfluorinated alkylate substances (PFASs), constitute a clear example how narrow reliance on published toxicity studies can be misleading and result in insufficient and delayed protection of public health [3]. New insight on PFAS immunotoxicity shows that the path from discovery of toxicity to decisions on intervention can be stalled for decades (Table 1).

After the beginning of commercial PFAS production in the 1950s, a brief review article from 1980 [4] for the first time mentioned industry-sponsored studies, some of which were carried out in monkeys. Perfluorooctanoic acid (PFOA) showed specific toxicity to the reticuloendothelial system (i.e. immune system) [5]. In this 90-day study, compound-related microscopic lesions were seen in bone marrow, spleen and lymph nodes, thus clearly suggesting immunotoxicity, although functional tests were not carried out. A parallel study on perfluorooctanoic sulfonic acid (PFOS), also from 1978, was aborted due to mortality of the monkeys at all doses (the lowest being 10 mg/kg/day) [6]. These two internal reports were eventually shared with the U.S. Environmental Protection Agency (EPA) in 2000 [7] and then became accessible to the public.

A medical thesis from 1992 mentioned the evidence from the monkey study and noted: "No follow-up studies of these observations have been reported" [8]. The thesis analyzed clinical examination data from PFOA production workers and found clear associations between increased PFAS concentrations in the blood and decreased

leukocyte counts. The results were not reported in a scientific journal. However, in connection with a recent law suit, a draft manuscript on this study has been released ("Peripheral blood lymphocyte count in men occupationally exposed to perfluorooctanoic acid" [9]). The draft concluded: "PFOA is associated with alterations in peripheral blood lymphocyte numbers in PFOA production workers, suggesting that cell-mediated immunity may be affected by PFOA". Other company materials outlined in an expert report include the comment "We're working with [the author] regarding some of the wording" [10]. Evidently, an agreement was not reached, and the findings were not published.

Human exposure to organofluorine compounds was discovered as early as 1968 [11] and was later confirmed in a more extensive study [12]. However, the exact identity and the sources were unknown at the time. Soon thereafter, PFASs were identified in blood from production workers, and in 1981 also in umbilical cord blood at a female worker's childbirth [13]. Although the latter finding signified placental passage and prenatal PFAS exposure, this observation was not revealed until 20 years later, after which it was soon confirmed in a larger study [14]. Of additional public health significance, an unpublished study on goats from 1993 showed that PFOS was transferred into milk [10], and this pathway was verified in humans, again many years later [15].

New insight into a hidden hazard

By about 2000, the widespread occurrence and persistence of PFASs in the environment became known [7], as reflected also by the presence of PFASs in serum samples from blood banks [16]. Only after this time, and especially during the most recent 10 years, did the scientific literature on PFASs expand (Fig. 1) [17]. Immune system deficits in PFOA-exposed mice were at first observed in studies of peroxisome proliferator activation [18]. Later, experimental studies of PFOS showed reductions in lymphoid cell numbers and de novo antibody synthesis [19], and a study in mice from 2009 demonstrated that PFOS exposure reduced the survival after influenza A infection [20]. Then followed in vitro evidence of adverse effects in human white blood cells [21]. Although the 1978 monkey study [5] could have been obtained from the U.S. EPA, none of these studies referred to these original findings.

Important evidence emerged after the discovery of PFAS contamination in the Mid-Ohio River Valley and

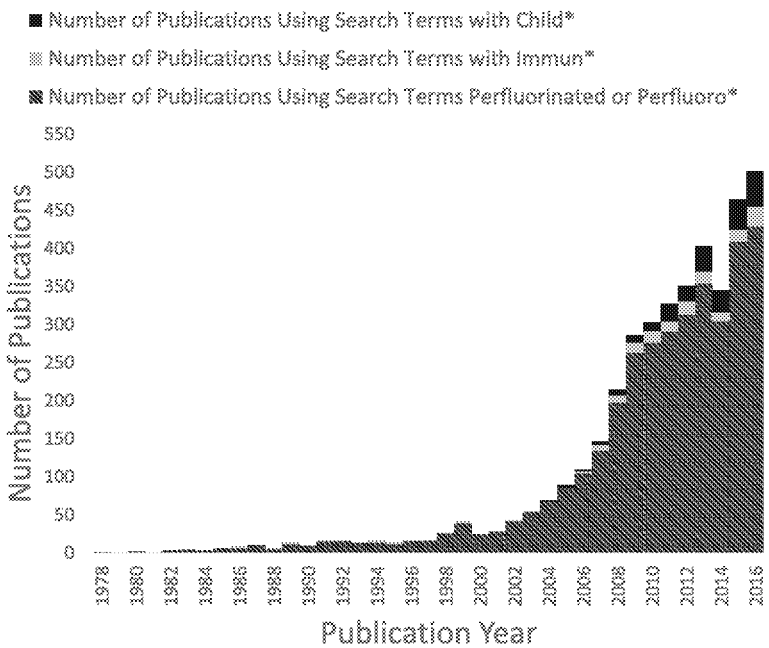

Fig. 1 Number of publications on PFASs over time, according to the Web of Science database (between 1978 and 2017), using the search terms "perfluorinated or perfluoro"* and restricting to environmental sciences, toxicology, or public, environmental, and occupational health categories. This search was further refined using the search terms "immun*" and "child*"

the court-mandated health examinations [22]. In regard to immunotoxicity, an interim report showed that increased PFOA exposure was associated with changes in serum concentrations of immunoglobulins [23]. A more focused study determined antibody responses to flu vaccination [24]. Elevated serum-PFOA concentrations were associated with a reduced antibody titer rise, particularly to an A influenza virus strain, with an increased risk of not attaining the antibody level needed to provide long-term protection. A later study on 12 adult volunteers with background exposures showed that two of the subjects failed to respond to a tetanus-diphtheria booster and that the steepness of the antibody responses was negatively associated with the serum-PFAS concentrations [25]. Cross-sectional data have also suggested lower vaccination antibody concentrations at elevated background PFAS exposures [26].

The first prospective study assessing children's antibody responses to routine childhood immunizations reported in 2012 that a doubling in exposure to PFOS and PFOA was associated with an overall decrease by up to 50% in the specific vaccine antibody concentration [27, 28]. When mutually adjusted, the regression coefficients for PFOA and PFOS changed only little [27]. Booster vaccine responses in children at age 5 years were lower at elevated serum-PFAS concentrations [28, 29]. A smaller Norwegian study of about 50 children aged 3 years also showed tendencies toward lower vaccination antibody concentrations at higher exposures during pregnancy [30]. As PFASs are now known to be transferred to the infant via human milk [31], it seems likely that PFAS exposures in early infancy represent a particular hazard to the adaptive immune system [32]. If true, the routine modeling of lifetime exposures for risk assessment is inappropriate, as it ignores the presence of vulnerable time windows.

PFAS exposure can also impact the body's ability to fight off common infections, such as colds and gastroenteritis, as seen in the Norwegian study [30]. A larger, prospective study in Denmark found that increased maternal serum concentrations of PFOA and PFOS were significantly associated with a higher frequency of fever and symptoms in the children [33], in agreement with a subsequent study from Japan that relied on retrospective assessment of the disease incidence [34]. In contrast, a substudy from the Danish National Birth Cohort examined the hospitalization rates for a variety of infections, such as airway infection, middle ear infection, and appendicitis, through to age 11 years and showed no association with PFOS and PFOA in early pregnancy serum from the mother [35]. However, a recent report from the project team raised doubt about the validity of the PFAS analyses [36].

Delayed interventions

Despite the support from both experimental and epidemiological data [37], most regulatory risk assessments of PFASs have focused on other target organs and have

emphasized toxicity testing in rodents [4]. The first opinion from the European Food Safety Authority (EFSA) in 2009 [38] listed a single report on immunotoxicity under "Other endpoints". That same year, the EPA issued provisional health advisories and concluded that "epidemiological studies of exposure to PFOA and adverse health outcomes in humans are inconclusive at present" [39]. Neither report referred to the 1978 monkey study that had become available in 2000. Early and more recent guidelines and recommended limits for PFOS and PFOA are shown in Table 2.

The EPA prepared more detailed risk assessment reports for PFOA and PFOS in 2014 [40, 41]. These drafts conclude that the two major PFASs exhibit immunotoxicity in experimental models and that the epidemiological evidence is additive, although mixed exposures complicate the attribution of effects to specific PFASs. A similar conclusion was reached by an ATSDR ToxProfile on the perfluoroalkyls in 2015 [42]. The coverage of human immunotoxicity was very brief, and no mention of this potential was made in the sections on public health implications. Although the monkey studies were cited, the risk assessment reports did not refer to the 1992 study of exposure-associated immune cell abnormalities in workers.

More recently, the National Toxicology Program (NTP) in 2016 reviewed the immunotoxicity information on PFOS and PFOA and concluded that both are "presumed" to constitute immune hazards to humans [37]. The term "presumed" is the strongest below "known" in the NTP vernacular. Both PFASs suppress the antibody response in animal studies, while the evidence in humans is "moderate", as all studies are observational (not experimental) and refer to mixed PFAS exposures. The revised ATSDR ToxProfile [43] just released concluded that decreased antibody response to vaccines is a potential outcome from exposure to all five PFASs commonly found in human blood samples. However, ATSDR stopped short of using epidemiology evidence for derivation of exposure limits.

Table 2 Guideline values expressed in terms of acceptable concentrations of PFOS and PFOA in drinking water (ng/L),[a] as compared with the estimated limit based on benchmark dose calculations for immunotoxicity in children [44]

Authority	Year	PFOS	PFOA
Australia			
	2016	70	560
Canada	2016	600	200
U.S. EPA	2009	200	400
	2016	70	70
ATSDR	2015	70	100
	2018	11	7
Minnesota	2008	300	300
	2017	27	35
New Jersey	2007	-	40
	2017	13	14
EFSA	2009	70	700
	2018	6.5	3
BMDL-based	2013	< 1	< 1

[a]Estimated from total intake limits, assuming 20% exposure contribution from water (rounded values)

Regulatory agencies frequently use benchmark dose calculations as a basis for generating exposure limits [38]. This approach relies on fitting a dose-response function to the data, and the benchmark dose (BMD) is defined as the dose that leads to a specific loss (or degree of abnormality) known as the benchmark response (BMR) in the outcome variable. The lower one-sided 95% confidence limit of the BMD is the benchmark dose level (BMDL), which is used as the point of departure for calculation of exposure limits. Relying on the vaccine antibody responses, BMDLs for PFOS and PFOA were calculated in 2013 to be about 1 μg/L serum [44], i.e., levels that are exceeded by a majority of the general population [45]. However, at first, these results were disregarded because of the absence of an unexposed control group [42], a condition that would be impossible to meet. Another concern was the high correlation between exposure components, such as PFOA and PFOS [40, 41, 43]. Still, mutual adjustment is possible and shows clear negative impacts of both of these major PFASs on immune system responses [27], and other calculations show virtually unchanged BMDLs for PFOA and PFOS after such adjustment [46].

In an updated opinion on PFOS and PFOA [47], EFSA used separate BMD calculations for several outcomes in humans, including immunotoxicity, relying on summary data in deciles or quartiles. For the vaccine response data [28], EFSA assumed that all subjects in the lowest decile exposure group had the same exposure, and the BMDs were similar to the average serum concentration in that group. For this reason, EFSA's calculated BMDs are several fold higher than the ones obtained from the continuous dose-effect relationship [44]. Still, the new tolerable intake limits are substantially lower than other published guidelines (Table 2), though quite similar to the Minimal Risk Levels developed by ATSDR [43].

The "untested chemicals assumption", as highlighted by the National Research Council [1] has clearly been inappropriately relied upon in past risk assessments of PFASs, and these substances must now be added to the list of environmental hazards [48] where standard risk assessment has failed. As a major reason, early evidence on PFAS toxicity was kept secret for 20 years or more, and even after its release, it was apparently overlooked.

A related reason is the absence of academic PFAS research on the immune system and other sensitive target organs until about 10 years ago. Further, regulatory agencies relied on experimental toxicity studies and disregarded emerging epidemiological evidence. As a result, even some of the current guidelines are orders of magnitude above exposure levels at which associations with adverse effects have been reported.

The PFASs therefore constitute an unfortunate example that risk assessment may be inappropriate to assess human health risks from chemical exposures when crucial documentation has not yet been published. Recognizing the weaknesses of conventional risk assessment, scientists from the U.S. EPA recently recommended to consider the full range of available data and to include health endpoints that reflect the range of subtle effects and morbidities in humans [48]. The present summary of delayed discovery, dissemination and decision-making on the PFASs indicates that a more comprehensive assessment of adverse health risks is urgently needed and that PFAS substitutes, as well as other persistent industrial chemicals, should not be considered innocuous in the absence of relevant documentation [49].

Conclusions

Early research on environmental PFAS exposures and their health implications became available at a substantial delay and was not taken into account in initial regulatory decisions on exposure abatement. Only in the last 10 years or so has environmental health research focused on the PFASs and revealed important human health risks, e.g., to the immune system. Although guideline values for PFASs in drinking water have decreased over time, they remain too high to protect against such toxicity. While the most commonly used PFASs will remain in the environment for many years, new PFAS substitutes are being introduced, although little information on adverse health risks is available. Given the serious delays in the discovery of PFAS toxicity, their persistence in the environment, and their public health impact, PFAS substitutes and other persistent industrial chemicals should be subjected to prior research scrutiny before widespread usage.

OUR CORE PRACTICES

COPE

Core practices are the policies and practices journals and publishers need to reach the highest standards in publication ethics. We include cases with advice, guidance for day-to-day practice, education modules and events on topical issues, to support journals and publishers fulfil their policies.

1. ALLEGATIONS OF MISCONDUCT

Journals should have a clearly described process for handling allegations, however they are brought to the journal's or publisher's attention. Journals must take seriously allegations of misconduct pre-publication and post-publication. Policies should include how to handle allegations from whistleblowers.

FIND OUT MORE publicationethics.org/misconduct

2. AUTHORSHIP AND CONTRIBUTORSHIP

Clear policies (that allow for transparency around who contributed to the work and in what capacity) should be in place for requirements for authorship and contributorship as well as processes for managing potential disputes.

FIND OUT MORE publicationethics.org/authorship

3. COMPLAINTS AND APPEALS

Journals should have a clearly described process for handling complaints against the journal, its staff, editorial board or publisher.

FIND OUT MORE publicationethics.org/appeals

4. CONFLICTS OF INTEREST/COMPETING INTERESTS

There must be clear definitions of conflicts of interest and processes for handling conflicts of interest of authors, reviewers, editors, journals and publishers, whether identified before or after publication.

FIND OUT MORE publicationethics.org/competinginterests

5. DATA AND REPRODUCIBILITY

Journals should include policies on data availability and encourage the use of reporting guidelines and registration of clinical trials and other study designs according to standard practice in their discipline.

FIND OUT MORE publicationethics.org/data

6. ETHICAL OVERSIGHT

Ethical oversight should include, but is not limited to, policies on consent to publication, publication on vulnerable populations, ethical conduct of research using animals, ethical conduct of research using human subjects, handling confidential data and of business/marketing practices.

FIND OUT MORE publicationethics.org/oversight

7. INTELLECTUAL PROPERTY

All policies on intellectual property, including copyright and publishing licenses, should be clearly described. In addition, any costs associated with publishing should be obvious to authors and readers. Policies should be clear on what counts as prepublication that will preclude consideration. What constitutes plagiarism and redundant/overlapping publication should be specified.

FIND OUT MORE publicationethics.org/intellectualproperty

8. JOURNAL MANAGEMENT

A well-described and implemented infrastructure is essential, including the business model, policies, processes and software for efficient running of an editorially independent journal, as well as the efficient management and training of editorial boards and editorial and publishing staff.

FIND OUT MORE publicationethics.org/management

9. PEER REVIEW PROCESSES

All peer review processes must be transparently described and well managed. Journals should provide training for editors and reviewers and have policies on diverse aspects of peer review, especially with respect to adoption of appropriate models of review and processes for handling conflicts of interest, appeals and disputes that may arise in peer review.

FIND OUT MORE publicationethics.org/peerreview

10. POST-PUBLICATION DISCUSSIONS AND CORRECTIONS

Journals must allow debate post publication either on their site, through letters to the editor, or on an external moderated site, such as PubMed Commons or PubPeer. They must have mechanisms for correcting, revising or retracting articles after publication.

FIND OUT MORE publicationethics.org/postpublication

Core practices

COPE's role is to assist editors of scholarly journals and publishers/owners - as well as other parties, such as institutions and funders, albeit less directly - in their endeavour to preserve and promote the integrity of the scholarly record through policies and practices that reflect the current best principles of transparency and integrity. COPE's new recommendations are intended to reflect these aims, in a practical way. COPE have therefore reviewed the Code of Conduct and Best Practice Guidelines for Editors and Code of Conduct for Journal Publishers and have consolidated them into one, much shorter, document entitled "Core Practices". [Available to download as an A4 poster.] Connected to each of these core practices will be hyperlinks to the detailed documents and resources COPE already publish, which are arrived at through extensive consultation, and which we will be building into a comprehensive, yet responsive library. The full range of COPE resources can be found here. .The Core Practices are applicable to all involved in publishing the scholarly literature: editors and their journals, publishers (and institutions).

COPE's Core Practices should be considered alongside specific national and international codes of conduct for research and is not intended to replace them.

Background to why the Code of Conduct for Journal Editors has been replaced with the Core Practices.

Journals and Publishers should have robust and well-described, publicly documented practices in all the following areas for their journals:

1. Allegations of misconduct

Journals should have a clearly described process for handling allegations, however they are brought to the journal's or publisher's attention. Journals must take seriously allegations of misconduct pre-publication and post-publication. Policies should include how to handle allegations from whistleblowers.

3. Complaints and appeals

Journals should have a clearly described process for handling complaints against the journal, its staff, editorial board or publisher

Latest resources

- In the news: April 2018 Digest (News)
- Complaints and appeals (News)
- COPE Education Subcommittee focus: Complaints and Appeals (News)

View all Complaints and appeals resources

4. Conflicts of interest / Competing interests

There must be clear definitions of conflicts of interest and processes for handling conflicts of interest of authors, reviewers, editors, journals and publishers, whether identified before or after publication

Latest resources

- Letter from the COPE co-Chairs: July 2018 (News)
- In the news: May 2018 Digest (News)
- COPE Education Subcommittee focus: Conflicts of Interest (News)

View all Conflicts of interest / Competing interests resources

5. Data and reproducibility

Journals should include policies on data availability and encourage the use of reporting guidelines and registration of clinical trials and other study designs according to standard practice in their discipline

Latest resources

- Letter from the COPE co-Chairs: July 2018 (News)
- In the News: July Digest (News)
- Creating and implementing data research policies: COPE webinar report (News)

6. Ethical oversight

Ethical oversight should include, but is not limited to, policies on consent to publication, publication on vulnerable populations, ethical conduct of research using animals, ethical conduct of research using human subjects, handling confidential data and of business/marketing practices

Latest resources

- In the News: July Digest (News)
- In the news: June 2018 Digest (News)
- COPE Forum discussion: Preprints: continuing the conversation (News)

View all Ethical oversight resources

7. Intellectual property

All policies on intellectual property, including copyright and publishing licenses, should be clearly described. In addition, any costs associated with publishing should be obvious to authors and readers. Policies should be clear on what counts as prepublication that will preclude consideration. What constitutes plagiarism and redundant/overlapping publication should be specified

View all Intellectual property resources

Latest resources

- Association of Research Integrity Officers 2018 (Event)
- In the News: July Digest (News)
- COPE Education Subcommittee focus: Intellectual Property (News)

8. Journal management

A well-described and implemented infrastructure is essential, including the business model, policies, processes and software for efficient running of an editorially independent journal, as well as the efficient management and training of editorial boards and editorial and publishing staff

View all Journal management resources

Latest resources

- In the News: July Digest (News)

- COPE Forum discussion: Preprints: continuing the conversation (News)

9. Peer review processes

All peer review processes must be transparently described and well managed. Journals should provide training for editors and reviewers and have policies on diverse aspects of peer review, especially with respect to adoption of appropriate models of review and processes for handling conflicts of interest, appeals and disputes that may arise in peer review

View all Peer review processes resources

Latest resources

- Letter from the COPE co-Chairs: July 2018 (News)
- In the News: July Digest (News)
- ISMTE North American Conference (Event)

10. Post-publication discussions and corrections

Journals must allow debate post publication either on their site, through letters to the editor, or on an external moderated site, such as PubPeer. They must have mechanisms for correcting, revising or retracting articles after publication

View all Post-publication discussions and corrections resources

We are writing in response to a proposed rule announced by the Environmental Protection Agency (EPA) in a 24 April 2018 press release (*1*). The release reads, "The rule will ensure that the regulatory science underlying Agency actions is fully transparent, and that underlying scientific information is publicly available in a manner sufficient for independent validation."

Data sharing is a feature that contributes to the robustness of published scientific results. Many peer-reviewed scientific journals have recently adopted policies that support data sharing, consistent with the Transparency and Openness Promotion (TOP) standards. These standards, however, recognize the array of workflows across scientific fields and make the case for data sharing at different levels of stringency; in not every case can all data be fully shared. Exceptional circumstances, where data cannot be shared openly with all, include data sets featuring personal identifiers.

We support maintaining the rigor of research published in our journals and increasing transparency regarding the evidence on which conclusions are based. As part of these goals, we require that all data used in the analysis must be available to any researcher for purposes of reproducing or extending the analysis. Importantly, the merits of studies relying on data that cannot be made publicly available can still be judged. Reviewers can have confidential access to key data and as a core skill, scientists are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results.

It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes.

Subject: FW: STPC September Meeting (Sep 12, 2-4 pm)
Attachments: STPC September Meeting

Hi all: Please find attached the final agenda and attachments for the quarterly STPC meeting on September 12 (2-4 pm). The agenda is also copied below.

AGENDA

SCIENCE & TECHNOLOGY POLICY COUNCIL MEETING

Wednesday, September 12, 2018
2:00 – 4:00 PM ET

Conference Room (DC): Ronald Reagan Building 4th Floor Room 41213
Audio Conference Call-in Number: [redacted]
Conference Code: [redacted]

Adobe Connect Information: [redacted]

1. **Introductory Remarks and Roll Call** (10 minutes, to 2:10)
   Lead: Jennifer Orme-Zavaleta (Science Advisor)
   Roll Call: Anand Mudambi, STPC Coordinator (OSA)

2. **Updates:** (40 minutes, to 2:50)
   a. Strengthening Transparency Rule (Response to comment and rulemaking): Maria Doa (ORD)
   b. PFAS Coordination : OW
   c. Pb Coordination : Hayley Hughes and Valerie Zartarian (ORD)
   d. Contaminants of Emerging Concern Project : Jeff Frithsen (ORD)
   e. Standing Groups Status : Anand Mudambi (OSA)

3. **Voluntary Consensus Standard (VCS) Development - Draft EPA Guidance** (20 minutes to 3:10)
   Lead: Elise Owen (EPA Standards Executive, housed in OCSPP)
   Purpose: Brief the STPC on the development of Agency guidance regarding EPA personnel participation in private sector Voluntary Consensus Standards (VCS) development
   Outcome: Inform STPC input on the draft guidance

4. **Citizen Science** (25 minutes, to 3:35)
   Lead: Jay Benforado (OSA)
   Purpose: Discussion of Draft Charge to Implement NACEPT and OIG Recommendations
   Outcome: Get STPC input on the charge activities

5. **RAF Cumulative Risk Assessment (CRA) Technical Panel Products** (20 minutes, to 3:55)
   Lead: Lawrence Martin (OSA)
   Purpose: Inform STPC about the CRA Guidelines on Planning and Problem Formulation, and the Document updating Chemical Mixtures Additivity
   Outcome: Preparation for STPC concurrence on the RAF's CRA products for external peer review

6. **Summary of Action Items** (5 minutes, to 4:00)
   Report: Anand Mudambi (OSA)

Next STPC Meeting: Wednesday, December 5, 2018

Lynn Flowers, PhD, DABT

Integrated advice of the Open Science Policy Platform Recommendations

Date of Adoption: 22nd April 2018- Date of Publication: 29 May 2018

1. Introduction

Open Science is scholarly research that is collaborative, transparent and reproducible and whose outputs are publicly available. The European Union will not remain competitive at the global level unless it promotes Open Science, and relatedly, Open Innovation. The time to act is now.

At its core, Open Science aims at: "increasing research quality, boosting collaboration, speeding up the research process, making the assessment of research more transparent, promoting public access to scientific results, as well as introducing more people to academic research"[1]. By taking advantage of Open Science, researchers can enhance the quality of curiosity-driven research, maximise the value and potential impact of their work to create new avenues of knowledge, and drive scientific progress and Open Innovation within Europe and beyond[2]. Open Science also makes research more transparent and accessible to citizens, and helps involve citizens more actively in research activities. Open Science thus "provides policymakers, research institutions, funding bodies and researchers themselves with an opportunity to critically consider: what does and should count as high-quality research; what goals researchers should pursue; how research results should be evaluated and disseminated; and how research should be supported and embedded within society"[3].

For Open Science to be successful, it must become embedded at every level and in every aspect of the scientific endeavour and not be perceived as separate from (or even in competition with) current practice. Open Science needs to stimulate research integrity and quality, which includes sensitivity to disciplinary differences and confidentiality issues around knowledge sharing. Open Science requires a systemic shift in current practices to bring transparency across the system, to ensure ongoing sustainability for the associated social and physical infrastructures, and to foster greater public trust in Science. To enable this, *all* stakeholders in research and its communication need to take responsibility for supporting Open Science activities, which includes appropriate financial and administrative support to ensure its long-term sustainability and minimize the bureaucratic burden on researchers.

It is the responsibility of all stakeholders, Member States and the European Commission (EC) to act on and actively promote Open Science amongst their respective communities, and to regularly and openly monitor and report on progress[4]. This document provides a prioritised set of actionable recommendations from the Open Science Policy Platform (OSPP; see Annex B for members) to achieve it. The OSPP members strongly recommend their urgent inclusion into FP9.

These recommendations are the next step towards implementing the longer-term vision articulated by Open Science consultations and expert groups set up by the EC and other organisations in Europe and worldwide (see Annex C for a list of relevant documents). There will need to be further work done to advise on the implementation of the roadmap for Open Science, and to help identify a range of tools and approaches to monitor progress.

The following recommendations target the major stakeholder groups represented by the OSPP and focus on publicly funded research. The roles of other important players in this ecosystem, such as SMEs, industry and NGOs, need to be explored at a later date. We recognise that some individuals and groups may fall into two or more stakeholder categories listed below, and we ask readers to identify with all groups that are most relevant to their functions and activitie

[1] Friesike, S. & Schildhauer, T. (2015). Open Science: many good resolutions, very few incentives, yet. In: Welpe, I.M., Wollersheim, J., Ringelhan, S. & Osterloh, M. (Eds.). *Incentives and Performance. Governance of Research Organizations*. Springer.

[4] European Commission (2018) *Final Report of MLE Open Science: Incentives and Rewards*

2. Recommendations

2.1. General recommendations

In addition to the specific targeted recommendations in the matrix below, we call upon all Member States and stakeholders to:

1. Appoint national coordinators and task forces for the implementation of Open Science. This instrument must foster the development of funded national plans and the alignment of the Open Science policy agenda across all stakeholders involved including Member States to ensure the coordinated action required for tangible change towards an Open Science approach.

2. Ensure the scholarly infrastructure in Europe is highly interoperable to enable the simple and open sharing of metadata between systems, disciplines and countries, and that credit for research contributions is given to all participants (including citizen scientists). This will need all actors to require the use of standardised, unique persistent identifiers for researchers and outputs, and for the acknowledgement of diversity in researcher contributions. Components of the ecosystem (identifiers, metadata, vocabularies, data citations, repositories and other data-infrastructures) need to be developed where necessary, refined, standardized and implemented through dialogue with relevant research communities. Whatever standards/infrastructures are developed, they need to be capable of adapting to innovations in Open Knowledge practices.

3. Ensure the HR Strategy for Researchers (HRS4R) practices and FP9 evaluation reflect the principles required to effectively embed a culture of Open Science at the institutional level. These must involve research integrity (including the social, ethical and legal implications), researcher evaluation and the public availability of research outputs. Codes for Open Science, Research Integrity and Recruitment need to be incorporated into The European Charter for Researchers[5] and in the FP9 grant agreement. Institutions that apply for the 'Human Resources in Research Award' should be required to demonstrate explicitly how the best practices in Open Science are integrated into their HR processes and strategies.

4. Foster Open Science literacy as essential to European competitiveness at the global level, together with other digital and information competencies. Member States need to secure support for the development of an accredited curriculum for Open Science skills training that fosters Open Science behaviours such as IT and data literacy, from primary school through the whole educational system.

5. Implement a Europe-wide campaign, coordinated by the EC, to raise awareness and communicate the benefits of Open Science among decision makers, research and education bodies, private sector, industrial and citizen organisations.

[5] European Commission (2005) The European Charter for Researchers: The Code of Conduct for the Recruitment of Researchers

2.2. Prioritised recommendations for the eight ambitions of Open Science

Below are a set of actionable recommendations from the OSPP to be taken as the next step towards the longer-term vision articulated by Open Science consultations and expert groups set up by the EC and other organisations in Europe and worldwide. The recommendations have been split up into the eight priorities identified from the 5 areas of the European Open Science Agenda[6], namely:

- Rewards and Incentives
- Research Indicators and Next-Generation Metrics
- Future of Scholarly Communication
- European Open Science Cloud
- FAIR Data
- Research Integrity
- Skills and Education
- Citizen Science

The major stakeholder groups (as listed in the key below) who have the main responsibility to drive the actions stated in the recommendations have been listed alongside each one.

Research & E-Infrastructures

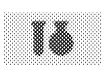
Research Libraries

Universities & Research Performing Organisations

Policy Making Organisations

Research Funding Organisations

Publishers



Researchers

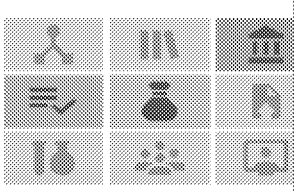
Scientific Societies & Academies

Citizen Science & Public Engagement Organisations

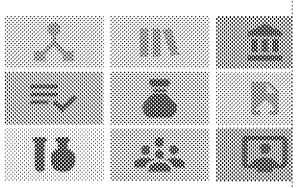
[6] Amsterdam Call for Open Science (2016)
https://www.government.nl/documents/reports/2016/04/04/amsterdam-call-for-action-on-open-science

Rewards and Incentives

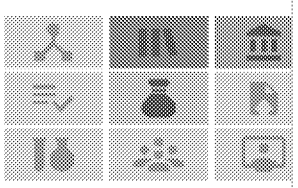
Funders, research institutions and other evaluators of researchers should actively develop/adjust evaluation practices and routines to give extra credit to individuals, groups and projects who integrate Open Science within their research practice.



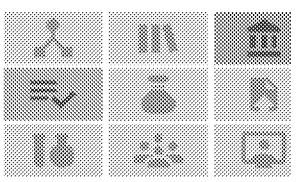
Studies must be commissioned and funded to propose guidelines for best practice and tools for research assessment by 2019, together with an active delivery plan and associated timeline for their implementation. These guidelines must take into account career stage and discipline, and be appropriately tailored to their target such as individual, institution and so forth. Exemplars of innovation and good open science practice must be collated, taking into account the DORA Declaration, the Leiden Manifesto, the OS-CAM and other relevant initiatives.



Public research performing and funding organisations (RPOs/RFOs) should provide public and easily accessible information about the approaches and measures being used to evaluate researchers, research and research proposals.



The traditional academic career structure disincentivises Open Science because of the current focus on tenured positions based solely or largely on publication output. Institutions need to have a career and reward structure for all researchers, and particularly for Early Career Researchers (ECRs), that values and promotes a diverse range of outputs, activities and career directions. This should include facilitating a means by which researchers can, for example, move between academia and industry or between national jurisdictions.



Research Indicators and Next-Generation Metrics

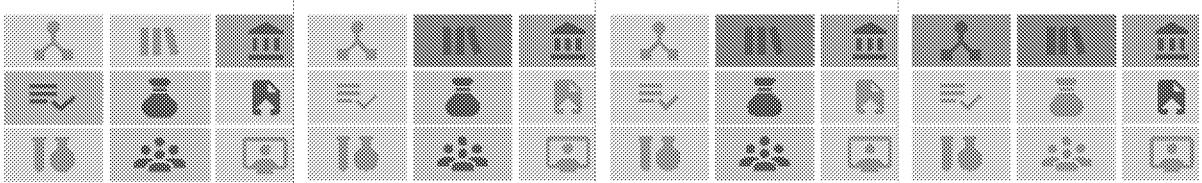
Evaluations of individual researchers or of research groups should not use journal brand or Impact Factor as a proxy for research quality. Those responsible for hiring, promotion, funding and/or the evaluation of researchers must use a broader, tailored range of quantitative and qualitative indicators of research activity, progression and impact that incentivises and rewards open research practice. All publication venues must prominently display a broad range of indicators for all research outputs.

Quantitative and qualitative indicators need to be identified and developed for research assessment that captures the full range of contributions to the knowledge system. These should reflect the complexity and varied context of the research environment, the specific characteristics of the research being undertaken, as well as the new kinds of questions and results that might emerge in an open system.

Experiments, pilots and case studies assessing the validity of such indicators need to be undertaken urgently, and included as part of FP9 with appropriate funding allocated to support them. The results and data of these pilots must be made publicly available as exemplars for further implementation.

All researchers need to be identified through an ORCID ID. Best practice for CV/biosketch evaluation should be developed and publicly showcased to encourage a broader recognition of the range of verifiable (and especially open) contributions individuals make to the knowledge system, including teaching and peer review, and the production of a broad range of output types. The career narrative should be central to the evaluation of individual researchers as it provides the crucial context in which indicators can be interpreted.

The data, metadata and methods that are relevant to research evaluation, including but not limited to citations, downloads and other potential indicators of academic re-use, should be publicly available for independent scrutiny and analysis by researchers, institutions, funders and other stakeholders.



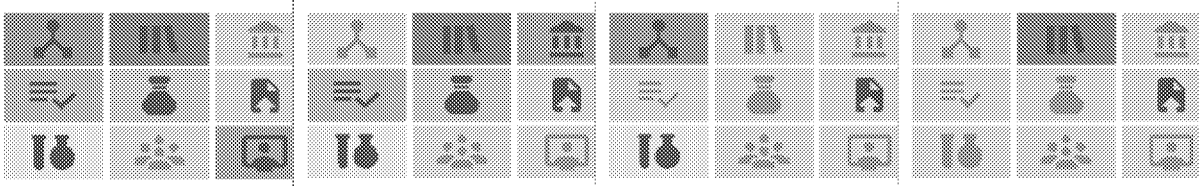
Future of Scholarly Communication

All published research outputs from public funding in Europe must be made public in a way that ensures both immediate Open Access and full text and data mining rights of that content, while being sensitive to disciplinary differences*. Venues used for the publication of research outputs must ensure long-term archiving and provide clear, consistent and easily accessible and machine-readable information on their Open Science policies.

Each Member State, together with its respective stakeholders, must develop policies to guarantee compliance with the EU Open Access mandate, including both incentives and enforcement, by 2020. This needs to happen in ways that are sensitive to disciplinary differences, the financial investment required and fast-changing publishing systems.

All authors must make their data and software (i.e. excluding, if relevant, data owned by third-parties, etc) appearing in their open access publications FAIR (Findable, Accessible, Interoperable and Reusable). To this end, a key requirement is deposition in a trusted repository that adheres to FAIR principles. In addition, all publications must include a statement of FAIR compliance for the source data underpinning their claims and the licence for its reuse.

All publication venues must prominently display their Open Access and FAIR data policies.



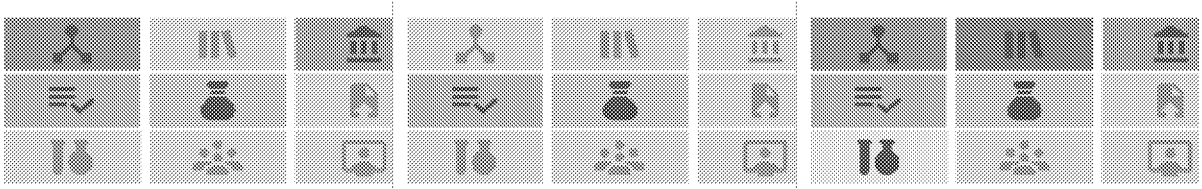
* Despite significant discussion between OSPP members, complete consensus could not be reached and STM and EUCHEMS do not agree to this recommendation.

EOSC

The European Open Science Cloud (EOSC) needs to implement a robust, transparent and participative governance structure to ensure that it has the trust and confidence of all stakeholders, including Member States. It must also support the diversity of requirements across all disciplines. The structure should provide clear channels for feedback, and be compatible with other related initiatives including national, European and Global Research infrastructures to ensure interoperability and the free movement of information across all national and international boundaries and between disciplines, while being sensitive to ethical, societal and legal issues. The EC has to take the lead in bringing the relevant parties together to agree on how this should be done, including the rules of engagement and a range of business models by end-2019.

EOSC must have a long-term baseline funding commitment to become trustworthy. An agreement on how this is to be done needs to be decided within 12 months (by April 2019). The EC must take the lead in bringing the appropriate funders together. EOSC must be free and easy to use for research and education purposes.

For FP9, all researchers must receive appropriate EOSC training and be required to deposit their research outcomes in EOSC-compliant infrastructures. This should be funded by a non-transferable allowable contribution from funders. To this end, access from all parties must be easy and inexpensive if it is to obtain universal support.

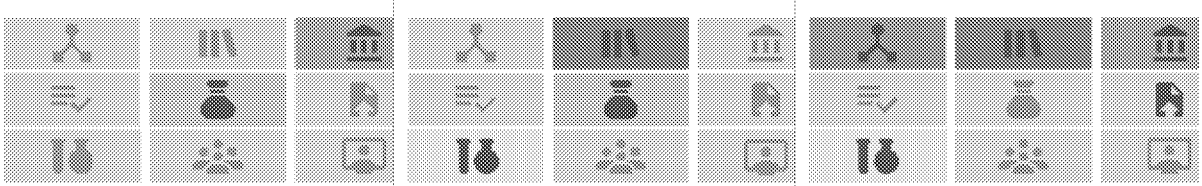


FAIR Data

Funders and Research Performing Organisations should give credit for Findable, Accessible, Interoperable and Reusable (FAIR) data resulting from research work, similar to publications, methods, code etc.

Output Management Plans (OMPs, including Data Management Plans, DMPs) and their implementation should be mandatory for all research projects. OMPs should be machine readable and regularly modified to reflect ongoing research developments.

Data resulting from publicly funded research must be made FAIR and citable, and be as open as possible, as closed as necessary.



Research Integrity

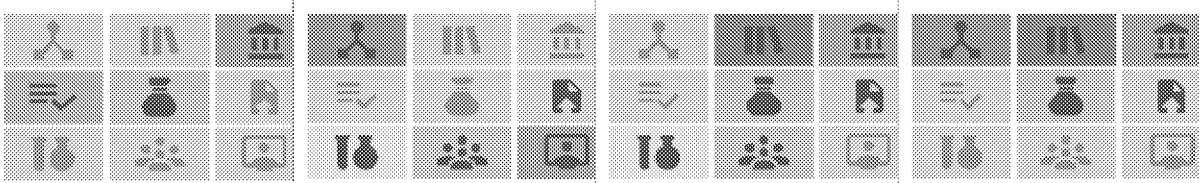
All research organisations must have a research integrity policy, including promotion of good research practices, clear procedures for dealing with allegations of research misconduct and a description of possible sanctions for proven cases of misconduct. This policy must be enforced and adequately staffed and financed to investigate any allegation pertinent to their staff. The processes for dealing with such issues should be public, transparent and prominently displayed. Outcomes should be published where the allegations are upheld, taking into account the sensitivity of the issues involved.

All published research outputs should be reported according to recognised community standards where they exist.

For any research project, researchers should define conditions by which their work can be replicated or otherwise verified by others.

All researchers must receive regular training and accreditation on research integrity pertaining to Open Science, including the ethical, legal and social implications of their research practices. Funders (including the EC through FP9) must ensure that there is adequate training given to the researchers they fund, either through the researcher's institution, or provided via other means.

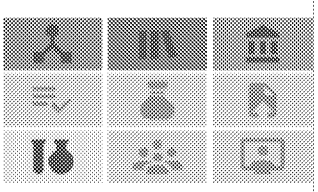
Publishers, data platform and infrastructure providers must agree a standardised set of minimum quality control checks on outputs and openly display the results. The task of undertaking these independent checks needs to be adequately funded. Outputs that pass these checks should be recognised and rewarded in research and researcher evaluation systems, such as FP9.



Skills and Education

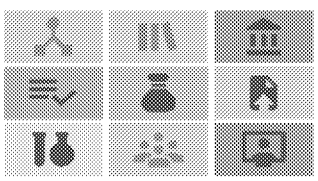
Research Performing Organizations (RPOs) need to work towards the design of appropriate Open Science training that is consistent across Member States, including data literacy, ethics and research integrity, for:

- All researchers, at all levels from early career researchers to senior researchers (R1-R4). Open Science skills need to be explicitly tailored to diverse career paths.
- Research managers and administrators, and other staff involved in the research ecosystem (librarians, repository managers, IT services, data stewards, etc.).
- Students (both undergraduate and graduate levels).



Policy makers, funders and institutions must provide incentives and support towards developing Open Science mentoring and training within a supportive culture and environment.

A fundamental part of a researcher's education is to have a common set of baseline skills on Open Science which must be integrated in the European Framework of Research Careers (EFRC) and the Innovative Doctoral Training Principles (IDTP).



Citizen Science

Publicly funded Citizen Science projects (as part of FP9 projects) should actively apply the principles of Open Science (including openness and reuse of all research outputs, data and publications).

Research-performing organisations (RPOs) are encouraged to promote infrastructures and human capacity to create a supportive and open environment for Citizen Science, which can further strengthen the outreach of RPOs to society. Research libraries are well placed, amongst others, to contribute actively to the necessary coordination and communication infrastructures as well as relevant training, fostering skills such as community management, co-production of knowledge, Open Science standards and social diversity. Appropriate funding and incentives need to be put in place to support this endeavour.

The EC must support an online toolkit for Citizen Science in Europe. This tool must promote Citizen Science as a European asset, offering an entry point and mutual learning space, interconnecting with existing activities and infrastructures at the European, national and local level. It should highlight particular achievements and best practices, and promote a clear set of principles, guidelines & quality criteria for Citizen Science.

Funding for Citizen Science projects should be flexible, long-term and allow for small or experimental projects in collaboration with key stakeholders to be funded. A small section of FP9 should be set aside for citizens to propose research topics or projects. These should be chosen on the basis that they are high risk, beyond traditional research fields and conform to the rigorous standards expected of other projects. Successful proposers will need to work with compliant institutions.

The National Academies of
SCIENCES • ENGINEERING • MEDICINE

July 16, 2018

Andrew Wheeler
Acting Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, DC 20460

Re: Strengthening Transparency in Regulatory Science (Docket ID No. EPA-HQ-OA-2018-0259)

Dear Administrator Wheeler,

We are writing in regard to the proposed rule for Strengthening Transparency in Regulatory Science (April 30, 2018, 83 Federal Register 18768). The proposed rule stipulates that the U.S. Environmental Protection Agency (EPA) will ensure that the data and models underlying the pivotal science that informs significant regulatory actions are made publicly available, in a format that allows for outside analysis and validation. While that provision is generally consistent with advice from the National Academies of Sciences, Engineering, and Medicine, overly stringent requirements for transparency may cause valid evidence to be discarded and thereby pose a threat to the credibility of regulatory science.

The potential impacts of the proposed rule on the quality of regulatory science will depend on many aspects of the rule's implementation that are not described in detail in the Federal Register notice, including the following:

(1) Criteria and processes to make objective and transparent decisions about which studies will be included in scientific analyses used to inform federal regulations;
(2) Approaches for evaluating the data and models used to characterize the dose-response relationships underlying federal regulations; and
(3) Approaches for protecting the confidentiality of certain kinds of data while balancing the need to make data publicly available.

The National Academies were established by the president of the United States and the U.S. Congress as institutions independent of government to provide objective advice to the nation on matters involving science, engineering, and medicine. The National Academies conduct hundreds of activities and dozens of studies each year to provide advice on a wide variety of issues at the request of EPA and many other federal agencies. The committees that conduct the Academies' studies are carefully selected to provide the best available scientific, technical, and policy expertise while avoiding conflicts of interest. Committee members are experts in their fields who volunteer their time to gather information and review the scientific literature as well as to provide their findings and recommendations to address the issue at hand. These reports are independently peer-reviewed and modified, if necessary, before becoming publicly available.

The National Academies have developed a long-standing body of work that demonstrates scientific literature can be evaluated in a transparent and objective manner without complete disclosure of the underlying data. We have issued a number of reports, summarized below, that describe how EPA could improve transparency by documenting its procedures and methods for collecting, evaluating, and analyzing data, by specifying assumptions, and by characterizing uncertainties. In particular, the National Academies have provided advice on the transparency, selection, and evaluation of studies used in EPA's regulatory policy formulation.

However, we want to emphasize that although these earlier reports can serve as a valuable resource to help inform decisions about some elements of the proposed rule, they were not designed to address the full breadth of the issues raised by the proposed rule. The proposed rule's scope, complexities, and potential serious implications for regulatory science and action clearly warrant additional thorough, independent, objective, and context-specific evaluation and analysis.

Transparency and Study Selection and Evaluation

The National Academies have carried out numerous studies that advise EPA on the scientific bases of regulatory decisions related to human health and the environment. Examples of relevant reports that advise on dose-response analysis and models, as well as how to perform literature-based reviews, include:

- *Application of Systematic Review Methods in an Overall Strategy for Evaluating Low-Dose Toxicity from Endocrine Active Chemicals* (NASEM, 2017a),
- *Review of EPA's Integrated Risk Information System (IRIS) Process* (NRC, 2014),
- *Critical Aspects of EPA's IRIS Assessment of Inorganic Arsenic: Interim Report* (NRC, 2013),
- *Review of the Environmental Protection Agency's Draft IRIS Assessment of Formaldehyde* (NRC, 2011),
- *Finding What Works in Health Care: Standards for Systematic Reviews* (IOM, 2011),
- *Science and Decisions: Advancing Risk Assessment* (NRC, 2009), and
- *Models in Environmental Regulatory Decision Making* (NRC, 2007).

These reports encourage EPA to consider all available science in the rule-making process and provide guidance about how the agency could be more transparent in describing how evidence is gathered and evaluated. Specifically, systematic-review methods should be adopted to ensure objectivity, rigor, and transparency in performing literature-based reviews (IOM, 2011; NRC, 2011, 2014). NASEM, 2017a, includes four case examples of systematic reviews.

Systematic-review methods should include a strategy for identifying and screening relevant studies and evaluating their quality. The strategy and methods are best established before undertaking the review to ensure objectivity in the search, screening of studies, and to make certain that studies are evaluated consistently. The evaluation criteria should be tailored to the type of evidence under consideration (human, animal, or mechanistic data). Individual study quality should be evaluated on the basis of information that is available in standard journal articles, such as the study design elements, analytical techniques, and statistical methods. Researchers may be contacted to answer questions about the conduct of the study or be asked to provide additional data. If the study data are not available, their

absence may affect how the study is rated and used in the analysis, but the study should not necessarily be eliminated from the assessment.

The Federal Register notice acknowledges that because of confidentiality concerns, exemptions from the proposed rule will be required because of the impracticality of making publicly available all data that underpin pivotal regulatory science. It is critical for EPA to define what "reasonable effort" would be required to make data publicly available before an exemption is granted. Decisions about exemptions should be based on formal agency guidance and not according to criteria established by a single EPA employee.

Dose-Response Data and Models

Several National Academies reports provide expert advice about how to evaluate dose-response relationships, as is mentioned in the proposed rule. For example, NRC, 2009, recommends that EPA unify the approach it takes to conducting dose-response assessments for cancer and non-cancer health effects, so that potential effects are evaluated based on the probability of harm. This approach will facilitate the assessment of risk management decisions. The recommended unified dose-response approach includes use of a spectrum of data from human, animal, mechanistic, and other relevant studies; a probabilistic characterization of health and environmental risks; explicit consideration of human heterogeneity; characterization of the most important uncertainties; evaluation of background exposure and susceptibility; use of probabilistic distributions when possible; and characterization of sensitive populations.

Making Data Publicly Available

The Federal Register notice cites National Academies reports that provide advice on issues related to data collected and acquired for and by federal statistical agencies to produce national statistics for the public good:

- *Innovations in Federal Statistics: Combining Data While Protecting Privacy* (NASEM, 2017b), and
- *Federal Statistics, Multiple Data Sources, and Privacy Protections: Next Steps* (NASEM, 2017c).

The EPA proposed rule references these reports to identify current approaches for protecting confidentiality while providing data for statistical purposes, such as those used by the Federal Statistical Research Data Centers. The reports consider the kinds of data that are typically collected and acquired under pledges of confidentiality for exclusively statistical purposes – pledges that are backed by strong statutory protections, with criminal penalties for violations.

There are several differences in the confidential microdata collected from individuals and businesses by federal statistical agencies through surveys, versus data and results from the kinds of studies that are within the scope of the EPA proposed rule. These differences have important implications about making data publicly accessible. What works well in the federal statistical environment may not translate effectively to EPA, where stakeholders might be strongly motivated to discount study results that run counter to their regulatory preferences.

In addition, EPA's proposed rule ignores the inherent risks involved in data disclosure, the ever-changing risk landscape, and the efforts needed to mitigate those risks – all of which are discussed in the cited National Academies reports. For example, the security of data held by federal agencies is exposed to new and evolving threats. In addition to cybersecurity concerns, computer scientists and cryptographers have demonstrated that statistical analyses of data sets that generate highly precise results – such as geographic specificity or other characteristics that identify respondents – may result in privacy breaches (NASEM, 2017b; NASEM 2017c). This presents a new challenge that federal statistical agencies are just beginning to address.

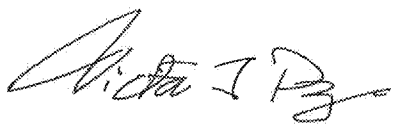
Conclusion

Much more clarity is required on these and many other issues. The potential negative consequences for EPA's ability to take needed regulatory action require more careful examination. We strongly encourage EPA to seek objective, expert guidance on the complexities of this rule and how it would be implemented. As independent and trusted advisers to the nation, the National Academies would be pleased to assist you in this effort.

Sincerely,

Marcia McNutt
President, National Academy of Sciences

C. D. Mote, Jr.
President, National Academy of Engineering



Victor J. Dzau

MINNESOTA

May 29, 2018

Tom Sinks
Office of the Science Advisor
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue Northwest
Washington, DC 20460

Submitted under Docket ID No. EPA-HQ-OA-2018-0259 via www.regulations.gov

RE: The Minnesota Pollution Control Agency and Minnesota Department of Health's joint comments regarding the U.S. Environmental Protection Agency's proposed rule, "Strengthening Transparency in Regulatory Science", published April 30, 2018, at 83 FR 18768, Docket ID No. EPA-HQ-OA-2018-0259.

Dear Tom Sinks:

The Minnesota Pollution Control Agency (MPCA) and the Minnesota Department of Health (MDH) are deeply disappointed in, and troubled by, the U.S. Environmental Protection Agency's (EPA) proposed rule, "Strengthening Transparency in Regulatory Science", published April 30, 2018, at 83 FR 18768, under Docket ID No. EPA-HQ-OA-2018-0259.

As regulatory agencies whose missions are to protect and improve Minnesota's environment and human health, the MPCA and MDH are deeply troubled by this proposed rule. The rule, seemingly written without the knowledge of career staff at EPA or EPA's existing scientific advisory boards, seems designed to undermine and disparage the important epidemiological studies that support public health protection from all pollutants. Simply stated, the proposal was written with the intent to cast doubt on EPA's prior judgement of, and dependence on, health research – and to create suspicion significant enough to deter future use of health-based studies in regulatory decision making. Privacy of health data is a foundational ethic for the medical and health science research fields, and EPA's proposal ignores the historical context under which the privacy rules around health data were developed.

Attached to this letter is a document (enclosure) outlining, in greater detail, the concerns that MPCA and MDH have regarding both the intent behind the rule, as described in the General Information and Background sections of 83 FR 18768.

The enclosure discusses the following points:

1. EPA provides no rationale regarding the need for, or reasonableness of, this proposal.
2. This proposed rule weakens longstanding privacy protections afforded US citizens.
3. This rule does not integrate, nor does it provide solutions for, the current work on data reproducibility within the scientific community.
4. This rule cannot be implemented within a reasonable timeframe.
5. This proposed rule is counter the current goal of Cooperative Federalism.
6. EPA must withdraw this proposal.

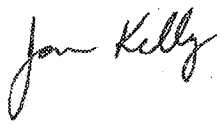
Promulgation of this rule would be a significant departure from EPA's core mission: to protect Americans' health and the environment. It would set a dangerous and potentially life-threatening precedent regarding the use of health-based data, modeling, and research in regulatory decision making. Although intended to "strengthen transparency", the Rule does not provide transparency or clarity at all — rather, it causes confusion and mistrust, and will threaten the lives of real people.

As proposed, the rule is arbitrary, capricious, unethical, and intellectually dishonest. EPA should immediately withdraw this dangerous and ill-conceived proposal.

If there are additional questions related to these comments, please contact Anne Jackson at the MPCA. She can be reached at anne.jackson@state.mn.us or at 651-757-2460.

Sincerely,

Frank Kohlasch, Manager
Air Assessment and Analysis
Environmental Analysis and Outcomes Division
Minnesota Pollution Control Agency



James Kelly, M.S., Manager
Environmental Surveillance & Assessment
Environmental Health Division
Minnesota Department of Health

Minnesota's comments on the proposed rule, "Strengthening Transparency in Regulatory Science" (83 FR 18768)

Docket ID No. EPA-HQ-OA-2018-0259

Agency support rather than regulatory action is the appropriate vehicle to improve data transparency.

Minnesota supports open data, and is a national leader in scientific and regulatory transparency. Our agencies are at the forefront of making environmental and health surveillance data publically available, providing technical assistance for using that data, and engaging partners across communities and research institutions around effective data dissemination and utilization. Our agencies host multiple platforms for accessing high-quality health surveillance and environmental monitoring data, while protecting privacy and providing essential risk communication and prevention strategies. Detailed data are similarly available for research uses, under the approval and guidance of state institutional review boards (IRBs).

As regulatory agencies whose missions are to protect and improve Minnesota's environment and human health, the MPCA and MDH are concerned about this proposed rule leading to the censorship of health sciences research and epidemiological findings (see the MPCA's May 15 letter to Administrator Scott Pruitt at the end of this document). These studies are the basis for establishing standards and toxicity values to protect public health.

The proposed rule undermines the important epidemiological studies that support public health protection from all pollutants, be they in the air, water, biota, or soil. Properly implementing this rule will require EPA to first address many legal aspects surrounding public and nonpublic data, significantly expand database tools and peer review capacity, and develop guidelines for the use of "independent validation" – all of which require considerable time and financial resources. As a result, the proposed rule does little to improve the transparency of current work and, in fact, will cloud the conduct and evaluation of health studies and delay the adoption of human health-based pollution standards for the foreseeable future.

The proposal casts doubt on EPA's prior judgement of, and dependence on, health research – and creates suspicion significant enough to interfere with the future use of existing health-based studies in regulatory decision making. More importantly, EPA's proposal flagrantly ignores the historical context and reasons for the privacy of health data used for epidemiological studies. Privacy of health data is a foundational ethic for the medical and health science research fields, upheld by decades of US Supreme Court decisions.

EPA provides no rationale regarding the need for, or reasonableness of, this proposal.

It is appropriate that EPA continues its efforts to make data publically available[1], to ensure that agency decisions are supported by the best available scientific knowledge and research, and that deliberations are well-reasoned and explained to the public. In the context of this proposal, however, Minnesota is most concerned about the implementation of this rule, and censoring studies from use in EPA work because they could not be "independently validated" because of privacy issues. Such an outcome would result in regulatory records supporting unreliable, pre-determined outcomes or decisions.

The preamble is not clear about the problem this proposed rule will address. EPA states that the proposed rule is designed to "...change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis" (83 FR 18770). Changing agency culture does not occur through rulemaking, especially if few resources are given to new rule implementation. Agency culture and work practices are changed when agency administrators provide leadership, direction, and support of technical and career staff through adequate funding and, in the case of EPA, partnerships with the health and environmental research communities.

This proposed rule's focus on the epidemiology of dose-response data undermines "pivotal regulatory science". Although EPA's argument is that there should be a regulation to ensure increased access to dose-response data and models, EPA offers no evidence of an existing problem with dose-response data transparency that needs to be addressed, nor does EPA demonstrate how independent validation outside of existing peer review processes improves upon current data transparency practices and data availability. EPA offers no evidence that EPA's previous judgement, particularly in the development of dose-response functions, has been inadequate, invalid, or otherwise arbitrary. Frankly, we view this proposal, and its requirement of making publically available data for "independent validation", simply as a means of providing industries concerned with various studies an opportunity to reanalyze data to reshape or recast conclusions drawn by researchers and subsequent peer reviews, and to allow EPA to censor important studies without justification.

The proposed rule's provision to allow the Administrator to provide case-by-case exemptions in Part 30.9 does not resolve our concerns. The rule sets no criteria for the Administrator to censor a study other than whether the data can be made publically available, nor does the rule require the Administrator to explain or justify why a study was censored or used in the regulatory decision. Without expanded criteria or the requirement to describe how or why studies are included or excluded from a regulatory decision, the Administrator would be free to act in an arbitrary manner.

From a risk assessment perspective, excluding epidemiological studies in regulatory science is not sound or prudent. Laboratory work, toxicological research, and epidemiological studies are complementary, and each facet is necessary when it comes to understanding and quantifying the effects of a pollutant on

[1] EPA has an ongoing program to expand and improve open access for research. https://www.epa.gov/open

human health. Eliminating evidence from one of these three essential disciplines threatens the scientific basis for regulatory decisions and actions. The proposed rule would put regulators tasked with protecting human health in the impossible situation of relying primarily on animal or in-vivo models, which cannot be directly extrapolated to human dose-response estimates.

Minnesota, and other states, rely on the EPA to provide us with scientific information that is accurate and sound. If EPA's data begins to depart from being scientifically sound and reliable, the Agency's credibility in protection of human health and environment is diminished. States are left with a data gap that simply cannot be filled with our limited resources. EPA's strong leadership in unbiased scientific research and reasoned application promotes consistency for state agencies across the country, regulatory certainty for businesses, and provides the information, standards and guidelines necessary to provide health protections for US citizens. Minnesota, and others, continue to depend on EPA's leadership.

This proposed rule weakens longstanding privacy protections afforded to U.S. Citizens.

While nothing in the proposed rule compels disclosure of personal identifying information (e.g., name, address), disclosure of analytic data sufficient to fully replicate study analyses would effectively breach confidentiality requirements upheld by public and private research through IRBs. Data availability, as it would be under this rule, would disclose information such as geocoded latitude/longitude residential locations; demographic covariates; and repeated measures in longitudinal population-based studies. If made publicly available, as required by the proposed rule, the specificity of these non-private covariates would facilitate, with relative ease, the re-identification of individuals and their protected health information. Further, it is this very specificity in geographic, demographic, and health information that contribute to epidemiological studies with the most robust quantification of dose-response and uncertainty relationships. It is well documented that privacy assurances are essential to access population health information, recruit and maintain population-based cohorts, and to mitigate non-random selection bias. The proposed rule does not make clear how it would assess or address bias or systematic errors in population studies that were able to release un-masked analytic data to the public.

Ethical and legal frameworks protecting patient and study participant confidentiality are foundational to robust and unbiased analyses; requiring release of these data would effectively bar the most informative population-based studies from contributing to regulatory science. It does not seem that such epidemiological studies could fulfill obligations of IRB-mandated informed consent, patient confidentiality, and Health Insurance Portability and Accountability Act (HIPAA) data governance systems. Not every IRB study is done by a HIPAA covered entity, but nearly every IRB study that involves human health is covered by some legal privacy protections similar to those under HIPAA.

This rule does not integrate, nor does it provide solutions for, the current work on data reproducibility within the scientific community.

EPA points to a "replication crisis" (83 FR 18770) as one possible reason prompting this rule proposal. There are alternative mechanisms for addressing the so-called replication crisis, however, including

peer-review and supervised re-analysis, as well as utilizing or expanding longstanding expert bodies that would not flout, and do not weaken, accepted and effective data privacy systems. These existing, robust mechanisms are also the appropriate locus for discerning appropriateness and adequacy of quantitative models and methods, including non-linearity and effect measure modification of dose-response relationships, as referenced in the proposed rule.

Rather than writing and promulgating a costly rule, the EPA should engage with and support current work that promotes solutions that improve and maintain reproducibility in science. For instance, the list below includes a number of organized discussions by universities, research organizations, and federal agencies to address potential issues surrounding about the problems of reproducibility of scientific studies:

Yale School of Public Health - https://publichealth.yale.edu/ehs/research/conferences/reproducibility/,
Keystone Symposia - https://virtual.keystonesymposia.org/ks/live/39/page/201,
National Institutes of Health - https://www.nlm.nih.gov/news/reproducible-research-conference2016.html,
Society of Toxicology - http://www.toxicology.org/events/am/AM2016/ss.asp,
Health Effects Institute - https://www.healtheffects.org/annual-conference.

Should EPA believe that more formal and defensible research data practices are needed, it would be more appropriate to follow past practice and request the National Academy of Sciences to develop guidance, similar to its request to develop risk assessment guidance, than to promulgate a new rule.

This rule is cannot be implemented in a reasonable timeframe.

We are not certain that this rule can be implemented within a reasonable timeframe, nor is there any evidence that EPA is currently making plans to implement this rule. To that end, if this rule is promulgated, we recommend that any application be only prospective. This rule must not be applied retrospectively; such application would only serve to create confusion with the intent of undermining existing public health regulations.

As the proposed rule offers no instruction as to how or whether EPA use the public's efforts in conducting "independent validation", we recommend that existing EPA programs evaluating human health studies continue under current practices until implementation is completed, including providing sufficient funding for developing open access to databases, establishing guidance as to how and when EPA is to assess or use unsupervised validation studies submitted by the public, as well as determining and resolving public and nonpublic data issues (securing permissions if necessary).

This proposed rule is counter to the current goal of Cooperative Federalism.

As an example, the MPCA manages facility air toxics emissions through modeling and risk-based assessments, with support from MDH. Specifically, we compare modeled air concentrations to inhalation health benchmarks. In order to keep our approach systematic and non-biased, the MPCA and MDH pre-select information sources of inhalation health benchmarks in the form of a hierarchy. Approximately 40% of the inhalation health benchmarks that the MPCA uses to manage air toxics

emissions are from EPA's Integrated Risk Information System (IRIS) or Provisional Peer-Reviewed Toxicity Values (PPRTV) programs. Our understanding of this proposed rule leads us to believe that the dose-response information used to develop these values could become mired in redundant and unnecessary review, should the rule be enacted. Any delay in the review of IRIS or PPRTV data greatly compromises the MPCA's ability to assess and appropriately set permit conditions for industries, or to determine clean up requirements for site remediation projects.

The MPCA and MDH do not disagree that it is worth looking at data practices for all research conducted by EPA, and that there may be opportunities for improvement. EPA would be better served making existing data easier to understand, better communicating the scientific research that is being done at the agencies, and how strong partnerships with third parties strengthens EPA's regulatory authority and its public image.

EPA must withdraw this proposal.

EPA claims in this proposal that it does not need to address EO 13045 (protecting children) nor EO 12898 (Environmental Justice in Minority Populations) because "this action does not concern an environmental health risk or safety risk" (83 FR 18773). This is an inaccurate and unsupported claim. The implementation of this rule would indirectly impact the rules and guidelines that are set to protect children, people of color, the elderly, low-income, and other underserved populations.

This action was correctly identified as a "significant regulatory action" under Executive Orders 12866 and 13563, which then requires a regulatory impact analysis (RIA). The RIA would include an estimate of costs of implementing this rule, and an estimate of resulting benefits. EPA claims benefits outweigh costs, but there is no published record or analysis to demonstrate that this claim is valid. This proposed rule is nearly a mirror image of the proposed HONEST Act (H.F. 1430). The Congressional Budget Office was able to estimate an implementation cost for the first two years of rule implementation, at a cost of $100 million each year[2]. It follows that this proposal would have initial implementation costs of more than $200 million, while having no benefit.

The intent of this rule is ill-considered, and its potential for implementation is severely limited. EPA asked for input in the public notice that would have been better addressed through an Advanced Notice of Proposed Rulemaking. The record provided with the docket for this proposed rule is nonexistent, and EPA has failed to meet many of the basic requirements in preparing rule proposals for public notice and comment. The rule will likely be determined to be arbitrary and capricious, and is certain to be challenged legally. EPA should withdraw this proposed rule immediately.

[2] Congressional Budget Office, March 29, 2017. " If the EPA continued to rely on as many scientific studies as it has used in recent years to support its covered actions, then CBO estimates that the agency would need to spend at least $100 million dollars per year to upgrade the format and availability of those studies' data to the level required by H.R. 1430". https://www.cbo.gov/publication/52545

MINNESOTA

May 15, 2018

The Honorable E. Scott Pruitt, Administrator
U. S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Mail Code 1101A
Washington, D.C. 20460

Re: Comments regarding the U.S. Environmental Protection Agency's proposed rule, "Strengthening Transparency in Regulatory Science", published April 30, 2018 at 83 FR 18768, Docket ID No. EPA-HQ-OA-2018-0259

Dear Administrator Pruitt:

The Minnesota Pollution Control Agency (MPCA) and Minnesota Department of Health (MDH) are deeply disappointed in, and troubled by, the U.S. Environmental Protection Agency's (EPA) proposed rule, "Strengthening Transparency in Regulatory Science," published April 30, 2018, at 83 FR 18768, under Docket ID No. EPA-HQ-OA-2018-0259. This proposed rule to "strengthen transparency" does not provide transparency or clarity at all — rather, it causes confusion and mistrust, and it will threaten the lives of real people. EPA should withdraw this dangerous proposal.

As regulatory agencies whose missions are to protect and improve Minnesota's environment and human health, the MPCA and MDH are appalled by the specious and brazen attack on health sciences research and the field of epidemiology. The proposed rule was clearly designed to undermine and disparage the important epidemiological studies that support public health protection from all pollutants, be they in the air, water, or soil. Simply stated, the proposal was written with the intent to cast doubt on EPA's prior judgement of, and dependence on, health research – and to create suspicion significant enough to deter future use of health-based studies in regulatory decision-making. EPA's proposal flagrantly ignores the reasons for the privacy of health data used for epidemiological studies. Privacy of health data is a foundational ethic for the medical and health science research fields.

While nothing in the proposed rule compels disclosure of personal identifying information (e.g., name, address), disclosure of analytic data sufficient to fully replicate study analysis would effectively breach confidentiality requirements upheld by public and private research through Institutional Review Boards (IRB). It is well documented that privacy assurances are essential to including people in health studies.

From a risk assessment perspective, not including epidemiology studies in regulatory science is not sound or prudent. Laboratory, toxicology, and epidemiology are complementary and necessary pieces of understanding and quantifying effects of a pollutant on human health. Excluding evidence from one of these three essential disciplines threatens the science basis for regulatory decisions and actions. The proposed rule would put regulators tasked with protecting human health in an impossible situation of relying primarily on animal models or in-vivo models that cannot be directly extrapolated to human dose-response estimates.

Minnesota supports open data access and is a national leader in science and regulatory transparency. Our agencies are at the forefront of making environmental and health surveillance data available, providing technical assistance for using data, and engaging partners across communities and research institutions

around effective dissemination and data utilization. Our agencies host multiple platforms for accessing high-quality health surveillance and environmental monitoring data, while protecting privacy and providing essential risk communication and prevention strategies. Detailed data are similarly available for research uses, under the approval and guidance of state IRBs.

Based on the lack of meaningful information and articulated or demonstrated need for the proposed rule, EPA has not made the case for a new regulation at 40 CFR Part 30.

The promulgation of this proposed rule would set a dangerous and potentially life-threatening precedent regarding the use of health-based data, modeling, and research in regulatory decision-making. As proposed, the rule is arbitrary, capricious, unethical, and intellectually dishonest. The EPA should immediately announce that it is withdrawing this proposal.

Our agencies will be submitting additional, substantive comments to the rulemaking record.

Sincerely,

John Linc Stine, Commissioner
Minnesota Pollution Control Agency

Re: Strengthening Transparency in Regulatory Science

To Whom it May Concern:

The Association of State Drinking Water Administrators (ASDWA) appreciates the opportunity to offer comments on the notice for "Strengthening Transparency in Regulatory Science" as published in the April 30th *Federal Register* (Volume 83 Number 83). ASDWA is the independent, nonpartisan, national organization representing the collective interests of the drinking water program administrators in the 50 states, five territories, the District of Columbia, and the Navajo Nation who implement the Safe Drinking Water Act (SDWA) every day to ensure the protection of public health and the economy. ASDWA supports and represents the collective interests of the states, territories, and the Navajo Nation in their administration of national drinking water program requirements within their states or territories. The following ASDWA comments are intended to broadly address the proposed rule, but they do not necessarily reflect the concerns of individual states.

Federal regulations are the basis for the actions of state drinking water programs in protecting public health. These regulations must be based on sound science to appropriately protect public health. The Safe Drinking Water Act (SDWA) has clear statutory language on the use of sound science, and states support the use of sound science in the SDWA regulatory development process. While states may disagree at times with details of the final regulations, states are generally comfortable with the transparency of the regulatory development process as practiced by the Office of Ground Water and Drinking Water (OGWDW). ASDWA does not recommend making significant changes in that process. In fact, if other environmental programs do not currently have a robust science-based regulatory development process, the process used by OGWDW would be a good model.

The SDWA statutory language in Section §1412(b)(3) requires the use of "best peer reviewed science and supporting studies conducted in accordance with sound and objective scientific practices". Therefore, a statutory requirement that the drinking water regulations have a strong scientific basis already exists. This section of the SDWA also outlines the way this information must be shared with the public, so the process is currently transparent. EPA has followed this statutory mandate since the 1996 SDWA Amendments and has relied not only on peer reviewed scientific studies but has also directly involved the scientific community in supporting rule

1401 WILSON BLVD · SUITE 1225 · ARLINGTON, VA 22209
PHONE (703) 812-9505 · FAX (703) 812-9506 · info@asdwa.org · www.asdwa.org

development. States have also been active participants in this science-based process. The rule development currently underway for perchlorate is a good example of the process at work. Recommendations from the Science Advisory Board (SAB) helped guide the methodology to develop the Maximum Contaminant Level Goal (MCLG). EPA has held two peer reviews to help refine the models and determine how best to apply the modeling to determine the appropriate MCLG. The SAB and the peer review process are all open and the recommendations are public, providing full transparency to the deliberations and decisions.

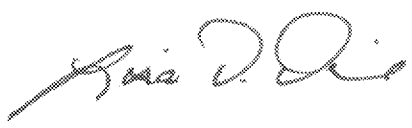
The references listed at the end of the preamble of any proposed drinking water regulation, and any other supporting documentation, is currently shared on the Water Docket, and the Docket provides open access and transparency now for states to examine the basis for new rules. States can review what scientific studies were used in the preparation of the proposed rule and enough detail is provided to judge whether these studies support EPA's conclusions. Since only peer reviewed studies are used, states already have assurances that the results are valid.

Regardless of the pivotal regulatory science used to support a proposed rule, states can openly question the validity of these studies during the comment period for the proposed rule. During this time, states can also recommend additional studies that they believe EPA should consider in developing the final regulations. In the future, EPA can enhance the opportunity for input by consistently allowing a minimum 90-day comment period for new/revised rules. Early involvement by states, as co-regulators, in the early stages of the regulatory development process (pre-proposal) will allow states even more opportunity to provide input on the science used to support the new rules. Beyond the science, involving states as early as possible in the regulatory development process means the resulting regulations can be effectively implemented and public health protection enhanced.

Thank you for considering these comments. As always, ASDWA is willing to continue to work with EPA to develop the best possible drinking water regulations. We encourage EPA to continue the current open and science-based development process and continue to actively involve states. While ASDWA's comments are intended to capture the diverse perspectives of states and state drinking water programs, EPA should also consider the comments/recommendations that may come directly from individual states and territories.

If you have questions or would like to discuss these comments in more detail, please contact me at ldaniels@pa.gov or contact Alan Roberson, ASDWA's Executive Director at aroberson@asdwa.org .

Sincerely,



Lisa Daniels, ASDWA President and Director, Bureau of Safe Drinking Water Director, Pennsylvania Department of Environmental Protection

Re: Advance Notice of Proposed Rulemaking – Increasing Consistency and Transparency in Considering Costs and Benefits in the Rulemaking Process
83 Fed. Reg. 27524 (June 13, 2018)
Docket ID No. EPA-HQ-OA-2018-0107

Dear Administrator Pruitt:

The undersigned Attorneys General are deeply concerned by the Environmental Protection Agency's advance notice regarding a possible rulemaking that may limit EPA's consideration of the benefits of environmental regulation and otherwise interfere with the agency's ability to properly analyze the benefits and costs of such regulation. For the reasons set out below, we write to ask that you extend the public comment period from 30 days to 120 days.

Where and how benefits and costs are analyzed in connection with environmental regulations is vitally important to protecting human health and the environment. We are concerned both about the compressed timeline under which EPA seeks to consider fundamental changes in policy that could affect many of EPA's rulemaking and other activities, and about the vagueness and potentially detrimental consequences of the proposal for those activities. As you know, EPA rules and other EPA actions are key elements of environmental protection that states rely on to safeguard the health of their citizens and natural resources. Under the cooperative federalism approach that underlies the Clean Air Act, the Clean Water Act and other federal environmental laws, states implement EPA's decisions regarding emissions and effluent standards and other regulatory matters, and thus those EPA decisions have a significant effect on the states' ability to protect their citizens and environment from toxic pollution and other harm. Thus, to the extent that consideration of benefits and costs is called for in connection with EPA actions, our states have a strong interest in ensuring that any EPA regulation or guidance governing the analysis of those benefits and costs is consistent with governing law and best practices and otherwise appropriate.

In light of the far-reaching impact the proposal could have on EPA's and the states' ability to protect public health and the environment, we ask that you extend the comment period for the advance notice by 90 days to provide for appropriate input from the public at large as well as from independent environmental experts, economists, and organizations with expertise in analysis of environmental benefits and costs. Given the extremely broad scope and impact of this proposal, the 30 days allowed for public comment in the advance notice is insufficient to give the affected public adequate opportunity to participate in the rulemaking and comment on the proposal as required by the Administrative Procedure Act. 5 U.S.C. § 553(c). Under section (2)(b) of Executive Order 13563, a standard comment period should be at least 60 days, but this tremendously consequential proposal calls for an even more deliberate pace given the profound potential impacts on the regulatory processes for many of the statutes EPA implements and enforces.

A full four-month comment period would be consistent with past practice for matters of similar importance and complexity, and is necessary to provide the public and other stakeholders a meaningful opportunity to evaluate the proposal and its implications for the agency's ability to meet its obligation to protect public health and the environment under federal environmental laws. We therefore request that EPA extend the comment period by 90 days, to October 11, 2018.

We appreciate your consideration of this important matter.

Respectfully submitted,

Executive Summary

The American Chemistry Council (ACC) is pleased to provide the following comments on the Environmental Protection Agency's (EPA) proposed rule, Strengthening Transparency in Regulatory Science (Strengthening Transparency), published in the Federal Register on April 30, 2018.[1] ACC and its members are directly impacted by the science-based regulatory actions of EPA under a myriad of federal environmental statutes. As such, ACC has a keen interest in EPA's adoption and implementation of a proposal as important as this one, which will reach across the breadth of the Agency's authority.

In the following comments, ACC offers its support for the proposed rule; responds to a number of questions posed by EPA in its preamble; and provides a number of specific recommendations regarding how the proposed rule can be improved and strengthened. Specifically, ACC suggests the following:

- Implementation of the rule would benefit from policy and/or guidance regarding the weight to be accorded the science informing significant regulatory decisions
- EPA should provide better historical context and applicability to the proposed rule
- EPA has not in all circumstances properly identified from where its authority is derived under the various federal environmental statutes cited in the proposed rule
- The regulation should apply to Executive Order 12866 significant regulatory actions at the proposal stage
- Key regulatory definitions and regulatory text require greater clarity
- Clarifications to the preamble are needed
- Implementation of the rule should be statute specific
- The proposed rule should apply to enforcement and permit proceedings
- EPA should incorporate stronger data and model access requirements into its Cooperative Agreements and Grants while complying with privacy and confidentiality requirements and laws
- The rule should apply to all EPA programs, including its IRIS program
- Methodologies and technologies providing protected access to confidential and sensitive data should be employed

[1] 83 FR 18768 (April 30, 2018).

- The rule should generally apply prospectively to EPA decision making
- Bias should not be presumed
- EPA should work with entities where scientific data are not publicly available in a manner sufficient for independent evaluation

I. Introduction and Background

ACC strongly supports EPA's demonstrated commitment in this proposal to build upon the principles underlying the Administrative Procedure Act (APA), Executive Orders 12866, 13777, and 13783, and guidance of Office of Management and Budget (OMB). In addition, ACC supports the proposal's expansion of the 2013 "Increasing Access to the Results of Federally Funded Scientific Research" memorandum directing federal agencies and offices to develop and submit plans to the White House Office of Science and Technology (OSTP) that ensure peer-reviewed publications and digital scientific data resulting from federally-funded scientific research are accessible to the public, the scientific community, and industry—to the extent practicable.

The OSTP directive required each agency to develop a public access plan that maximizes access to federally-funded "digitally formatted scientific data"[2] while also protecting confidentiality, personal privacy, confidential business information (CBI), intellectual property rights, and U.S. competitiveness.[3] In 2016, EPA issued its Plan to Increase Access to Results of EPA-funded Scientific Research in response to the OSTP directive.[4] Importantly, EPA's Strengthening Transparency proposal appears to extend such commitments beyond the government-funded requirement of the OSTP directive to "dose response data and models underlying pivotal regulatory science regardless of the source of funding or identity of the party conducting the regulatory science."[5]

ACC believes that EPA's proposal correctly codifies an important good governance principle—that government agencies should be as transparent as possible, within the bounds of the law, about scientific information relied upon and the justifications for the significant regulatory decisions they make.

---

[2] As defined in OMB circular 110 as "the digital recorded factual material commonly accepted in the scientific community as necessary to validate research findings, including data sets used to support scholarly publications. . ." It is a definition consistent with that of "research data" in the regulatory text of EPA's proposal.

[3] More than 20 federal agencies have developed and implemented Data Access Plans, including EPA, the National Institutes of Health (NIH), the Center for Disease Control (CDC), and the Food and Drug Administration (FDA).

[4] Plan to Increase Access to Results of EPA-Funded Scientific Research (USEPA, November 29, 2016) https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf

[5] ACC suggests improvements to EPA's terminology in the preamble that are described later in these comments in sections VI and VII.

The Agency's focus on dose-response data and models appropriately reflects the evolution of toxicology from a largely observational science to a discipline that applies advanced scientific techniques and knowledge. Research programs within academia, government, and private sector labs have greatly improved our ability to investigate and understand the underlying biological mechanisms, modes of action, and dose responses of toxicants. We can now evaluate biological events leading to toxicity and consider how (in a dose-response manner) these biological events relate to potential risks to human health. This was not possible 10-to-20 years ago. This improvement should directly translate to the application of transparent weight-of-the-evidence approaches to the assessment of human relevance; the development of points of departure; and the derivation of protective human health equivalent dosages that minimize the use of uncertainty factors and variability. A goal has been to apply this knowledge to improve the scientific basis of government regulatory policies and industry product stewardship.

For environmental concerns, exposure-response is the more appropriate relationship to evaluate because most of the environmental test guidelines require quantifying concentrations in media external to the organism for use as the exposure metric. Toxicity information and—when available—knowledge of mechanisms, are integrated with exposure-response models for risk-based environmental safety decision making.

Despite significant scientific progress in the understanding of mechanisms of action (MOA) and adverse outcome pathways (AOP), the movement away from default precautionary assumptions has been slow to occur, particularly in certain EPA programs. Significant investments by government, academia, and the private sector into toxicological research are counteracted by the failure to move away from default assumptions toward science-based decisions.

ACC encourages EPA to implement best available scientific procedures under this rulemaking. The Agency should move away from the outdated linear concept of how biology operates toward biologically-based mechanisms, i.e., mode of action (MOA) and adverse outcome pathways (AOP) for both cancer and non-cancer effects, that clearly establish the threshold nature of toxicological endpoints for derivation of points of departure for establishing regulatory values and making regulatory decisions.[6] [7]

In the following discussion, ACC offers its comments to help clarify and strengthen the proposed rule.

---

[6] Critics of this proposed policy appear to overlook the fact that the call to evaluate different dose response models is entirely consistent with the Agency's Cancer Guidelines, which have been in place since 2005. See Guidelines for Carcinogen Risk Assessment https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf

[7] https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3038594/

II. Implementation of the Rule Would Benefit from Policy and/or Guidance Regarding Weight Accorded the Science Informing Significant Regulatory Decisions

As EPA has noted, the proposed rule is consistent with and builds upon the EPA policies implemented by previous administrations. Implementation would be aided by a policy statement or guidance that indicates greater weight will be given to studies using validated test methods and procedures, models, and approaches when and where those data are based on publicly accessible data, and transparent computer algorithms.

Other scientifically relevant and reliable studies and data should not be eliminated from consideration, but rather, accorded less weight when integrating evidence from multiple studies within and across different lines of evidence. Any guidance and other relevant documents developed to assist EPA staff to comply with this rule should include specific examples and/or case studies, perhaps drawing from recent EPA rulemakings, to demonstrate what constitutes regulatory science that is material to EPA's significant regulatory decisions.

III. EPA Should Provide Better Historical Context and Applicability to the Proposed Rule

EPA is proposing to add this rule to 40 C.F.R. 30, contained in Chapter 1, Subchapter B, dedicated to "Grants and Other Federal Assistance," without explaining how or why this rule fits within this subchapter, thereby creating potential confusion regarding its applicability. The potential for confusion was enhanced by the fact that EPA's public website currently contains information regarding the content that was formerly within 40 C.F.R. 30 but was repealed on December 19, 2014, i.e., general terms and conditions applicable to grant recipient and sub-recipients.[8] In addition, a number of questions on which EPA seeks comment relate solely to EPA cooperative agreements and grants or access to EPA-funded data.

In contrast, Section 30.3 of the proposed regulatory text state that "the provisions of this section apply to dose-response data and models underlying pivotal regulatory science regardless of who funded or conducted the underlying data, models, or other regulatory science." Stakeholders would benefit greatly from EPA providing clarification regarding the applicability of Subchapter B and whether and to what extent this rule applies to government-funded and/or beyond government-funded scientific research. We believe the broader approach is warranted.

[8] https://www.epa.gov/grants/epa-general-terms-and-conditions-applicable-40-cfr-part-30-and-31-recipients-effective and see, 79 Fed. Reg. 244 at 76054 (Dec. 19, 2014).

IV. EPA Authority under Federal Environmental Statutes

The provisions cited by EPA under the Clean Air Act (CAA), the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and the Emergency Planning and Community Right-To-Know Act (EPCRA) in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations "as are necessary to carry out [the Administrator's] functions" under the statute. The citation to the Resource Conservation and Recovery Act (RCRA) speaks to Labor Standards in the issuance of grants, and does not appear applicable to this rulemaking authority. EPA cites Section 25(a)(1) of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), which does provide the Agency with broad authority to "prescribe regulations to carry out the provisions of this subchapter [FIFRA]." It should be noted, however, that the statutory language is a bit different from the other cited statutes and does not read as "as are necessary to carry out....". In addition, FIFRA Section 136r(a) does not relate to rulemaking and instead provides the Agency broad authority to undertake research necessary to carry out the purposes of FIFRA. As such, EPA may mistakenly have included Section 136r(a) to support the proposal as cited on 83 Fed. Reg. 18769. EPA's reference to section 10 under the Toxic Substances Control Act (TSCA) also does not appear on-point. ACC believes EPA's authority to implement this rule is derived from TSCA Section 26(h), which speaks directly to scientific information and standards to which the Agency must adhere in the administration of its work under TSCA Sections 4, 5, and 6.

V. The Regulation Should Apply to E.O. 12866 Significant Regulatory Actions at the Proposal Stage

A. Definitions in E.O. 12866 Are Well-Established, Understood, and Applied.

The proposed rule would apply to significant regulatory actions as defined by E.O. 12866 at Section 3(f) as:

> (f) ''Significant regulatory action'' means any regulatory action that is likely to result in a rule that may:
>
> > (1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;
> > (2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;
> > (3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
> > (4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in this Executive order.

This definition has been applied by the Executive Branch since the Clinton Administration promulgated E.O. 12866 in 1993. Its meaning is well-established with more than twenty-

five years of use. The underlying principles, however, precede its adoption. For example, the E.O. carried over the threshold of an annual $100 million effect on the economy that had been in place since 1978. This (3)(f)(1) threshold for economically significant regulatory actions is the same threshold that requires cost-benefit review for proposed and final regulations considered by OIRA.

A significant benefit of using the E.O. 12866 definition in the final rule is that EPA can easily apply it, against substantial practice and precedent, in a reliable, consistent, and predictable manner. This reduces the burden on the agency, and importantly, provides greater predictability to stakeholders and the public so they can understand to which agency actions the regulation will apply.

B. Conformity with E.O. 12866 Definitions Promotes Efficient OIRA Review.

Similarly, the process by which significant regulatory actions are identified under E.O. 12866 is also well-established. Here, with respect to application of the proposed rule, EPA would retain primary responsibility to identify the significant regulatory actions to which the rule should apply. OIRA would assess EPA's identification against the criteria set out in E.O. 12866. Neither EPA nor OIRA would be charged with applying a new or unfamiliar definition, nor a new process for review.

C. The Range of Agency Actions to Which the Rule Will Apply Should Not be Narrowed.

The significant regulatory elements of E.O. 12866 already require OIRA review and have for the past 25 years of established practice. The proposed rule respects that principle, and indeed, leverages it for maximum efficiency.

EPA specifically invites comment on whether a narrower definition might be appropriate, such as final regulations that are determined to be "major" under the Congressional Review Act, or "economically significant" under E.O. 12866. Either of these approaches would lose the efficiency and predictability benefits of using the E.O. 12866 definition—and would increase work for both EPA and OIRA. Further, many significant and precedential agency actions do not meet the "economically significant" threshold. For example, many federal agencies administer environmental, health and safety requirements for workers, consumer products, and environmental media—air, water, soil. It should never be the case that EPA, or EPA and other agencies, establish and/or enforce conflicting and irreconcilable health values for the same compound; require the use of different personal protective equipment; or simultaneously prohibit and permit use or discharge of a particular compound. The same rigorous scientific standards, best available science and weight-of-the-evidence approaches should be applied across programs and media to protect human health and the environment. Adoption of the E.O. 12866 definition of significant regulatory action helps avoid inconsistent regulatory decisions by federal agencies that might interfere with policies designed to protect human health and the environment, unfairly burden businesses, and impede the protection of human health and the environment.

D. The Final Rule Should Apply to Significant Guidance Documents.

OMB's Final Bulletin for Agency Good Guidance Practices defines a "significant guidance document" as a guidance document disseminated to regulated entities or the general public that may reasonably be anticipated to:

> (i) Lead to an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local, or tribal governments or communities;
> (ii) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;
> (iii) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
> (iv) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in EO 12866, as further amended.

EPA already maintains and publishes a list of significant guidance documents that meet the OMB definition.[9] [10] Applying the rule to EPA's significant guidance allows for greater parity and consistency with respect to the application of scientific principles in regulatory and guidance contexts. It ensures that the same quality and rigor will underpin decision making. It also helps ensure that EPA will apply the same principles to both regulatory requirements and implementing guidance, which provides greater certainty to the regulated community and the public.

VI. Key Regulatory Definitions and Regulatory Text Require Greater Clarity

EPA's terminology and regulatory definitions should be more concise and applied consistently to achieve greater clarity regarding the meaning and proposed application of the rule. For example, proposed section 30.2 refers to "**pivotal** regulatory science as the studies or analyses that **drive** the requirements and/or quantitative analysis of EPA final significant regulatory decisions." [Emphasis added]. This definition is distinguished from "regulatory science," defined as "scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions." These two definitions can be interpreted as simultaneously referencing something identical as well as one being a subset of the other. Therefore, the definitions are vague and need clarification.

---

[9] See https://www.epa.gov/laws-regulations/significant-guidance-documents

[10] Notably, EPA's list of significant guidance documents include guidance that applies directly to the regulated community, such as the agency's *2017 Guidance To Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act* (EPA-HQ-OPPT-2017-0341-0002) and *Interpretive Guidance for the Real Estate Community on the Requirements for Disclosure of Information Concerning Lead-Based Paint in Housing, Part I* (EPA-HQ-OPPT-2007-0765-0001).

Assuming the intent is to define and distinguish the subset of scientific studies and analyses that form the scientific foundation for EPA's regulatory decisions from the larger universe of *all* the scientific information reviewed and considered by the agency, a more precise word than "pivotal" would be "material." In other words, those scientific studies and analyses that are material to its regulatory decision must be or be made publicly available in a manner sufficient for independent validation.

The regulatory text in 30.4 and 30.5 should be clarified. Section 30.4 appears to apply to EPA's use of studies (or other regulatory science) relied upon when EPA takes *any* final agency action (emphasis added). In those instances, EPA should make all such studies available to the public to the "extent practicable." Section 30.5 refers specifically to the requirements that apply when "EPA uses dose response data and models underlying "pivotal" (which ACC believes is more aptly expressed as "material") regulatory science." ACC interprets this to mean that in these specific circumstances, the dose response data and models must be "publicly available in a manner sufficient for independent validation," which EPA defines as in a manner "consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security." Information considered "publicly available in a manner sufficient for independent validation" when it includes the information "necessary for the public to understand, assess, and replicate findings." As noted above, for environmental safety, exposure-response is the more appropriate relationship to evaluate because most of the environmental test guidelines require quantifying concentrations in media external to the organism for use as the exposure metric. EPA should provide greater clarity regarding what it intends to do in circumstances where raw data cannot be made publicly available.

EPA should include a discussion in the final rule regarding how it proposes to address exposure assessments and risk characterization data and models in the future extensions of related rules on Transparency in Regulatory Science.

Section 30.7 appears to be missing one or more words in the header to the section. It states: "What role does independent peer review in this section?" ACC believes the missing word is likely "have," but EPA should clarify and correct this section in the final rule.

EPA uses the word "justify" frequently throughout the various sections of proposed regulatory text when referencing the use of regulatory science to make its decisions. For example, section 30.7 states: "EPA shall conduct independent peer review on all *pivotal regulatory science* used to justify *regulatory decisions.*" ACC suggests that there are more precise words that EPA should use to link "pivotal regulatory science" with "regulatory decisions," such as "underpin" or constitute the "foundation" of the "scientific basis" of its regulatory decisions.

ACC has offered some additional, specific language suggestions in a redline version of the proposed regulatory text that is included in these comments in Appendix A.

VII. Clarifications to the Preamble are Needed

A. Definition of "Pivotal Regulatory Science" is needed.

The definition in the proposed regulatory text and may lead to confusion among stakeholders. We recommend consistency between the preamble and the regulatory text and that EPA clarify its terminology.

Importantly, in footnote three on page 18769 of the preamble, EPA states:

> EPA has the authority to establish policies governing its reliance on science in the administration of its regulatory functions. Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use [of] non-public data in support of its regulatory actions. *See Coalition of Battery Recyclers Ass'n v. EPA,* 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass'n v. EPA,* 283 F.3d 355, 372 (D.C. Cir.2002). EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.

ACC believes that this footnote should be clarified to be consistent with the regulatory text that provides that there are exemptions to this policy outlined in sections 30.5 and 30.9. EPA's preamble should not be at odds with the regulatory text.

Invariably there will be circumstances where underlying data no longer exist for studies and/or models that are high quality and reliable. For example, most organizations have data retention policies that have resulted in the disposal of underlying data. Furthermore, Good Laboratory Practices (GLP) regulations include defined periods of time to retain data and study records.[11] EPA should address how it will continue to use those studies and models in light of these policies.

B. Assertions about proposal not "directly regulating entities outside of federal government" and not having "substantial direct effects" on the states.

On page 18769 under section A, EPA states that the proposed regulation does not "directly regulate any entity outside the federal government" and on page 18772, EPA states under section E that "this action imposes no enforceable duty on any state, local or tribal governments or the private sector." Under Section F, EPA asserts that this action does not have federalism implications and will not have "substantial direct effects on the states." ACC is not certain that these statements are accurate. Consider, for example, the establishment of water quality standards (WQS).

[11] 40 C.F.R. 160.

Under Section 303(c) of the CWA, states and authorized tribes must develop WQS and submit them to EPA for its approval or disapproval. To help them develop the standards, EPA provides scientific guidance through its "Section 304(a) National Criteria Recommendations," which specify quantitative concentrations/level and qualitative measures of pollutants that, if not exceeded, generally will ensure acceptable water quality. In developing these recommendations, EPA evaluates acceptable water quality. When developing these recommendations, EPA evaluates available scientific data on a pollutant's effects on public health and welfare, aquatic life, and recreation. EPA recommends that states and tribes consider the Agency's water quality criteria when developing their WQS, though states and tribes may also consider other scientific criteria that differ from EPA's recommendations.

While EPA's national water quality criteria recommendations are not regulations and do not impose binding requirements, they do serve as the scientific basis for the development of water quality standards and WQS are the foundation of a number of CWA programs. As EPA states in its Water Quality Standards Handbook, these standards "establish the baseline used for measuring the success of the CWA programs, so adequate protection of aquatic life and wildlife, recreational uses, and sources of drinking water, for example, depends on developing and adopting well-crafted WQS."[12]

C. Publications should be cited.

ACC suggests that EPA revise its statement that the proposed rule "takes into consideration the policies or recommendations of third-party organizations who [sic] advocated for open science." The recommendations referenced by EPA actually emanate from a survey of the members of three professional organizations whose memberships represent repositories of knowledge and experience in regulatory assessment.[13] As such, reference 10 in EPA's proposal should also be revised to cite the publication, Expert Opinion on Regulatory Risk Assessment, A Survey by the Center for Media and Public Affairs (CMPA) and Center for Health and Risk Communication (CHRC) at George Mason University" (December 6, 2013).[14]

D. Definition of "reproducibility" is needed.

EPA uses the term "reproducibility" in the preamble, but never defines the term and does not include the term in the definitions in the proposed regulatory text. It is unclear what constitutes a reproducible versus non-reproducible finding. It is important to consider that there are different types of reproducibility, such as methods reproducibility, results reproducibility, and reproducibility of conclusions.

---

[12]Water Quality Standards Handbook, Office of Water, EPA 820-B-14-008, September 2014, at p. 2.
[13] The Risk Assessment Specialty Section of the Society of Toxicology (SOT-RASS), the Dose Response Section of the Society for Risk Analysis (SRADRS), and the International Society for Regulatory Toxicology and Pharmacology (ISTRP).
[14] https://cmpa.gmu.edu/wp-content/uploads/2013/12/GMU-Study-Report.pdf.

For example, OMB's Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies defines "capable of being substantially reproduced" as "independent reanalysis of the original or supporting data using the same methods would generate similar analytical results, subject to an acceptable degree of imprecision." [15] However, the inability to reproduce research studies can be related to issues of study design, variability or differences in biological test systems, data integrity, data analyses, and in some cases, scientific misconduct. As Carl Sagan stated, "extraordinary claims require extraordinary evidence." Accordingly, new or novel findings that purport to indicate effects that have little or no biological basis, based on the weight of the evidence coupled to first principles of relevant scientific disciplines, should be subjected to suitable reproducibility requirements, which could include causal analytics.

E. Definition of "publicly available" is needed.

EPA does not define what it means by its use of the term, "publicly available." There is more than one definition of the term currently in use by federal agencies.[16] EPA should clarify the level of access and disclosure to the public that is intended. If it intends to determine this on a case-by-case basis, that also should be made clear.

F. Greater clarity on data refinement issues is needed.

Another important aspect relevant to "public availability" is the level of data refinement EPA will require. The National Academies of Science, Engineering, and Medicine (NAS) held a workshop in 2016 to discuss obstacles for sharing data.[17] The NAS defined several key terms to ensure clarity at the workshop. EPA should consider adopting a similar lexicon to increase the clarity of its regulation. (See Table 1 in Appendix B). In addition, the NAS Report suggests a "cleaned dataset" would be acceptable to use for all routine analyses and verification. (See Table 2 in Appendix B). EPA should establish clear standards on the acceptability of "*cleaned datasets*." This will help to standardize data reporting and formatting. It will also prevent over- and under-reporting.

---

[15] https://obamawhitehouse.archives.gov/omb/fedreg_final_information_quality_guidelines/

[16] Publicly available information means "any information that you reasonably believe is lawfully made available to the general public from: (i) Federal, state or local government records;(ii) Widely distributed media; or (iii) Disclosures to the general public that are required to be made by federal, state or local law." 17 CFR 160.3 [Title 17 -- Commodity and Securities Exchanges; Chapter I -- Commodity Futures Trading Commission; Part 160 -- Privacy of Consumer Financial Information]. Publicly available information is information that has been published or broadcast for public consumption, is available on request to the public, is accessible on-line or otherwise to the public, is available to the public by subscription or purchase, could lawfully be seen or heard by any casual observer, is made available at a meeting open to the public, or is obtained by visiting any place or attending any event that is open to the public. Office of the Director of National Intelligence & Office of the Director of National Intelligence, National Counterintelligence and Security Center, CI Glossary 2011.

[17] National Academies of Sciences, Engineering, and Medicine. 2016. Principles and obstacles for sharing data from environmental health research: Workshop summary. Washington, DC: The National Academies Press. doi: 10.17226/21703.

VIII. Implementation of the Rule Should be Statute-Specific

EPA requested comment on the effect this proposed rule may have on individual EPA programs. Each of the federal environmental statutes referenced by EPA as a source for its authority to propose this rule, was enacted and designed to achieve a specific environmental goal and purpose (e.g., TSCA regulates new and existing chemicals, CAA controls air pollution on a national level, and SDWA regulates public drinking water supplies across the nation). Each statute confers its unique authority upon the agency, requiring agency review according to different scientific standards; each has its own regulations designed to effectuate the specific corresponding program's mission; and, in many cases, each statute relies on different and variable scientific disciplines. As such, ACC believes that this rule, while applicable to all the statutes identified, should be implemented by regulations specific to the objectives and scientific disciplines of each statute. ACC believes that just as the Freedom of Information Act (FOIA), which is overseen by the US Department of Justice (DOJ), is implemented by each agency with specific and separate regulations relevant to the requirements of each statute, this policy rule should be implemented by each EPA program office charged with implementing a given statute in a manner consistent with the authorities granted and requirements unique to that statute.[18]

IX. The Proposed Rule Should Apply to Enforcement and Permit Proceedings

EPA should apply the final rule to both ". . . enforcement activities or permit proceedings (including site-specific permitting actions) . . ." 83 Fed. Reg. 18768, 18771. In both these areas, EPA staff routinely use scientific evidence to make case-specific policy decisions that raise the same type of problems that occur when EPA promulgates regulations; therefore, this proposed regulation should apply to those to ensure that decisions in those areas are made appropriately.

For example, in both administrative and civil judicial enforcement programs, EPA routinely makes discretionary decisions targeting cases to pursue on the basis of scientific data on exposure of humans and ecological resources to pollutants. To do so, EPA relies on data regarding the inherent hazards of the chemical pollutants, and then estimates exposure potential and risks in a manner essentially the same as the approach EPA used to craft the regulations under the applicable environmental statute. Then, on an enforcement case-specific basis, EPA enforcement staff routinely use exposure/risk information to determine whether violations of the law (for regulatory enforcement under the CAA, CWA, RCRA, FIFRA, etc.) or releases to the environment (CERCLA, RCRA corrective action, OPA) have occurred warranting enforcement and determining the extent of sanctions and relief EPA will seek in an enforcement proceeding.

---

[18] See, for example, the discussion of CWA criteria earlier in these comments under section VII. B., which is a good example of why it is important that EPA consider each statute it regulates when applying this proposed rule.

In CAA New Source Review enforcement cases, EPA must decide whether a violation of the program occurred by constructing a "major modification" to a source by assessing whether the pollutant-specific regulatory thresholds were exceeded; analyze emissions calculations using emission factors and/or test data collected from engineering studies; and then extrapolate to the specific plant. To identify the remedial action to impose, EPA must decide which Best Available Control Technology (BACT) limits are for the modifications and that decision, in turn, requires a complex analysis of data regarding costs and efficacies of various control technologies.

In a CWA enforcement case, EPA must decide whether a facility is subject to CWA jurisdiction by determining if a discharge into a jurisdictional "waters of the United States" is subject to the National Pollutant Discharge Elimination System (NPDES) permitting and then whether the discharge violates effluent discharge requirements. If so, EPA must analyze what remedial measures are necessary, including to the receiving waters. In both the CAA and CWA cases, EPA must also prepare proposed civil penalty and pollution "mitigation" assessments, each of which require the analysis of complex economic and environmental data. This policy will require EPA to be more transparent regarding its assessment and analysis of this complex data, which is much needed.

In a CERCLA enforcement case, EPA has to decide what the removal or remedial action should be, which necessitates among other things, a site-specific risk assessment and remedial technologies selection, using a wide variety of environmental and engineering data, which should be publicly available to be verified and replicated.

Similarly, for permitting purposes under environmental statutes, EPA must routinely analyze scientific studies to decide whether to grant a permit and, if so, what conditions to impose in the permit to mitigate environmental impacts to acceptable levels. For example, in a CWA NPDES permit review, EPA determines the level of each pollutant that would be discharged to waters of the United States, whether the proposed discharge will comply with effluent limits required by technology-based effluent guidelines and water-quality standards (including Total Maximum Daily Load programs), and whether control technologies will ensure that the effluent limits will be achieved consistently. Each of those decisions requires analyzing complex environmental/engineering data on a case-specific basis.

X. Incorporate Stronger Data and Model Access Requirements into Cooperative Agreements and Grants while Complying with Privacy and Confidentiality Requirements and Laws

EPA requested comment on how EPA can incorporate stronger data and model access requirements into the terms and conditions of Cooperative Agreements and Grants. ACC believes EPA can accomplish this by implementing requirements that all models and results developed under EPA Cooperative Agreements and Grants be open access and not proprietary. EPA should also require all grant proposal applicants to include as part of any

grant proposal a data management plan, similar to those required by the National Institutes of Health (NIH).[19] EPA may elect to exclude from these requirements grants/agreements of some specified annual amount, but that annual amount should be reasonable and ensure that the vast majority of models and results developed under grants/agreements is shared.

EPA should adopt model evaluation criteria to apply the greatest weight and credibility to models that are open access, describe the endpoint predicted clearly, are based on unambiguous open access computer algorithms, have a defined domain of applicability, have been transparently verified with publicly available datasets, and are shown to be robust and scientifically sound for the intended use.

In addition, EPA should develop common data templates and digital platforms for the most common types of research studies to be used by entities subject to Cooperative Agreements and Grants to facilitate public use and validation.

XI. The Rule Should Apply to all EPA Programs, including its IRIS Program

EPA established the Integrated Risk Information System (IRIS) in 1985 to develop and maintain a database of human health hazard assessments for chemicals. EPA's website states: "The goal of the IRIS Program was to foster consistency in the evaluation of chemical toxicity across the Agency."[20] However, the IRIS Program has been plagued for years by its slow pace generating IRIS assessments and lack of scientific transparency and reproducibility, among other deficiencies. The U.S. Government Accountability Office included IRIS in its High Risk Report, which noted that EPA has not "developed sufficient chemicals assessment information under these programs to limit exposure to many chemicals that may pose substantial health risks"[21] Although the IRIS Program has initiated changes to address some of these deficiencies, no final IRIS assessment to date reflects the full panoply of recommendations issued by the NAS in its review of the IRIS program in 2011.

Appendix C offers several specific examples of IRIS assessment that failed to reflect the best available science. We strongly recommend that the Agency apply this rule to any IRIS assessment that could be used as the basis for significant regulation.

XII. Methodologies and Technologies Providing Protected Access to Sensitive or Confidential Data

In circumstances where company CBI and other intellectual property may be implicated, EPA should confer with the CBI data owner to determine how to make that data available to the greatest extent possible without disclosing the CBI within that data, study, or model. How this is handled will likely be impacted by the type of

[19] https://grants.nih.gov/grants/policy/data_sharing/data_sharing_guidance.htm

[21] https://www.gao.gov/highrisk/transforming_epa_and_toxic_chemicals/why_did_study#t=0

regulatory decision and statute involved.

For example, under TSCA, while the summarized study results, analysis, and final report may be publicly available, the underlying data in a health and safety study may qualify as CBI when the underlying data are not in the public domain and that data provides a commercial value to its owner.[22] In such circumstance, it is the availability of the underlying data that determines whether or not an unpublished study can be used by a competitor to support its notification or registration of a substance overseas without obtaining ownership or citation rights to use such data, depriving the data owner of the value of its investment in the underlying data. Current EPA regulations require chemical manufacturers to submit health and safety studies under some circumstances. However, it is noteworthy that none of these regulations routinely require study submitters to submit underlying data along with a final report. This indicates that the final report likely communicates sufficient information about the potential health and environmental effects to the public when a company has submitted health and safety studies in which it has a commercial interest in protecting.[23]

ACC believes that making a final study report publicly available where the underlying data are CBI would, in most circumstances, be an effective way to make relevant information publicly available about studies and data EPA may rely on, but which must be protected as CBI in circumstances triggering this policy. In these situations, EPA can access the underlying data to confirm the methods, models, and approaches are based on validated procedures, accessible data, etc. If necessary, when specialized expertise is needed, EPA could contract with an independent third-party science reviewer to confirm those findings, although we believe this would likely only be necessary in unusual circumstances. In addition, EPA might also consider an approach followed under FIFRA where Data Evaluation Records of studies are made publicly available, but not full studies.[24] Another approach is that of the European Union's REACH program, which makes Robust Study Summaries (RSS) publicly available, while protecting from disclosure the competitively sensitive underlying data of health and safety studies.

When protecting data while also promoting data access, NIH guidelines should be consulted.[25] ACC believes many of these guidelines could be applied in EPA's implementation of this proposed policy under each of the statutory programs EPA administers to ensure the guidelines adopted suit the specific needs of each statute.

---

[22] See, e.g., *Cohen v. Kessler*, No. 95-6140 (D.N.J. Nov. 25, 1996).

[23] 40 C.F.R. §720.50(a)(3)(i) requires that if data do not appear in the open scientific literature, the submitter must provide a full study report, including the experimental methods and materials, results, discussion and data analysis, conclusions, references, and the name and address of the laboratory that developed the data.

[24] See, e.g., https://archive.epa.gov/pesticides/chemicalsearch/chemical/foia/web/pdf/010501/010501-050.pdf

[25] See https://osp.od.nih.gov/2016/05/02/protecting-data-promoting-access-improving-our-toolbox/; https://www.niaid.nih.gov/research/data-security; and https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5302472/

EPA should ensure that it implements its final rule in a manner that enables it to use confidential health records that may exist with certain kinds of studies, such as long-term air pollution and workplace exposure studies that involve confidential health records. Several agencies and organizations, in addition to NIH, have successfully addressed the issue of data access while maintaining confidentiality that should be considered by EPA. For example:

- The existing rule requiring federally funded research to be made available to other researchers. This standard could be adopted and applied to third-party funded researchers.
- Health care claims and related data are now being made available to researchers in de-identified form by some health insurance companies, such as Optum, which offers a "proprietary research database of health care and administrative data that links patient, physician, and treatment attributes from millions of geographically diverse individuals in the U.S." Optum appears to have developed methods and procedures to appropriately address confidentiality concerns.
- Medicare claims data are already available to researchers in de-identified form. Algorithms and methods developed by the Center for Medical Services should be examined by the EPA.
- Several professional societies have guidance on the protection of health data and de-identification, such as the Institute of Electrical and Electronic Engineers and the International Association of Privacy Professionals. [26]

EPA should develop clear guidance on protecting privacy, de-identifying data, and settling disputes should a breach occur. It may also want to consider establishing an office similar to that of NIH's Office of Research Integrity to adjudicate any issues that may arise in the administration of its practices under this rule.[27]

XIII. The Rule Should Generally Apply Prospectively to EPA Decision Making

ACC does not support retrospective application of the final rule in cases where the Agency follows a periodic review schedule for updating regulations, which includes review of underlying scientific assessments. Retrospective application of any regulation (and its underlying scientific evaluations) is rife with complication, confusion, and significant ambiguity for EPA and stakeholders alike. For example, each NAAQs review under the CAA is based on a substantial amount of scientific and policy information used to inform EPA's determinations of appropriate levels for each standard. The retroactive application of this proposal to those administrative records would only serve to confuse, distress, and impede a NAAQS review process that is already severely overburdened. For example, it is unclear which administrative NAAQS records would be covered by the proposal and how far back it would apply.

[26] http://www.ehealthinformation.ca/wp-content/uploads/2014/08/2010-Risk-based-de-identification-of-health-data.pdf and https://iapp.org/media/pdf/knowledge_center/Perspectives_on_Health_Data_De-Identification_final.pdf

[27] https://ori.hhs.gov/

Without a clear statement, the proposal could potentially cover more than a decades' worth of NAAQS administrative records and scientific analyses. The value of such an application is similarly uncertain. While ACC remains supportive of increased transparency in significant regulatory actions in the future, we encourage EPA to avoid the creation of unnecessary ambiguity and burdens and refrain from the application of this proposal to previous administrative NAAQS records. ACC recommends the final rule be applied prospectively in a manner that integrates its application within the periodic review schedule established for each criteria air pollutant.

However, in cases where EPA has developed analytical tools and models, e.g., ECOSAR, in the past that incorporate dose response data, it may be valuable to apply this rule retrospectively. In other cases, such as IRIS assessments, where the Agency has yet to articulate a periodic review schedule for updating scientific assessments dating back 10-20 years or longer, EPA should develop appropriate mechanisms for application of the rule.[28]

XIV. Bias Should not be Presumed

EPA requested comment on how application of the proposal might inadvertently introduce bias regarding the timeliness and quality of the scientific information available. If EPA uses a weight-of-the-evidence approach (as required under TSCA)[29] and EPA has concerns about bias having been introduced, it can evaluate this using a sensitivity analysis by evaluating the impact of each study and/or model on the overall outcome of the analysis.[30] That said, bias should not be inferred if newer, more scientifically robust studies based on modern, up to date knowledge of biology and dose response are determined to be of better quality, relevance, and evidentiary value.

XV. EPA Should Work with Entities Where Scientific Data are not Publicly Available in a Manner Sufficient for Independent Evaluation

Where data are not available in a manner sufficient for independent evaluation, EPA should attempt to work with data owners to reach an agreement to make the information available to the public to the greatest extent practicable without

---

[28] In addition, stakeholders who seek to urge EPA to undertake a retrospective review do have options at their disposal, e.g., they can develop a voluntary new evaluation under TSCA, petition EPA, or file an Information Quality Request (IQA) requesting a correction.

[29] The TSCA Risk Evaluation rule provides an excellent definition of "weight-of-the-scientific-evidence" that should be adopted across the federal government, but certainly across EPA, at a minimum. That definition is: " a systematic review method, applied in a manner suited to the nature of the evidence or decision, that uses a pre-established protocol to comprehensively, objectively, transparently, and consistently identify and evaluate each stream of evidence, including strengths, limitations, and relevance of each study and to integrate evidence as necessary and appropriate based upon strengths, limitations, and relevance." See 82 Fed. Reg. 33726, 33733 (July 20, 2017).

[30] EPA's implementation and adherence to systematic review in the implementation of this proposal as it has committed under TSCA, will serve to guard against the introduction of bias. See EP's *Application of Systematic Review in TSCA Risk Evaluations* at https://www.epa.gov/sites/production/files/2018-06/documents/final_application_of_sr_in_tsca_05-31-18.pdf

jeopardizing the privacy, confidentiality, or the proprietary interests that deserve protection. In circumstances where there is significant difficulty making data available in a meaningful way, EPA should consider contracting with external experts in the scientific discipline at issue, have them sign confidentiality agreements, analyze the data, and prepare a confidential report with a non-confidential summary for EPA to share publicly.

APPENDIX A: Proposed Regulatory Text

Section 30.1 What is the purpose of this subpart?
This subpart directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.

Section 30.2 What definitions apply to this subpart?
As used in this subpart, all terms not defined herein shall have the meaning given them in the Act or in subpart A; and the following terms shall have the specific meaning given them.

- **Dose Response data and models** – the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a measured or predicted response or health or environmental impact.

  A dose response and concentration response can be empirical, e.g., it can describe the measured relationship from experimental measurements. A response can be just a response and not an actual "impact."

- **Material Regulatory Science** – specific scientific studies and analyses that represent the best available science that, based on weight-of-the-evidence, are material to and represent the scientific basis of the requirements and/or quantitative analyses of EPA final significant regulatory decisions.

- **Regulatory decisions** – final regulations determined to be "significant regulatory actions" by OMB per EO 12866, which is defined as any regulatory action that is likely to result in a rule that may:

  - Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health, or safety, or state, local, or tribal governments or communities;
  - Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;
  - Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
  - Raise novel legal or policy issues arising out of legal mandates, the president's priorities, or the principles set forth in the Executive Order 12866.

- **Regulatory science** – scientific information, including assessments, models, criteria documents, and regulatory impact analyses that provide the basis for EPA's policies, procedures, guidance, proposed and final significant regulatory decisions.

- **Research data** – as defined by UAR is: the recorded factual material commonly accepted in the scientific community as necessary to validate research findings, but not any of the following: preliminary analyses, drafts of scientific papers, plans for future research, peer reviews, or communications with colleagues. This ''recorded'' material excludes physical objects (e.g., laboratory samples).

  "Research data" do not include:

  (i) Trade secrets, commercial information, materials necessary to be held confidential by a researcher until they are published, or similar information which is protected under law; and
  (ii) Personnel and medical information and similar information the disclosure of which would constitute a clearly unwarranted invasion of personal privacy, such as information that could be used to identify a particular person in a research study.

Section 30.3 How do the provisions of this subpart apply?
"To dose response data and models underlying pivotal regulatory science that are used to justify significant regulatory decisions regardless of who funded it or the identity of the party conducting the regulatory science." These provisions do not apply to "physical objects (like laboratory samples), drafts, and preliminary analyses." Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of regulatory action, including enforcement actions and permit proceedings, etc.

Section 30.4 What requirements apply to EPA's use of studies when taking final action?
EPA shall clearly identify all studies or other regulatory science relied upon when it takes any agency action and make all studies available to the public to the "extent practicable."

Section 30.5 What requirements apply to use of dose response data and models?
When promulgating significant regulatory actions, the Agency shall ensure that the dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation, **verification,** and analysis.
This may include:

- Data (where necessary, could be subject to access and use restrictions)
- Associated protocols
- Computer algorithms and models[31]
- Recorded factual materials
- Detailed descriptions of how to access and use such information

But in a manner consistent with law, protects privacy, confidentiality, CBI, and is sensitive to national and homeland security.

[31] We suggest substituting "algorithms" in place of "codes" because specific computer codes can be proprietary.

Information is "publicly available in a manner sufficient for independent evaluation" when it includes the information necessary for the public to "understand, assess, and replicate findings."

Section 30.6 What additional requirements pertain to the use of dose response and models underlying pivotal science?
EPA shall describe and document any assumptions and methods used and should describe variability and uncertainty. EPA shall evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold response, on a case-by-case basis. EPA shall clearly explain scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high-quality studies that explore: a broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models the incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

Section 30.7 What role does independent peer review [have] in this section?
EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions, consistent with OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions therein apply. EPA will ask peer reviewers to articulate the strengths/weaknesses of EPA's justification for assumptions applies and the implications of those assumptions for the results.

Section 30.8 How is EPA to account for cost under this subpart?
EPA shall implement the provisions of this subpart in a manner that minimizes costs.

Section 30.9 May the EPA Administrator grant exemptions to this subpart?
Yes. The Administrator may grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable because:
(a) It is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security; or
(b) It is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality Bulletin for Peer Review (70 FR 2664), Section IX.

Section 30.10 What other requirements apply under this subpart?
EPA shall implement the provisions of this section consistent with the definition of ''research data'' in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in Public Law 89–487, and other applicable federal laws. Where appropriate, data sharing agreements and state-of-the-art data-masking techniques may be employed to facilitate access to information.

ACC notes here its support for the text of Public Law 89-487, which is incorporated by reference in Section 30.10 provides the following exemptions are applicable to this proposed regulation:

1) Specifically required by Executive Order to be kept secret in the interest of national defense or foreign policy;
2) Related solely to the internal personnel rules and practices of any agency;
3) Specifically exempted from disclosure by statute;
4) Trade secrets and commercial or financial information obtained from any person and privileged or confidential;
5) Inter- or intra-agency memorandums or letters which would not be available by law to a private party in litigation with the agency;
6) Personnel and medical files and similar files the disclosure of which would constitute a clearly unwarranted invasion of personal privacy;
7) Investigatory files compiled for law enforcement purposes except to the extent available by law to a private party;
8) Contained in or related to examination, operating, or condition reports prepared by, on behalf of, or for the use of any agency responsible for the regulation or supervision of financial institutions; and
9) Geological and geophysical information and data (including maps) concerning wells.

Where appropriate, data-sharing agreements and data-masking techniques may be used.

APPENDIX B: Definitions of NAS Principles

Definitions in NAS Principles and obstacles for sharing data from environmental health research: Workshop summary.
Definition: meta-analysis *Meta-analysis* is a way of quantitatively combining data from many different studies using a statistical process.
Definition: reanalysis The term "*reanalysis*" is defined as conducting further analyses of the exact same data to determine if the same results are obtained and may include use of the same programs and statistical methodologies that were originally used to analyze the data or may use alternative methodologies.
Definition: replication The term "*replication*" is the repetition of a scientific experiment or a trial using exactly the same protocols and statistical programs but with data from a different population to determine if consistent results are obtained with data from a different population.
Definitions: reproduction The term research "*reproduction*" refers to an experiment conducted to addresses the same research question as the original work, but examines the question from a different angle.
Definition: raw data The term "raw data" is defined as the unmodified or unprocessed data that is obtained directly from a survey or experiment (modified from NAS, 2016 P6)
Definition: cleaned-up data *Cleaned-up data* consist of the raw data modified to remove obvious errors.
Definition: processed data The term "processed data" refers to information that has been computed and analyzed to extract relevant information (NAS, 2016), and may include: • Aggregation – combining multiple pieces of data. • Analysis – collection, organization, analysis, interpretation and presentation of data • Classification – separation of data into various categories. • Reporting – list detail or summary data or computed information. • Sorting – the arrangement of items in some sequence and/or in different sets. • Summarization – reducing detail data to its main points. • Validation – Ensuring that supplied data is correct and relevant. (wiki https://en.wikipedia.org/wiki/Data_processing)
Definition: final clean data set

The term "*final clean data set*" is the information provided with a scientific publication (modified IOM, 2016 P6)
Definition: metadata *Metadata* is a set of data that describes other data

TABLE 2 – Data flow from NAS Report

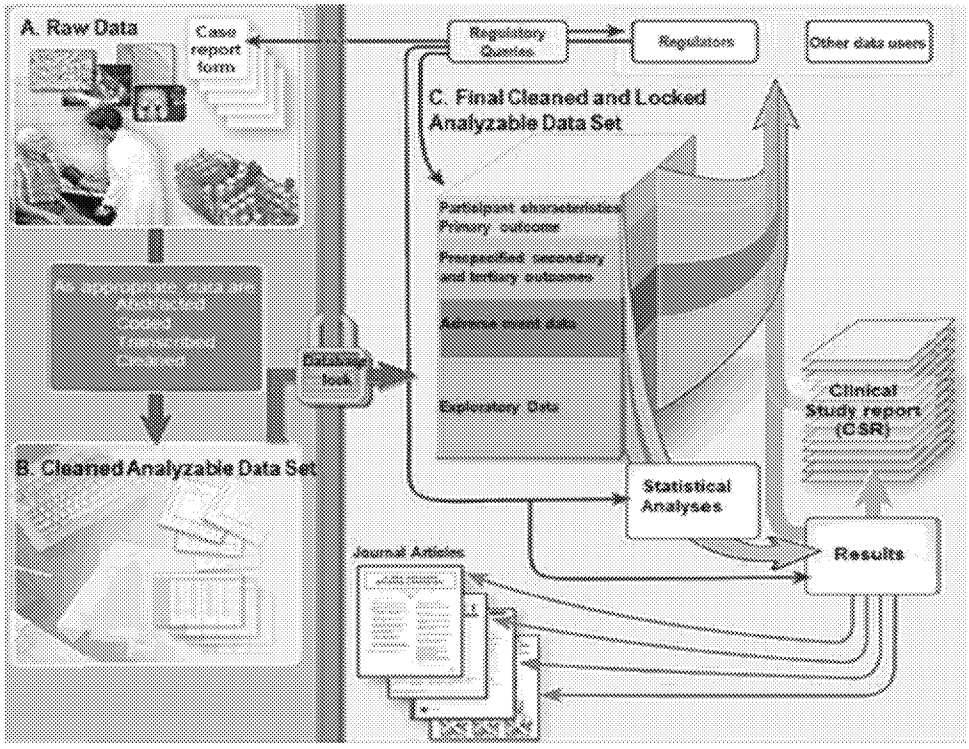

FIGURE 2-1 Data flow from participant to analyzed data and reporting.
SOURCE: IOM, 2014.

APPENDIX C: Chemical-Specific Case Studies

Case Study 1: Trimethylbenzenes (TMBs)

On September 9, 2016, EPA issued its final report on the IRIS assessment of Trimethylbenzenes (TMBs), which addresses the potential non-cancer and cancer human health effects from long-term exposure to TMBs. Humans are not exposed to individual TMB compounds, but to complex mixtures. According to EPA, the primary uses for TMBs are: as a blending agent in gasoline formulations (C9 aromatic fraction); solvents; and paint thinner.

In its review of TMBs, the EPA fell far short in meeting its obligations to improve its IRIS processes and assessment reports. Without explanation, EPA failed to respond to public comments on the draft TMBs assessment, even though the IRIS process for developing assessments explicitly includes a response to comments element.

The IRIS assessment of TMBs does not accurately represent the health effects associated with exposure to TMBs because it failed to utilize a consistent and transparent data evaluation procedure for evaluating and weighing the full body of evidence.
In particular, EPA failed to rely on available guideline studies on commercial complex C9 aromatic mixtures that industry conducted under EPA's TSCA program. The entire commercial C9 aromatic blend, which contains a high percentage of TMBs, has similar toxicological properties and health effects as the individual isomers of TMB. Thus, guideline studies on the commercial complex of aromatic mixtures are highly relevant to assessing the toxicology of TMBs.
EPA's Office of Pesticide Programs (OPP) has also reviewed the toxicology of TMBs and determined that the health effects of TMBs can be efficiently assessed by relying on C9 aromatic mixture studies. OPP reached different scientific conclusions, including different quantitative health effect numbers, than that of EPA's IRIS Program. EPA, however, did not resolve these differences during the IRIS assessment of TMBs.

Case Study 2: Formaldehyde

Formaldehyde occurs naturally in every living system – from plants to animals to humans – all of which produce formaldehyde as a normal part of metabolism. In addition, its unique and versatile chemical properties make it a common and beneficial part of modern life. Formaldehyde has been the subject of extensive and robust scientific inquiry. EPA has been involved in assessing the human health risk of formaldehyde since the late 1970s. Large numbers of epidemiology, toxicology and biomechanical studies have informed the science surrounding formaldehyde, so that there a rich body of data exists.

The most recent draft Integrated Risk Information System (IRIS) formaldehyde assessment (2010) proposed exposure limits so low that the trace levels of formaldehyde found in human breath would present a cancer risk. The 2010 draft assessment also noted that: *"Human epidemiological evidence is sufficient to conclude a causal association between formaldehyde exposure and nasopharyngeal cancer, nasal and paranasal cancer, all*

leukemias, myeloid leukemia and lymphohematopoietic (LPH) cancers as a group." The National Academy of Sciences (NAS) then conducted a peer review of this draft and issued its final report in April 2011. The NAS report was critical of the draft IRIS assessment---an assessment that the IRIS program took 12 years to develop.

The NAS stated that EPA's claims regarding all leukemias, myeloid leukemia or related hematopoietic cancers were not supported. It noted that EPA's preliminary conclusions appeared subjective and that no clear scientific framework had been used by EPA to reach its conclusion. The NAS recommended that EPA revisit its determination of causality for specific LHP cancers, using methodology that integrates lines of evidence and addresses the specific criticisms in the NAS report. The NAS also made numerous recommendations for the improving the overall process and application of science used in all assessments generated by the IRIS program. Now, seven years since that NAS report was published, EPA continues to revise its assessment while not disclosing how emerging scientific evidence or modern risk assessment methods are being employed.

Meanwhile, newly published research based on the recommendations in the NAS report has advanced the state of the science. Raw data (made available after multiple years of FOIA requests) from studies conducted by the Federal government ---and upon which EPA relied on for its previous assessment conclusions--- were re-analyzed and the findings contradicted the original study conclusions. Today our knowledge regarding formaldehyde is much greater; yet it does not appear that this new knowledge has been applied in the EPA's assessment of formaldehyde risk. Published research demonstrates that inhaled formaldehyde cannot reach the bone marrow where leukemia occurs and that safe thresholds for formaldehyde exposure exist. This formaldehyde case study is an example of the long-term problems with the lack of consistent, transparent application of modern scientific knowledge regarding chemical exposures and human health risk.

Case Study 3: Ethylene Oxide

The Integrated Risk Information System (IRIS) assessment of ethylene oxide (EO) originated with a carcinogenicity assessment in 1985. The first comprehensive draft was published in 1998. An external review draft was issued in 2006, followed by a Science Advisory Board (SAB) review in 2007. Revisions of the EO assessment were made in 2011 and 2013, and an additional SAB review was conducted in 2014-2015. The final IRIS assessment for EO was posted in December 2016.

Using unsupportable and un-reviewed conservative risk assessment modeling, the IRIS assessment concludes that the one-in-a-million lifetime cancer risk value associated with exposure to EO is less than 1 part per trillion (ppt). This value is far below both EO background levels in the environment and EO levels naturally converted from ethylene in humans through breathing. This conclusion is not plausible and not scientifically supportable. It is based on an inadequate evaluation of a body of evidence from human studies that include historical exposure levels to EO that are far higher than current occupational exposure limits. Other, more accurate data sources are available, and alternative scientific risk assessment modeling approaches could have been used, but the

IRIS Program did not systematically integrate all of the evidence. Public comments on the EO IRIS assessment can be found in Docket No. EPA-HQ-ORD-2006-0756.

EO has dozens of important applications, including the manufacture of ethylene glycol based antifreeze, aircraft deicers, and PET plastics. EO is also used to produce higher-value derivatives such as ethoxylates, ethanolamines, glycol ethers, and polyether polyols. A small but critical use of EO is for the sterilization of medical equipment.

EPA's SAB 2007 review concluded that substantial revisions were needed to the draft IRIS assessment including:

- Acquiring and using individual data for modeling rather than grouping populations, which results in overly conservative estimated cancer risks;
- Considering using both linear and non-linear approaches to estimate cancer risk due to the distribution of and questionable association with certain cancer types; and
- Providing more transparency and correcting flaws associated with inappropriately grouping lymphohematopoietic cancers and combining genders for the dose-response analysis.

Meeting materials, including public comments, can be found at https://yosemite.epa.gov/sab/sabproduct.nsf/MeetingCal/7E3E313F627541D78525711400470D01.

The 2015 SAB Committee that reviewed the revised 2013 EO draft IRIS assessment did not conduct an independent, unbiased review. Problems included:

- Several SAB members made inaccurate public statements indicating industry produced scientific studies should be not be considered due to potential industry influence, although no evidence of biased data sponsored by industry was ever presented.
- SAB members did not understand new evidence-based medicine concepts regarding mutagenicity of cancer cells and the contribution of naturally occurring EO in DNA repair mechanisms.
- The SAB recommended using epidemiology data sets with questionable or scientifically unsound characteristics to estimate cancer risk and rejected alternative data sets that are as or more robust than those selected.

EPA still did not use individual data for modeling as recommended by the SAB in 2007, and did not adequately explore alternatives to the linear low dose modeling approach.

Meeting materials, including public comments, can be found at https://yosemite.epa.gov/sab/sabproduct.nsf/MeetingCal/17F305EC43EB1A6585257E2D0050255F.

The IRIS Program used a spline approach (piecewise linear model that was not presented during either SAB review) for exposure-response analyses for each of the lymphoid and breast cancer endpoints and ultimately combined the results. This approach results in higher risk at lower exposure levels and leads to proposed regulatory levels that are orders of magnitude lower than what the epidemiologic and genotoxicity scientific evidence would support.

Further, the IRIS Program did not fully consider all available evidence in finalizing the EO assessment. Scientific evidence clearly indicates that EO is a weak mutagen and a unit risk factor of less than 1 ppt is not realistic or reliably measurable, and is orders of magnitude lower than levels of EO in ambient air and the normal, endogenous levels of EO present in human bodies. Moreover, the assessment fails to consider the difference between exposures to EO produced outside the human body and exposure to EO produced within the human body as a normal metabolic product.

Agenda
ORD Team Meeting
Strengthening Transparency in Regulatory Science
September 5, 2018

1) Overview
2) Issues
    a. PII
    b. Dose-response models
    c. Assessing the validity of prior epidemiologic studies (without public access to data and analytic methods)
    d. Infrastructure
    e. Requirements for cooperative agreements and grants
    f. Replication/reproducibility
    g. Proprietary models
    h. Specific chemicals

COMMENTS OF THE ELECTRIC POWER RESEARCH INSTITUTE ON

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 30

[EPA-HQ-OA-2018-0259; FRL-9977-40-ORD]

Strengthening Transparency in Regulatory Science

August 7, 2018

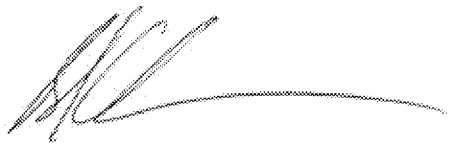
The Electric Power Research Institute, Inc. (EPRI) respectfully submits the enclosed comments on the U.S. Environmental Protection Agency's (EPA's) proposed rule titled *Strengthening Transparency in Regulatory Science*. EPRI appreciates the opportunity to comment on this rule.

EPRI is a nonprofit corporation organized under the laws of the District of Columbia Nonprofit Corporation Act and recognized as a tax-exempt organization under Section 501(c)(3) of the U.S. Internal Revenue Code of 1986, as amended, and acts in furtherance of its public benefit mission. EPRI was established in 1972 and has principal offices and laboratories located in Palo Alto, Calif.; Charlotte, N.C.; Knoxville, Tenn.; and Lenox, Mass. EPRI conducts research and development relating to the generation, delivery, and use of electricity for the benefit of the public. As an independent, nonprofit organization, EPRI brings together its scientists and engineers as well as experts from academia and industry to help address challenges in electricity, including reliability, efficiency, health, safety, and the environment. EPRI also provides technology, policy and economic analyses to inform long-range research and development planning, as well as supports research in emerging technologies. As a tax-exempt research organization, EPRI makes its research results widely available to the interested public through license, purchase or other dissemination.

These comments on the proposed rule reflect EPRI's opinions derived from its research and development experience over the last 40 years in the field of human health effects. In particular, EPRI has robust research programs investigating exposure- or dose-response questions of relevance to the electric power industry and its stakeholders, including criteria air pollutants, trace metals and organic compounds, low dose ionizing radiation, and electromagnetic fields. These comments reflect EPRI's research activities in that they are technical rather than legal in nature. The enclosed comments reflect only EPRI's opinion and expertise and do not necessarily reflect the opinions of those supporting and working with EPRI to conduct collaborative research and development.

EPRI hopes its comments and technical feedback will be valuable to EPA.

Sincerely,



Robert Chapman
Vice President, Energy and Environment

Strengthening Transparency in Regulatory Science

Submitted by:
ELECTRIC POWER RESEARCH INSTITUTE
3420 Hillview Avenue
Palo Alto, CA 94304

August 7, 2018

INTRODUCTION:

The Electric Power Research Institute, Inc. (EPRI) respectfully submits the enclosed comments on the U.S. Environmental Protection Agency's (EPA's) proposed rule titled *Strengthening Transparency in Regulatory Science*. EPRI appreciates the opportunity to comment on this rule.

EPRI has robust research programs investigating exposure- or dose-response questions of relevance to the electric power industry and its stakeholders, including criteria air pollutants, trace metals and organic compounds, low dose ionizing radiation, and electromagnetic fields. EPRI's research in the area of human health effects spans more than 40 years.

The proposed rule focuses on dose-response data. Such data can be generated in *in vitro* or *in vivo* toxicological studies, controlled human exposure studies (also termed clinical studies), and observational epidemiology studies in humans. In the case of toxicological data, making information publicly available is generally straightforward. However, human data present unique challenges due to privacy and confidentiality. Detailed study protocols are required that outline steps that will be taken by the researchers to protect confidential information, and in any study involving humans, approval by an Institutional Review Board (IRB) is required. An IRB

is a committee that evaluates the ethics of a given research endeavor, with the goal to protect human subjects from any physical or psychological harm. Universities and other research organizations cannot conduct research that involves human subjects without IRB approval.

EPRI understands the importance of transparency in scientific research, and supports efforts to make datasets available for use by the scientific community to the extent possible. For example, EPRI has funded an extensive air quality monitoring campaign – the Southeastern Aerosol Research and Characterization Study (SEARCH) – for more than a decade (see Hansen et al., 2003 for a description). This rich dataset includes detailed daily data from multiple sites on criteria pollutants, PM components, volatile and particle-phase organic compounds, and pollen and mold spores, over varying time periods. The data have been utilized in more than 300 peer-reviewed articles, including multiple time-series epidemiological analyses, and are available free of charge at https://www.dropbox.com/sh/o9hxoa4wlo97zpe/AACbm6LetQowrpUgX4vUxnoDa?dl=0. In fact, EPRI encourages use of these data by the broader community as EPRI believes they are a tremendous resource for both physical and health sciences researchers.

EPRI conducts research in the public benefit. To this end, EPRI supports efforts to improve transparency and to allow the best science to be used to protect public health and the environment. This includes transparency in dataset availability, methodologies, models, and other aspects of scientific research. In the past, EPRI has commented on a variety of regulatory activities along these lines, including recent comments encouraging transparency in modeling of the social cost of carbon (e.g., EPRI, 2014a; 2014b).

More specifically, to achieve EPRI's public benefit mission, it is vital that EPRI be able to provide its research results to inform regulatory discussions, such as those with the EPA and other stakeholders. In many studies, EPRI employs data originating from publicly available sources. However, some of EPRI's work involves data that may not be publicly shared, including proprietary material from member companies and other collaborators, data that EPRI must purchase or obtain through special arrangements to facilitate research, personally identifiable information (PII), and data that are classified because of national security considerations. As such, EPRI has two primary comments on the proposed rule. The first focuses on the objective of providing sound scientific input to ensure that standards, rules, and other regulatory actions are scientifically defensible and are health-protective while minimizing cost. EPRI will provide examples of its past, existing, and future work to illustrate how the rule may impact the utilization of such scientific input to inform these aspects of the regulatory process. EPRI's other comment focuses on the alternative dose-response models referred to in the proposed rule. EPRI also has six questions and issues for clarification.

COMMENTS:

1. **Confidential/Personal Health Information:** EPRI has funded, is funding, and plans to fund a number of studies involving primary data used in epidemiological analyses evaluating dose-response relationships. These data can consist of exposure information as well as individual-level health outcome information. In some cases, EPRI-funded researchers collect data directly (e.g., panel epidemiology studies), and EPRI would typically own the collected data. In other cases, however, EPRI-funded research involves the use of datasets owned by other institutions, which EPRI obtains through permissions or, at times, licenses. And in other studies, EPRI purchases access to data from a third party, subject to stringent license terms and use thereof limited to specific purposes under strictly controlled conditions.

   Given that the proposed rule requires data to be publicly available "in a manner sufficient for independent validation", this may present a challenge for a number of these studies to the detriment of the public if they are excluded from consideration. Complete exclusion of an entire study could limit access to scientifically defensible information to regulators and other stakeholders to achieve desired regulatory aims. EPRI research cannot inform deliberations on proposed regulation or provide new learning to EPA if the study cannot comply with the requirements of the proposed rule given the placement of undue burden on the study investigators to provide required documentation (e.g., redacted death certificates in cohort mortality studies), complete additional IRB applications, or submit additional applications to other originators of data for permission to share publicly. An unintended outcome of the rulemaking could be elimination from consideration of not only EPRI's but also other past, present, and future research that could be useful to regulators and other stakeholders.

   Examples of past and current research that EPRI believes are important for consideration in regulatory activities are described below (note that this is not an exhaustive list.) Each example provides an explanation of the potential issues associated with making data required to understand human health effects and dose-response relationships publicly available.

   a) *Medicare Cohort Study to Understand Air Pollution Health Effects*: EPRI has funded the purchase and analysis of a large Medicare beneficiary dataset to investigate important questions related to air pollution health effects (Pun et al., 2017; Eum et al., 2018; additional papers forthcoming). Analyses of this dataset are expected to continue into the future. The health outcome data (mortality) were obtained from the Centers for Medicare and Medicaid Services (CMS) via a costly, labor-intensive, and protracted process. Deidentification of these data to a form that would be acceptable for sharing by CMS would preclude their use in meaningful air pollution epidemiological research. This is because identifying information such as the ZIP

codes of residence is required to assign pollutant exposures, and identifying information such as age, gender, and race is required to allow adjustment for these factors in epidemiological models.

The proposed rule also mentions data research centers that facilitate secondary data usage by the public. If the CMS data are considered to fall in this category, EPRI would encourage EPA to work with CMS to streamline and simplify the data acquisition process and make the data available to the public free of charge. Otherwise, the cost and security requirements of obtaining these data may place an undue burden on stakeholders seeking to replicate analyses, since the data for EPRI's project were acquired at a significant cost (> $100,000) and a comprehensive data management plan that outlined rigorous security protocols was required. Clearly, these requirements would make replication of the work untenable for many researchers. EPRI has concerns that the challenges of making these data available in an equitable fashion may result in the data and insights from this study being removed from consideration in standard-setting activities for $PM_{2.5}$, ozone, and NO_2.

b) *Occupational Epidemiology Study of Hexavalent Chromium Cancer Risk*: EPRI funded a study to update the mortality, exposure reconstruction and dose-response modeling for a cohort of workers from the Painesville, Ohio Chromate Production Plant who were exposed to hexavalent chromium, resulting in elevated rates of lung cancer (Proctor et al., 2017). This cohort is associated with significant regulatory precedent as it updated a study used by the Occupational Safety and Health Administration for risk assessment when the hexavalent chromium Permissible Exposure Limit was lowered in 2006. The current EPA inhalation cancer slope factor, originally set in 1984, was also based on an earlier study of workers from the Painesville plant, but the EPRI study uses more robust data and included short-term workers, thus allowing examination of the dose-response relationship in the low-exposure range.

Clearly this study is of interest for risk assessment (in particular, the EPA's Integrated Risk Information System [IRIS] program); however, the original data are not publicly available as they are owned by the company that employed the workers, and EPRI's research was subject to a strict confidentiality agreement. EPRI believes it could be possible to prepare a publicly available analytical file that provides individual-level deidentified data with dose measures for each unidentified cohort member, with the occurrence of lung cancer, the occurrence of significant covariates used in the model (e.g., smoking), approximate date of birth (e.g., birth year in a 2-year range)

and other variables needed to calculate expected number of deaths (race, gender and approximate date of death, within a range). However, whether or not the file is ultimately made publicly available would depend on the availability of resources to create the file, likely permission from the data owner to distribute the information, even in its deidentified form, and possibly an additional IRB application. If these requirements were met, the information could be used to reproduce the published dose-response model without violating agreements with the original IRB's approval of the study or agreement with the Centers for Disease Control (CDC) for use of National Death Index (NDI) data. However, complete study validation, as expressed in the proposed rule (i.e., data to be publicly available *in a manner sufficient for independent validation*), would not be possible. The raw data required to reconstruct exposures or identify causes of death are not sharable because the information is protected (due to ownership by the employer). To reconstruct the cohort-specific Job Exposure Matrix, inclusion of PII regarding the work history, including job titles over time as well as starting and termination dates, is needed. This information could not be made publicly available without disclosing PII. Also, it is not possible to provide the raw data to reconstruct the outcome (lung cancer death occurrence in this case). In some cases, cause of death was identified by death certificate, which could be redacted, although with significant effort by the researchers; however, NDI data were destroyed upon completion of the study, consistent with the agreement that the Centers for Disease Control (CDC) had with the researchers for use of the data. Thus, to recreate those raw data, significant PII would be required to search the NDI records again. This would not only be extraordinarily time-consuming and costly but would have to be approved by CDC and would require a new IRB review and approval. EPRI is concerned that this important study, which reported a different inhalation cancer slope factor for hexavalent chromium as compared with previously published studies, would be eliminated from consideration in the IRIS process or other proceedings in which toxicity factors are determined.

c) *Children's Air Pollution Asthma Study (CAPAS)*: EPRI funded a panel study of asthmatic children involving residential exposure assessment and collection of pulmonary function and symptom data. Several papers resulted from the research related to the associations between indoor and outdoor $PM_{2.5}$ and its individual components and asthma exacerbation (Habre et al., 2014a, 2014b; Rohr et al., 2014; Schachter et al., 2015; additional paper forthcoming). The consent form utilized in the study stated that indoor exposure data as well all questionnaire data would be kept strictly confidential. This would preclude the consideration of all data from this study with the exception of the ambient monitoring data which were obtained

through a combination of a state-operated monitoring network and an EPRI-funded fixed monitoring site. EPRI is concerned that this body of research would be eliminated from consideration in standard-setting activities. Additionally, CAPAS provided important information on the role of PM components in the health effects, which is a topic of interest to EPA and others, given that it is unlikely that all PM components are equally toxic.

d) *Low Dose Radiation Exposure Health Effects*: EPRI has for nearly 10 years worked to increase the understanding of effects from low doses of ionizing radiation. In this arena, EPRI faces problems similar to those that EPA identifies, because the primary datasets of individualized data for human epidemiological studies of the atomic bomb survivors and workers at early production and utilization facilities are not readily available. These observational studies have been well-utilized and form the basis for radiation protection standards around the world (Ozasa et al., 2012; Richardson et al., 2015). The detailed data of the survivors of the atomic bombings of Hiroshima and Nagasaki are controlled by the Radiation Effects Research Foundation, and cannot be released to those outside of the Foundation under agreements with Japan and the United States. Similarly, studies of early cohorts of workers from the United States, England, France, and other countries are pooled and controlled by the International Agency for Research on Cancer. Since many of the data from human radiation studies are managed by other research organizations that have highly restrictive data access policies, it is unclear that special arrangements can be made with these entities to release the data for public access. EPRI is concerned that these seminal studies may be eliminated from future consideration as a result of this proposed rule.

2. **Dose-Response Models: Shape and Uncertainty:** The proposed rule states that EPA should give appropriate consideration to high-quality studies that explore a broad range of concentration-response modeling approaches, in addition to linearity. EPRI has been conducting research on different models and agrees that a variety of models should be applied to dose-response data, including linear, linear threshold, non-linear non-threshold, and non-linear threshold, with the objective to determine the best-fitting model. EPRI research on both hexavalent chromium and inorganic arsenic, for example, has suggested the presence of a threshold for the carcinogenicity of these trace metals (e.g., Thompson et al., 2015, 2017; Gentry et al., 2014; Efremenko et al., 2015). EPRI agrees that complete model fit statistics should be included in papers for transparency. However, it should be noted that "best fit" may not always be clear. For example, a common method of evaluating model fit is the Akaike Information Criterion (AIC). In some cases, the difference in the AIC

between models may be very small, which makes it challenging to determine which model truly represents the underlying data. In evaluating model fit, EPRI encourages the development and/or application of other methods so that consistency across approaches can be determined. However, regardless of the amount of information available on the best-fitting model for a particular dose-response relationship, there still may be some level of subjective judgement. The proposed rule should consider emphasizing the importance of conveying this judgment and associated uncertainty in a transparent manner.

It is also important that priority not be given to any particular dose-response model. The optimal dose-response curve should be dictated by the best available science and the degree of uncertainty present. The proposed rule states that EPA should incorporate the concept of model uncertainty; EPRI further suggests that studies should present uncertainty in the different model fits and that this information should be presented in a transparent manner. Further, uncertainties should be assessed both for the dose, and for the effect, so that a complete picture of uncertainties is presented. EPRI has supported the development of an Integrated Uncertainty Analysis (IUA) tool for air pollution risk assessment (Smith and Glasgow, 2017). This tool has the capability to comprehensively and simultaneously consider multiple sources of uncertainty in a given exposure-outcome relationship. Such a tool or approach could be useful in achieving the goal expressed in the proposed rule.

ISSUES AND QUESTIONS FOR CLARIFICATION:

1. **Timeliness of Public Access:** It is not clear whether *study validation/replication* would be required for consideration of any given research results in regulatory activities, or whether *data accessibility* is sufficient. A situation could be envisioned whereby a dataset is made publicly available just prior to a regulatory action/process component, e.g., publication of an Integrated Science Assessment for a NAAQS review. In this case, there may be a previously published study using these data, but insufficient time for another investigator to replicate the study methodology. It is not clear how this situation would be dealt with, i.e., whether the original study would then be excluded from the ISA. EPRI requests clarification of this issue.

2. **Costs Associated with Making Information Public:** It is unclear how the costs of obtaining data would be paid. For example, if researchers are required to expend significant effort and resources to deidentify datasets for dose-response modeling (which, as discussed above, is likely insufficient to fulfill the intent of the proposed rule in most cases), what recovery mechanisms would be in place to assist with the costs?

Would the federal government offer resources to assist with attempts to meet the new requirements for existing and future research efforts? Further, if data are purchased and then required to be shared (note that as discussed above, this is an unlikely scenario given privacy and confidentiality issues), will the original investigator be able to recoup costs associated with that purchase from subsequent researchers of the now-publicly available information? The additional costs associated with complying with the proposed rule may place an undue burden on research organizations and efforts such that research in these areas is not conducted at all to the detriment of the public. EPRI requests that the issue of funding for data accessibility be addressed.

3. **Use of Standardized Methodology:** The proposed rule states that EPA will utilize standardized test methods. It is not clear how new test methods or analytical methods would be factored into considerations. In some cases, new analytical approaches may not yet have reached the status of standard methods, but such techniques may be very informative in understanding the implications of data for use in a rulemaking. EPRI requests that EPA clarify that scientifically-grounded alternative testing methods and evaluations may be included in developing regulatory actions.

4. **Definition of "Data":** Section 30.5 of the proposed rule specifies the type of information that would be made public to allow independent validation. As discussed in some parts of Comment #1 above, the interpretation of the term "data" has critical implications. For complete independent validation and analysis, as stated in the proposed rule, the primary data record would be required. This could include, for example, raw death certificates and raw chemical monitoring data, both of which are subject to transcription error during creation of an analytical file, as well as, in the case of death certificates, challenges related to mortality coding. Notwithstanding privacy concerns, which is the subject of other portions of the proposed rule, public posting of these large quantities of data would be unwieldly. EPRI requests clarification of this issue.

5. **Independent Peer Review:** Section 30.7 of the proposed rule states that EPA shall conduct independent peer review of pivotal regulatory science. The proposed rule lacks any detail of this process, including selection criteria for peer reviewers, decision criteria, and how this compares to existing processes through the Science Advisory Board (SAB) and third-party contractor-managed peer reviews. EPRI requests clarification and additional detail related to this key provision of the proposed rule.

6. **Exemption Process:** Section 30.9 of the proposed rule states that the Administrator may grant exemptions on a case-by-case basis. While a reasonable exemption process could allow certain excluded research to be considered in regulatory proceedings, no detail is

provided regarding the process by and criteria under which such exemptions would be granted. EPRI requests clarification and additional detail related to this key provision of the proposed rule. EPRI also requests clarification and additional information on the process by which organizations or investigators can seek to resolve a situation where high quality scientific data/studies might be excluded.

submitted electronically

Re: Docket EPA-HQ-OA-2018-0259-0025, Strengthening Transparency in Regulatory Science

Thank you for the opportunity to comment on this proposed Environmental Protection Agency (EPA) regulation.

The Collaboration for Research Integrity and Transparency (CRIT) at Yale is dedicated to promoting health by improving the integrity and transparency of biomedical and clinical research. Although we are strong proponents of responsible data sharing, and seek to make data available to researchers, we request that the EPA withdraw the proposed regulation.

We believe that the proposed regulation will not advance transparency in regulatory science. Instead, we suspect that the proposed regulation may limit the EPA's ability to rely on many well-designed longitudinal and cross-sectional scientific studies. First, there are concerns that the preamble and proposed regulation are not aligned with existing data sharing policies and that the proposed rule directly contradicts established policy and law. Second, although the proposed regulation outlines the importance of "reproducibility", it does not provide a framework for how the reproducibility of an individual study can or should be assessed. Lastly, there are opportunities to promote data sharing without requiring that all data be made publicly available.

Consistent with the larger societal move toward open science, the U.S. federal government, including the EPA, has adopted policies that facilitate data sharing. For instance, the National Institutes of Health (NIH) requires that researchers conducting agency-funded research pre-register clinical trials, pre-specify study endpoints and statistical plans, and report research results. Moreover, all NIH applications for $500,000 or more in direct funding in any given year must contain a data sharing plan, and some

EMAIL CRIT.ADMIN@YALE.EDU

institutes of the NIH share data with researchers via a secure website.[1] Many federal agencies, including the EPA, require that any published articles based on federally-funded research be made available via the PubMed Central (PMC) website.[2] In addition to government entities, professional societies and journals have also adopted transparency policies. For instance, the International Committee of Medical Journal Editors (ICMJE) has adopted a policy requiring pre-registration of clinical trials, and publication of a data-sharing statement.[3] In 2015, the Institute of Medicine (IOM) published a report recommending that trials be registered prospectively (i.e., at or before the time of first patient enrollment), that summary-level results be shared with the public after trial completion, and that the metadata and patient-level data be responsibly shared with researchers 6 months after scientific publication, or 30 days after regulatory approval.[4] **None of these policies require that all individual-level underlying data and models be made available to the public.**

The EPA's mission necessitates the use of research findings from a variety of sources: research funded or conducted by the EPA or other U.S. government agencies; research funded or conducted by other governments; and research conducted without EPA or other government funding. With regard to studies conducted with human subjects, data may contain personal health information, and particularly with regard to longitudinal studies, may contain such detailed and specific information regarding each individual that the data cannot be properly de-identified for release to the public. In addition, the move toward data-sharing is relatively new, and historical studies with human subjects used written informed consent that did not contemplate sharing of data. Making data from such studies available to the public would violate federal Human Subjects regulations.

The EPA has already embarked on a well-thought-out plan to require and promote research transparency, as described in the EPA's 2016 *Plan to Increase Access to Results of EPA-Funded Scientific Research* ("*Plan*"). Although the preamble to the proposed regulation cites and "applies concepts and lessons learned" from the *Plan*, there are some concerning differences.

First, the *Plan* indicates that it does not apply to "scientific research data collected before its implementation."[5] In contrast, the preamble and the proposed regulation suggest that the regulation may apply retrospectively:

> …EPA seeks comments on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could inadvertently introduce bias regarding the timeliness and quality of the scientific information available.[6]

We do not recommend any retroactive application of this regulation. It is well-established that agency rules cannot be applied retroactively unless Congress expressly granted the agency that power.[7] There is no specific grant of power to apply this proposed regulation retroactively. Moreover, the two bills upon which this proposed regulation is modeled, the Honest and Open New EPA Science Treatment (HONEST) Act of 2017 (H.R. 1430 – 115th Congress, 2017-2018), and the Secret Science Reform Act of 2015 (H.R.1030 – 114th Congress 2015-2016), were not enacted.

Second, the preamble and proposed regulation appear to suggest that peer-reviewed studies are only valid if the underlying data and models are publicly available. In contrast to the *Plan*, the proposed regulation proceeds from the erroneous assumption that peer-reviewed research is only valid if it is able to be replicated by others. However, many key environmental studies cannot be replicated, for ethical or practical reasons. For example, the federal Office of Management and Budget has stated:

> OMB urges caution in the treatment of original and supporting data because it may often be impractical or even impermissible or unethical to apply the reproducibility standard to such data. For example, it may not be ethical to repeat a ''negative'' (ineffective) clinical (therapeutic) experiment and it may not be feasible to replicate the radiation exposures studied after the Chernobyl accident.[8]

203.436.8420
EMAIL CRIT.ADMIN@YALE.EDU

Furthermore, according to the *Plan*, not all research can be made fully, thus publicly, available:

> It is important to recognize that some research data cannot be made fully available to the public but instead may need to be made available in more limited ways, e.g., establishing data use agreements with researchers that respect necessary protections. Whether research data are fully available to the public or available to researchers through other means does not affect the validity of the scientific conclusions from peer-reviewed research publications.[9]

The preamble and proposal also acknowledge this concern, and highlight that strategies need to be identified for data that cannot be made publicly available:

> —EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective and may include: requiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.[10]

Over the past few years, there have been growing efforts to promote the transparency and reproducibility of science.[11] However, the nomenclature surrounding "reproducibility" is complex.[12] Historically, there has been no clear criteria for what constitutes "successful replication and reproduction",[13] which makes certain components of the current proposal concerning. We believe that it is important to ensure that the "reproducible research" movement is not being co-opted for political purposes. Without a clear understanding of

[13] *Id.*

research reproducibility, different standards (i.e., "case-by-case" decisions) can be applied to discredit individual studies.

According to a recent effort to standardize the language of reproducibility,[14] there are three key areas of reproducibility:

1. Methods reproducibility
   - This is when a study provides enough information about the experimental and/or computational procedures so that future authors can repeat the study using the same data to obtain the same results.
2. Results reproducibility
   - This is when a new study produces corroborating results using experiment methods that are closely matched to a previous study.
3. Inferential reproducibility
   - This is when a new study draws qualitatively similar conclusions from either an independent replication or re-analyses.[15]

These three areas of reproducibility can have different meanings for various areas of scientific research. "Methods reproducibility" may be realistic for laboratory-based studies, where it is possible to implement the exact experimental and computation procedures with the same (or very similar) tools to obtain the same results. However, new clinical or environmental studies may use procedures that are closely matched, but not identical, to previous evaluations. When it comes to observational research, it is well known that some weaknesses are unavoidable. For instance, it is often difficult to eliminate all potential sources of confounding, or to adjust for the same confounders across studies from different time periods. Therefore, it would be unfair to argue that all aspects of a study, including the design and analyses characteristics, need to be reproduced exactly.

The goal of repeating a study should be to increase the total amount of evidence. Furthermore, if a hypothesis being tested has strong evidence from an existing study (i.e., rigorous methods, large sample sizes, transparent reporting), a considerable amount of high quality evidence is necessary to change prior reasoning. Moreover, one small study that does not validate the results of a previous study should not automatically imply that the original study lacks reproducibility.

The emphasis in the proposed regulation on accepting only reproducible studies with publicly available data could eliminate EPA reliance on well-conducted longitudinal studies such as the Six Cities Study, an example of rigorous and robust observational

[14] *Id.*
[15] *Id.*

research, which established the association between fine-particulate air pollution and mortality.[16] After the results were published, an independent group of investigators re-analyzed the results, assessed the robustness of the findings, and confirmed the original results.[17] We believe that similar rigorous re-analyses and replications are possible without mandating public availability of all data.

While data sources that do not pose significant human subject re-identification concerns should be shared publicly using existing data repositories, such as those employed by the National Center for Health Statistics, the Centers for Disease Control and Prevention, and the NIH's NHLBI Biologic Specimen and Data Repositories Information Coordinating Center (BioLINCC), the EPA should focus on creating a data sharing system for long term human subject studies where privacy concerns exist. Under the model that we proposed, only properly deidentified data should be shared, and redaction and de-identification needs to ensure anonymity of research participants according to the Health Insurance Portability and Accountability Act of 1996 (HIPAA). P.L. No. 104-191, 110 Stat. 1938 (1996).

In order to make data available to external researchers for scientific purposes, the EPA should follow previous efforts to facilitate the sharing of data.[18] In particular:

1. An independent intermediary group should be created and should partner with the EPA to oversee data requests. By allowing an independent group to have full jurisdiction to make decisions regarding data access, potential political motivations can be avoided.

2. The independent group should ensure that data are made available for scientific research that is aimed at advancing knowledge. Data requestors should provide basic information about the principal investigators, all study personnel and

funders, and submit a detailed proposal outlining specific aims and specifying study methodology. All data requests should undergo external review, to facilitate feedback from independent experts in the field to verify scientific merit. To ensure transparency, the independent group should make all of the data requests publicly available, along with the reasons for granting or denying data requests.

3. All requestors should be required to sign a Data Use Agreement (DUA), which states that access to the data will be used to enhance knowledge and that all findings will be made publicly available through publications and meetings.

4. The independent group should ensure that the scope of the analyses is limited to the specific aims set out in the proposal and that additional objectives are outlined in new submissions.

Responsible data sharing is a complex endeavor and should be done in a manner that is safe and in the best interest of society. Although the IOM report *Sharing Clinical Trial Data: Maximizing Benefits, Minimizing Risk* focuses on clinical trial transparency, some of the conclusions are applicable to the EPA proposed rule:

> The committee's position is that the benefits of data sharing belong primarily to the public in the form of valid scientific knowledge and improvement of clinical practice and public health. However, these benefits are not necessarily best attained by full open transparency…If full open transparency of clinical trial data carries on balance more risk than benefits, it does not serve the public good.[19]

Furthermore, the language in the EPA proposal is dangerous as it may allow for "case-by-case" determinations that would permit the Administrator to "exempt significant regulatory decisions on a case-by-case basis if he or she determines that compliance is impracticable."[20] Well-established legal precedent frowns upon case-by case determinations where, as here, a general rule would be appropriate.[21] In addition, this provision would allow the EPA to selectively choose studies to rely on and to disregard by granting exemptions to the public availability requirement. Moreover, CRIT believes

that any new regulation involving reproducibility and transparency proposed by the EPA should be applied to research from all sources, including studies conducted by industry.

Lastly, we are also concerned about the lack of scientific justification for the emphasis in the proposed regulation on privileging non-linear models for dose-response over the well-accepted linear models, and the inclusion of the previously non-existent concept of "pivotal regulatory science."[22] The preamble to the proposed regulation makes an unsupported claim that there is "growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects;"[23] and establishes new priorities for EPA funding of research that privilege non-linear models, in direct opposition to the accepted scientific methodology. The proposed regulation states:

> When available, EPA shall give explicit consideration to high quality studies that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.[24]

It is inappropriate to establish major changes in research priorities through insertion of additional language in a proposed regulation ostensibly on another topic, as was done here, rather than to use the normal channels of consultation with stakeholders, advisory boards, and reference to prior commissioned studies from the National Academies of Sciences.[25] These proposed changes are antithetical to the governing law, existing regulations, and well-established agency practice.

approximately 15 percent of students receive their education exclusively through distance education while 68.3 percent took no distance education courses. However, at proprietary institutions almost 59.2 percent of students were exclusively distance education students and 30.4 percent had not enrolled in any distance education courses.[1] The delay in a clear State authorization rule for distance education may slow the reshuffling of the postsecondary education market or the increased participation of small entities in distance education, but that is not necessarily the case. Distance education has expanded over recent years even in the absence of a clear State authorization regime.

In the analysis of the 2016 final rule, we noted that the Department estimated total State Authorization Reciprocity Agreement (SARA) fees and additional State fees of approximately $7 million annually for small entities, but acknowledged that costs could vary significantly by type of institution and institutions' resources and that these considerations may influence the extent to which small entities operate distance education programs. Small entities that do participate in the distance education sector may benefit from avoiding these fees during the delay period. If 50 percent of small entities offer distance education, the average annual cost savings per small entity during the delay would be approximately $3,280, but that would increase to $6,560 if distance education was only offered by 25 percent of small entities. This estimate assumes small entities have not already taken steps to comply with the State authorization requirements in the 2016 final rule. The Department welcomes comments on the distribution of small entities offering distance education, the estimated costs to obtain State authorization for their programs, and the extent to which small entities have already incurred costs to comply with the 2016 final rule.

The Department also estimated that small entities would incur 13,981 hours of burden in connection with information collection requirements with an estimated cost of $510,991 annually. Small entities may be able to avoid some of the anticipated burden during the delay. To the extent small entities would need to spend funds to comply with State authorization requirements for distance education, the proposed delay would allow them to postpone incurring those costs. And although institutions may have incurred some of the $510,991 annual costs to prepare for the information collection requirements, it is possible that institutions could avoid up to that amount during the period of the delay.

Paperwork Reduction Act of 1995

As indicated in the Paperwork Reduction Act section published in the 2016 final regulations, the assessed estimated burden was 152,565 hours affecting institutions with an estimated cost of $5,576,251.

The table below identifies the regulatory sections, OMB Control Numbers, estimated burden hours, and estimated costs of those final regulations.

Regulatory section	OMB control No.	Burden hours	Estimated cost $36.55/hour institution
600.9	1845–0144	160	5,848
668.50(b)	1845–0145	151,715	5,545183
668.50(c)	1845–0145	690	25,220
Total	.....	152,565	5,576,251
Cost savings due to delayed effective date	.....	152,565	5,576,251

This notice proposes to delay the effective date of the all of the cited regulations.

40 CFR Part 30

[EPA–HQ–OA–2018–0259; FRL–9978–31–ORD]

RIN 2080–AA14

Strengthening Transparency in Regulatory Science; Extension of Comment Period and Notice of Public Hearing

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule; extension of comment period; notice of public hearing.

SUMMARY: On April 30, 2018, the Environmental Protection Agency (EPA) proposed a rule titled, "Strengthening Transparency in Regulatory Science." The EPA is extending the comment period on the proposed rule, which was scheduled to close on May 30, 2018, until August 16, 2018. The EPA is also announcing a public hearing to be held for the proposed rule. The hearing will be held on July 17, 2018 in Washington, DC. The EPA is making these changes in response to public requests for an extension of the comment period and for a public hearing.

DATES: The public comment period for the proposed rule published in the **Federal Register** on April 30, 2018 (83 FR 18768), is being extended. Written comments must be received on or before August 16, 2018. The public hearing will be held on July 17, 2018.

ADDRESSES: The EPA has established a docket for the proposed rulemaking (available at *http://www.regulations.gov*). The Docket ID No. is EPA–HQ–OA–2018–0259. Submit your comments, identified by the appropriate Docket ID, to the *Federal eRulemaking Portal: http://www.regulations.gov*. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or withdrawn. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. If you need to include CBI as part of your comment, please visit *http://www.epa.gov/dockets/comments.html* for instructions. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make.

For additional submission methods, the full EPA public comment policy, and general guidance on making effective comments, please visit *http://www.epa.gov/dockets/comments.html.*

Public hearing: The public hearing will be held at the Environmental Protection Agency, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, DC 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST or one hour after the last registered speaker has spoken, whichever is earlier. The EPA will make every effort to accommodate all speakers that arrive and register. Because this hearing is being held at a U.S. government facility, individuals planning to attend the hearing should be prepared to show valid picture identification to the security staff to gain access to the meeting room. No large signs will be allowed in the building, cameras may only be used outside of the building, and demonstrations will not be allowed on federal property for security reasons.

If you would like to present oral testimony at the public hearing, please register online at *https://www.epa.gov/osa/strengthening-transparency-regulatory-science* or contact Tom Sinks, Environmental Protection Agency, Office of the Science Advisor, (MC 8105R), 1200 Pennsylvania Avenue NW, Washington, DC 20460, telephone (202) 564–0221, *staff_osa@epa.gov,* no later than 2 business days prior to the public hearing. The last day to register will be July 15, 2018. If using email, please provide the following information: Time of day you wish to speak (8:00 a.m.–12:00 p.m., 12:00 p.m.–4:00 p.m., 4:00 p.m.–8:00 p.m.), name, affiliation, address, email address, and telephone and fax numbers.

FOR FURTHER INFORMATION CONTACT: Questions concerning the proposed rule, "Strengthening Transparency in Regulatory Science" should be addressed to Tom Sinks, Office of the Science Advisor, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, Washington, DC 20460; (202) 564–0221; email address: *staff_osa@epa.gov.*

SUPPLEMENTARY INFORMATION: This document extends the public comment period for the proposed rule to ensure that the public has sufficient time to review and comment on the proposal. EPA is proposing this rule under authority of 5 U.S.C. 301, in addition to the authorities listed in the April 30th document.

The public hearing provides the public with an opportunity to present oral comments regarding EPA's proposed regulation entitled "Strengthening Transparency in Regulatory Science." This proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that, for the science pivotal to its significant regulatory actions, EPA will ensure that the data and models underlying the science is publicly available in a manner sufficient for validation and analysis. EPA is proposing this rule under authority of 5 U.S.C. 301, in addition to the authorities listed in the April 30th document.

The public hearing will provide interested parties the opportunity to present data, views, or arguments concerning the proposal. EPA solicits comments on all aspects of the proposal and specifically on the issues identified in Section III of the April 30th document. The EPA may ask clarifying questions during the oral presentations, but will not respond to the presentations at that time. Written statements and supporting information submitted during the comment period will be considered with the same weight as any oral comments and supporting information presented at the public hearing.

Oral testimony will be limited to 5 minutes for each commenter. The EPA encourages commenters to provide EPA with a copy of their oral testimony electronically via email or in hard copy form.

The hearing schedules, including lists of speakers, will be posted on EPA's website *https://www.epa.gov/osa/strengthening-transparency-regulatory-science.* Verbatim transcripts of the hearings and written statements will be included in the docket for the rulemaking. EPA will make every effort to follow the schedule as closely as possible on the day of the hearing; however, please plan for the hearing to run either ahead of schedule or behind schedule.

Dated: May 21, 2018.

Tom Sinks,

Director, Office of the Science Advisor.

Air Plan Approval; Wisconsin; Particulate Matter Standard

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing to approve a January 4, 2018, request by the Wisconsin Department of Natural Resources (Wisconsin) to revise its state implementation plan (SIP) for fine particulate matter ($PM_{2.5}$). Wisconsin updated its ambient air quality standards for $PM_{2.5}$ to be consistent with EPA's 2012 revisions to the $PM_{2.5}$

will consider all comments and material received during the comment period. Your comment can help shape the outcome of this rulemaking. If you submit a comment, please include the docket number for this rulemaking, indicate the specific section of this document to which each comment applies, and provide a reason for each suggestion or recommendation.

We encourage you to submit comments through the Federal eRulemaking Portal at *http://www.regulations.gov*. If your material cannot be submitted using *http://www.regulations.gov,* contact the person in the **FOR FURTHER INFORMATION CONTACT** section of this document for alternate instructions.

We accept anonymous comments. All comments received will be posted without change to *http://www.regulations.gov* and will include any personal information you have provided. For more about privacy and the docket, visit *http://www.regulations.gov/privacyNotice.*

Documents mentioned in this NPRM as being available in the docket, and all public comments, will be in our online docket at *http://www.regulations.gov* and can be viewed by following that website's instructions. Additionally, if you go to the online docket and sign up for email alerts, you will be notified when comments are posted or a final rule is published.

List of Subjects in 33 CFR Part 165

Harbors, Marine safety, Navigation (water), Reporting and recordkeeping requirements, Security measures, Waterways.

For the reasons discussed in the preamble, the Coast Guard proposes to amend 33 CFR part 165 as follows:

PART 165—REGULATED NAVIGATION AREAS AND LIMITED ACCESS AREAS

■ 1. The authority citation for part 165 continues to read as follows:

Authority: 33 U.S.C. 1231; 50 U.S.C. 191; 33 CFR 1.05–1, 6.04–1, 6.04–6, and 160.5; Department of Homeland Security Delegation No. 0170.1.

■ 2. Add § 165.T09–0242 to read as follows:

§ 165.T09–0242 Safety Zone; Blazing Paddles 2018 SUP Race; Cuyahoga River, Cleveland, OH.

(a) *Location.* The safety zone will encompass all waters of the Cuyahoga River in Cleveland, OH, beginning at position 41°29′36″ N and 081° 42′13″ W to the turnaround point at position 41°28′52″ N and 081°40′33″ (NAD 83).

(b) *Enforcement Period.* This rule is effective from 8:30 a.m. until 11:30 a.m. on June 23, 2018.

(c) *Regulations.*

(1) In accordance with the general regulations in § 165.23 of this part, entry into, transiting, or anchoring within this safety zone is prohibited unless authorized by the Captain of the Port Buffalo or his designated on-scene representative.

(2) This safety zone is closed to all vessel traffic, except as may be permitted by the Captain of the Port Buffalo or his designated on-scene representative.

(3) The "on-scene representative" of the Captain of the Port Buffalo is any Coast Guard commissioned, warrant or petty officer who has been designated by the Captain of the Port Buffalo to act on his behalf.

(4) Vessel operators desiring to enter or operate within the safety zone must contact the Captain of the Port Buffalo or his on-scene representative to obtain permission to do so. The Captain of the Port Buffalo or his on-scene representative may be contacted via VHF Channel 16. Vessel operators given permission to enter or operate in the safety zone must comply with all directions given to them by the Captain of the Port Buffalo, or his on-scene representative.

Dated: April 23, 2018.

J.S. Dufresne,

Captain, U.S. Coast Guard, Captain of the Port Buffalo.

RIN 2080–AA14

Strengthening Transparency in Regulatory Science

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: This document proposes a regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation. In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

DATES: Comments must be received on or before May 30, 2018.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OA–2018–0259, at *https://www.regulations.gov*. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.,* on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *https://www.epa.gov/dockets/commenting-epa-dockets.*

FOR FURTHER INFORMATION CONTACT: Tom Sinks, Office of the Science Advisor, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, Washington, DC 20460; (202) 564–0221; email address: *staff_osa@epa.gov.*

SUPPLEMENTARY INFORMATION:

Submitting CBI. Do not submit information that you consider to be CBI electronically through *https://www.regulations.gov* or email. Send or deliver information identified as CBI to only the following address using U.S. Postal Service: U.S. Environmental Protection Agency, EPA Docket Center, EPA–HQ–OA–2018–0259, Mail Code 28221T, 1200 Pennsylvania Avenue NW, Washington, DC 20460. For other methods of delivery, see *https://www.epa.gov/dockets/where-send-comments-epa-dockets.*

Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD–ROM that you mail to EPA, mark the

outside of the disk or CD–ROM as CBI and then identify electronically within the disk or CD–ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. If you submit a CD–ROM or disk that does not contain CBI, mark the outside of the disk or CD–ROM clearly that it does not contain CBI. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 Code of Federal Regulations (CFR) part 2.

Organization of This Document. The following outline is provided to aid in locating information in this preamble.

I. General Information

A. Does this action apply to me?

This proposed regulation does not directly regulate any entity outside the federal government. However, any entity interested in EPA's regulations may be interested in this proposal. This proposal may be of particular interest to entities that conduct research and other scientific activity that is likely to be relevant to EPA's regulatory activity.

B. What action is the Agency taking?

This notice solicits information and comment from the public on a proposed regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that, for the science pivotal to its significant regulatory actions, EPA will ensure that the data and models underlying the science is publicly available in a manner sufficient for validation and analysis. In this notice, EPA solicits comment on this proposal and how it can best be implemented in light of existing law and prior statements of policy that have called for increasing public access to data and influential scientific information used to inform federal regulation. EPA has not previously implemented these policies and guidance in a robust and consistent manner. This proposal will help ensure that EPA is pursuing its mission of protecting public health and the environment in a manner that the public can trust and understand.

C. What is the Agency's authority for taking this action?

The Agency proposes to take this action under authority of the statutes it administers, including provisions providing general authority to promulgate regulations necessary to carry out the Agency's functions under these statutes and provisions specifically addressing the Agency's conducting of and reliance on scientific activity to inform those functions, including Clean Air Act sections 103, 301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act section 328, 42 U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609. This action is also consistent with requirements in the Administrative Procedure Act to ensure public participation in the rulemaking process. As noted in Section III below, EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.

II. Background

The best available science must serve as the foundation of EPA's regulatory actions.[1] Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA's regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in enhancing the public's ability to understand and meaningfully participate in the regulatory process.[2] In applying the best available science to its regulatory decision-making, EPA must comply with federal transparency and data integrity laws, and must also ensure that its decision-making is marked by independence, objectivity, transparency, clarity, and reproducibility. Although these standards are important in all scientific endeavors, they are of paramount importance when the government relies on science to inform its significant regulatory decisions that will affect the public. When EPA develops significant regulations using public resources, including regulations for which the public is likely to bear the cost of compliance, EPA should ensure that the data and models underlying scientific studies that are pivotal to the regulatory action are available to the public. This proposed rule is designed to increase transparency in the preparation, identification, and use of science in policymaking.

This proposed rule is consistent with the principles underlying the Administrative Procedure Act and programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.[3] This proposed rule is also consistent with Executive Orders 13777[4] and 13783,[5] and the focus on transparency in OMB's *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies*[6] (the Guidelines) and OMB

[1] See Exec. Order No. 13563, 76 FR 3821 (Jan. 21, 2011). "Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation. It must be based on the best available science."

[2] See Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity (Mar. 9, 2009). "If scientific and technological information is developed and used by the Federal Government, it should ordinarily be made available to the public. To the extent permitted by law, there should be transparency in the preparation, identification, and use of scientific and technological information in policymaking."

[3] EPA has the authority to establish policies governing its reliance on science in the administration of its regulatory functions. Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use non-public data in support of its regulatory actions. *See Coalition of Battery Recyclers Ass'n* v. *EPA,* 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass'ns* v. *EPA,* 283 F.3d 355, 372 (D.C. Cir. 2002). EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.

[4] Exec. Order No. 13777, 82 FR 12285 (Mar. 1, 2017). Regulatory reform efforts shall attempt to identify "those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard for reproducibility."

[5] Exec. Order No. 13783, 82 FR 16093 (Mar. 31, 2017). "It is also the policy of the United States that necessary and appropriate environmental regulations comply with the law, are of greater benefit than cost, when permissible, achieve environmental improvements for the American people, and are developed through transparent processes that employ the best available peer-reviewed science and economics."

Continued

Memorandum 13–13: Open Data Policy—Managing Information as an Asset.[7] It builds upon prior EPA actions[8] in response to government-wide data access and sharing policies, as well as the experience of other federal agencies in this space.[9] In particular, this proposal applies concepts and lessons learned from its ongoing implementation of the 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research to significant regulatory decisions. The proposed rule takes into consideration the policies or recommendations of third party organizations who advocated for open science.[10] These policies are informed by the policies recently adopted by some major scientific journals,[11] spurred in some part by the "replication crisis."[12]

Today, EPA is proposing to establish a clear policy for the transparency of the scientific information used for significant regulations: Specifically, the dose response data and models that underlie what we are calling "pivotal regulatory science." "Pivotal regulatory science" is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.

With this notice, EPA is soliciting public comment on a proposed regulation designed to provide a mechanism to increase access to dose response data and models underlying pivotal regulatory science in a manner consistent with statutory requirements for protection of privacy and confidentiality of research participants, protection of proprietary data and confidential business information, and other compelling interests. The proposal takes comment on how to ensure that, over time, more of the data and models underlying the science that informs regulatory decisions (over and above the dose response data and models underlying "pivotal regulatory science") is available to the public for validation[13] in a manner that honors legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification. As such this proposed regulation is designed to change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis.

Regulatory determinations based on science should describe and document any assumptions and methods used, and should address variability and uncertainty. Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments. EPA's regulatory science should be consistent with the Office of Management and Budget's *Final Information Quality Bulletin for Peer Review.*[14] Robust peer review plays a critical role in independently validating key findings and ensuring that the quality of published information meets the standards of the scientific and technical community.

In addition, this proposed regulation is designed to increase transparency of the assumptions underlying dose response models. As a case in point, there is growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects. The use of default models, without consideration of alternatives or model uncertainty, can obscure the scientific justification for EPA actions. To be even more transparent about these complex relationships, EPA should give appropriate consideration to high quality studies that explore: A broad class of parametric concentration-response models with a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the exposure range; and spatial heterogeneity. EPA should also incorporate the concept of model uncertainty when needed as a default to optimize low dose risk estimation based on major competing models, including linear, threshold, and U-shaped, J-shaped, and bell-shaped models.

Across EPA programs, much of the science that informs regulatory actions is developed outside the Agency. It is the charge of regulators to ensure that key findings are valid and credible, as required by OMB's Guidelines[15] (which apply to "third party" information—*e.g.,* non-government scientific research—if the agency use of that information provides the appearance of representing agency views). Using scientific information that can be independently validated will lead to better outcomes, and strengthen public confidence in the health and environmental protections underpinning EPA's regulatory actions.

EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government.[16] Nothing in the proposed rule compels

[15] February 22, 2002 (67 FR 8453) *OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information* (2002) *https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information.*

[16] See examples from the U.S. Department of Health and Human Services, National Institute of Standards and Technology, U.S. Department of Education, and the U.S. Census Bureau.

the disclosure of any confidential or private information in a manner that violates applicable legal and ethical protections. Other federal agencies have developed tools and methods to de-identify private information for a variety of disciplines.[17] The National Academies have noted that simple data masking, coding, and de-identification techniques have been developed over the last half century and that "Nothing in the past suggests that increasing access to research data without damage to privacy and confidentiality rights is beyond scientific reach." [18] More recently, both the National Academies and the Bipartisan Commission on Evidence Based Policy [19] have discussed the challenges and opportunities for facilitating to secure access to confidential data for non-government analysts.

Considering the breadth of dose response data and models used in the development of significant EPA regulations, the requirements for availability may differ. These mechanisms may range from deposition in public data repositories, consistent with requirements for many scientific journals,[20] to, for certain types of information, controlled access in federal research data centers that facilitate secondary research use by the public.[21] EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective and may also include: Requiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.[22]

Implementation of this proposed rule will be consistent with the definition of "research data" in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in Public Law 89–487, and other applicable federal laws.

This proposed regulation is intended to apply prospectively to final regulations that are determined to be "significant regulatory actions" pursuant to E.O. 12866. The Agency's offices should be guided by this policy to the maximum extent practicable during ongoing regulatory action, even where such research has already been generated, solicited, or obtained.

III. Request for Comment

EPA solicits comment on all aspects of the proposed regulation and the bases articulated for it above. Specifically, EPA believes that it has identified appropriate sources of statutory authority for this proposed regulation in Section I(c) above, and solicits public comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation. EPA further believes that a generally applicable regulatory provision of the type proposed here is the appropriate vehicle to establish and implement the policies articulated in Section II above, in the interests of consistency, predictability, and transparency across the functions that EPA performs.

EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II above.

EPA solicits comment on the effects of this proposed rule on individual EPA programs, including whether certain activities are appropriate to be excepted or if other requirements would affect implementation. EPA also seeks comments on which criteria the Agency should use to base any exceptions, including whether case-by-case exceptions may be appropriate.

Although the proposed regulatory text would impose requirements specifically on final regulations determined to be "significant regulatory actions" under E.O. 12866, EPA solicits comment on whether and to what extent these requirements, or other provisions and policies, should apply to other stages of the rulemaking process, including proposed rules, as well as to other types of agency actions and promulgations, such as guidance. EPA also solicits comment on whether a narrower scope of coverage would be appropriate, such as only final regulations that are determined to be "major" under the Congressional Review Act, or "economically significant" under E.O. 12866. EPA also requests comment on whether certain categories of regulations should be excluded from coverage, such as those that merely reaffirm an existing standard, or some other category. For instance, we request comment on whether the provisions of the proposed rule should apply to individual party adjudications, enforcement activities, or permit proceedings when EPA determines that these provisions are practical and appropriate and that the actions are scientifically or technically novel or likely to have precedent-setting influence on future actions. EPA seeks comment on whether the Agency should apply the provisions of the proposed rule to these actions or to specific types of actions within these categories. The Agency also seeks comment on whether other agency actions, beyond significant final regulatory actions under E.O. 12866, should be included, such as site-specific permitting actions or non-binding regulatory determinations.

EPA solicits comment on the definitions of "*pivotal regulatory science,*" and "*dose response data and models*" and how to implement such definitions.

EPA also solicits comment on how to incorporate stronger data and model access requirements into the terms and conditions of cooperative agreements and grants. EPA solicits comments on how it can build upon other federal agencies' policies regarding grantee and cooperator requirements for data access and data sharing. EPA also solicits suggestions for a platform that would enable the Agency to implement the provisions of this proposal related to increasing public access to EPA-funded data. EPA also seeks comment on methodologies and technologies designed to provide protected access to identifiable and sensitive data, such as individual health data, and on commenters experience with the use of such methodologies and technologies and their strengths and limitations. Similarly, EPA seeks comment on how to balance appropriate protection for copyrighted or confidential business information, including where protected by law, with requirements for increased transparency of pivotal regulatory science. EPA also requests comment on whether there are other compelling interests besides privacy, confidentiality, national and homeland

security that may require special consideration when data is being released.

EPA solicits comment on implementation of the proposed regulation, including which parts of the Agency should be responsible for carrying out these requirements. EPA seeks comment on the effective date of a rule as well as on whether the Agency should seek to phase-in the requirements for certain significant regulatory actions or seek to prioritize specific actions. For regulatory programs, like the National Ambient Air Quality Standards program, in which future significant regulatory actions may be based on the administrative record from previous reviews—particularly where the governing statute requires repeated review on a fixed, date-certain cycle—EPA seeks comment on the manner in which this proposed rule should apply to that previous record. EPA also solicits comments on whether and how the proposed rule should apply to dose response data and models underlying pivotal regulatory science if those data and models were developed prior to the effective date. In addition, EPA seeks comment on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could inadvertently introduce bias regarding the timeliness and quality of the scientific information available. EPA seeks comment on how to address a circumstance in which EPA has a statutory requirement to make a determination for which scientific information publicly available in a manner sufficient for independent validation does not exist. EPA also seeks comment on any additional implementation challenges not discussed in this notice that commenters may be aware of as well as suggestions for addressing them.

The proposed rule includes a provision allowing the Administrator to exempt significant regulatory decisions on a case-by-case basis if he or she determines that compliance is impracticable because it is not feasible to ensure that all dose response data and models underlying pivotal regulatory science are publicly available in a fashion that is consistent with law, protects privacy and confidentiality, and is sensitive to national and homeland security, or in instances where OMB's Information Quality Bulletin for Peer Review provides for an exemption (Section IX). The agency requests comment on whether these exemptions are appropriate, and on whether there are other situations in which specific significant regulatory actions, or specific categories of significant regulatory actions should be exempted.

EPA also requests comment on whether the disclosure requirements applicable to dose response data and models in the proposed rule should be expanded to cover other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulatory interventions on complex economic or environmental systems.

IV. Statutory and Executive Orders Reviews

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review. Any changes made in response to OMB recommendations have been documented in the docket.

EPA believes the benefits of this proposed rule justify the costs. The benefits of EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets; this is consistent with the conclusions of the National Academies [23] This action should be implemented in a cost-effective way and is consistent with recent activities of the scientific community and other federal agencies, which will help to lower costs of implementation. The proposed rule directs EPA to make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making dose response models and data underlying pivotal regulatory science used in significant regulatory decisions available to the public in a manner sufficient for independent validation, consistent with law and protection of privacy, confidentiality, and national and homeland security. However, it does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way that complies with the law and appropriate protections is not possible.

By limiting the proposed rule to pivotal regulatory science for final significant regulatory actions pursuant to E.O. 12866, the proposed rule ensures that this standard for transparency affects a smaller subset of regulations which are economically significant, create inconsistency for other federal agencies, alter budgetary impacts, or raise novel legal or policy issues. One recent analysis found that: "Improvements in reproducibility can be thought of as increasing the net benefits of regulation because they would avoid situations in which costs or benefits are wrongly estimated to occur or in which regulatory costs are imposed without corresponding benefits. . . ." They concluded that "an increase in existing net benefits from greater reproducibility, which, if it occurred, would cover the costs of obtaining the data and making the data available." [24]

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not expected to be an Executive Order 13771 regulatory action because it relates to "agency organization, management or personnel."

C. Paperwork Reduction Act (PRA)

This action does not contain any information collection activities and therefore does not impose an information collection burden under the PRA.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national

[23] *https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities.*

[24] *https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf.*

government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of "covered regulatory action" in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This action is not a "significant energy action" because it is not likely to have a significant adverse effect on the supply, distribution or use of energy.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard.

List of Subjects in 40 CFR Part 30

Environmental protection, Administrative practice and procedure, Reporting and recordkeeping requirements.

Dated: April 24, 2018.

E. Scott Pruitt,

Administrator.

For the reasons set forth in the preamble, EPA proposes to add 40 CFR part 30 as follows:

PART 30—TRANSPARENCY IN REGULATORY DECISIONMAKING

■ 1. Add part 30 to read as follows:

PART 30—TRANSPARENCY IN REGULATORY DECISIONMAKING

Sec.

Authority: Clean Air Act sections 103, 301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C. 300j–1, 300j–9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act section 328, 42 U.S.C. 11048; Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609.

§ 30.1 What is the purpose of this subpart?

This subpart directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.

§ 30.2 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Act or in subpart A; and the following terms shall have the specific meanings given them.

Dose response data and models means the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact. Such functions typically underlie pivotal regulatory science that drives the size of benefit-cost calculations, the level of a standard, and/or the points of departure from which reference values (reference doses or reference concentrations) are calculated.

Pivotal regulatory science means the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.

Regulatory decisions mean final regulations determined to be "significant regulatory actions" by the Office of Management and Budget pursuant to Executive Order 12866.

Regulatory science means scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.

Research data means "research data" as that term is defined in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards.

§ 30.3 How do the provisions of this subpart apply?

The provisions of this subpart apply to *dose response data and models* underlying *pivotal regulatory science* that are used to justify significant *regulatory decisions* regardless of the source of funding or identity of the party conducting the regulatory science. The provisions of this section do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses. Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.

§ 30.4 What requirements apply to EPA's use of studies in taking final action?

EPA shall clearly identify all studies (or other regulatory science) relied upon when it takes any final agency action. EPA should make all such studies available to the public to the extent practicable.

§ 30.5 What requirements apply to EPA's use of dose response data and models underlying pivotal regulatory science?

When promulgating significant regulatory actions, the Agency shall ensure that *dose response data and models* underlying *pivotal regulatory science* are publicly available in a manner sufficient for independent validation. Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security. Information is considered "publicly available in a manner sufficient for independent

validation" when it includes the information necessary for the public to understand, assess, and replicate findings. This may include, for example:

(a) Data (where necessary, data would be made available subject to access and use restrictions).

(b) Associated protocols necessary to understand, assess, and extend conclusions;

(c) Computer codes and models involved in the creation and analysis of such information;

(d) Recorded factual materials; and

(e) Detailed descriptions of how to access and use such information.

The provisions of this section apply to dose response data and models underlying pivotal regulatory science regardless of who funded or conducted the underlying data, models, or other regulatory science. The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national and homeland security is not possible. Where data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section.

§ 30.6 What additional requirements pertain to the use of dose response data and models underlying pivotal regulatory science?

EPA shall describe and document any assumptions and methods used, and should describe variability and uncertainty. EPA shall evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis. EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high quality studies that explore: A broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

§ 30.7 What role does independent peer review in this section?

EPA shall conduct independent peer review on all *pivotal regulatory science* used to justify *regulatory decisions,* consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

§ 30.8 How is EPA to account for cost under this subpart?

EPA shall implement the provisions of this subpart in a manner that minimizes costs.

§ 30.9 May the EPA Administrator grant exemptions to this subpart?

Yes. The Administrator may grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable because:

(a) It is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security; or

(b) It is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality Bulletin for Peer Review (70 FR 2664), Section IX.

§ 30.10 What other requirements apply under this subpart?

EPA shall implement the provisions of this section consistent with the definition of "research data" in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in Public Law 89–487, and other applicable federal laws. Where appropriate, data sharing agreements and state-of-the-art data-masking techniques may be employed to facilitate access to information.

STATEMENT OF WORK

TITLE: Support for EPA Proposed Rule on "Strengthening Transparency in Regulatory Science" Management and response Support for EPA Docket Comments and Public Hearing.

CONTRACT NO.: EP-D-14-033, Work Assignment 3-05

PERIOD OF PERFORMANCE: Time of Award – September 30, 2018

WORK ASSIGNMENT MANAGER (WAM):
Robin R. Clarke
1200 Pennsylvania Avenue, NW (Mail Code 8101R)
Washington, DC 20460
Phone: 202-564-6493
Fax: 202-564-2070
Email: clarke.robin@epa.gov

TECHNICAL POINT OF CONTACT:
TBD

Cheryl A. Hawkins
1200 Pennsylvania Avenue, NW (Mail Code 8105R)
Washington, DC 20460
Phone: 202-564-7307
Fax: 202-564-2070
Email: hawkins.cheryla@epa.gov

BACKGROUND

On April 30, 2018, the U.S. Environmental Protection Agency (EPA) published a Notice of Proposed Rulemaking in the Federal Register titled ***Strengthening Transparency in Regulatory Science.*** [EPA-HQ-OA-2018-0259; FRL-9977-40-ORD]. The proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, it should ensure that the data underlying the regulation are publicly available in a manner sufficient for independent validation. EPA solicited comments on this proposal until May 30, 2018. However, the agency has received many comments to extend the comment period and will likely grant an extension through August 16, 2018. In addition, requests have been received for a public hearing to solicit public testimony on this proposed rule. EPA is anticipating that a public hearing will be conducted.

.

PURPOSE AND SCOPE

The purpose and scope of this Statement of Work is for the contractor to provide technical support to EPA in sifting, analyzing, organizing, and summarizing public comments received in the EPA Docket and managing the public hearing. In order to prepare the deliverables, EPA anticipates that the contractor staff will familiarize themselves with the public comments in the

EPA docket and review and consider all comments and any other relevant information provided by EPA to the contractor to help with the development of a comment response document, the public hearing and support in developing a final agency product.

Task 1: Prepare Work Plan

The Contractor shall prepare a work plan and cost estimate in accordance with the terms and conditions of the contract. The Contactor shall provide a work plan outlining the approach, resources, timeline, and estimated costs for all tasks listed below. Estimates of costs and hours shall be presented by task, professional staff level and estimated month of completion. The Work Assignment Manager (WAM) will review the work plan and will request revisions and or changes as needed. If necessary, the Contractor shall incorporate EPA comments into the final work plan.

Task 2: Support for Public Hearing

The contractor shall support the Agency in providing logistical and other support for a 1-day public hearing to be held in Washington DC. EPA will provide the list of public members that have requested to testify at the public hearing and the contractor shall organize and provide the logistical support at the public hearing to ensure that the public has an opportunity to provide comments. The contractor shall provide the AV equipment for a large meeting room and a court reporter (or equivalent) that can transcribe the comments from the public. The contractor shall also gather any written, electronic or other materials that the public offers in coordination with their comments.

The contractor shall provide the transcribed comments and a report from the meeting that summarizes the number of commenters, the substantive comments, and other information for review by the WAM prior to submission to the docket.

Task 3: Support with Organization and Review of Public Comments and Development of a Comment Response Document

The contractor shall support the Agency by organizing comments received in the public docket into a searchable excel table (to include all comments provided during the public hearing). The contractor will develop a template for EPA to approve that contains, at a minimum, fields for: the name of the commenter(s), the comment, whether the comment is considered editorial or substantive, and the proposed response to the comment. The comments shall be organized by theme area, based on the initial review of the public comments. The contractor shall provide a draft of the comment response document and work with EPA to develop the responses to public comments.

The contractor shall also provide a summary of the substantive comments organized by theme and with references to the comment identifier in the docket. Substantive comments are ones that contain comprehensive arguments, analyses and data. The comment summaries developed by the contractor will be provided to EPA in an excel table format. The contractor will use the excel table to document key information about substantive comments including commenter name, organization, organization type, regulated sector, affected EPA office, statute, Federal Register citation, primary contact, and supporting details. The contractor shall provide the WAM a

proposed template for approval before developing the comment summaries. The contractor shall provide a draft of the substantive comments document to the WAM for review. Based upon the review the contractor shall update the products to ensure consistency.

The contractor will provide a count of all non-substantive comments received and categorize the non-substantive comments by theme. Non-substantive comments are mass mailings/form letters or individual comments lacking comprehensive arguments related to the proposed rule, analyses or data.

Task 4: Support for the Development of a Final Action

The contractor shall support EPA by preparing information that can be used to support the development of the final action, to include language that can be used in a regulation, guidance or policy, as appropriate. The language will be based on the comment response document, the public hearing, other analyses that may be needed to satisfy OMB requirements and other input from EPA.

SCHEDULE OF DELIVERABLES

Task Number and Deliverable	Schedule
Task 1: Prepare Work plan and cost estimate	Within 20 days of initiating WA
Task 2: Support for Public Hearing	
• Logistical and Organizational Support for Public Hearing	Public Hearing to occur on July 17, 2018, with preparatory work before and follow up work after
• Draft and Final Transcribed public comments for submission to docket	Draft transcribed public comments within 2 weeks of hearing and final within 3 weeks of hearing
Task 3: Comment Review, Organization and Templates	
• Draft Templates	Templates due within 25 days of initiating Task Order
• Draft Comment Response Document • Final Comment Response Document • Summary of Substantive Comments Report	Other deliverables due to the WAM based on the volume of comments received
Task 4: Support for Final Action	TBD, under the direction of the WAM

Hi Tom,

Attached are more items from CCU along with a file with response letters/emails for each.

Please pay special attention to AX-18-000-7232 and the response. That letter is from several Attorneys General and was sent out from the NY Attorney General's office. Since the NY attorney general who signed the letter is no longer there, I addressed the letter to all of the Attorneys General without specifying their names and have it addressed to be sent back to the NY office.

Secretary Scott Pruitt
Environmental Protection Agency,
Mail Code 1101A,
1200 Pennsylvania Avenue, N.W.,
Washington, DC 20460.

Dear Secretary Pruitt,

I am writing to ask that you reconsider a proposal to introduce a regulation that would only allow studies with public data to influence writing regulations. While this proposal sounds good, it would severely limit the pool of scientific research that the EPA uses to base its rules. For example, an insistence that data be "reproducible" will prevent the EPA from looking at data from events that are impossible or unethical to simulate—such as the BP oilspill or lead in children's drinking water. It seems to me that the EPA should cast a broad and wide net in looking to scientific data for information that impacts human health and safety and the health of our environment.

I trust the Union of Concerned Scientists, which opposes this regulation. Groups such as the oil and gas lobbyists, who are in favor of this regulation would appear to have a serious conflict of interest. The organization you oversee is the Environmental PROTECTION Agency. Please act accordingly.

I look forward to hearing from you.

Sincerely,

Judi Paradis

Folks – today Administrator Pruitt announced this proposed rule. Many of you have heard about this in the media. The proposal likely touches upon three aspects of OSA work – public access to EPA funded research, human subjects research protection, and scientific integrity. **Deliberative Process / Ex. 5**

Deliberative Process / Ex. 5

I expect a high volume of emails and telephone calls coming into OSA. Tom Cawiezell's phone number is listed in the NPRM as is an STPC staff email. No doubt we will all have a lots of questions re this – but I wanted you to be aware of this and encourage you to read about it.

Subject: SIGNED: Strengthening Transparency in Regulatory Science

Good afternoon
Today, the Administrator signed the proposed rule "Strengthening Transparency in Regulatory Science."

This proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation.

In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

Attached is the signed and dated proposed rule. For your convenience, please go to p. 19 for the Administrator's signature.

Please contact me if you have any questions.

Sincerely,
Laura

Subject: RE: Request re BYU Professor Pope & Proposed EPA Transparency Rule

Cheryl – I agree with you. Let's keep a folder of incomings that we do not forward to the docket with an explanation of why.

In this instance, an individual (Dr. Enstrom) sent a personal email to several scientists he has been challenging for several years regarding their past studies on air pollutants. He copied the OSA email box as a bcc. His email does not indicate that this information was intended for the docket nor does it provide any comment about the proposed rule.

Subject: Request re BYU Professor Pope and Proposed EPA Transparency Rule

Dear Colleagues of BYU Professor Clive Arden Pope III,

I am writing regarding the Proposed EPA Rule "Strengthening Transparency in Regulatory Science" (https://www.federalregister.gov/documents/2018/04/30/2018-09078/strengthening-transparency-in-regulatory-science). The Summary of this Rule is "This document proposes a regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation."

This rule is necessary in large part because Professor Pope and the American Cancer Society (ACS) have conducted 'secret science' epidemiologic research on fine particulate matter (PM2.5) and mortality that has been used by EPA to establish and tighten the 1997 PM2.5 National Ambient Air Quality Standard (NAAQS). My March 28, 2017 *Dose-Response* article "Fine Particulate Matter and Total Mortality in the Cancer Prevention Study Cohort Reanalysis" (http://journals.sagepub.com/doi/full/10.1177/1559325817693345), based on my independent reanalysis of the 1982 ACS Cancer Prevention Study (CPS II) data, found that Professor Pope's research is seriously flawed and does not support a scientific and public health basis for the PM2.5 NAAQS. My reanalysis clearly demonstrates the importance of access to underlying data and shows the need for the EPA Transparency Rule.

Since you have been involved in some way with Professor Pope's PM2.5 health effects research, please email me as soon as possible your YES or NO answer to the following four questions:

1) Do you support the Proposed EPA Rule "Strengthening Transparency in Regulatory Science"?

2) Is there extensive valid evidence that contradicts Professor Pope's evidence relating PM2.5 to premature deaths?
3) Should Professor Pope be held fully accountable for the validity of his research relating PM2.5 to premature deaths?
4) Should Americans, particularly Californians, be relieved of PM2.5 regulations that are based on a scientifically invalid relationship of PM2.5 to premature deaths?

Please let me know if you need clarification of these questions or this request. Until you respond to the contrary, I will assume that your answers to all four questions are NO.

Thank you very much for your consideration of this important request.

Sincerely yours,

James E. Enstrom, PhD, MPH, FFACE

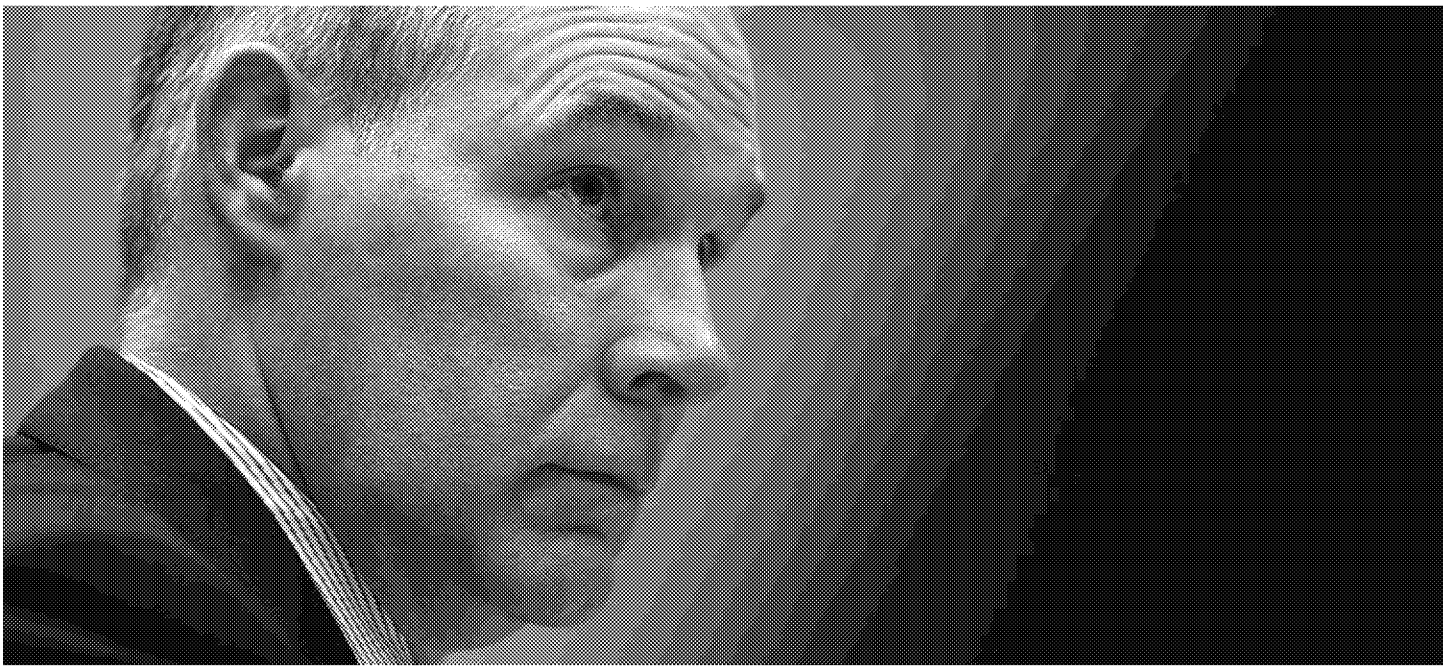
Scott Pruitt's New Rule Could Completely Transform the EPA



Environmental Protection Agency Administrator Scott Pruitt ALEX BRANDON/AP

By ROBINSON MEYER,
The Atlantic
| April 27, 2018

It would not only undermine 30 years of clean-air regulations, but radically restrict what science the agency is allowed to use.

- In one sweeping move, the Trump administration may soon not only destabilize the last three decades of clean air and water rules, but also completely overhaul how the Environmental Protection Agency uses science in its work. If EPA administrator Scott Pruitt's recently-proposed rule gets enacted, it will spark a revolution in environmental regulation. But the question is—will it stand up in court?

Pruitt proposed the regulation on Tuesday, describing it as an effort to increase transparency. It would require the EPA to publish all the underlying scientific data used to support studies which guide clean-air and clean-water rules. It would forbid the use of studies that do not meet this standard, even if they have been peer-reviewed or replicated elsewhere.

Crucially, the proposed rule does not carve out an exemption for medical data, which is tightly regulated by federal law. As such, it could immediately disqualify many historic or long-running studies—especially those documenting the dangers of pesticides or air pollution—as the researchers who ran those studies never secured their subjects' permission to openly reveal their medical data. Under federal law, scientists can face criminal penalties if they publish confidential medical information about someone without first securing their permission.

Both environmental groups and anti-regulation activists said the rule would utterly transform the EPA's mission in ways that would outlast this administration. The proposal "may be the most consequential decision made by EPA since the

election of Donald Trump," said Joseph Bast, the director of the Heartland Institute, a conservative think tank that rejects the mainstream scientific consensus about climate change, in a statement.

"The science that we use is going to be transparent, it's going to be reproducible," Pruitt said after signing the proposal. "It's going to be able to be analyzed by those in the marketplace, and those that watch what we do can make informed decisions about whether we've drawn the proper conclusions or not."

"This is not a policy. This is not a memo. This is a proposed rule," he added, implying that future administrations will not be able to reverse the measure once it is finalized. Before it becomes a rule though, it's likely to become a lawsuit—numerous environmental groups have already promised to fight the rule in court. And the way its written, many say, makes it unlikely to stand up to such scrutiny.

To support the measure, the EPA cites a large, nonpartisan literature of recommendations about science in government. An agency statement bragged that the rule "is consistent with" two bipartisan reports in particular: one from the Administrative Conference of the United States, and one from the Bipartisan Policy Center.

Wendy Wagner, a law professor at the University of Texas, knows both of those reports well. In fact, she wrote them. Wagner was the sole author of the Administrative Conference report, and she served on the seven-author panel that produced the Bipartisan Policy Center's recommendations.

She said the proposed rule had nothing to do with her and her colleagues' work.

"I really don't know what the problem is that they think they're fixing," she said, adding that many of her co-authors "would laugh and hoot" at some of the scientific ideas expressed in the rule.

"They don't adopt any of our recommendations, and they go in a direction that's completely opposite, completely different," she told me after reading the rule. "They don't adopt any of the recommendations of any of the sources they cite. I'm not sure why they cited them."

Other legal scholars were unsparing in their criticism of the rule. "There's so many different issues with it that it's hard to know where to begin," said Sean Hecht, a professor of environmental law and policy at UCLA. "Reading the rule, it doesn't look like a proposal that has been strongly vetted by career lawyers."

"To anyone who's looked at a lot of EPA rules, this rulemaking is extraordinary in the lack of reference to any legal authority," he said.

Betsy Southerland, a former director in the EPA's Office of Water and a 30-year veteran of the agency, told me that the rule did not legally seem like a rule at all. At one point, the agency asks the public to comment on which Congressional laws give it the greatest authority to issue the rule. "That's a stunner," she said.

"The proposed rule is very sloppily drafted, to be sure," said Wagner. "It's very hard to know what they're talking about, why they're doing it, how they're doing it, why and where they see it applying —it's very mysterious. As a legal matter, that's not going to help."

The new rule also appears to invent entirely new terms in environmental law. One phrase—"pivotal regulatory science"—frequently appears throughout the proposed rule. The term seems to be completely novel: It does not appear anywhere else in the laws, rules, or court decisions that govern the EPA, Hecht said. According to Google, that exact phrase hasn't even appeared on the internet before.

"It's relatively rare for an agency to make up a term out of whole cloth and try to insert it into the law," said Hecht.

Wagner said she was "very, very confused" by that and other phrases in the law. Even though the rule is explicitly about "research data," the rule does not define that term, she said.

She worried that the rule was drafted ambiguously on purpose. "A sinister answer is that the ambiguity gives litigants more points to hold the agency up in court. Every single term is an attachment point," she said, meaning that a company suing the EPA can seize on the new phrase and attempt to get a court to define it.

Other aspects of the rule "seem to me to be efforts to allow rich stakeholders to 'data bomb' the agency," she said. They seemed designed to force the agency to surrender old data, she said, so that the fossil-fuel and chemical industry can run endless studies reanalyzing it, tweaking their models each time until they get the answers they want.

Just about everyone involved in the rule-making process agrees that the rule targets a specific and foundational piece of environmental science: the "Six Cities" study, from the Harvard School of Public Health. First published in 1993, the study found that Americans living in more air-polluted cities died earlier than Americans living in cleaner ones.

The killer was a specific type of air pollution: fine particulate matter smaller than 2.5 microns, which scientists call $PM_{2.5}$. Subsequent studies of human anatomy and biochemistry have backed up this finding: $PM_{2.5}$ appears to be so tiny that it can seep through the lungs and enter the bloodstream, where it weakens and inflames heart tissue, injures organ walls, and damages cell structures.

$PM_{2.5}$, in other words, appears to be exceedingly deadly. This makes it exceedingly expensive.

Every time the EPA adopts a new air or water rule, it must run a cost-benefit analysis, proving that the new rule's benefits to the public exceed its costs. Each time an American dies earlier than they otherwise would have, the EPA says their death costs the U.S. economy about $9.2 million. Since $PM_{2.5}$ kills hundreds of thousands of Americans every year, the costs of all these early deaths can quickly become overwhelming. The EPA has justified many air-pollution rules—including the Clean Power Plan, President Obama's landmark climate-change rule for the power sector—on the basis of the high cost of $PM_{2.5}$.

But it all comes back to the Six Cities study, say anti-regulation activists. While conducting the research in the 1970s and 1980s, Harvard scientists drew on hundreds of confidential medical records. These scientists say they cannot now release the underlying data to the public because doing so—even on an anonymized basis—would reveal the identity of individual patients.

But Harvard has turned over its data to third-parties and industry groups multiple times in the past. Each time, those scientists have reanalyzed the data and largely validated the results of the Six Cities study.

This isn't enough for Steven Milloy, a policy adviser at the Heartland Institute and a former coal executive. "If you have data that's really important for public health, then you ought to be willing to share it," he told me. "PM is the granddaddy of all this stuff. It's where the secret science came from."

He argues that the EPA must release the data from the Six Cities study, even though that data is controlled by Harvard University. Milloy has long fought for the HONEST Act, a law by Lamar Smith, a Republican congressman of Texas, that closely resembles the new rule.

"It's the biggest science fraud that has gone on in this country's history," he said of the Six Cities study and the larger effort to regulate $PM_{2.5}$.

He contests that $PM_{2.5}$ is not toxic at all. "I have challenged EPA for years and they have never produced a body," he said. "They've never been able to do that, not in China, not in India, not in the United States, not anywhere. China, for the last few years, has had these huge episodes of $PM_{2.5}$. No one's died."

The World Health Organization has found that ambient outdoor air pollution, including $PM_{2.5}$, killed 23 million people in China in 2012.

Milloy said that the new rule was "actually better than what I thought was coming."

"If it's actually implemented, it's going to be revolutionary for EPA science and regulatory science, period," he said. The new rule would force the agency to reshape rules on radiation, drinking water, pesticides, and air-quality issues, because much of the evidence supporting those rules is drawn from medical research using confidential patient data.

But first the rule must stand up in court. It's unclear how it will fare. On the one hand, the rule is inexactly written and disinterested in citing legal authority.

The rule also directly contradicts a 2002 ruling from the D.C. Circuit Court of Appeals. "We agree with EPA that requiring agencies to obtain and publicize the data underlying all studies on which they rely 'would be impractical and unnecessary,'" the court decided in that case.

But the federal judiciary is being remade by the Trump administration. President Trump appointed 12 new appellate court judges in 2017, a record for a president's first year in office. These new, more conservative judges might find themselves more amenable to anti-regulatory arguments than their predecessors would have been.

It's possible that the rule, in any form, could outlast the EPA chief who signed it. Pruitt now faces the worst crisis of his 20-year political career: To describe him as scandal-plagued would be an understatement. He has set off a scandal pandemic. This weekend, The New York Times revealed that Pruitt personally met with a top energy lobbyist last year, even as Pruitt rented a $50-a-night condo from the lobbyist's wife. This follows revelations into alleged ethics lapses over staff pay, luxurious travel arrangements, and grift among his subordinates.

There are at least 10 different federal investigations into Pruitt's ethics scandals, including ones led by the White House and the Republican-led House Oversight Committee. Pruitt will testify before two House committees on Thursday.

Subject: FYI - NIH policy re certificates of confidentiality

Not certain I shared this with you but it is also relevant to aspects of the HONEST ACT

Certificates of Confidentiality for NIH Funded Research

NIH awardees no longer have to apply for a CoC.

Per Section 2012 of the 21st Century Cures Act as implemented in the 2017 NIH Certificates of Confidentiality Policy, all ongoing or new research funded by NIH as of December 13, 2016 that is collecting or using identifiable, sensitive information is automatically issued a CoC. Compliance requirements are outlined in the NIH Grants Policy Statement, which is a term and condition of all NIH awards.

This policy applies to NIH funded:

- Grants
- Cooperative Agreements
- R&D Contracts
- Other Transaction Awards
- NIH's own intramural research

How do I know if my NIH funded research project is covered by a CoC?

Research in which identifiable, sensitive information is collected or used, including research that

- Meets the definition of human subjects research, including exempt research in which subjects can be identified
- Is collecting or using human biospecimens that are identifiable or that have a risk of being identifiable
- Involves the generation of individual level human genomic data
- Involves any other information that might identify a person

If your research meets any of the above criteria then your research data or information is automatically protected by a CoC from NIH.

What does having a CoC mean I need to do?

1. **Researchers with a CoC may ONLY disclose identifiable, sensitive information in the following circumstances:**
    - if required by other Federal, State, or local laws, such as for reporting of communicable diseases
    - if the subject consents; or
    - for the purposes of scientific research that is compliant with human subjects regulations
2. **AND you must ensure that anyone who is conducting research as a subawardee or receives a copy of identifiable sensitive information protected by the policy understand they are they are also subject to the disclosure restrictions, even if they are not funded directly by NIH.**

How do I document that I have a CoC for my NIH funded Research?

NIH will no longer issue a physical certificate. You may point to your Notice of Award and the NIH Grants Policy Statement as documentation of the CoC protection.

Will I ever need to extend or amend my CoC?

If your NIH-funding will or has ended but the collection of new data from research participants will continue without NIH-funding you will need to apply for a CoC for continuity of protections using the CoC application system. If your NIH funding will or has ended but your study has completed all enrollment and data collection, there is no need to extend the Certificate. Sensitive, identifiable research information maintained by investigators during any time a Certificate is in effect, is protected permanently.

Where can I learn more?

Read the 2017 NIH Certificates of Confidentiality Policy.

Have a CoC Question?

Please address your inquiries to: NIH Office of Extramural Research: NIH-CoC-Coordinator@mail.nih.gov

Hi John – sharing this with you – **Deliberative Process / Ex. 5**

Deliberative Process / Ex. 5

EPA: Pruitt is expected to restrict science. Here's what it means Climatewire

U.S. EPA chief Scott Pruitt is expected to roll out plans soon to restrict the agency's use of science in rulemakings, pitting him against critics who say it would threaten public health and environmental protections.

In a closed-door meeting at the Heritage Foundation on Monday, Pruitt told a group of conservatives that he has plans for additional science reform at the agency, according to multiple attendees. EPA hasn't formally shared details of the plan, but it's widely expected to resemble an effort that Republican lawmakers and conservative groups have been pushing for years. It's been met with staunch resistance from Democrats and many scientists.

The plan could come "sooner rather than later," said Steve Milloy, who served on Trump's EPA transition team and attended the meeting at the Heritage Foundation.

EPA did not respond to a request for comment. And Milloy cautioned that he did not know the specifics of the plan and said he was not authorized to discuss the meeting.

The initiative is expected to require EPA — when issuing rules — to rely only on scientific studies where the underlying data are made public. It's an idea that House Science, Space and Technology Chairman Lamar Smith (R-Texas) has been championing for years. He and others argue that EPA has been crafting regulations based on "secret science" to advance its regulatory agenda.

Smith, one of the leading opponents of mainstream climate science in Congress, has repeatedly accused federal climate scientists of engaging in a massive conspiracy to falsify climate data. And he has repeatedly introduced bills that would require EPA to publicize data it uses when crafting regulations.

Those efforts died when President Obama was in the White House, and Smith's newest legislative push doesn't appear to be moving even though Republicans control both chambers of Congress. The House passed a bill dubbed the "Honest and Open New EPA Science Treatment (HONEST) Act" — requiring that EPA rules be based on science for which

underlying data is publicly available and reproducible — last March. But the measure has gone nowhere since it was referred to the Senate Environment and Public Works Committee.

Smith has tried to push the idea elsewhere, too. In comments on the 2019 budget proposal, the GOP majority on the Science panel led by Smith suggested that EPA's funding should be contingent on the administrator's "requiring that all scientific and technical information and data relied on to support a risk, exposure, or hazard assessment; criteria document; standard; limitation; regulation; regulatory impact analysis; or guidance issued by the EPA is made publicly available."

Smith did not respond to a request for comment.

Critics on the left and in the scientific community see the effort as an attempt to hinder EPA from issuing rules.

"A lot of the data that EPA uses to protect public health and ensure that we have clean air and clean water relies on data that cannot be publicly released," said Yogin Kothari with the Union of Concerned Scientists.

Many scientific studies rely on data that can't be made public for reasons like patient privacy concerns or industry confidentiality.

"If EPA doesn't have data to move forward with a public protection for a safeguard, it doesn't have to do that at all," said Kothari. "It really hamstrings the ability of the EPA to do anything, to fulfill its mission."

Publishing raw data also opens scientists up to attacks from industry, which can twist or distort data to shape a deregulatory agenda, said Betsy Southerland, a former senior EPA official in the Office of Water who worked on a staff analysis of the "HONEST Act."

Southerland, who left EPA last summer, said the effort is deceptive and is not about transparency, but about sidelining peer-reviewed science that supports regulation of pollution. She said there are numerous examples of groundbreaking studies that are not replicable, such as human health studies after the dropping of atomic bombs in Hiroshima or the ecological effects of the BP PLC Gulf of Mexico oil spill. In many of the older studies, there are a plethora of people, including some who are dead, who could no longer be tracked down.

"This is just done to paralyze rulemaking," she said. "It's another obstacle that would make it so hard and so difficult to go forward with rulemaking that in the end, the only thing that would happen — in the best case you would greatly delay rulemaking; in the worst case you would just prevent it. It would be such an obstacle you couldn't overcome it."

Publicizing the data in some EPA actions, which often come after years of research, could be extensive. For example, risk assessments for certain chemicals sometimes cite hundreds or even thousands of studies, all of which would have to be tracked down for data collection, according to the EPA analysis of the "HONEST Act."

Requiring data transparency would cost hundreds of millions of dollars because it would require EPA staff to track down data from study authors and create an online management system to store and present those data, the analysis found. In addition, EPA staff would have to spend time redacting personally identifiable information in the studies, and study authors would likely require payments for preparing and sending their data.

EPA career staff estimated that Smith's legislation would add $250 million in costs annually for the first few years after it was implemented, Southerland said. That estimate was dismissed by senior EPA officials who said those costs were inflated and that the agency would not use many studies to which the rule would apply, but they did not provide evidence, she said. EPA's **analysis** of Smith's bill was published by the radio program "Marketplace."

Milloy, who has long pushed for EPA to stop issuing regulations unless the underlying scientific data are made public, said the science reform effort could be done through a directive, in the same way that Pruitt reshaped EPA's science advisory panels.

The overhaul of those committees is another area where Pruitt came through on one of Smith's longtime priorities.

In October, Smith was seated front and center at an event where Pruitt announced that he would reform the advisory panels to bar researchers who take government funding. Critics said that move skewed the advice EPA is getting by making it tough for researchers who rely on public funding to participate, but keeping industry-funded scientists on board.

Pruitt then appointed as science advisers a number of researchers whose work is funded by industry, energy lobbying groups and conservative think tanks, while forcing out academics from major research institutions.

"Pruitt did a great job in cleaning up the science advisory boards, and if he does that kind of work on this, that's fantastic," Milloy said of the expected science data reform effort. "My goal is to make sure EPA does not rely on scientific studies unless the data is made available for replication by somebody."

Kothari of the Union of Concerned Scientists called it "alarming" that the Trump administration's science agenda "is being run by the chairman of the Science Committee, given that he has continued to not care about how science informs policymaking."

"This is the second thing now that this administrator will be implementing based on legislation that was never enacted," Kothari said. "It's just another excuse for Pruitt's EPA to really abrogate EPA's responsibility to protect human health and the environment."

Subject: Response letters and emails for CMS items
Attachments: Response letters and emails 05182018.docx; 18-000-6993.pdf; 18-000-7134.pdf; 18-000-7322.pdf; 18-000-7423_2.pdf; 18-000-7325.pdf; 18-000-7383.pdf; 18-000-7309.pdf; 18-000-7154.pdf; 18-000-7155.pdf; 18-000-7159.pdf

Hi Tom,

Attached is a file with the response letters and email for CMS items AX-18-000-7159, AX-18-000-7309, AX-18-000-7322, AX-18-000-7325, AX-18-000-7383, AX-18-000-6993, AX-18-000-7134, AX-18-000-7154, AX-18-000-7155, and AX-18-000-7423. I've also attached all of the CMS files in case you want to see them.

I believe the first letter in the file can be printed, signed by you and sent. All of the other letters and the emails should be held until the FRN for the public comment period extension and public hearing is posted since these CMS included requests for extension of the comment period and a public hearing. I will need to add the url for the new FRN to these letters once it is posted.

I ask that you take a quick look at the response letters and email file, let me know if he is okay with the additional language for the new FRN and then I'll work with Thomas to get the letters sent out.

Washington, DC 20008

Dear Mses. Bell and Roos,

Thank you for your comments regarding the US EPA proposed rule "Strengthening Transparency in Regulatory Science," available at https://www.federalregister.gov/documents/2018/04/30/2018-09078/strengthening-transparency-in-regulatory-science.

Your comments have been submitted to Docket ID No. EPA-HQ-OA-2018-0259 at Regulations.gov. Please submit any future comments to https://www.regulations.gov/docket?D=EPA-HQ-OA-2018-0259.

With regard to your request for an extension of the comment period and a public hearing, the comment period has been extended to July 30, 2018, and a public hearing will be held on July 17, 2018. Further details can be found at (link to new FRN).

Sincerely,

Tom Sinks, Ph.D.
Director, Office of the Science Advisor

Response email for Control Numbers AX-18-000-7309, AX-18-000-7322, AX-18-000-7325, AX-18-000-7383

Thank you for your comments regarding the US EPA proposed rule "Strengthening Transparency in Regulatory Science" available at https://www.federalregister.gov/documents/2018/04/30/2018-09078/strengthening-transparency-in-regulatory-science.

Subject: FW: SIGNED: Strengthening Transparency in Regulatory Science

Yesterday today Administrator Pruitt announced this proposed rule. The proposed rule touches upon three aspects of OSA work – public access to EPA funded research, human subjects research protection, and scientific integrity. It has highly significant implications for EPA programs and regions in defining how access to research data is used in rulemaking.

I presume it will be released in the Federal Register shortly. The proposed rule seeks comments and I suspect your state, local, academic, industry, and NGO partners will be interested. Please feel free to distribute it to them.

Subject: SIGNED: Strengthening Transparency in Regulatory Science

Good afternoon
Today, the Administrator signed the proposed rule "Strengthening Transparency in Regulatory Science."

This proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation.

In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

Attached is the signed and dated proposed rule. For your convenience, please go to p. 19 for the Administrator's signature.

Please contact me if you have any questions.

Sincerely,
Laura

Hi Doug – I'm still waiting to get a + response from the CDC Vietnam office. My contact has moved on and the current director has not responded to me.

Meanwhile, I thought this might interest you. The Administrator released it yesterday. It is based on the House 2016 HONEST Act which the Senate would not take up. Don't know if you are interested in commenting or sharing with others but your expertise in causality and the underlying thesis that public access and reanalysis of a dataset = quality = causation is an interesting concept.

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now

close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Subject: Website Help for Public Hearing

Hi Jessica and Jacques,

We are likely going to be holding a public hearing for the Strengthening Transparency in Regulatory Science rule, and we are going to need a webpage were people can go to sign up for time slots to speak at the hearing. We are going to need to get this set up pretty quickly. Jessica, I know you've helped us before with creating sign up forms online. I don't know if we would use Eventbrite or something else for registration, or if we can just do it via a webform.

Would the two of you be able to assist? I'm copying Manisha Kumar in OSA- she is the EIC for the webpage where this will live and can help get this posted. I'm also copying Fred and Tom and Susan who are all lucky members of this team. The webpage is here-

https://www.epa.gov/osa/strengthening-transparency-regulatory-science

Thanks!

Subject: RE: Reported extension of public comment period on proposed rule re "Strengthening Transparency in Regulatory Science"

Sean – I did not want to get ahead of the official announcement …

Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments

on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Subject: Reported extension of public comment period on proposed rule re "Strengthening Transparency in Regulatory Science"

Dr. Sinks:

Just wanted to check on a report I've received that EPA will extend the comment period from May 30 to Aug. 16, accompanied by at least one public hearing. Is that correct? (I've reached out to EPA's press office, but have thus far gotten no response and am simply trying to confirm that this information is accurate.)
Thank you in advance for your assistance.

Regards,
Sean Reilly

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening

Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Subject: new FRN and website registration

We made the edits for the FRN that announces the public hearing on the rule. Cheryl will send Manisha and Carolyn the document tomorrow to help you complete the registration sign-up site.

FYI - Greg is coming in tomorrow to complete the package in ORD and send it to the FRN office. I assume they will get it tomorrow or Monday. Once it leaves EPA, I believe it takes 5 days to publish in the FRN. The registrations site will need to be ready to launch the day before the FRN is published and go live the morning of the publication.

Subject: Articles to Include in the Record for the "Strengthening Transparency in Regulatory Science" Proposed Rule

Dear Dr. Sinks,

Attached please find an article on EPA's "Strengthening Transparency in Regulatory Science" proposed rule that was published in the New England Journal of Medicine (NEJM) on August 29, 2018, as well as several articles referenced by the first article. All of the attached documents should be included in the administrative record for the rulemaking.

We understand that the comment period on the proposed rule officially closed on August 16, 2018. As this article was published by the NEJM on August 29, however, it could not have been submitted before the comment period closed. Therefore, we are providing the article and the articles it references to the EPA now, less than three weeks after the comment period closed, which should provide a sufficient amount of time for the EPA to consider them as the Agency decides whether and how to move forward on this proposal.

Please confirm that the attached documents will be included in the record. I am happy to answer any questions.

Best regards,
Tyler Smith

Abstract

Background: Geographic Information Systems (GIS) can provide valuable insight into patterns of human activity. Online spatial display applications, such as Google Earth, can democratise this information by disseminating it to the general public. Although this is a generally positive advance for society, there is a legitimate concern involving the disclosure of confidential information through spatial display. Although guidelines exist for aggregated data, little has been written concerning the display of point level information. The concern is that a map containing points representing cases of cancer or an infectious disease, could be re-engineered back to identify an actual residence. This risk is investigated using point mortality locations from Hurricane Katrina re-engineered from a map published in the Baton Rouge Advocate newspaper, and a field team validating these residences using search and rescue building markings.

Results: We show that the residence of an individual, visualized as a generalized point covering approximately one and half city blocks on a map, can be re-engineered back to identify the actual house location, or at least a close neighbour, even if the map contains little spatial reference information. The degree of re-engineering success is also shown to depend on the urban characteristic of the neighborhood.

Conclusion: The results in this paper suggest a need to re-evaluate current guidelines for the display of point (address level) data. Examples of other point maps displaying health data extracted from the academic literature are presented where a similar re-engineering approach might cause concern with respect to violating confidentiality. More research is also needed into the role urban structure plays in the accuracy of re-engineering. We suggest that health and spatial scientists should be proactive and suggest a series of point level spatial confidentiality guidelines before governmental decisions are made which may be reactionary toward the threat of revealing confidential information, thereby imposing draconian limits on research using a GIS.

Background

Geospatial technologies and even Internet applications such as Google Earth are now frequently used in both social and biological sciences in the search for spatial patterns and processes (for recent commentaries and examples see [1-3]). Geospatial display on the internet, such as

Google Earth, not only provides a means to publicize the importance of "geography", but also acts as a dissemination tool for spatial results. This democratisation of spatial insight can have a dramatic impact on communities without the technical ability, hardware or software to use a Geographic Information System (GIS). At a recent symposium jointly hosted by the National Institute on Drug Abuse and the Association of American Geographers [4], in the concluding discussion session the universal appreciation of GIS was obvious. However, there was also a general concern expressed about preserving individual confidentiality within spatial displays. This concern is justified as map making, and the ability to deliver maps to a mass audience through the Internet becomes steadily easier [5-8].

Most health related maps are thematic involving data aggregated to a spatial unit, the most common map type being the graduated color or "choropleth" map. In an effort to protect individuals, the Health Insurance Portability and Accountability Act (HIPAA) provides guidelines to inform researchers as how to preserve confidentiality by employing minimum spatial denominator units on a map. According to the U.S. Department of Health and Human Services (HHS) health information can only be disclosed, if all zip codes with the same three initial digits exceed 20,000 people; otherwise the initial three digits are changed to 000 [9]. This guideline can be interpreted in another way. If we (conservatively) assume each building contains approximately 4 people, then health information should not be mapped at the residential level in areas containing less than five thousand buildings. It is unfortunate, however, that little exists explicitly for data display at this point (residential) level, even though many such maps exist in the academic literature. Examples of these health related point level maps which will be briefly discussed in this paper include, the spatial association between birth outcomes and disease (Toxoplasmosis) [10], birth outcomes and residential/work proximity to the World Trade Center [11], health effects of living close to heavily trafficked routes [12] and cases of an infectious disease[13].

Among the precautions that can be taken to preserve point level confidentiality include the masking or spatial manipulation of the location [14-17], the removal of other geographic reference layers, or the use of software agents [18]. In this last example the investigator never works with point level information. A software agent acting on behalf of the investigator, can access the data server where confidential data are stored, perform the required analysis functions, and return only useful aggregate results without any individual-identifiable details to the researcher [18].

If the researcher does have access to the original data, simply removing map detail, for example a road network, may not be enough to ensure that confidentiality is preserved [16]. For example, if a residential "point" appears in the middle of a map displaying only zip code boundaries, how could this display violate any individual's confidentiality, especially if all zip codes contain at least 20,000 individuals? The problem arises if the zip code boundaries can be used to re-engineer the map data back to smaller neighbourhoods, maybe even a street or single house, and in so doing dramatically change the size of the denominator. It is only prudent to test this assumption, and attempt to re-engineer information (also called inverse or reverse address matching) back to an individual residence from an apparently "detail free" map [16]. This is especially important given how easy it is to output GIS layers and display information to a large Internet audience through geospatial packages such as Google Earth, layers which as graphics can in turn be extracted and imported back into a GIS environment.

Contributing factors in the successful re-engineering of information from a cartographic display is the published map's scale, the size (and quality) of the published map, the projection used, and the accuracy (or error) in the initial mapping of the points. An error one would expect to find between the geocoded and re-engineered address is the positional error due to the address-matching procedure. This error occurs when a list of addresses is matched to a street network layer using a GIS. The extent of this error can be calculated by comparing the location of the gecoded addresses with a second measurement, usually generated with a Global Positioning System (GPS) satellite receiver or from an aerial image. As an example of such an investigation using a random sample of 200 addresses taken from a life history project of 3286 subjects, Bonner et al. (2003) found 79% of all distances between the gecoded and the GPS point to be within 100 m, the median distance being 38 m. [19]. The same study also found that urban addresses were slightly more accurate than non-urban, with 33% of addresses being within 25 meters. The accuracy of placement also varied according to the length of the road, with longer road segments, which again tend to be found in non-urban areas, being the least accurate [19].

When using a GIS to investigate geocoding error, the accuracy of the GPS measurement should also be taken into consideration. The positional accuracy of the GPS receiver can be tested using a National Geodetic Survey (NGS) point. GPS positions are recorded by holding the unit directly over the NGS point, for which the exact location is known. Usually, more than 100 positions are recorded for the same location at equal time intervals (for example, every second). The final coordinate is then calculated as

the spatial average of all recorded positions. Positional data can be used uncorrected or differentially corrected with data from a nearby base station. Differentially corrected positions have a higher accuracy compared to uncorrected positions. Listi, et al. (2007) tested the positional accuracy of the GeoExplorer® 3 Data Collection System (a hand-held GPS receiver in the mid-price range) from Trimble Navigation Limited for field mapping scattered human remains or other materials in forensic investigations. Using the spatial average of 206 positions and without any differential correction, the GPS unit produced an error of 3.523 meters (approx. 11.62 feet). In contrast, post-processed differential correction for the same spatial average of 206 positions produced an error of 0.424 meters (approx. 1.4 feet))[20]. Other considerations when using a GPS to confirm geocode accuracy include where the measurement was taken (for example the property line or front door), the position of the satellites, atmospheric conditions, and the line-of-sight to the satellites, which can be interrupted by tree cover, buildings or other structures.

As an alternative measure of geocode accuracy, Cayo and Talbot (2003) determined the positional error for 3,000 residential addresses using the distance between each geocoded point and its true location as determined with aerial imagery [21]. They found error increased as population density decreased and that the geocoding error substantially decreased, when property data are used instead of street network files. Both GPS and aerial imagery will be used in this paper to verify re-engineered addresses.

The question posed in this paper is to what degree can confidential information in the form of a person's home residence be extracted, or "re-engineered" from a map appearing in a journal article, book, newspaper or Internet site, especially if most traditional spatial reference layers, such as road networks, are removed from the map? In order to investigate this question two experiments could have been designed. The first would have been to fabricate data that are then geocoded, mapped, and printed before being given to a second team as a hard copy for re-engineering. First (fabricated) and second (re-engineered) addresses could be compared for separating distance (see [22]for an example). This is a valuable line of inquiry because of the insights it might provide not only in terms of the violation of confidentiality, but also in how the underlying population structure, street type, and building patterns impact the process of re-engineering. In his experiment Armstrong (2002) found that 68% of addresses could be re-engineered to the correct residence, 85% to the immediate neighbour, and 97% to the correct street segment [16]. He goes on to comment that errors in the geocode process would always leave an element of doubt in this type of exercise as the accuracy (was it the "correct" house) would be fuzzy. The second approach, and the one employed in this paper, is to take an actual published map of confidential residential information, and re-engineer these data back to actual addresses. This approach is the most appealing as it approximates the danger posed by spatially representing confidential information, and having a third party with no access to the actual data attempting to identify the residence of the "case". Although the second approach is most appealing, it is, by definition, almost impossible to investigate. If the data being mapped are confidential, how would the field researcher know if he/she had discovered the actual residence? However, Hurricane Katrina provided such an opportunity as a published map displayed point locations of deaths, and the search and rescue notations spray-painted on the houses allowed field teams to verify the accuracy of the re-engineering process. These markings also provide the means to identify the correct address missing in the Armstrong study. Figure 1 shows a field team member standing in front of a typical destroyed house using a GPS to mark the location. The search and rescue markings can be seen on both the roof and wall of the building. These markings can be deciphered as follows: the search team affiliation (left side of the X), the date of visit (top of the X), any "additional" information such as signs of looting or whether animals were present (right side of the X), and if any corpses were discovered (bottom of the X). It was therefore possible to identify those houses where fatalities had been discovered if a "1" or greater number was marked at the bottom of the "X". In addition, other markings are associated with mortalities, including comments such as "1 DB in back" or "Ken" which identifies the recovery team most frequently tasked to remove the body. In Figure 1 the first search and rescue team identified a dead body on September 11th ("1 dead" appears at the bottom of the X), and the body was removed on September 19th.

The Baton Rouge *Advocate* printed a map of mortality locations in Orleans and St Bernard Parishes on the 30th December 2005 (Fig 2). This map contained neighborhood areas of New Orleans (for example the Garden District, Lower Ninth Ward) and important features of the disaster, including the location of levee breaks, canals and floodwalls. The mortality locations were overlaid on a graduated color surface of poverty rate mapped by census tract. The map contained no roads or other references points, except for a generalized location of the University of New Orleans. Three neighborhoods heavily impacted by Hurricane Katrina, but of different urban character, were chosen for this study, these being the area around the London Canal levee break, New Orleans East, which suffered flooding directly from Lake Pontchartrain's surge, and the Lower Ninth Ward which flooded as a result of the Industrial Canal break. The specific goal of this investiga-

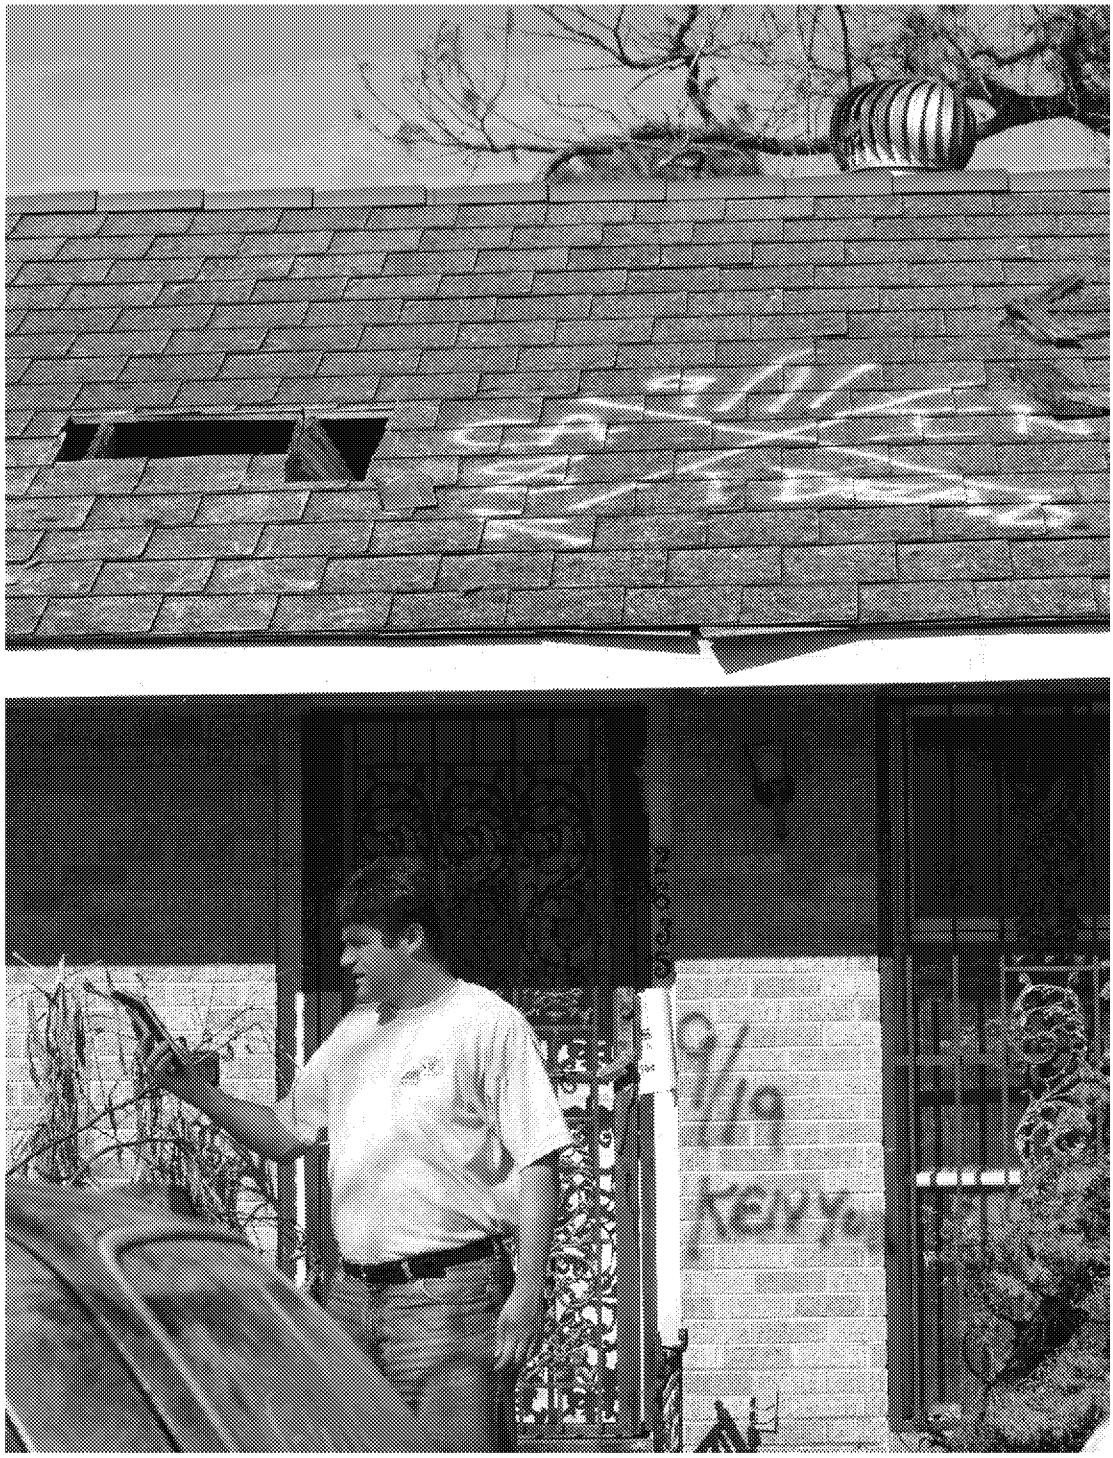

Figure 1
Hurricane Katrina search and rescue marking. This house displays the typical search and rescue "X". A California task force visited the house on September 11th and they found "1 dead". "Kenyon" removed the body on September 19th. The field team member is seen in front of the house marking its location with a GPS.

Figure 2
Deaths from Katrina map. The original map appearing in the Baton Rouge *Advocate* on December 30th. The red points are the mortality locations which have been digitised and overlaid on the original image.

tion was to use the *Advocate* map to guide field teams to the actual residence where a body was found. The larger concept was to investigate how a similar map displaying health outcomes could also be re-engineered to an actual residence. It can be argued that the *Advocate* map of mortalities does not represent a confidential surface as these data were mapped in the local paper, they are still "officially" considered such and have not been released to the authors of this paper for further validation purposes. However, this argument does not detract from the larger purpose of the study.

Results

Table One displays the distances from all mortalities re-engineered from the *Advocate* map to the closest street segment of the Orleans Parish street network. This was performed to assess the degree to which the underlying street pattern was preserved in the point locations on the map, remembering that actual streets had been removed. In total over 22% of all re-engineered mortalities were within 5 meters of a street segment. This percentage rose to over 45% when the distance from the mortality coordinate to the street was 10 meters or less. This result suggests that the original cartographer had employed a GIS based address matching approach and the underlying street pattern was still preserved within the mortality distribution. Of the three study neighborhoods investigated in this paper, the London Canal area had the greatest percentage of addresses within 5 meters (37.5%) of a road section. Although this might be indicative of the urban character of the neighborhood, with more tightly packed streets leading to a shorter distance to a road section by chance alone, the percentage of randomly generated points from 100 simulation runs in the same area within 5 meters was only 18%.

For all of Orleans Parish 18.4% of re-engineered mortalities were greater than 25 meters from a street centre line.

Table 1: Distance for re-engineered and randomly generated points to the closest road.

Distance from road (meters)	0 to 5	6 to 10	11 to 15	16 to 20	21 to 25	Above 25
New Orleans East						
Deaths From Map	16.7%	16.7%	8.3%	25.0%	8.3%	25.0%
Random Points	16.4%	12.5%	10.8%	9.4%	9.0%	42.0%
London Canal						
Deaths From Map	37.5%	4.2%	16.7%	25.0%	8.3%	4.2%
Random Points	18.0%	15.7%	13.0%	10.3%	11.0%	32.1%
Ninth Ward						
Deaths From Map	19.4%	27.8%	16.7%	11.1%	8.3%	16.7%
Random Points	19.6%	18.0%	14.9%	11.8%	10.0%	25.9%
All Deaths From Map (Orleans Parish)	22.5%	23.0%	14.1%	13.6%	8.4%	18.4%

Of the three study neighborhoods, the area with the highest percentage of (poorly) re-engineered mortalities falling in this 25-meter category was New Orleans East (25%), with the smallest percentage being the London Canal area (4.2%). When considering the randomly generated points falling into this greater than 25-meter category, all three neighborhoods registered higher percentages, ranging from 42% in New Orleans East to 25.9% in the Lower Ninth Ward. This shows how the underlying street pattern was still preserved in the mapped mortality surface.

Of the 24 mortalities re-engineered from the *Advocate* map in New Orleans East, 16 were identified to actual houses by the field team. Around these 16 houses a further eight residences were also sprayed with mortality markings. These additional residences were so close to the re-engineered location so as to fall within the "mortality circle" which covered approximately one-and-half-city blocks (Fig 3). The "mortality circle" is the white dot displaying the death location on the *Advocate* map. Of the 20 mortalities re-engineered from the *Advocate* map in the London Canal area, 14 were identified by the field team. Around these 14 houses a further two residences also could be identified with mortality markings. Of the 36 mortalities re-engineered from the *Advocate* map in the Lower Ninth Ward, 22 were identified by the field team. Around these 22 houses a further four residences could also be identified with mortality markings.

Table Two displays distances between the re-engineered mortalities and the closest field verified residences. The percentage of verified residences falling into each category of 5-meter increments is displayed. Of the three neighborhoods, New Orleans East produced the highest percentage of close distances between the re-engineered mortality and the actual residence "pairs" with almost 23% being within 10 meters, and over 40% being within 20 meters. By comparison, only 6% of the pairs for the London Canal, and 23% for the Lower Ninth Ward were within 20 meters.

As previously mentioned in this paper, there is an element of uncertainty concerning any exact distance measurement due to variations in both geocoding and GPS data collection. Therefore a second measure, the number of actual houses separating the re-engineered mortality and the field verified residence, as identified on the aerial imagery, was recorded. In three instances for New Orleans East both the re-engineered mortality and the field verified residence fell on the same house. In addition, three further pairs were separated only by the distance of the

Table 2: Distance between re-engineered and field verified residences.

Distance in meters	0 to 5	6 to 10	11 to 15	16 to 20	21 to 25	Above 25
New Orleans East						
Percentage of matched	4.5	18.2	13.6	4.5	4.5	54.5
London Canal						
Percentage of matched	0	6.3	0	0	6.3	87.5
Ninth Ward						
Percentage of matched	0	0	19.2	3.8	7.7	69.2

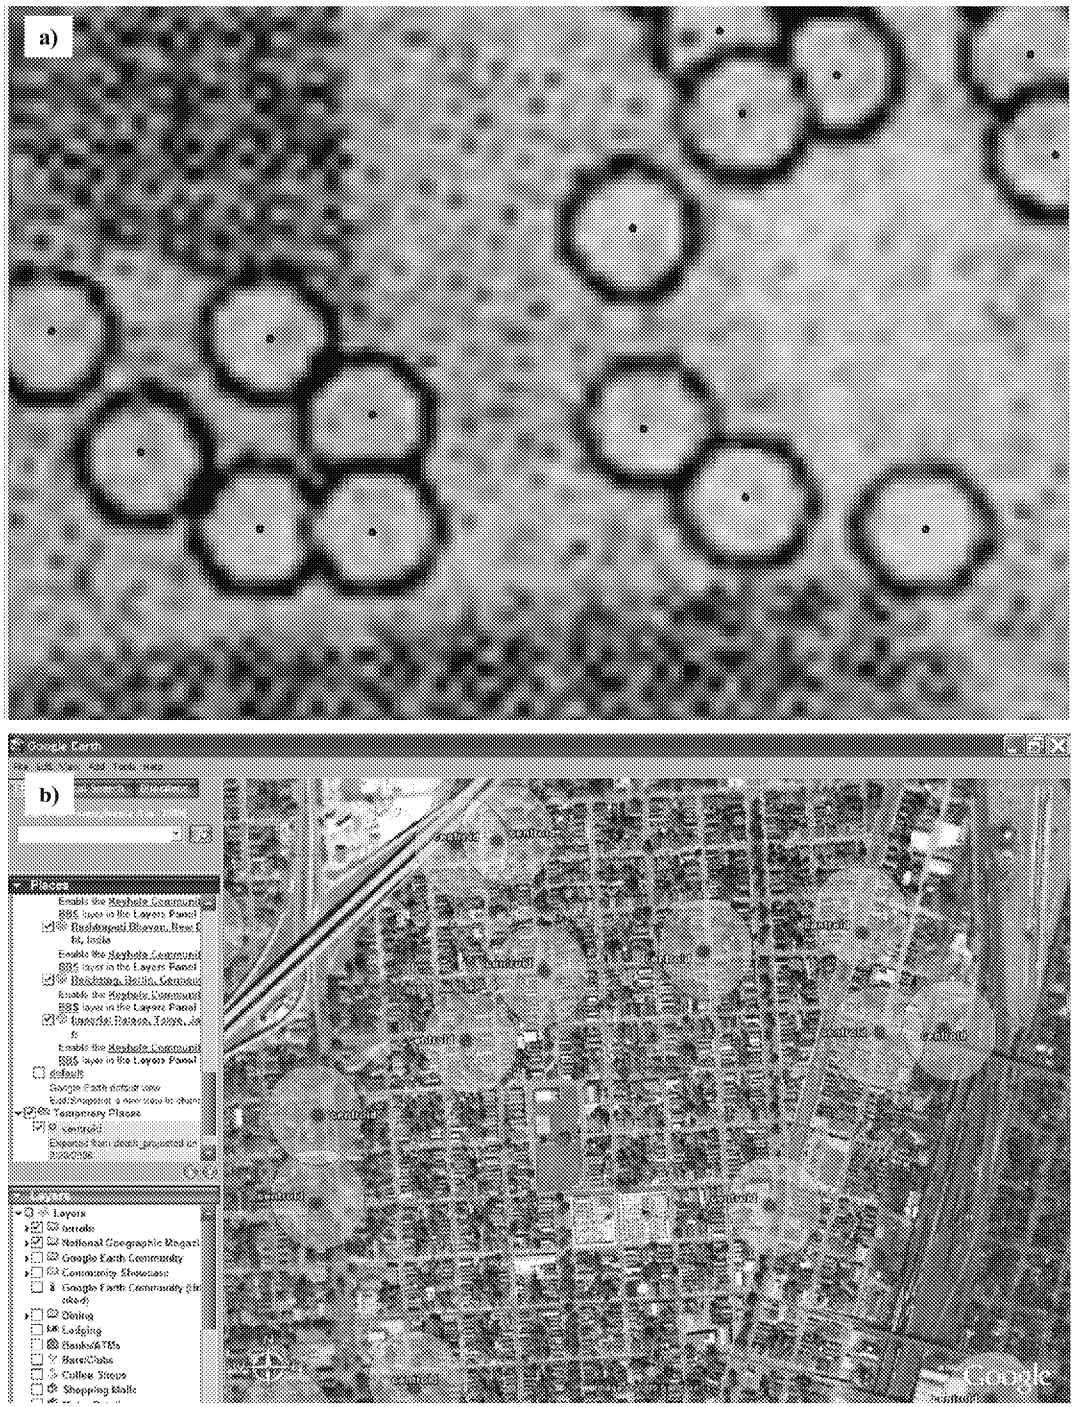

Figure 3
Digitised mortality locations. Mortality locations have been digitised from the newspaper map and are shown in terms of the coarseness of the original map image (a), and on a Google Earth display using the kmler tool in ArcMap (b). Each circle covers approximately 1.5 city blocks.

Figure 4
Distances between re-engineered mortalities and verified locations. The two locations in the detail from New Orleans East are separated by half a street width (a). In the London Canal Area, both locations fall on the same house (b). In the Lower Ninth Ward the two locations are found on either side of the same street (c).

house to the middle of the road. Five locations were next door, and three more had only two intervening residences. The greatest intervening distance was six residences. For the London Canal area, one of the re-engineered mortalities fell on the same field-verified residence, three were separated only by the distance to the middle of the road or the house on the opposite side of the street, and two houses were immediate neighbours to the re-engineered location. The greatest separating distance was nine houses. The extent of damage in the Lower Ninth Ward made this form of measurement impossible due to the amount of residential destruction with many houses having floated from their original foundation. Figures 4a–c display details for all three neighborhoods, with the red dot marking the re-engineered coordinate, and the yellow dot being the GPS measurement. Figure 4a (New Orleans East) shows an example of the separating measure between the pairs as being the middle of the road, figure 4b (London Canal) is an example of where both coordinates fall on the same residence, and 4c (Lower Ninth Ward) shows where the address is on the other side of the street.

A final step was to determine if the re-engineered coordinate actually guided the field team to the mortality location, or whether chance alone would have resulted in the same level of discovery. A series of random coordinates equalling the number of mortality residences were scattered throughout the study areas. This simulation was repeated 100 times generating a test distribution of mortalities. A 95% confidence level was determined if the distance between the actual re-engineered mortality and the field verified residence was smaller than in 95 of all simulated distances between a random coordinate and the same field verified residence. Meeting this 95% level were 73% of the New Orleans East pairs, 75% of the London Canal pairs, and 50% of the Lower Ninth Ward pairs. As an even more extreme comparison, for New Orleans East 9 of the 22 pairs were closer than in any of the simulation runs. Similarly, 3 of 16 pairs for the London Canal area, and 1 in the Lower Ninth Ward were closer than to any of the simulated coordinates.

Discussion

The success of this research should not be judged by the percentage of successfully re-engineered mortalities that can be verified back to an actual residence as other externalities could impact this process. These include: the body was recovered from a non-residence, such as a road median; the house has since been cleaned of all markings, or no distinguishable "mortality" marking was left on the residence; and the neighborhood could have suffered such extreme damage that mortality markings were not obvious, or the residence itself had disappeared or been moved. The success of re-engineering mortalities from the *Advocate* map should rather be judged if *any* residence could be verified. The fact that many of the re-engineered coordinates could be used to identify an actual address, or an address within the immediate vicinity, should sound a note of caution for academics publishing maps displaying human cases as points. In order to further impress on this point, and to show that similar cartographies have been employed to map health data, the following surfaces in the *American Journal of Public Health, American Journal of Tropical Medicine and Hygiene, Emerging Infectious Diseases, Environmental Health Perspectives,* and the *International Journal of Health Geographics* are briefly discussed.

Oyana et al. (2006) consider the proximity of asthma cases and controls to different pollution sources [12]. Their map contains an outer boundary shape of Buffalo, New York. The map contains additional "reference" material in terms of major roads. Cases (and controls) are displayed as a triangle or dot. The inner area of the study, the "West Side" is heavily populated making the potential re-engineering of addresses difficult. However, the re-engineering process would be easier to accomplish in the more sparsely populated areas (in terms of cases and controls), and especially if the residence falls close to locations useful for registering the image. For example, the area to the south of the map would be of particular concern with relatively few cases, and where several roads converge.

Lederman et al (2004), in their investigation of the effects of the World Trade Center disaster on birth outcomes, create a map showing work and home addresses as points [11]. Geographic features in the map that would allow for the georegistering of the image include the land/water boundary and major roads. Although the map on the journal page is relatively small, it is also possible to view a larger version of the figure at the journal's website.

Eng et al (1999) use three maps in their study of toxoplasmosis on Vancouver island, British Columbia, with residences being displayed as points [10]. The first map displays the geographic location of 94 acute cases of toxoplasmosis. The second and third maps display the location of women screened during pregnancy, who were either negative, or had non acute toxoplasmosis. These maps appear to be relatively safe as they contain few geographic references suitable for the georegistering of the image, beyond a detailed outer boundary of the map. As a larger version of the map is available on the journals website, it would still be interesting to see how close a re-engineered coordinate would be to the actual address.

Huhn et al (2005), in their investigation of the 2002 West Nile virus epidemic of Illinois, use a map displaying West Nile virus cases in Cook County. A solid cross is used to

mark the addresses of 536 cases. Although the overlap of crosses in the more case clustered areas would make the re-engineering of individual residences difficult, there are several sections of the map where relative geographic isolation of cases occurs [13]. In a second publication investigating the same outbreak, cases are overlaid onto a raster image of elevation [23]. This raises another issue, how would the re-engineering process be improved if a commonly available grid of data is used as backdrop? A second map in the same article is the most obvious candidate for a successful re-engineering as human cases are displayed as crosses on a map of census tracts. This map contains a greater georegistration potential than the *Advocate* New Orleans map used in this paper.

In none of these examples is mention made of any masking procedure applied to the point placement of human cases on the map. This suggests that the cases (usually shown as points) should mirror the underlying street network, and are therefore vulnerable to re-engineering. These comments are not meant to be criticisms of the academics involved in each study as the danger of re-engineering information from a map is a relatively new concern, though warnings have previously been sounded about mapping unmodified geocoded data [16,24]. There are, however, other more proactive studies that should be applauded for addressing confidentiality in their display.

Rothenberg et al. (2005) map the social and geographic interconnections for a subgroup of HIV infected individuals in their Colorado Springs study using a spider plot (nodes being connected with lines, with color being added to indicate the strength of connection). The authors comment that "...the map has insufficient detail to read the exact placement of nodes." [26] However, in order to preserve confidentiality each node was randomly moved by 1600 m. The authors further state that this "masking" allows for easier map interpretation while preserving the geographic relationship between nodes and links. Although the authors were mistaken in that the map does contain sufficient detail to allow re-engineering (census block boundaries are included), the random displacement of the nodes makes this a mute point.

Previous research has shown that urban density, urban/non-urban, and even length of street segment impact the success of geocoding [19], and similarly this paper has revealed how urban neighborhood structure plays a marked role in the success of re-engineering residential information. This is largely a result of two factors: the housing pattern on a street, which can affect address-matching results, and the amount of neighborhood detail allowing for more accurate georegistering of the image.

For example, the London Canal area has the highest percentage of mortalities (37.5) being close (within 5 meters) to a street section (Table 1). This area also has the lowest percentage (4.2%) of locations falling in the greatest distance away from a street category (above 25 m). If we look at the original georeferenced map, the London Canal area has the greater number of adjoining Census tracts of the three neighborhoods, resulting in more geographic detail, which in turn allows for more accurate georegistering of that part of the image. Although these coordinates are close to the street network, this does not reflect the accurate placement of geocoded points along a street, which in turn would have an impact in terms of the distance between mortality coordinate and verified residence. New Orleans East was the most successful in terms of this measure with just over 22% of the pairs within 10 meters. This suggests that house spacing within this area allows for a more accurate geocode. Most address matches are calculated with the house number being proportionally placed within the range of addresses on a street segment. More accurate address placement tends to occur in homogenous neighborhoods, such as in the suburbs, or in newer housing developments such as in New Orleans East. The worst neighborhood for geocode accuracy is the Lower Ninth Ward, with no pairs being within 10 meters. This can be explained by the considerable heterogeneity of housing structure, both in terms of size and lot placement. However, even in this neighborhood, a high proportion of the re-engineered mortalities were found, and 50% of these were closer than to any simulated "address" in 95 out of 100 simulation runs.

Conclusion

This paper has shown that any map containing point data, even when little secondary spatial information is presented, is vulnerable to being re-engineered to reveal the actual addresses associated with the points. It is therefore vital that some masking occurs of the original point data. Although HIPAA regulations state that health information can only be disclosed, if all zip codes with the same three initial digits exceed 20,000 people it is still feasible that a point displayed on a Parish boundary with no political subdivisions, meaning the cartographer is not violating any HIPAA regulation in terms of an apparent minimum denominator, could still be re-engineered if enough detail is present in the boundary shape. The question needing further discussion is how we should determine minimum denominators. If such a re-engineering process places a residence within a denominator area of 50 houses, this is a violation of the spirit of HIPAA.

Further research should concentrate on the degree of masking required in relation to urban structure, what could be considered safe amounts of map detail, and an appropriate minimum denominator of "alternative" resi-

dences. The suggestion should also be that until such research has been conducted, are maps really necessary in publications? Why not chose an abstract space on which to display spatial patterns [25]. The reader of the paper may need a graphic to understand the described relationship between geographic features, but it is unlikely he/she needs the actual geographic space. It is better to err on the side of caution than to make a mistake that might lead to a breach in patient privacy and further restrict the access spatial researchers have to confidential data

Methods

A map from the Front Page of the December 30, 2005 Baton Rouge *Advocate*, entitled "Deaths from Katrina hit both rich, poor", displayed a total of 412 mortality locations, though only 369 fell inside Orleans Parish which contains New Orleans. This map was scanned and georegistered using ArcMap 9.1. The process of georegistration, also called registering or rectifying an image, converts a representation of the earth into its real-world location by assigning coordinates to the image. After scanning the map, the image was added to an ESRI ArcMap 9.1 view already containing a shapefile of Census 2000 tract boundaries. On the *Advocate* map the point pattern of death locations is displayed on a choropleth map of poverty by census tract. Poverty is classified into four categories graded by colours from light yellow to dark brown (Figure 2). Due to the lack of streets or other geographic references that could be used in the georegistration of the map, only the Census tract layer was used as a source for control points assigned to the image.

Georegistration

The 2000 Census tract boundary file provides intersections that are recognizable throughout the map and thus were the primary source for assigning geographic coordinates to the graphic. The accuracy of matching the image to its real-world location is dependent on assigning control points evenly throughout the map. In this case, due to reliance on recognizable tract boundaries, some areas were assigned more control points than others. Also, in the *Advocate* map, when contiguous Census tracts fall into the same poverty classification the boundary between them is no longer visible, thus degrading ability to use these areas for control points. Even with these potential sources of inaccuracy, the resulting overlay of paper map and digital tract boundary left little error.

Digitizing death locations

Each mortality was heads-up digitized, meaning the mortality circle was added into the GIS by being drawn around its circumference using the mouse. Both this outer circle and the centroid, the circle's center point, were captured as digital layer files. The outer circle, once exported to Google Earth covered approximately one-and-a-half city blocks (Fig 2b). Each centroid was mapped onto a street map of New Orleans. Figure 2 shows the digitised centroids as red points on the original *Advocate* map.

Employing digitized death locations in field analysis

From Arc 9.1, 8.5 × 11 size maps were generated for each neighborhood showing streets, street names and the digitised centroids. These maps were used by the field team who systematically went to each coordinate point on the map, estimating exactly where they should find the residence along the street section, including on which side of the road it should fall. The field team did not search for the mortality residence beyond the immediate vicinity of the dot on the map, unless the location was situated inside a city block with no indication as to which street section the residence fell. Those houses in which a mortality was marked by a search and rescue team were photographed, the address recorded, and a GPS coordinate captured, using a Trimble GeoExplorer 3 hand-held GPS receiver.

Comparing field data with re-engineered death locations

The latitude and longitude coordinates of the re-engineered mortality and the verified address were displayed on high-resolution imagery (1 foot resolution post-Katrina imagery that originated with the Army Corps of Engineers and was flown by 3001 Inc.) of New Orleans using ESRI ArcMap 9.1. In order to determine how close the re-engineered coordinates were to the Orleans Parish road network, the distance between each coordinate and the closest street section was recorded using the spatial join feature in ArcMap 9.1. The distance was also calculated between each pair of re-engineered coordinates and the field verified address. A second distance measure was also employed for these pairs being the number of separating houses between the re-engineered coordinate and the actual address. This count was easily achieved by using the high-resolution imagery.

In order to determine if the re-engineered mortalities had guided field teams to the verified residences or whether the discovery was by chance alone, one hundred simulation surfaces were created for each neighborhood. These simulation surfaces were comprised of randomly located residences, where the "n" for each neighborhood equalled the number of re-engineered mortalities extracted from the *Advocate* map (24 for New Orleans East, 20 for the London Canal area, and 36 for the Lower Ninth Ward). The simulation surface was created using Hawth's Analysis Tools for ArcGIS which provide additional functions to ESRI's ArcGIS program. The Generate Random Points tool was used to randomly distribute points across the polygon layer of Census tracts. In order to see how dissimilar a geocoded surface was to a randomly generated point surface in terms of mirroring the underlying street network,

the distance between each randomly generated point and its closest street section was recorded using the spatial join tool in Arc 9.1. Similarly, to see how frequently a randomly generated point would fall closer to a field verified address than a mortality coordinate, the distance between the address and its closest randomly generated point was recorded using the spatial join tool in Arc 9.1. By recording this distance for 100 simulation runs, a test distribution of mortalities was created against which the distances of the mortality coordinate and field verified address pairs could be compared.

Competing interests

The author(s) declare that they have no competing interests.

Authors' contributions

AC JM and ML collected all field data. JM performed the re-engineering of mortality locations from the *Advocate* map. AC conceived of the study, and participated in its design and coordination and helped to draft the manuscript. All authors read and approved the final manuscript.

Acknowledgements

The authors would also like to thank the reviewers of an earlier version of this paper for their insightful comments. The authors would like to acknowledge John Pine and Barrett Kennedy at Louisiana State University for their work with the GIS Clearinghouse. Andrew Curtis and Jackie Mills would also like to acknowledge the Department of Geography at the University of Southern California, and Stewart Fotheringham at National Centre for Geocomputation, Maynooth, Ireland, for helpful comments during presentations of this work.

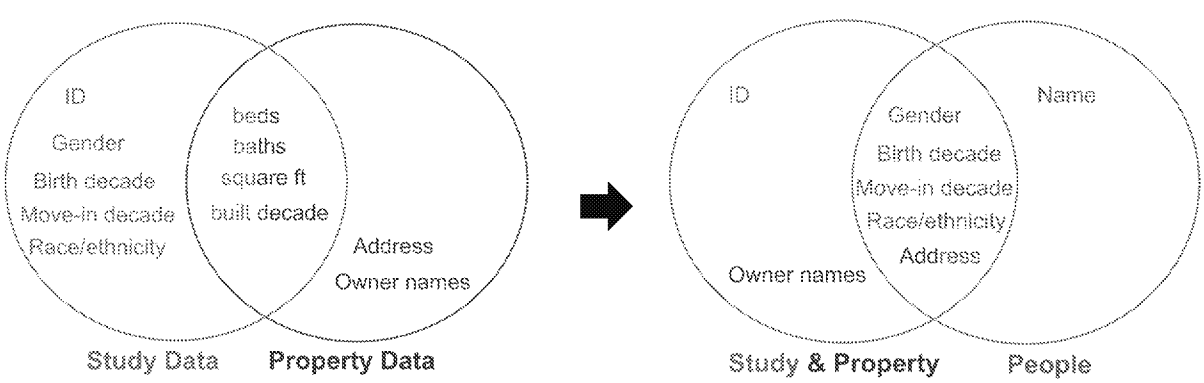
Re-identification Risks in HIPAA Safe Harbor Data: A study of data from one environmental health study

Latanya Sweeney, Ji Su Yoo, Laura Perovich, Katherine E. Boronow, Phil Brown, and Julia Green Brody

Highlights

- The HIPAA Safe Harbor is not sufficient to protect data against re-identification
- We found correct re-identifications for ~25% of records in a subset of a HIPAA-compliant environmental health dataset
- We used demographic and non-demographic fields to link a HIPAA-compliant dataset with external data sources
- Group re-identifications can extend potential harms to all individuals associated with the same record



(a) Phase 1 (b) Phase 2

Re-identification strategy to associate an ID in the Study Data with an Address and Name of a participant in the study

Abstract

Researchers are increasingly asked to share research data as part of publication and funding processes and to maximize the benefits of publicly funded research. The Safe Harbor provision of the U.S. Health Information Portability and Accountability Act (HIPAA) offers guidance to researchers by prescribing how to redact data for public sharing. For example, the provision requires removing explicit identifiers (such as name, address and other personally identifiable information), reporting dates in years, and reducing some or all digits of a postal (or ZIP) code. Is this sufficient? Can research participants still be re-identified in research data that adhere to the HIPAA Safe Harbor standard? In 2006, researchers collected air and dust samples and interviewed residents of 50 homes from Bolinas and Richmond (Atchison Village and Liberty Village), California, to analyze the residents' exposure to pollutants. The study, known as the Northern California Household Exposure Study [1], led to publications that have been cited hundreds of times. We conducted experiments with separate "attacker" and "scorer" teams to see whether we could identify study participants from two versions of the data redacted beyond the HIPAA standard, one in which all dates were reported in ranges of 10 or 20 years and another in which a study participant's birth year was reported exactly. The attackers were blinded to the names and addresses of the participants, and the scorers were blinded to the strategy.

Results summary: We correctly distinguished the 10 records from Bolinas and 32 records from Atchison Village, and we presented 9 records that included the 8 correct records from Liberty Village. When the redacted data contained the exact birth year, as allowed by HIPAA Safe Harbor, we correctly identified 8 of 32 (25 percent) Atchison Village participants by name and 9 of 32 (28 percent) by address. In comparison, earlier studies found unique re-identification rates in data that adhered to the level prescribed by HIPAA Safe Harbor to be much lower, namely 0.013 percent [2] and 0.04 percent [3]. However, these earlier studies relied solely on demographic fields for re-identification. Our experiments used fields beyond demographics (e.g., housing characteristics), and by doing so, substantially increased re-identification risk in data compliant with HIPAA Safe Harbor. Even in more heavily redacted data showing participants' birth years in 10- or 20-year ranges, we uniquely and correctly identified 1 of 32 (3 percent) of the Atchison Village study participants by name and address and identified 4 of 32 (13 percent) participants as being one of fewer than five named choices. No correct results were found for Liberty Village or Bolinas under these conditions. These results suggest that the HIPAA Safe Harbor is not a sufficient privacy guard for environmental health data and bring into question the practice of using the HIPAA Safe Harbor standard as a general rule for "de-identifying" other datasets in today's data-rich, networked environment.

Introduction

The Privacy Rule of the Health Information Portability and Accountability Act (HIPAA) is the U.S. federal regulation that governs the sharing of patient medical information by doctors,

hospitals, and others involved in direct patient care or in the billing for that care [4]. Improper handling of patient information can result in civil and criminal penalties. For example, an incidental data breach could cost $50,000, and patient information knowingly disclosed could result in a criminal penalty of $250,000 and ten years of imprisonment [5].

On the other hand, if the data are redacted as prescribed by the Safe Harbor provision within HIPAA, then the redacted version can be shared freely without concern for civil or criminal penalties [6]. HIPAA Safe Harbor requires eliminating 16 kinds of patient identifiers (e.g., patient name, Social Security number, email address, and telephone, account, and all other record numbers) and generalizing date and geography information: dates must be reported as years, and the smallest reportable geographic subdivision is the first 3 digits of the ZIP (postal) code (unless the three-digit ZIP code contains fewer than 20,000 people, in which case it is reported as 000) [7]. Personal health information redacted in this format can be shared widely, online or offline, with no restrictions and without a data use agreement. Promulgated on August 14, 2002, the HIPAA Privacy Rule remains in effect today. Although it formally applies to patient health records, HIPAA Safe Harbor is sometimes proposed as a benchmark in other contexts, such as Institutional Review Board oversight of research [8].

The HIPAA Safe Harbor standard uses a traditional pillar of data privacy known as de-identification – the removal of explicit identifiers from data to make the result sufficiently anonymous. The rationale behind de-identification is simple. If an individual cannot be distinctly identified in data, then no individual's privacy interests are affected, so the data can be shared widely for many worthy purposes.

HIPAA Safe Harbor is convenient. A researcher can easily comply by merely making the appropriate data redactions. No special computer programs, statistical modeling, or advanced analysis is necessary. But does the HIPAA Safe Harbor adequately protect privacy?

Re-identification

When sharing personal data widely, the biggest privacy threat to "de-identified" data is "re-identification" – the ability for an interested adversary to use reasonable effort to match details in the de-identified dataset to distinct persons sufficiently to contact them. We use the term "named person" to refer to having sufficient information to identify a person by name and "named location" to refer to having sufficient information to identify a physical place having few people. An example of a named location is the residential address of a family. If specific records in a de-identified dataset can be associated with one or few named people or named locations, then we say in this writing that the dataset is re-identified (regardless of whether the associated records contain the true identity). Harm from a re-identification may result if sensitive information contained in the data becomes known about named persons or named locations. For example, when Sweeney re-identified hospital discharge data released by Washington state, her re-identification exposed records that included sensitive

information such as "references to venereal diseases, drug dependency, alcohol use, [and] tobacco use" [9].

A "unique re-identification" occurs when a record in the data matches exactly one named person or location. A "group re-identification" occurs when one or a few records in the dataset match a small number of named people or locations. Both unique and group re-identifications raise privacy concerns. For example, if a de-identified dataset does not include names or home addresses, but does include age in months, gender, and 5-digit ZIP codes, it is possible to use publicly available websites to deduce the identity and home addresses of many individuals in the database, as was demonstrated by the recent re-identification of de-identified medical records from Washington state [9]. A one-to-few match can be just as damaging as a one-to-one match. For example, showing that a record in a de-identified dataset of lead poisoning cases belongs to one of few named locations could cause all the real estate properties in the group to suffer adverse consequences, even though only one of the named locations actually has the lead poisoning risk. As another example, a group re-identification of de-identified medical records showing that 6 of 7 named people have a genetic disposition toward cancer would leave the impression that each individual was equally likely (6 in 7) to have that condition, including the individual without the condition. It is well recognized that one-to-few and few-to-few re-identifications pose privacy risks similar to unique re-identification [10].

Rarely is zero risk of re-identification required in publicly shared datasets, and HIPAA is no exception. In 2011 El Emam et al. conducted a review of 14 published re-identification attacks [11]. Of the 14 examples, the authors dismiss 11 as being conducted by researchers solely to demonstrate or evaluate the existence of a risk of re-identification, not necessarily knowing whether the re-identification was correct. They classify the work of Narayanan and Shmatikov [12] in this category. Narayanan and Shmatikov demonstrated the possibility of re-identifying published Netflix rental histories from the (identified) movie reviews submitted by Netflix customers.

More generally, Sweeney used 1990 Census data to estimate that 0.04 percent of the United States population was uniquely identified by the basic demographic fields allowed by the HIPAA Safe Harbor – namely, year of birth, gender, and first 3 digits of ZIP [3]. Both the study by Kwok and Lafky and the study by Sweeney examined only demographic fields, and both found low likelihoods for unique re-identifications. Are we failing to consider other possible risks of re-identification by only studying those addressed by HIPAA Safe Harbor? What about small group re-identifications? What about matching on fields other than demographics?

Answers to these questions are critical as researchers seek to share research data widely. Many academic publications now require authors to submit a version of the data on which results are reported as a condition of publication (for examples, see [13, 14]). Also, federal, state and city governments increasingly make their datasets publicly available as part of

open data initiatives (e.g., [15]). Sharing research data freely is important for science because it allows other researchers to verify published findings and can lower research costs through data reuse. U.S. regulations for data sharing are sector–specific, and most kinds of research data are not subject to any federal data sharing standards. In cases where the data are not subject to HIPAA, researchers and Institutional Review Boards that approve data sharing for research often wonder whether the HIPAA Safe Harbor's prescriptive solution will suffice [8]. In what cases does the HIPAA Safe Harbor provide sufficient privacy protections for sharing research data?

Background

In 2006, researchers (including this paper's authors Brody, Perovich, and Brown) from the Silent Spring Institute, Northeastern University, and the University of California, Berkeley, with funding from the National Institute of Environmental Health Sciences, collected air and dust samples and interviewed residents in 40 homes in two neighborhoods in Richmond, California, and 10 homes in Bolinas, California. This project, known as the Northern California Household Exposure Study (HES), aimed to improve scientific understanding of indoor exposures to pollutants [1]. The two communities of Atchison and Liberty Villages in Richmond were chosen for the study because they were industrial communities within a few miles of the Chevron Richmond Refinery, major transportation corridors, and a marine port [14]. Bolinas was chosen on the advice of the community advisory council to provide a rural comparison within the same region. The researchers published findings in leading journals with summary statistics that describe the demographics of the research participants and detailed analysis of chemical pollutants found in the participants' homes and outdoor air [1, 16, 17, 18, 19].

In addition, the researchers wanted to share the study data widely for further analysis by others. For example, the US Environmental Protection Agency requested access to the HES data to estimate human exposures from consumer products. However, the researchers sought to honor the privacy statement made to research participants when sharing data. The informed consent for the study states:

HOW WILL THE DATA BE KEPT CONFIDENTIAL?
All information that could identify you will remain confidential to the full extent of the law. The samples from your home will be identified with a number rather than your name when they are sent to the laboratory for tests. Any record that includes your name or personal identifying information will be kept in locked file cabinets and access to these records will be restricted to researchers involved in this study.

In research studies like these, the risk of re-identification is a matter not only of privacy protections required by the IRB and described to participants when they first consented to the study, but also of researchers' broader responsibilities to avoid harms to participants. For

example, if participants' names or addresses can be matched to the research data, the information about certain pollutants in their homes could adversely impact the value of their properties. If participants were renters, identification might lead landlords to terminate or refuse to renew leases in the belief that the renters may have exposed them to economic problems by participating in research.

Knowledge from an attempt to re-identify a HIPAA Safe Harbor–compliant version of the HES research data can inform data-sharing practices, informed-consent documents, and the development of new strategies to protect study participants.

HES researchers did not collect the data as part of patient medical care, so it was not subject to HIPAA. Still, they faced decisions about data redaction and wondered what protection a HIPAA Safe Harbor version would offer.

In the next sections, we report on our attempt to match names and addresses of research participants to a HIPAA Safe Harbor–compliant version of the demographic and house information collected as part of the exposure study. The HES researchers have never shared the data publicly, so this experiment reports on risks of data that would result if the data were shared in compliance with HIPAA Safe Harbor.

About Re-identification

A "re-identification strategy" in this writing is a means to assign identifying information to entities (e.g., people or addresses) whose information is believed to appear in de-identified records. Approaches typically include a stepwise process applied to various datasets, where one of the datasets is the de-identified dataset itself.

The relevant outcome of a re-identification strategy is usually a set of sufficiently small group re-identifications. The total "number of re-identifications" is the number of records re-identified, regardless of whether the correct identification is included. If only unique re-identifications are of interest, then the number of re-identifications is the number of one-to-one associations found. When larger-sized groups are relevant, then the number of re-identifications of records in the dataset is the number of groups. For example, consider a re-identification having 4 groups, with 2 named people in each group. One person in each of the two person groups is believed to be the correct person, but the re-identification strategy does not distinguish which of the two named people that person might be. Therefore, the number of re-identifications is 4, one person from each group.

A re-identification does not necessarily need to be correct to be harmful. If a sufficiently reliable re-identification strategy strongly associates a record to a person, then that person will likely suffer the same harm whether they are named correctly or incorrectly. We use the term "correct re-identification" to distinguish instances when re-identification identifies the

true person. Consistent with data privacy literature, both re-identifications and correct re-identifications are important.

In prior work, Sweeney introduced the notion of a "binsize" as the number of entities (people or addresses) that matches one or more de-identified records indistinguishably [9, 20, 21]. Unique re-identifications have a binsize of 1, denoting a single one-to-one matchup, uniquely identifying the person or address. A binsize of k lists k possible matches to a single person or address.

The number of unique re-identifications is the value at binsize 1 (we write k=1). Past government data-sharing policies required suppression of data that could lead to re-identifications for binsizes less than 5 (k<5) (e.g., [22]). Recent government data-sharing policies proscribes re-identifications for binsizes less than 11 (k<11) (e.g., [23]). Guidelines for defamation cases have focused on expecting no re-identifications for binsizes less than 20 (k<20) (e.g., [24]) or 25 (e.g., [25, 26]). Therefore, for generalizability, we report the number of re-identifications having thresholds at k=1, k<5, k<11, and k<20.

A re-identification strategy identifies a "risk pool" for groups 1 to k [27], comprising all distinct entities named in the re-identified groups from size 1 to k. Risk pools are important because they identify which other entities may be harmed indiscriminately. In the prior example in which the results of a re-identification strategy was 4 groups with two named people for each group, then 8 named people are in the risk pool and the total number of re-identifications is 4. Notice that the risk pool, as defined here, relates to a re-identification strategy. Another re-identification strategy operating on the same de-identified dataset may generate a different risk pool.

Methods

We split ourselves into two separate teams, the "Scorers" and the "Attackers," to conduct an experiment in which the names and addresses of study participants, held by the Scorers, were kept private from the Attackers, and re-identification strategies, developed and conducted by the Attackers, were kept private from the Scorers until the experiment's conclusion. Although we met to organize ourselves, actual names, addresses and re-identification strategies were not shared during these discussions. The Attackers attempted to put names and addresses to records in a HIPAA Safe Harbor–compliant dataset and then submitted batched matches to the Scorers. The Scorers consisted of co-authors Brody, Perovich, Boronow, and Brown. The Attackers consisted of co-authors Sweeney and Yoo. The Attackers performed two preliminary iterations with the Scorers before establishing the more succinct version of the re-identification strategy described here.

A re-identification experiment requires registers containing named people and locations to match to the de-identified records. Because the HES is a study of air and dust samples from homes, we used property tax registers for Atchison Village and Bolinas, California, where

most homes were owned by residents. Liberty Village is rental housing, so an address register had to be constructed. HES participants lived in the homes tested, so registers were constructed of the names and addresses of adult residents in those communities during the study period. Below is a description of materials, subjects, and our 7-step approach.

Materials

The "HES Study Dataset" refers to the original data collected in the Northern California Household Exposure Study (HES) [1]. These data include demographic information about participants such as race, gender, birthdate, education level, the year they moved into their residence, and whether they owned the home. Information about residences includes room descriptions and dimensions, use of carpet per room, year the house was built, heating and cooking options, and numerous details about appliances, cleaning choices, pesticide use, pets, and lawn care. The HES Study Dataset also includes extensive one-time air and dust measurements taken at each home. The original dataset was redacted and modified to comply with HIPAA prior to re-identification (see Detailed Approach).

"HES Publications" refers to the set of papers previously published about the study (including [1, 16, 17, 18, 19, 28, 29]).

The "Atchison Village Property Register" is a copy of the 2006 tax assessor data for Atchison Village purchased from the County of Contra Costa Assessor's Office for $35 [29]. For each homeowner in Atchison Village, these data include the names of the property owners, the address of the property, the number of rooms, baths and bedrooms, the date the house was built, whether a garage is present, and the total land area.

The "Bolinas Tax Data" is a copy of the 2006 tax assessor data for Bolinas, California purchased for $112 from the Marin County Assessor's office [40]. Unlike the Atchison Village Property Register, the Bolinas tax data do not include any of the specific housing characteristics, such as the number of rooms, baths and bedrooms, the date the house was built, whether a garage is present, and the total land area. The data do include the names of the owners, the address of the property, and various tax parameters.

An online subscription to a "data broker" website allows searches that associate the names and biographical information of people to known addresses, and vice versa, and therefore provided the ability for the Attackers to construct a register of people who live in a particular geographical area. Hundreds of data brokers sell personal information on Americans, including names, telephone numbers, birthdates, and current and historical addresses [31, 32, 33]. Some data brokers list the dates at which the person was known to reside at an address. Many data broker websites allow searches by any field – e.g., by name or historic or current address. Subscription costs typically range from $12.95 per month to $99 per month for an unlimited number of searches or $1 to $5 per search.

Internet tools include a web browser and the use of Google Earth and Google Street View images [34]. Additional data include the Census data on the popularity of occurrences of first names by gender ("Gender Names") [35] and of last names by race and ethnicity, specifically Black, White, Asian, Native American, and Hispanic surnames ("Race Names") [36]. Computational tools include a spreadsheet program, a text editor program, and the Python programming language [37] running on off-the-shelf laptops.

Subjects

The subjects of the re-identification experiment were the 50 adult participants in the HES study, 10 of whom resided in Bolinas, California, and 40 of whom resided in the Atchison Village or Liberty Village communities of Richmond, California.

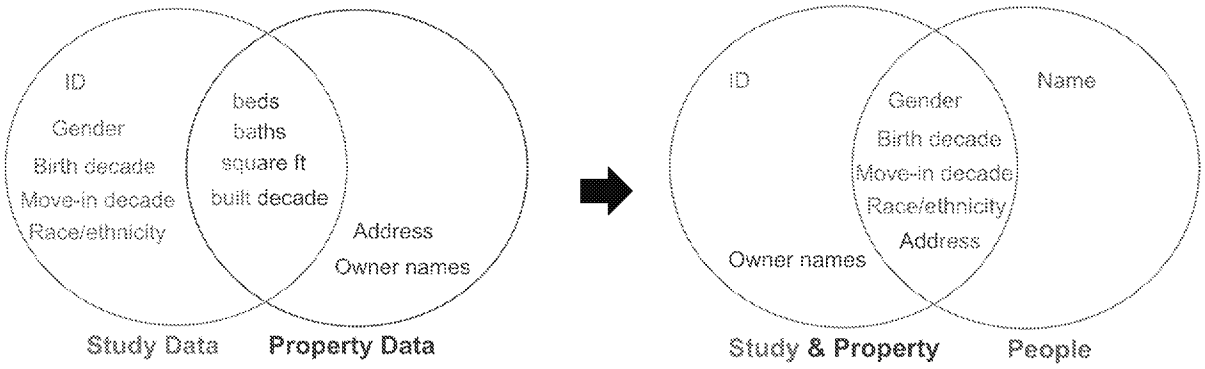
Approach

The Attackers crafted a re-identification strategy that involves matching HES data to community real estate and people registers. "Property registers," drawn from real estate data, contain the same kind of housing characteristics – namely, the number of beds and baths, total living area, and when the house was built – that the HES data contain. The real estate data additionally include the address of the property and the names of the homeowners. A "people register" is a list of people in a community relevant to the re-identification. For example, a local voter list is a people register of all registered voters in a community and might be useful for re-identifications involving a geographically bounded group of adults. People registers tend to include the names, addresses and demographics of the people in the community. The study was conducted in 2006, so the Attackers sought to construct registers of property as it was in 2006 and of people who lived in these communities in 2006.

The Attackers' approach unfolds in two phases; see Figure 1. In the first phase, the Attackers match HES data to real estate data on housing characteristics (see the left side of Figure 1). Any matches found will associate named property owners and home addresses to the demographics of participants in the HES who reside at a home having those characteristics. If unique matches result, then re-identifications would likely be done for those HES records. However, houses in these communities tend to have similar number and types of rooms, and most were built at the same time. Therefore, multiple matches are likely for each HES record and so further matching is necessary.

In the second phase, the Attackers match the results from the first stage to a people register on race, gender, age, address, and move-in date, in order to associate names of people residing at those residences. See the right side of Figure 1. Matches associate the name of someone known to live at the address in the people register with an HES participant living in a similar house and having those demographics. Further, if the homeowner name is the same

as the name from the match in the people register, and the HES data states the person is a homeowner, then the match is further confirmed.



(a) Phase 1 (b) Phase 2

Figure 1. Re-identification strategy to associate an ID in the Study Data with an Address and Name of a participant in the study. (a) First, match records in the HES study data (green) to real estate property data (brown) on beds, baths, square feet of living area, and decade group in which the house was built (mixed green and brown lettering) to put an address to an ID. Then, (b) match the joined information (green and brown) from (a) on gender, decade group of birth, move-in decade group, race and ethnicity, and address (mixed green, orange, and brown lettering) to a people register (orange) to put a name to the ID. The name of a known resident at the address in the people register may or may not be the same as the name of the owners in the real estate property data. A re-identification results when a name or address is associated with an ID. "Decade" refers to dates grouped in ranges of 10 to 90 years.

The Attackers assess the re-identification strategy by identifying risk pools and computing the number of re-identifications for k<5, 11, and 20. These re-identifications are believed to contain the correct match, but they do not necessarily contain the correct match. Therefore, each experiment concludes when the Scorers report, by binsize, how many of the proposed groupings include the correct named person or the correct address. Re-identifications of addresses rely on the same matches of resident demographics, but are evaluated separately because addresses themselves are important personal information, as described earlier.

Finally, Attackers also explore variations of the approach based on human matching versus automated matching. Computers can process more records quickly, but humans tend to use heuristics that may provide improved results.

The next subsection provides a stepwise description of the approach for replication and detailed study. The general reader can advance to the Results section without loss of understanding.

Detailed Approach

To test their re-identification strategy, the Attackers acquire and construct appropriate property and people registers and then match records, as described in the 7 steps below.

Step 1. The Scorers construct dataset that satisfies more than the minimum HIPAA Safe Harbor requirements. Starting with the original HES Dataset, the Scorers redact names, addresses, and other personally identifiable information and identifiers (e.g., number of dogs in the home, information on IV treatments, individual room dimensions). All dates (e.g., birth year, year house built, year moved in) are converted to decade and aggregated, so that they are reported in ranges of 10 or more years. Decades were aggregated so that each reported range contained at least 5 records. One field was constructed (total square feet of living area in aggregated ranges) because the Scorers considered individual room dimensions or exact square footage as potentially uniquely identifiable data. We refer to the resulting data as the "HIPAA Dataset".

Step 2. The Attackers attempt to distinguish Richmond from Bolinas records and, among the Richmond records, Atchison Village from Liberty Village, in order to improve re-identification accuracy. Using information in the HES Publications, the Attackers identify characteristics in the HIPAA Dataset that are specific to homes in Atchison Village, Liberty Village, and Bolinas and then subdivide the records of the HIPAA Dataset into those records likely to be specific to those communities. The Scorers report the accuracy of the Richmond-Bolinas and Liberty Village-Atchison Village subdivisions at the end of the study, even though the Attackers may use these partitions in intermediate steps.

Step 3. The Attackers construct a dataset to use for re-identification. They compute new fields that are convenient for re-identification and eliminate fields that are not relevant to the re-identification strategy. We refer to the result as the "De-ID Dataset." The De-ID Dataset remains HIPAA Safe Harbor–compliant because it is a subset of the HIPAA Dataset. All re-identification attempts are on the De-ID Dataset.

Step 4. The Attackers construct a property register for the rental units in Liberty Village. The tax assessor data list the Liberty Village complex as one large real estate block. So the Attackers use Google Earth images and rental property websites to infer the addresses, number of baths, and number of bedrooms for each unit. We refer to the result as the "Liberty Village Property Register."

Step 5. The Attackers construct a property register for Bolinas, California. Unlike the tax assessor data for Atchison Village, the acquired 2006 tax assessor data for Bolinas does not contain any housing details [38]. Instead, the data for each home include the names of the owners, address, a unique parcel identifier, and various tax values. However, the tax assessor additionally hosts a website on which searches by a parcel identifier yield detailed housing characteristics, such as the number of rooms, baths, and bedrooms for the parcel [39]. The Attackers use the parcel identifiers from the acquired property tax data to construct a "Bolinas Property Register" with the same fields as the Atchison Village Property Register.

Step 6. The Attackers construct registers of people known to have lived in Atchison Village, Liberty Village, and Bolinas in 2006. Many HES participants in Atchison Village and Bolinas are homeowners, but reliance solely on the names found in the property registers may be misleading and limiting, so the Attackers construct registers of people known to be associated with the addresses in these communities. Using information from a data broker, the Attackers search the addresses from the Atchison Village Property Register to identify named people who lived at an Atchison address in 2006, from the Bolinas Property Register to identify those who lived at a Bolinas address in 2006, and from the Liberty Village Property Register to identify those who lived in a Liberty Village unit in 2006. We refer to the resulting registers as the Atchison People Register, the Bolinas People Register, and the Liberty People Register, respectively.

Step 7. The Attackers execute re-identification strategies, and the Scorers report results. There are four sub-steps.

In Step 7a, the Attackers associate records in the De-ID Dataset with known addresses by matching housing characteristics, such as number of baths and bedrooms, in the De-ID Dataset to those in the property registers. Rather than matching against all records in the De-ID Dataset, the Attackers use the partitions derived in Step 3 to match those records in the De-ID considered most relevant to a community. The result is an association of named locations to specific records in the De-ID Dataset.

In Step 7b, the Attackers put names from the people registers to specific records in the De-ID Dataset by matching the combined property and addresses linkages from the results of Step 7a to records in the people register on personal demographics, such as age, gender, and race/ethnicity. The Attackers visually determine gender from the person's first name and Hispanic ethnicity from the person's last name and perform matching manually using a spreadsheet program. The result is an association of named people and locations to specific records in the De-ID Dataset.

In Step 7c, the Attackers repeat Step 7b using a computer program to associate race and gender to last and first names based on statistical occurrences of those names in U.S. Census data and to match records automatically based on personal demographics, such as age, gender, and race/ethnicity. The result is another association of named people and locations to specific records in the De-ID Dataset.

Finally, in Step 7d, the Scorers report on the correctness of the associations (or matchups) separately by community. Scorers report the number of HES participants found in each people register and the number of addresses of HES participants found in each address register. Matchups (or re-identifications) of one or more named people or named locations to a specific study record are given to the Scorers, who report the number correct per binsize group.

When scoring results, the Scorers apply the following rules:

- Names must match exactly, except in the following cases:
  - Shortened versions of names (e.g., Jon for Jonathan)
  - Commonly accepted nicknames (e.g., Bill for William)
  - Hyphenated last names, where at least one name overlaps (e.g., Jon Smith and Jon Smith-Jones will match)
  - Participant last name is listed as a middle name with a different last name (e.g., maiden name adopted as middle name following marriage)
  - Excepting the above case, middle names and initials will not be considered for matching. Note: if the Attackers re-identified "Katherine Jones" as an HES subject, but the HES Dataset listed "Katherine Smith," the Scorers would not consider the Attackers successful. However, the scorers would accept Katherine Smith Jones as a match to HES participant Katherine Smith.
  - Obvious misspellings, including non-alphanumeric characters, spacing, and capitalization
- Addresses much match exactly, except in the following cases:
  - Street suffix abbreviations (e.g., St for Street)
  - Street suffix omissions
  - Prefixes used to designate unit may differ, but unit number must match (e.g., Unit 1 and Apt 1 will be accepted as a match, but Unit 1 and Apt 2, or Unit 1 and Unit 2, will not)
  - Word order changes
  - Obvious misspellings

Step 8. The Scorers construct a dataset with exact birth years, which satisfies the minimum HIPAA Safe Harbor requirements. A second version of the HIPAA Dataset, provided after re-identification on the first version, included exact birth year. We refer to this as the "HIPAA Exact Dataset". The Attackers then repeat the relevant parts of Step 7 using the HIPAA Exact Dataset.

Results

This section walks through the work performed. In the first subsections, the Attackers establish a dataset redacted beyond the HIPAA Safe Harbor standard that provides the basis for re-identification. The Attackers also explain the means used for distinguishing between Atchison Village, Liberty Village, and Bolinas records in the dataset.

The next consecutive subsections report on the construction of property registers for Atchison Village, Liberty Village, and Bolinas. Afterwards, subsections detail the assembly of people registers for each community and report on demographic statistics for each population.

The remaining subsections report on matches of records in the dataset to people and addresses in the registers made after assembly of all the components – the dataset, the property registers and the population registers – and itemize which matches were correct. These results appear in consecutive subsections, one for each of the communities, Atchison Village, Liberty Village, and then Bolinas.

The final subsection repeats the matching experiment having year of birth information in the records of the dataset. The section ends with a comparison of results between data redacted beyond the HIPAA standard to data redacted at a level permissible by the HIPAA standard. The paper ends in the following section with a discussion of the findings.

Results for Step 1. HIPAA Dataset

The Scorers produced the "HIPAA Dataset" from the original HES Study Dataset that goes beyond the minimum HIPAA Safe Harbor requirements. The HES dataset consists of three files, divided into survey data, air measurements, and dust measurements. Appendix A provides a complete list of field descriptions for the files.

The Survey file contained 50 rows, one row for each house sampled. There were 256 fields, including demographic data about the research participants such as race, gender, birth decade group, education level, decade group participant moved into the residence, whether participant owns the home, square footage of living area, number and types of rooms, decade group house was built, and details about the home and the use of various appliances and pesticides.

Dates in the Survey file appeared in decade groups of at least 10 years. Specifically, values for birth were: 1920-1939, 1940-1949, 1950-69, or 1970-1989. Values for move-in date were: 1970-1989, 1990-1999, or 2000-2009. Values for house built date were: 1840-1949 or 1950-1989.

Values for total square footage were: 450-500, 500-650, 650-700, 700-1000, or 1000-2000.

There was no ZIP (or postal code) or other explicit geographical designation in the Survey file.

The Air and Dust files described the compounds found. The Air file had 12,767 indoor and outdoor measurements, and the dust file had 3,871 measurements for the 50 homes.

Results for Step 2. Records for each neighborhood

The Attackers reviewed HES Publications, found the following description of participant demographics, and reviewed online information about the communities.

The study was done 10 years earlier in 2006. Table S1, available as a supplement to the online version of the article [1], provides the following demographic summary.

Participants were 85 percent female and 15 percent male from Richmond and 60 percent female and 40 percent male from Bolinas. In Richmond, 5 percent were less than 26 years in age, 15 were between 26 to 40 years, 43 percent were between 41 and 60 years, and 37 percent were more than 60 years in age. In Bolinas, 10 percent were less than 26 years in age, 20 percent were between 41 and 60 years, and 37 percent were more than 60 years in age.

In Richmond, 41 percent of the participants self-identified as Hispanic, 54 percent self-identified as White, and 11 percent selected another race/ethnicity (3 percent Black, 5 percent Native American, and 3 percent Asian). Participants could self-identify as more than one race. Sixty-two percent were interviewed in English and 38 percent in Spanish. In Bolinas, none of the participants were Hispanic, 89 percent were White, and 44 percent selected another race/ethnicity (11 percent Black, 22 percent Native American, and 11 percent Asian); all were interviewed in English. The racial composition of Bolinas reflects a correction provided by the Scorers due to one person missing race information in Bolinas that was not noted in the original Table S1 [1].

Highest educational attainment in Richmond was as follows: 37 percent had a college education or higher, 26 percent had some college or post-high school training, 5 percent were high school graduates, and 32 percent had completed 11th grade or less. In comparison, 100 percent of Bolinas participants had at least a college degree.

Finally, in Richmond, 79 percent were homeowners compared to 70 percent in Bolinas.

From these characteristics, the Attackers computed the following invariants about the 10 records of Bolinas participants:

- All 10 Bolinas participants spoke English
- 4 were male, 6 were female
- 0 Hispanic, 1 Asian, 1 Black, 2 Native American
- More than one race per person reported
- 3 were renters, 7 were homeowners
- All 10 have a college education or better
- Year of birth groups:
    - 1 was born 1970-1989
    - 2 or fewer were born 1950-1969
    - 9 or fewer were born 1940-1049
    - 7 or fewer were born 1920-1939

None of the 50 records indicated a garage. Forty of the properties were built between 1840 and 1949, five between 1950 and 1989, and five were missing built year.

Based on these findings, the Attackers sought to identify which 40 of the 50 records in the De-ID Dataset belonged to Richmond participants and which 10 records belonged to Bolinas

participants by using published information about the study and values that appeared in the 50 records. The three geographical areas had a combined population of about 3,000 adults at the time of the study.

The attackers wrote a computer program to search all possible combinations of 10 of the 50 records that satisfied the demographic constraints. The computer identified 3 combinations of 12 records that satisfied all the demographic constraints for Bolinas. The remaining records would be the 40 for Richmond.

Another published table (reprinted in Appendix B) showed differences between outdoor air samples for homes in Bolinas and those in Richmond [17]. Attackers reviewed the publication for any chemical differences that might distinguish Bolinas and Richmond homes and learned that fluoranthene values for 33 Richmond homes reportedly ranged from 0.41 to 2.7 ng/m^3. For Bolinas, 8 homes did not have detectable levels of fluoranthene, one home had the maximum of 3.8 ng/m^3, and one home had an unknown level.

The Attackers manually examined the outdoor fluoranthene measures for the 43 homes and found that there were exactly 33 records in the 0.41 to 2.7 ng/m^3 range and 10 others that conformed to the summary statistics for Bolinas. Therefore, the Attackers believed the 10 records to be the Bolinas records and all others to be Richmond (including those for which no outdoor fluoranthene measurement was available). This configuration also agreed with one of the combinations found by the computer, which further supported the finding.

The Attackers submitted 40 PrivacyIDs as belonging to Richmond participants and 10 PrivacyIDs as belonging to Bolinas participants. The Scorers reported (after the experiment concluded) that the record designations were 100 percent correct. Therefore, the Attackers were able to use previously published results from the study to identify which records belonged to which community (Bolinas or Richmond).

The researchers reported that 40 of the records came from Richmond but did not distinguish how the 40 records split between Atchison Village and Liberty Village. The Attackers examined the 40 Richmond records and found 8 were for renters, 31 were for homeowners and one was unknown. Liberty Village is a rental complex, so all Liberty Village participants should be renters. Atchison Village is a housing cooperative. A "homeowner" in Atchison Village owns a share of the cooperative, and the cooperative decides who lives where. Cooperatives often have specific rules that impose limitations on renting. Therefore, the Attackers concluded that the 31 homeowners were from Atchison Village, the 8 renters were from Liberty Village, and the one unknown could belong to either neighborhood. In summary, the Attackers split the 40 Richmond records into 32 records for Atchison Village and 9 records for Liberty Village, a total of 41 records because one record appears in both groups. The Attackers then used these groupings for re-identifications involving Atchison Village and Liberty Village.

The Scorers reported (after the experiment concluded) that the 32 records for Atchison Village were correct and 8 of the 9 records for Liberty Village were correct. Therefore, the Attackers were able to reasonably ascertain which records belonged to Atchison Village and which to Liberty Village.

Results for Step 3. De-ID Dataset

Based on the Attacker's approach (see Figure 1), the data observations noted, and derivations above, the Attackers identified 15 fields in the HIPAA Dataset and 3 computed fields (the number of rooms and the numbers of bedrooms and bathrooms) as the subject of re-identification. The result is the De-ID Dataset, which contains 50 data rows and 18 fields. The fields include participants' race, gender, decade group of birth, education level, decade group for when they moved into their study residence, and whether they owned the home. Information about a residence includes square footage, room counts, and multi-decade grouping in which the house was built (i.e., 1840-1949 and 1950-1989). Fluoranthene level in outdoor air was also included. Figure 2 provides a summary of the fields in the De-ID Dataset.

Field name	Field Description: Possible Values
PrivacyID	From HIPAA Dataset: Unique ID created for scoring
birth_yr	From HIPAA Dataset: Year born in: reported as decade group
school	From HIPAA Dataset: Highest grade in school completed: <= 8th grade, …
own_home	From HIPAA Dataset: Owns own home: Yes or No
gender	From HIPAA Dataset: Gender of respondent: Male or Female
movein	From HIPAA Dataset: Year moved to this house: as decade group
housebuilt	From HIPAA Dataset: Year house was built: reported as decade group
SurveyLanguage	From HIPAA Dataset: Survey language: English or Spanish
totalsquareft	From HIPAA Dataset: Total square feet of living area in ranges
race_asian	From HIPAA Dataset: Asian or NA
race_white	From HIPAA Dataset: White or NA
race_black	From HIPAA Dataset: Black or NA
race_his	From HIPAA Dataset: Hispanic or NA
race_nam	From HIPAA Dataset: Native American or NA
fluoranthene	Copied from air data (Fluoranthene) in HIPAA Dataset
totalrooms	Computed from room1,…,room9 fields in HIPAA Dataset
numberBaths	Computed from room1,…,room9 fields in HIPAA Dataset
numberBeds	Computed from room1,…,room9 fields in HIPAA Dataset

Figure 2. Fields of the De-ID Dataset, as selected and computed from fields in the HIPAA Dataset listed in Appendix A. These 18 fields are the basis for re-identification. Possible values for birth_yr: 1920-1939, 1940-1949, 1950-69, or 1970-1989; for move-in: 1970-1989, 1990-1999,

or 2000-2009; housebuilt: 1840-1949 or 1950-1989; and for totalsquareft: 450-500, 500-650, 650-700, 700-1000, or 1000-2000.

Results for Step 4. Atchison Village and Liberty Village Property Registers

Atchison Village Property Register

As described earlier, the Attackers purchased the 2006 tax assessor data for Atchison Village from the County of Contra Costa Assessor's Office [29]. The Atchison Village Property Register had 124 fields and 450 data rows. The fields included the names of the owners, the address of the property, the numbers of bedrooms and baths, the total number of rooms, the year the house was built, and the total living area. The Attackers identified these 8 (of the 124 fields) fields as being relevant to re-identification; see Figure 3a.

All 450 properties had one living unit built in 1942. Most had two bedrooms, one bathroom, and a total of 4 rooms in a living area of 781 square feet (179 of 450 houses or 40 percent). Figure 3b displays the counts of bedrooms, bathrooms, total rooms, and living area in combination.

Field name	Field Description (original field names in tax assessor data)
owner1	Name of primary owner of property (P_OWNR_NM)
owner2	Name of secondary owner of property (OWN_NM_2ND)
address	Address of property (concatenate S_STR_NBR, S_STR_NM, S_STR_SUF)
numberBeds	Number of bedrooms (BEDS)
numberBaths	Number of bathrooms (BATHS)
totalrooms	Total number of rooms (TOT_ROOMS)
housebuilt	Year house built (YR_HS_BLT)
totalsquareft	Total living area (TLA)

Figure 3b. The number and percent of units in Atchison Village having specific combinations of bedrooms, bathrooms, total rooms, and total living area. There are a total of 450 units. The typical unit has 2 bedrooms and 1 bath (179 of 450 units or 40 percent).

Because the tax assessor data should be a complete record of all properties in Atchison Village, a list of the addresses from the Atchison Village Property Register should contain all the addresses of HES participants from Atchison Village. So the Attackers submitted the list of 450 addresses. At the end of the experiment, the Scorers reported that 32 of the addresses from HES participants appeared on the list, further suggesting that the remaining eight Richmond addresses are from Liberty Village.

Liberty Village Property Register

At the time of these experiments, Liberty Village was a 100-unit rental complex consisting of 50 duplexes comprised of one-, two- and three-bedroom single-story units that ranged from 528 square feet to 816 square feet [40]. The units were grouped into courtyards with a front and back yard for each residence, were carpeted, and had gas stoves and heating. There was also a clubhouse and a swimming pool. The one-bedroom units were 528 square feet, the two

bedroom units were 624 square feet, and the three bedroom units were 816 square feet [41]. All units had one kitchen, living room, and bathroom. The complex was built in 1942.

The Attackers used aerial Google images [34] to determine the bedroom count for each unit as follows. First, the Attackers measured the length of each roofline to determine the number of bedrooms in a unit. Then, they used parking spot numbers to estimate approximate street numbers for the addresses. Finally, the Attackers associated the addresses with the number of bedrooms for each unit. Below is a walk-through of the approach.

Figure 4 shows a Google image of Liberty Village. The buildings with the brown roofs are Liberty Village. From the image, each building has two pathways leading to the building, implying each building houses two rental units, with the possible exception of the clubhouse area.

The Attackers measured the lengths of the rooflines in a printed image and found that each roof was one of three measurements: 1.9 cm, 2.1 cm, or 2.6 cm. The roofline lengths and the fact that each building had two pathways led to the following inferences: each of the smallest buildings houses two one-bedroom units; each of the middle-sized building houses two of the two-bedroom units; and, each of the largest buildings houses two of the three-bedroom units. The 4 small buildings (red lines in Figure 5) identified 8 one-bedroom units. The 34 middle-sized buildings (green lines in Figure 5) identified 64 two-bedroom units. Finally, the 12 large buildings (blue lines in Figure 5) identified 24 three-bedroom units. In total, the Attackers graphically identified 100 units, which was the correct total number of units in Liberty Village.

The aerial Google images name streets. The Attackers used parking spot numbers to infer the street numbers of the units, as practical (yellow circles in Figure 6). The Google Earth interface allowed a user to identify some addresses by hovering over rooftops. The Attackers refined these addresses based on the parking spaces and unit address patterns (rectangles in Figure 6). The result was 111 addresses for the 100 units because of ambiguity with some addresses. The final street addresses were from 7 to 168 Chanslor Circle, from 6 to 30 Chanslor Row, from 14 to 24 Circle Court, from 118 to 217 Chanslor Avenue, and from 115 to 348 West Chanslor Avenue.

The 111 addresses identified as being in Liberty Village had 3 configurations based on the number of bedrooms. The most commonly occurring home had two bedrooms, one bathroom, a living room, and a kitchen, for a total of 6 rooms in a living area of 624 square feet. Figure 7 lists the counts of the three configurations.

The final result was the Liberty Village Property Register, which listed the address, number of bedrooms and baths, total rooms, year house built, and square footage for each of the 100 Liberty Village units at 111 addresses. See Figure 7.

Figure 4. Original Google aerial image of Liberty Village. The brown-roofed buildings comprise Liberty Village [34].

Figure 5. Measurements of the rooflines of the buildings in Liberty Village. Three measurements found: red was 1.9 cm, green was 2.1 cm, and blue was 2.6 cm. Red lines show duplexes with 2 one-bedroom units. Green lines show duplexes with 2 two-bedroom units. Blue lines show duplexes with 2 three-bedroom units. In total, there are 100 units.

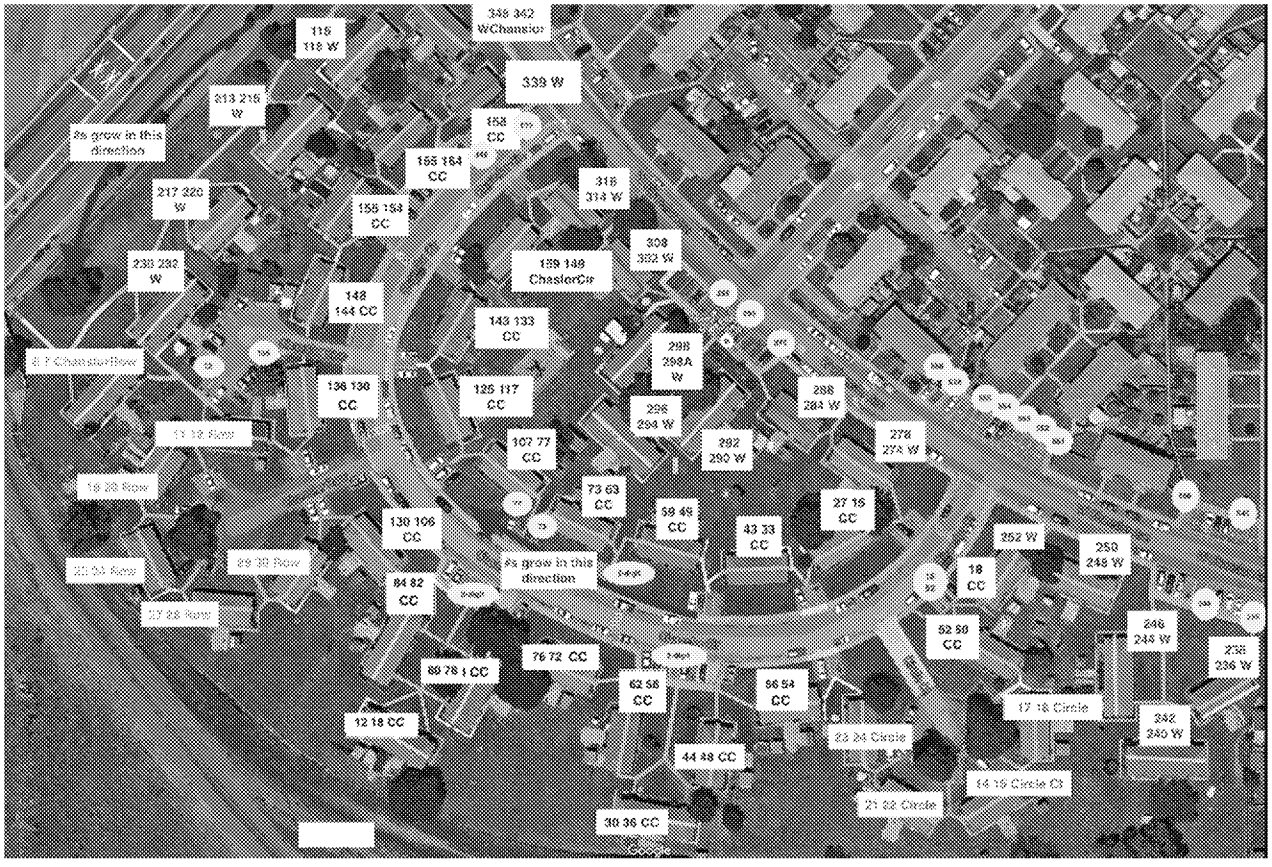

Figure 6. Addresses of the 100 units in Liberty Village (rectangles) and the parking spot numbers (yellow circles) as inferred by the Attackers. Streets are Chanslor Circle (CC), Chanslor Row (Row), Circle Court (Circle Ct), and West Chanslor Avenue (W).

Beds	Baths	Total Rooms	Living Area	Number	Percent
1	1	4	528	8	7%
2	1	5	624	75	67%
3	1	6	816	29	26%

Figure 7. The number and percentage of units in Liberty Village having specific combinations of bedrooms, bathrooms, total rooms, and total living area. A total of 100 units were found with 111 possible addresses. The typical unit has 2 bedrooms and 1 bath (75 of 111 units or 68 percent).

totalsquareft	Total living area: 528 sq ft, 624 sq ft, or 816 sq ft

Figure 8. Fields of the Liberty Village Property Register constructed by the Attackers using aerial images and published facts about the rental community.

The Attackers sent a list of the 111 addresses from the Liberty Village Property Register to the Scorers. The Scorers reported, at the end of the experiment, that 5 of the addresses from HES participants appeared on the list. Together with the Atchison Property Register, the Attackers identified 37 out of 40 Richmond addresses. The HES researchers never disclosed the number of Liberty Village versus Atchison participants in their publication.

Results for Step 5. Bolinas Property Register

As described earlier, the Attackers purchased the 2006 Bolinas Tax Data [38]. Unlike the tax data for Atchison Village, the Bolinas tax data did not contain housing characteristics; specifically, it did not contain the number of rooms, bedrooms, baths, or total living area. Instead, the tax data for Bolinas included the address and owners of the property, the number of units on the property used for living, and then various fields related to the tax computations, such as land value. There were 26 fields and 1,583 data records. However, only 626 of the data records were properties that had units for living; the other records concerned land that apparently had no property on which people lived. Of the 626 real estate properties where people lived, only 610 had addresses listed. Most of the 610 addresses had single-family dwellings (572 of 610 or 94 percent). The median and average were homes with one living unit, and the standard deviation was 0.4. One property had the maximum of 6 units in which people lived.

The Attackers constructed a table with these fields: property id, the number of units on the property in which people live, the names of the owners, and the address for each property that had living units. We term this the "Bolinas Tax Data table."

The Marin County Tax Assessor's office had a website that displayed the number of bedrooms and baths and other housing characteristics for a property once a "property id" is given [39, 42]. Figure 9 steps through the pages of the website to display housing characteristics for the randomly selected residence having property id 188-100-05.

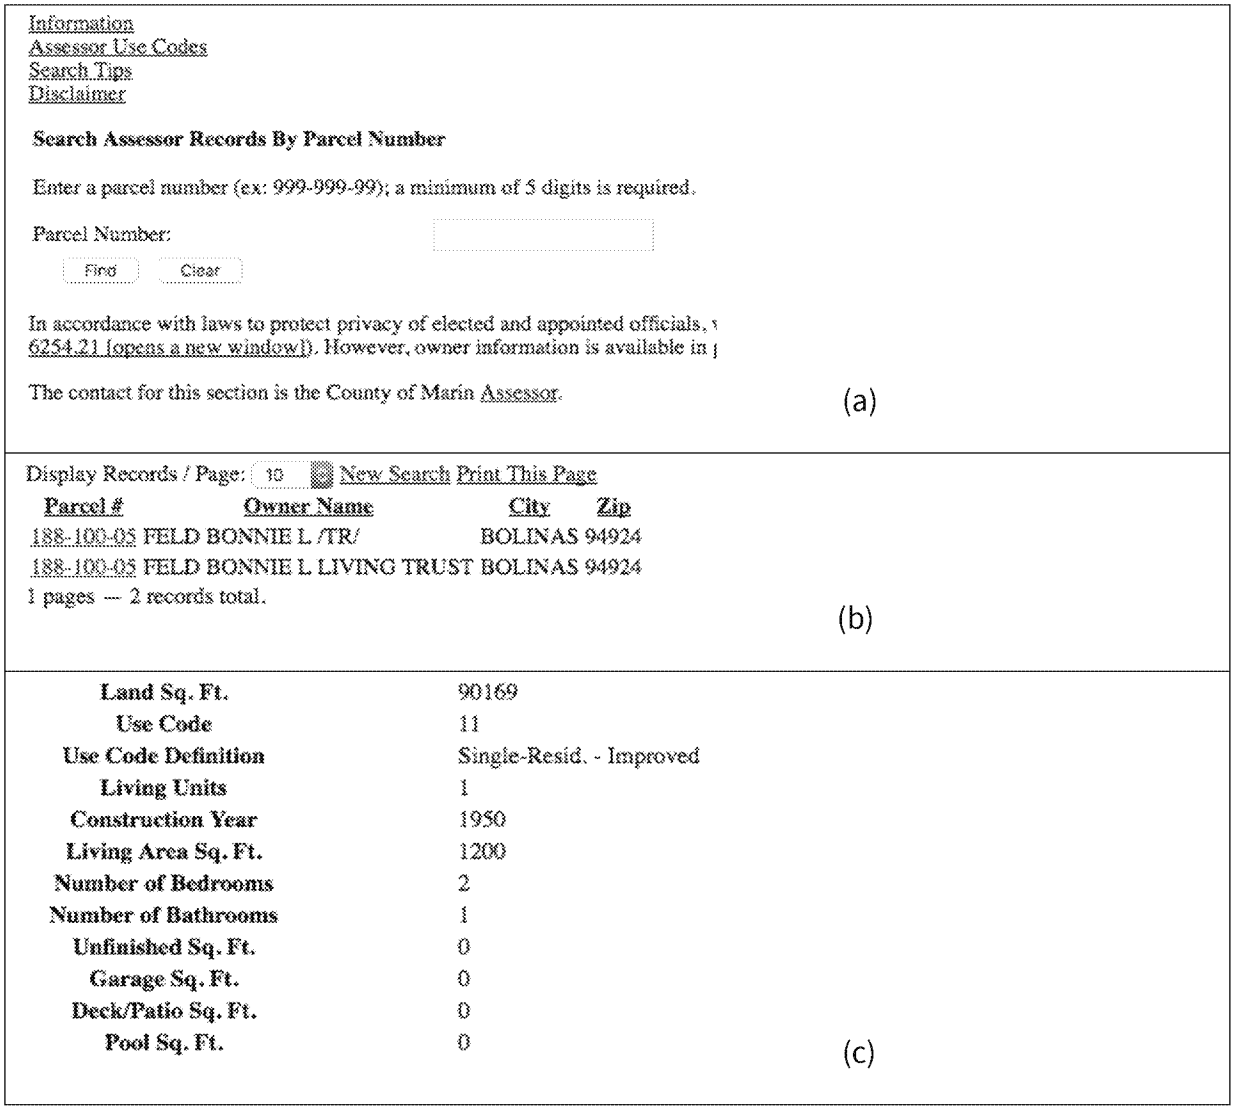

Figure 9. A walk-through of the Marin County Tax Assessor website [42] to learn the housing characteristics for a Bolinas property: (a) The initial screen requires a parcel number, which appears as the property id in the Bolinas Tax Data. (b) Search results for the property id (or parcel) 188-100-05. (c) Selection of a search result gives housing characteristics for the property id, in this case a single residential home constructed in 1950 having 2 bedrooms and 1 bath in a living area of 1,200 square feet.

Using the website added uncertainty, because the identity of the homeowners was from 2006 tax data but the housing characteristics were mined from the website in 2013 (and replicated in 2017). An HES participant from Bolinas could have made home renovations that changed the number of bedrooms or bathrooms during this time, and if so, the recorded information would not match the 2006 information.

Regardless, the Attackers automated the process shown in Figure 8 by writing a Python program that used the property (parcel) ids from the Bolinas Tax Data to walk through the website in the same way a human would to retrieve the housing characteristics for each of the 610 Bolinas residences. If an error was encountered, the Attackers then searched for properties having the same first groups of digits on the parcel number and the same owner that did not otherwise appear on the list. In these cases, the parcel numbers may have changed between the date of the tax data (2006) and the web searches of housing characteristics (2013 and replicated in 2107), so this was a means of locating the new property id to fetch the housing characteristics. The website provided housing characteristics for 533 of the 610 parcels. Searches for the remaining 77 parcels gave an error, and no other parcel id was found for the property.

Of the 533 parcels found on the assessor's website, 3 were built after 2006, so they were dropped. The final result was housing, address, and ownership information for 530 of 610 (or 87 percent) of the Bolinas residential properties. Of these 530 addresses, 105 (20 percent) had parcel changes since 2006, most of which were subdivisions. An unknown number of parcels may have further changed, and likely increased, the number of bedrooms or baths since 2006.

The Attackers constructed a file that associated the owner names and property addresses from the Bolinas Tax Data with the housing characteristics retrieved from the website for the same property; this is the "Bolinas Property Register." It had 8 fields and 530 data rows. Figure 11 lists its fields.

The Bolinas Property Register is similar to the Atchison and Liberty property registers, except it does not include the total number of rooms. It does include the names of owners, whereas the Liberty Property Register includes no names. The Bolinas Property Register additionally includes the square footage of the garage.

The Bolinas properties were far less homogeneous than the Atchison Village and Liberty Village properties. Of the 530 properties in the Bolinas Property Register, 477 (or 90 percent) had a unique combination of bedrooms, baths, and living area, with the variability being greatest in the amount of living area. For example, the largest number of residences having the same combination of bedrooms, baths, and living area was 7 for homes having 2 bedrooms and one bathroom and 768 square feet. Even though 158 (or 30 percent) of the 530 homes had 2 bedrooms and one bathroom, the possible living areas ranged from 465 to 2,338 square feet, with a median of 968 square feet, an average of 1,057 and a standard deviation of 361. Figure 10 shows descriptive statistics for each housing characteristic separately.

Figure 11. Fields of the Bolinas Property Register. Addresses and ownership based on 2006 tax assessor data, as acquired from the Marin County Assessor's Office [38]. Housing characteristics from the Marin County Assessor's Website in 2013 [39, 42].

The Attackers sent a list of the 530 addresses that constitute the Bolinas Property Register to the Scorers. The Scorers reported, at the end of the experiment, that 9 of the 10 Bolinas addresses of HES participants (or 90 percent) appeared in the Bolinas Property Register.

Results for Step 6. People Registers

At this point, the Attackers had constructed three property registers, one each for Atchison Village, Liberty Village, and Bolinas. Later, the Attackers used these property registers in the first stage of the re-identification, as depicted on the left side of Figure 1. The second stage of the re-identification required the construction of people registers, which are lists of named people known to have lived at the addresses during the study period.

The names of homeowners from the Atchison Village property data were not used as a people register because the Atchison Village Cooperative accommodates relocations within Atchison Village. As a consequence, the tax data for an individual property may not reflect the true resident at the time of the study. The names of homeowners from the Bolinas property data were not used as a people register because some participants from Bolinas rented. So the Attackers constructed people registers for all 3 communities using the following 3 steps:

1. Start with a blank people register. The fields are: address, name, birth year, move-in and move-out years, gender, and race.
2. For each address in the property register:
   Search a public data broker's website [31, 32] for people who lived at the address during 2006 (the study period).

   a. For each person found:
      Add a record to the people register that contains the person's name, birth year, the earliest year they were known to live at the address, and the year they moved out, if provided.
3. For each name acquired in (2) above:
   a. Infer the person's gender, as possible, from the person's first name and append the information to the person's record in the people register.
   b. Infer the race or ethnicity of the person, as possible, from the person's last name (also known as the family or surname) and append the information to the person's record in the people register. Using last names to infer race is not a good predictor of Blacks because Whites and Blacks often share a last name. Therefore, some number of those identified as white may be black using last name inference.

The subsections below describe the demographics of the people register in more detail than is necessary to interpret the results. The reader can advance to the summary subsection, Summary of Property and People Registers, without loss of information sufficient to understand the results. Meanwhile, the reader seeking a deeper understanding of the communities involved in this study should proceed.

Atchison Village People Register

The Attackers searched each of the 450 addresses from the Atchison Village Property Register on the public data broker's website. Names and demographics for 1,290 adult residents were found for 434 (or 96 percent) of the addresses; 16 addresses reported no residents.

Almost half the addresses (213 of 434 or 49 percent) had 1 or 2 adult residents. Figure 12(a) shows the distribution of the number of adults per address: 1,127 of 1,290 (or 87 percent) of the people had a year of birth. Figure 12(b) shows the distribution of the birth years of the adults. The youngest people were born in 1993 and the oldest in 1900. The median year of birth was 1956 and the average was 1954 with a standard deviation of 19 for the 1,127 people having birth year information.

Figure 12(c) shows the distribution of move-in dates. The person living at their Atchison Village address the longest moved into the residence in 1970. The median year in which people moved to their Atchison address was 1998, and the average was 1997 with a standard deviation of 7 for the 1290 people.

Many people (142 of 1,290 or 11 percent) moved into their Atchison residence during the year of the study, while 76 residents moved out during the study year of 2006.

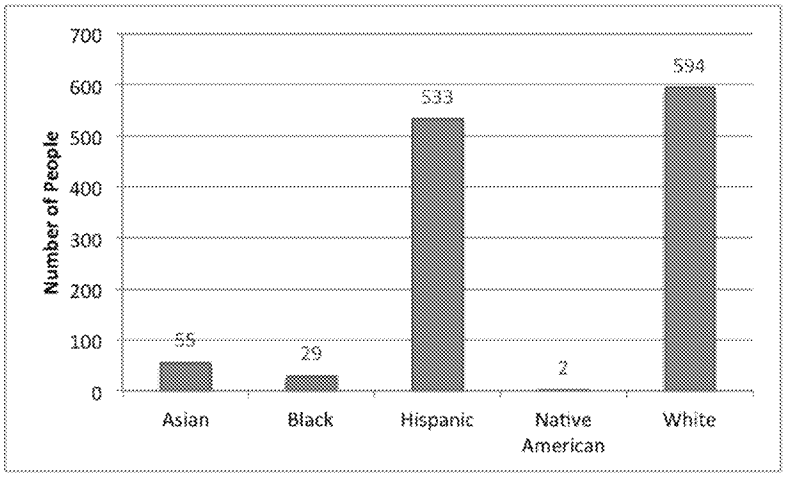
Year Person Moved into Residence

(c)



(d)

Figure 12. Distributions of information about named people who lived in Atchison Village in 2006: (a) the number of people per address; (b) their birth years; (c) the year in which they moved into their residence; and, (d) residents' race or ethnicity inferred from last name by computer program. Using last names to infer race is not a good predictor of Blacks; some number of those identified as white may be black.

The Attackers wrote a Python program that used a list of the 1,645 most popular first names and their frequency of gender usage in the 1990 U.S. Census [35] to assign gender. Of the 1,290 names for residents identified in Atchison Village, 560 (43 percent) had first names more likely to be associated with males, and 582 (45 percent) had first names more likely to be associated with females. Gender was assigned to 1,142 of 1,290 (89 percent) of the names in the Atchison Village People Register.

The Attackers wrote a Python program that used a list of the 151,671 most popular last names and their frequency by race and ethnicity in the 2000 U.S. Census [36]. Of the 1,290 names found for residents in Atchison Village, 594 (46 percent) had last names more often associated with Whites, 533 (41 percent) had names more often associated with Hispanics, and 77 names (6 percent) could not be assigned an inferred race. Figure 12(d) shows the distribution by race and ethnicity. Values in the race field in the Atchison Village People Register were assigned accordingly.

The Attackers submitted the names of the 1,290 residents that they found as residents of Atchison Village in 2006. At the end of the experiment, the Scorers reported that 32 of the names from HES participants appeared on the list of 1,290 residents.

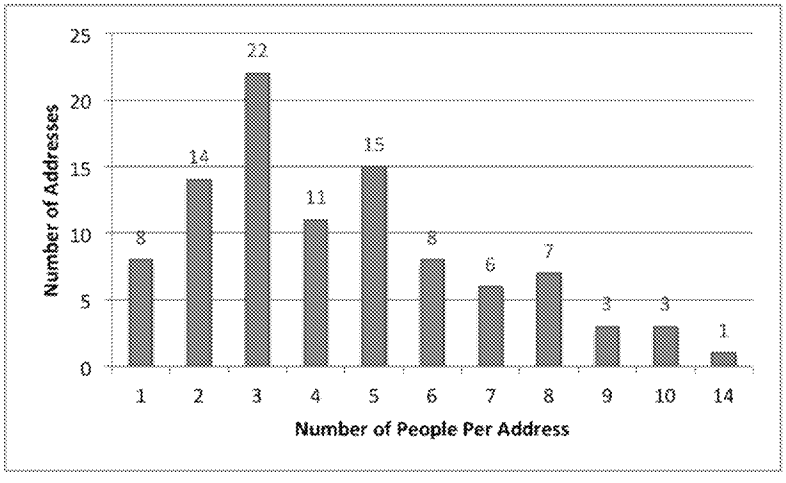
Liberty Village People Register

The Attackers searched each of the 111 addresses from the Liberty Village Property Register on the public data broker's website. Names and demographics for 438 adult residents were

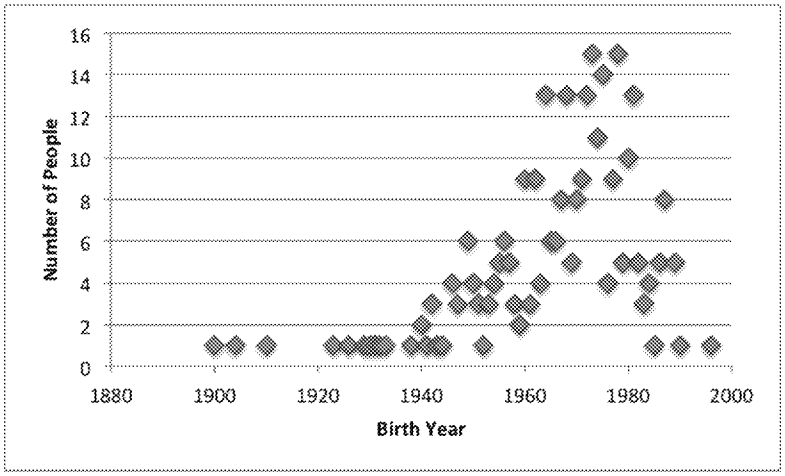
found for 98 addresses. Recall, Liberty Village actually had 100 units with 100 addresses, and the Attackers had derived 11 additional addresses. The data broker's website found some addresses defunct, yielding people for 98 of 100 (98 percent) units.

Almost half the addresses (44 of 98 or 45 percent) had 1, 2, or 3 adult residents; see Figure 13(a). Only 303 of 438 (or 69 percent) of the people had year of birth. Figure 13(b) shows the distribution of the birth years. The youngest person was born in 1996 and the oldest in 1900. The median year of birth was 1970, and the average was 1967 with a standard deviation of 14 for the 303 people. Figure 13(c) shows the distribution of move-in dates. The person living at their Liberty Village address the longest moved into the residence in 1980. The median year was 2004, and the average was 2003 with a standard deviation of 4 for the 438 people.

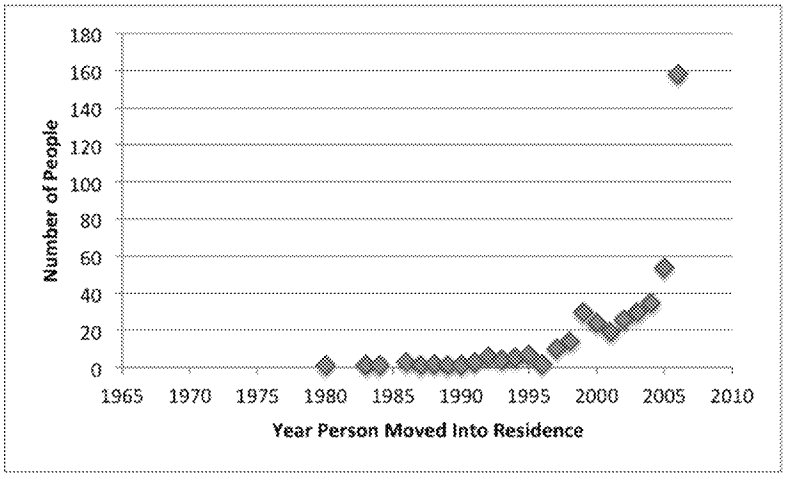
Many people (158 of 438 or 36 percent) moved into their Liberty Village residence during the year of the original study. Many people (112 of 438 or 26 percent) also moved out of their Liberty Village residence during the study year. The number of named residents that the Attackers found who neither moved in nor moved out of Liberty Village during 2006 was 244 (of 438 or 56 percent) of the residents, which is about half of all the Liberty Village residents that the Attackers identified.



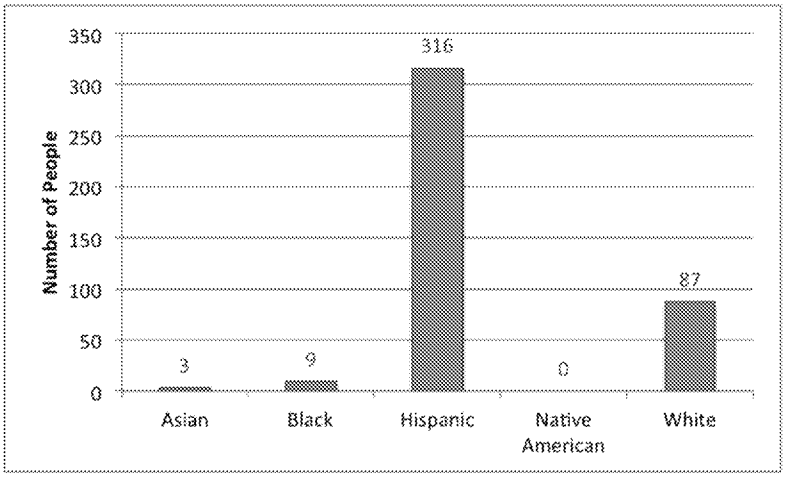
(a)



(b)



(c)



(d)

Figure 13. Distributions of information about named people who lived in Liberty Village in 2006: (a) the number of people per address; (b) their birth years; (c) the year in which they moved into their residence; and, (d) residents' race or ethnicity inferred from last name by

computer program. Using last names to infer race is not a good predictor of Blacks; some number of those identified as white may be black.

The Attackers used their Python program (described earlier) to assign gender to the names of the people identified as living in Liberty Village during the study year. Of the 438 names of residents identified in Liberty Village, 209 (48 percent) had first names more likely to be associated with males, and 161 (37 percent) had first names more likely to be associated with females. Gender was assigned to 370 of 438 (84 percent) of the names in the Liberty Village People Register.

The Attackers used their Python program (described earlier) to assign race and ethnicity to the names of the residents identified as living in Liberty Village during the study year. Of the 438 names found for residents in Liberty Village, 316 (72 percent) had last names more often associated with Hispanics, 87 (20 percent) had names more often associated with Whites, and 23 (5 percent) had no race or ethnicity assigned. Figure 13(d) shows the distribution. Overall, 415 of 438 (95 percent) of the surnames were assigned a race or ethnicity.

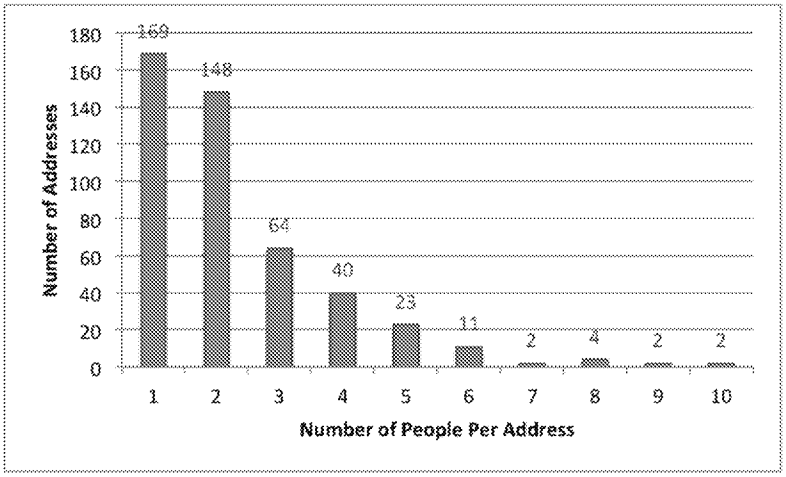
The Attackers submitted the names of the 438 residents that they found as residents of Liberty Village in 2006. At the end of the experiment, the Scorers reported that 3 of the names from HES participants appeared on the list of 438 residents.

Bolinas People Register

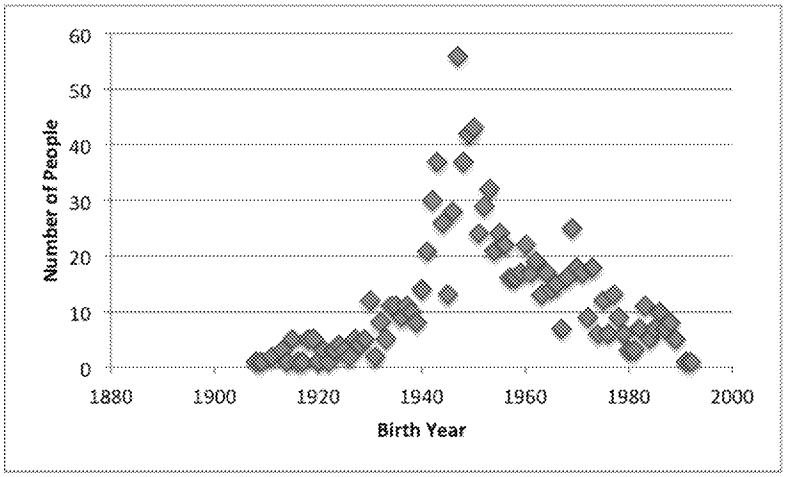
The Attackers searched each of the 530 addresses from the Bolinas Property Register on the public data broker's website. Names and demographics for 1,082 adult residents were found for 465 (87 percent) of the addresses; 67 addresses reported no residents.

More than half the addresses (317 of 465 or 68 percent) had 1 or 2 adult residents; see Figure 14(a). Most people, 1,038 of 1,082 (96 percent), had a year of birth; only 44 did not; see Figure 14(b). The youngest person was born in 1992 and the oldest in 1908. The median year was 1952, and the average was 1954 with a standard deviation of 16 for the 1,038 people. Figure 14(c) shows the distribution of move-in dates. The person living at their Bolinas address the longest moved into the residence in 1963. The median year was 1994, and the average was 1994 with a standard deviation of 8 for the 1,082 people.

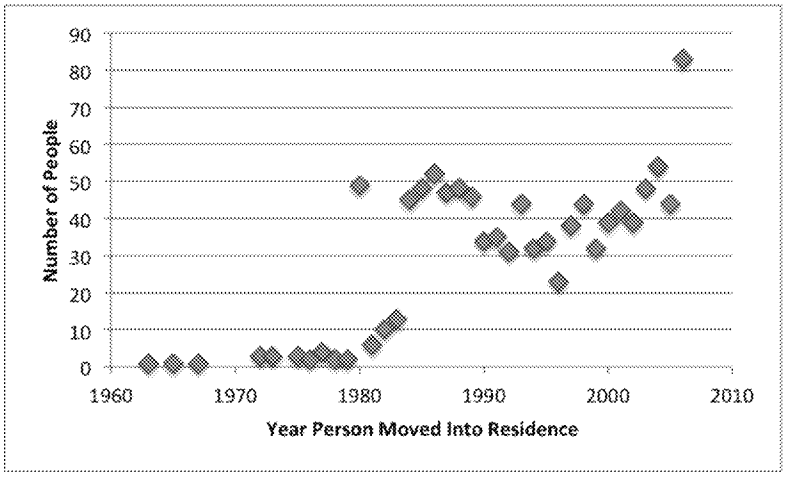
Some people (83 of 1,082 or 8 percent) moved into their Bolinas residence during the year of the study. Similarly, some Bolinas residents (90) moved out during the study year of 2006. The number of named residents that the Attackers found who neither moved in nor moved out of Bolinas during 2006 was 949 people.



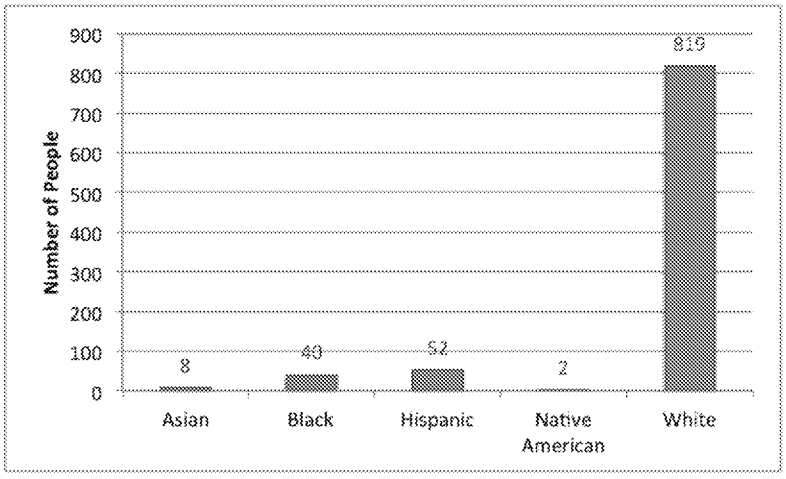
(a)



(b)



(c)



(d)

Figure 14. Distributions of information about named people who lived in Bolinas in 2006: (a) the number of people per address; (b) their birth years; (c) the year in which they moved into their residence; and, (d) residents' race or ethnicity inferred from last name by computer program. Using last names to infer race is not a good predictor of Blacks; some number of those identified as white may be black.

The Attackers used their Python program (described earlier) to assign gender to the names of the people identified as living in Bolinas during the study year. Of the 1,082 names of residents identified in Bolinas, 476 (44 percent) had first names more likely to be associated with males, and 495 (46 percent) had first names more likely to be associated with females. Gender was assigned to 971 of 1,082 (90 percent) of the names in the Bolinas People Register.

The Attackers used their Python program (described earlier) to assign race and ethnicity to the names of the residents identified as living in Bolinas during the study year. Of the 1,082 names found for residents in Bolinas: 52 (5 percent) had last names more often associated with Hispanics, 819 (76 percent) had names more often associated with Whites, and 161 (or 15 percent) had no assignment; see Figure 13(d). Overall, 921 (of 1082 or 85 percent) of the surnames were assigned a race or ethnicity.

The Attackers submitted the names of the 1082 residents that they found as residents of Bolinas in 2006. At the end of the experiment, the Scorers reported that 5 of 10 (or 50 percent) of the names from HES participants appeared on the list of 1,082 residents.

Summary of Property and People Registers

Each property register was produced in a distinct manner. The Atchison Village Property Register, containing 450 addresses, came directly from the tax assessor data, and therefore should contain all addresses in Atchison Village with their appropriate housing characteristics. Liberty Village was a rental community of 100 units. The Attackers constructed a property register by inferring 111 addresses and housing characteristics for the 100 units. The Bolinas Property Register started with tax information to identify addressed parcels having living units, but the Attackers mined the housing characteristics from a tax assessor website almost 10 years after the study for the list of 530 addresses. Therefore, the Atchison Village and Liberty Property Registers appear to be the most complete and Atchison the most accurate.

The communities differed in their property characteristics and homogeneity. Atchison Village and Bolinas were both communities of primarily homeowners, whereas Liberty Village was a rental complex. The housing characteristics – number of bedrooms and baths and living area – of Atchison Village and Liberty Village were homogeneous. Most homes had two bedrooms and one bathroom built in 1942.

Of the 530 properties in the Bolinas Property Register, 477 (90 percent) had a unique combination of beds, baths, and living area with the variability being greatest in the amount of living area. The houses were built between 1879 and 2005 with a median year of 1959. The largest number of residences having the same combination of bedrooms, baths and living area was only 7 homes, which had 2 bedrooms and one bathroom with a living area of 768 square feet.

The Attackers constructed population registers using information available from a data broker. While the information seemed reasonable and comprehensive, there was no guarantee that the data were accurate or complete.

The characteristics of residents differed among the communities. The residents found for Atchison Village had last names the computer program associated with Whites (46 percent) and Hispanics (41 percent). The names found for residents in Liberty Village were much more frequently associated by the computer program with Hispanics (72 percent) than Whites (20 percent). The computer program associated names of Bolinas residents predominantly with Whites (76 percent) with few Hispanics (5 percent).

Liberty Village experienced a lot of mobility during the study year (as reported earlier in Liberty Village People Register). A total of 76 of the 98 units (78 percent) changed occupancy during the year of the study. A third of the properties in Atchison Village changed occupants during the study year (150 of the 450 or 33 percent). However, few of the Bolinas residences changed occupancy during the same year (40 of the 530 or 8 percent of the addresses).

The characteristics described above about these people registers place important limits on re-identification attempts. Here is a summary based on a comparison of demographic homogeneity, the number of adults per residence, mobility, and data quality.

The more homogeneous a community, the more difficult it is to acquire correct small group re-identifications because many different people and homes share the same features indistinguishably. All three groups are homogeneous, but there is a noticeable difference in racial homogeneity. The Liberty Village People Register is almost all Hispanic, and the Bolinas People Register is almost all White. Only the Atchison Village People Register has substantive variability in race (about half Hispanic), so we might expect more matches from Atchison Village than the other two. Liberty Village had the most homogeneous property register.

A population having more adults per residence will likely make larger groups in matches of people by name based on housing. The Liberty Village People Register has many more people on average per household than does Atchison Village or Bolinas, so we might expect Liberty Village to have fewer small group re-identifications.

The greater the number of people moving in and out of a residence during the year of the study, the more difficult it is to match a person to a residence because the register and the data may show different residents for the same year. Liberty Village had the greatest mobility during the study period.

Finally, using Bolinas housing characteristics that are 10 years newer than the study data would be expected to limit correct matchups of Bolinas data.

Results for Step 7. Re-identifications

Matching Characteristics

Matches between the property data and the HES records in the De-ID Dataset should have no garage, the same number of bedrooms and baths, and, in the case of Richmond homes, be built in 1942.

At least 32 of the 50 properties (64 percent) in the De-ID Dataset were from Atchison Village, yet the property square footages did not match those listed in the De-ID Dataset even accounting for smaller units at Liberty Village. The Attackers modeled the records in the De-ID Dataset as a random sample drawn from the three different communities and then compared the distributions of their square footages for living units. The Attackers assumed the distributions in the De-ID dataset were representative of the population, so normalizing the distributions allowed the Attackers to associate values in the De-ID dataset with likely equivalents in the property data based on the following cut-offs used for all three communities.

totalsquareft in De-ID Dataset	Total Living Area in Property Data
400-450	<= 750
450-500	>=700 and <=790
500-650	>=736 and <=890
650-700	>=840 and <=910
700-1,000	>=875 and <=1,125
1,000-2,000	>= 1,080

A record in a people register matches a record in the De-ID Dataset if the person's birth year, move-in date, gender, and race or ethnicity assignment agrees. A person's year of birth would match to one the following ranges: 1920-1939, 1940-1949, 1950-1969, and 1970-1989. Similarly, a person's move-in year in a people register matches one of the following ranges found in records in the De-ID Dataset: 1970-1989, 1990-1999, or 2000-2009. Gender is Male or Female and race is one or more of: Black, White, Hispanic, Asian, or Native American.

Two sets of matches exist based on whether a computer or human assigned gender and race. The computer-assigned set also includes whether matches to missing values for gender or race in the people register are used or not. The set whose values for race and gender were tagged manually matches only to non-blank results. Below we report on the most relevant results.

The subsections below describe details of matchups and the scoring of matchups in detail by community. A summary of results starts the Discussion section.

Atchison Village Re-Identifications

The Attackers matched the records in the Richmond records of the De-ID Dataset to those in the Atchison Village Property Register based on housing characteristics using a computer program written by the Attackers; see Figure 1(a). The program matched records having the same number of bedrooms and baths, having been built in 1942, and having living areas consistent with the ranges described earlier.

The result was 3,813 matches for 32 of 40 (or 80 percent) of the Richmond records. These matches agreed with the 32 records the Attackers considered to be Atchison Village records. The Attackers continued their analysis with these 32 possible Atchison Village records.

Two records in the De-ID Dataset each matched to only one record in the Atchison Village Property Register. In terms of the maximum number of matches, 3 records in the De-ID Dataset matched to 223 different records in the Atchison Village Property Register. The same record in the Atchison Village Property Register may match to more than one record in the De-ID Dataset. Figure 15 shows the cumulative number of Richmond records in the De-ID Dataset matched to records in Atchison Village Property Register by binsize.

This matching result combines the Atchison Village Property Data to the De-ID dataset. Subsequent steps use this combined dataset.

1	2
3	3
5	4
7	6
48	7
68	11
96	20
215	29
223	32

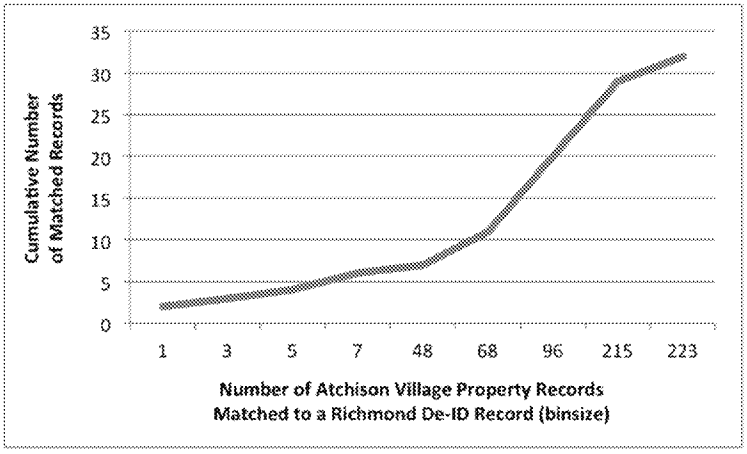

Figure 15. Matches of records in the Atchison Village Property Register to 32 records in the De-ID Dataset based on housing characteristics alone. The binsize is the number of property records matched to the same De-ID Dataset record. Two records matched uniquely. Three records in the De-ID Dataset each matched to 223 records in the Atchison Village Property Register. The same record in the Atchison Village Property Register may match to more than one record in the De-ID Dataset.

Atchison Village Re-Identifications: Named People with Hand Labels

The Attackers matched the combined Atchison Village property and De-ID data to records in the Atchison Village People Register using a Python program that the Attackers wrote. The program matched records based on birth year and move-in year information; see Figure 1(b). Gender and race were not used. The Attackers then manually assigned race and ethnicity and gender to the matching records and concluded the matching manually using information from HES Publications and a spreadsheet program.

The Attackers found a total of 121 matches of people from the Atchison People Register to records in the combined Atchison Village De-ID and property data for 17 of 32 (53 percent) of the Atchison records having a small group (k<20) re-identification. Five matches were unique re-identifications. For k<5, the risk pool was 9 people for 7 re-identifications. For k<11, the risk pool was 40 people for 12 re-identifications. For k<20 the risk pool was 109 people for 17 re-identifications. Some people appear in more than one group. Figure 16 shows the accounting of binsizes for the matches.

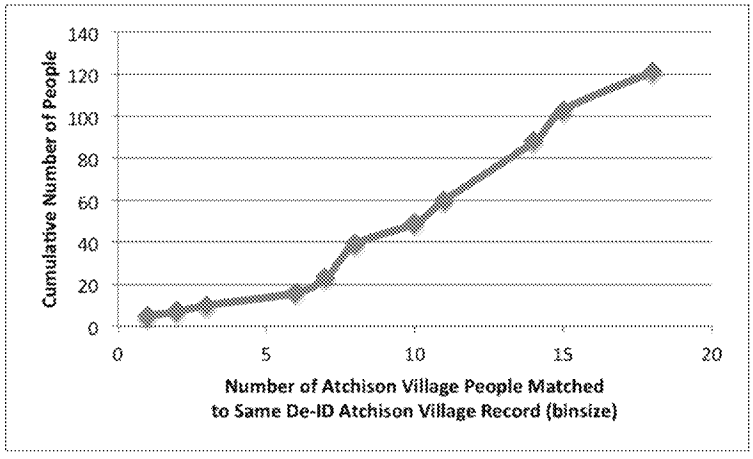

Figure 16. Small group re-identification (*k*<20) of named Atchison Village people based on housing characteristics and personal demographics with human-assigned values for gender and race. Matching records in the combined Atchison Village property and De-ID Dataset were further matched to records in the Atchison Village People Register; see Figure 1(b). Binsize is the number of named people matched to combined De-ID and property records. A total of 121 matches to named people appeared for 17 of 32 (or 53 percent) of the De-ID Dataset records for Atchison Village having small group (*k*<20) re-identifications.

Atchison Village Re-Identifications: Addresses with Hand Labels

The Attackers also examined the re-identification of addresses from the same Atchison Village People Register in which the Attackers manually assigned gender and race. The Attackers found a total of 135 matches of addresses from the Atchison Village People Register to records in the combined Richmond De-ID and Atchison Village property data for 18 of 32 (56 percent) of the Atchison Village records having a small group (*k*<20) re-identification. As had been the case with matches to named people, 5 were unique re-identifications. For *k<5*, the risk pool was 9 addresses for 7 re-identifications. For *k<11*, the risk pool was 39 addresses for 12 re-identifications. And, for *k<20* the risk pool was 109 addresses for 18 re-identifications. Some addresses appear in more than one group. Figure 17 shows the accounting of binsizes for the matches.

Matching records in the combined Atchison Village property and De-ID Dataset were further matched to records in the Atchison Village People Register; see Figure 1(b). Binsize is the number of addresses matched to combined De-ID and property records. A total of 135 small group (*k*<20) matches to addresses appeared for 18 of 32 (56 percent) of the De-ID Dataset records for Atchison Village.

Atchison Village Re-Identifications: People with Computer-Assigned Labels

The Attackers then matched the combined Atchison Village property and De-ID data to records in the Atchison Village People Register using a Python program that the Attackers wrote that included matches on the computer assignment of values for gender and race. Matches were based on birth year, move-in date, race and ethnicity, and gender. Blank entries were not matched.

The computer program found a total of 162 matches of people from the Atchison Village People Register to records in the combined Atchison Village De-ID and property data for 21 of 32 (66 percent) of the Atchison Village records having small group (*k*<20) re-identifications. Two matches were unique re-identifications. For *k<5*, the risk pool was 15 people for 7 re-identifications. For *k<11*, the risk pool was 58 people for 14 re-identifications. And, for *k<20* the risk pool was 124 people for 21 re-identifications. Some people appear in more than one group. Figure 18 shows the accounting of binsizes for these matches.

Matching records in the combined Atchison Village property and De-ID Dataset were further matched to records in the Atchison Village People Register; see Figure 1(b). Binsize is the number of named people matched to the combined De-ID and property records. A total of 162 small group (*k*<20) matches of named people appeared for 21 of 32 (66 percent) of the De-ID Dataset records for Atchison Village.

Atchison Village Re-Identifications: Addresses with Computer Assigned Labels

The Attackers also examined the re-identification of Atchison Village addresses from the same data in which a computer program assigned gender and race. The Attackers found a total of 159 matches of addresses from the Atchison Village People Register to records in the combined Atchison Village De-ID and property data for 21 of 32 (66 percent) of the Atchison Village records having a small group (*k*<20) re-identification. There were 2 unique re-identifications. For *k<5*, the risk pool was 16 addresses for 7 re-identifications. For *k<11*, the risk pool was 57 addresses for 14 re-identifications. And, for *k<20* the risk pool was 108 addresses for 21 re-identifications. Figure 19 shows the accounting of binsizes for the matches.

Binsize is the number of addresses matched to combined De-ID and property records. A total of 159 matches of addresses appeared for 21 of 32 (66 percent) of the De-ID Dataset records for Atchison Village having small group (*k*<20) re-identifications.

Atchison Village Re-Identifications: Results

The Attackers sent small group results for addresses and named people for Atchison Village re-identifications to the Scorers to identify which, if any, of the groups sized $k<20$ had a correct match. Figure 20 provides a summary of the results sent to the Scorers. Of the hand-labeled groups, 7 of the 17 (41 percent) named people groups contained the correct person, and 10 of 18 (56 percent) address groups contained the correct address. The computer labeled matches scored better. One of the 2 unique re-identifications was correct for the named person and the address, 16 of the 21 (76 percent) of the named people groups $k<20$ contained the correct person, and 16 of 21 (76 percent) of the address groups $k<20$ contained the correct address. Figure 21 and Figure 22 show the detailed results.

Overall, the Attackers correctly identified the 32 records from Atchison Village and correctly and uniquely identified 1 of 32 (3 percent) by name and address.

Atchison Village Re-Identification Strategy	k=1	k<5		k<11		k<20	
		Pool size	# of groups	Pool size	# of groups	Pool size	# of groups

Liberty Village Re-Identifications

The Attackers associated 9 records in the Richmond subset of the De-ID Dataset to Liberty Village (8 renters and 1 whose home ownership was not known), and then matched those 9 records to records in the Liberty Village Property Register based on housing characteristics using a computer program written by the Attackers; see Figure 1(a). Matches had the same number of bedrooms and baths, were built in 1942, and had living areas consistent with the ranges described earlier.

The result was 623 matches for the 9 records. None of the matches was unique, and there were no small group matches, a result reflecting the homogeneity of the rental units. Figure 23 (left) lists the cumulative number of records in the Liberty Village Property Register matching to the Richmond records in the De-ID Dataset. Figure 23 (right) shows the cumulative number of Richmond records known to be renters in the De-ID Dataset matched to records in the Liberty Village Property Register by binsize. Subsequent steps use this combined dataset.

Number of Property Records in a Match (binsize)	Cumulative Number of Matches
29	2
75	3
83	9

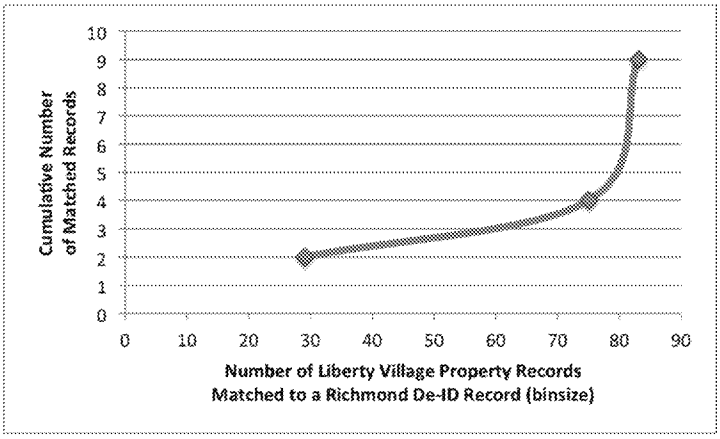

Figure 23. Matches of records in the Liberty Village Property Register to records in the De-ID Dataset based on housing characteristics alone. The binsize is the number of property records matched to the same De-ID Dataset record. There were no unique or small group matches. The same record in the Liberty Village Property Register may match to more than one record in the De-ID Dataset.

Liberty Village Re-Identifications: Hand Labels

Just as was done with Atchison Village, the Attackers matched the combined Liberty Village property and De-ID data to records in the Liberty Village People Register using a Python program that the Attackers wrote, notwithstanding concerns mentioned earlier – i.e., homogeneity of the population and property, and the greater number of residents per household. Gender and race were not used. The Attackers then manually assigned race/ethnicity and gender to the matching records and concluded the matching manually using a spreadsheet program.

The Attackers found a total of 76 matches of people from the Liberty People Register to records in the combined De-ID and property data. The matches were for 7 of the 9 records that the Attackers believed were from Liberty Village. For $k=1$ and $k<5$, the risk pool was 1 person for 1 re-identification. For $k<11$, the risk pool was 8 people for 4 re-identifications. And, for $k<20$ the risk pool was 26 people for 7 re-identifications.

Similarly, the Attackers found a total of 70 matches of addresses from the Liberty Village People Register to records in the combined Richmond De-ID and Liberty Village property data. The matches were for 7 of the records believed to be from Liberty Village. For $k=1$ and $k<5$, the risk pool was 1 person for 1 re-identification. For $k<11$, the risk pool was 7 addresses for 4 re-identifications. And, for $k<20$ the risk pool was 24 addresses for 7 re-identifications.

Liberty Village Re-Identifications: Computer Assigned Labels

Just as was done with Atchison Village, the Attackers then matched the combined Liberty Village property and Richmond De-ID data to records in the Liberty Village People Register using a Python program that the Attackers wrote that included matches on the computer assignment of values for gender and race. Matches were based on birth year, move-in date, race and ethnicity, and gender.

When matches were restricted to records in the Liberty Village People Register that had complete values – i.e., no missing move-in or birth year information, no small group re-identifications resulted. Therefore, computer matches were insufficient with complete information and possible but speculative with missing information.

Liberty Village Re-Identifications: Results

The Attackers sent the hand-labeled results for addresses and named people for Liberty Village re-identifications to the Scorers to identify which, if any, of the groups had a correct match. The Scorers reported that 1 of 7 named people groups contained the correct person and 2 of 7 address groups contained the correct address (Figure 24).

Liberty Village People Re-identification Scores					
Hand-Label Gender, Race			Hand-Label Gender, Race		
Group size	Total no. of groups	No. of groups having a correct match name	Group size	Total no. of groups	No. of groups having a correct match address
1	1	0	1	1	0
7	3	0	6	3	1
18	3	1	17	3	1
TOTAL	**7**	**1**	**TOTAL**	**7**	**2**

Figure 24. Scored results for Liberty Village People Re-identifications for binsizes of 20 or less. The data have manually labeled gender and race. One of 7 of the groups included the correct person by name (left), and 2 of 7 of the groups included the correct address (right).

Overall, the Attackers believed 9 records were from Liberty Village, and 8 of those records were actually from Liberty Village. Regardless, the Attackers did not correctly identify any small group re-identifications (k<5).

Bolinas Re-Identifications

Just as was done with the other communities, the Attackers matched the records in the Bolinas records of the De-ID Dataset to those in the Bolinas Property Register based on housing characteristics using a computer program written by the Attackers; see Figure 1(a). The program matched records having the same number of bedrooms and baths, being built in the same time period, and having living areas consistent with the ranges described earlier.

The result was 200 matches for 10 of 10 (100 percent) of the Bolinas records. None of the records in the De-ID Dataset matched uniquely. Figure 25 shows the cumulative number of Bolinas records in the De-ID Dataset matched to records in Bolinas Property Register by binsize. This curve is more similar to that for Atchison Village (Figure 18) than for Liberty Village (Figure 23), suggesting that there exists sufficient variability for matching. However, concerns about the quality of the matches remain because of the property data are from 2017 and the HES data are from 2006.

Number of Property Records in a Match (binsize)	Cumulative Number of Matches
4	2
9	4
12	5
21	6
24	8
28	9
65	10

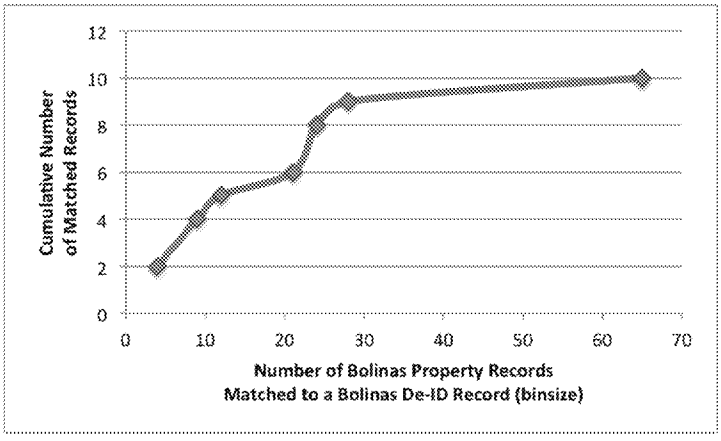

Figure 25. Matches of records in the Bolinas Property Register to records in the De-ID Dataset based on housing characteristics alone. The binsize is the number of Bolinas property records matched to the same Bolinas De-ID Dataset record. No records matched uniquely. A total of 163 Bolinas addresses matched to the 10 Bolinas De-ID records.

The Bolinas registers did not lend themselves to reliable manual matches. While some derivations were possible, the Attackers lacked confidence in the results because of the homogeneity of the people, small sampling fraction, and the lack of reliability in the housing data. Similar limitations existed for the matches using the computer-labeled data. For k<20, the risk pool was 18 people and addresses for 7 re-identifications. As we anticipated might be the case, none of the re-identifications was correct upon scoring.

At the HIPAA Safe Harbor

We repeated the experiments again using HES data that had exact year of birth (rather than decadized), which is permitted by HIPAA. Rather than reporting a study participant's age in bands of 10 or 20 years, we produced re-identifications using a De-ID Dataset that was the same as previously described except that the year of birth was provided. Information about the move-in date and when the house was built remained grouped in ranges of 10 or 20 years.

We matched records in the Atchison Village People Register to the combined Atchison Village property and De-ID records using a Python program that the Attackers wrote. Matches were based on birth year, move-in date, race and ethnicity, and gender. Blank entries were not

matched. The computer program found 11 unique re-identifications for named people and addresses. For *k<5*, *k<11* and *k<20*, the risk pool was the same 27 named people and addresses for 18 re-identifications. Figure 26 shows the accounting of binsizes for the matches.

The Attackers sent these results to the Scorers, who reported that 8 of the 11 (73 percent) unique re-identifications of named people were correct, and 9 of the 11 (82 percent) unique re-identifications of addresses were correct. For $k<5$ (same as for $k<20$), 15 of the 18 (83 percent) groups had a correct named person, and 16 of the 18 (89 percent) groups had a correct address. The Attackers uniquely ($k=1$) and correctly identified 8 of 32 (25 percent) Atchison Village records by name and 9 of 32 (28 percent) by address in the version of the HIPAA-compliant data having exact year of birth, compared to 1 of 32 (3 percent) by name or address in the version of the HIPAA-compliant data having year of birth grouped in 10- or 20 year ranges and using computer-assigned labels.

Similarly, for binsizes $k<5$, the Attackers correctly identified 15 of 32 (47 percent) Atchison Village records by name and 16 of 32 (50 percent) by address in the version of the HIPAA-compliant data having exact year of birth. The correct identifications dropped to 4 of 32 (13 percent) by name or address in data having year of birth grouped in 10- or 20-year ranges and using computer-assigned labels.

Even with the actual year of birth, no reliable re-identifications resulted for Liberty Village or Bolinas.

Atchison Village People Re-identification Scores					
Year of Birth			Year of Birth		
Group size	Total no. of groups	No. of groups having a correct match name	Group size	Total no. of groups	No. of groups having a correct match address
1	11	8	1	11	9
2	5	5	2	5	5
3	2	2	3	2	2
TOTAL	**18**	**15**	**TOTAL**	**18**	**16**

Figure 26. Scored results for Atchison Village People Re-identifications for binsizes of 20 or less using year of birth information. Left side reports results for named people, in which 15 of 18 or 83 percent of the groups included the correct person. Right side reports results for addresses, in which 16 of 18 or 89 percent of the groups included the correct address.

Discussion

We evaluated the potential for re-identifying 10 people and addresses from Bolinas, and 40 people and addresses from two communities in Richmond (32 from Atchison Village and 8 from Liberty Village), California, by matching a dataset redacted at and beyond the HIPAA

Safe Harbor standard with constructed people and property registers. Our results demonstrate that high rates of re-identification are sometimes possible even with heavily redacted data. When less-redacted data (including exact birth year) from Richmond were matched to Atchison Village registers with computer-inferred values for race and gender, we uniquely and correctly identified 8 of 32 (25 percent) by name and 9 of 32 (28 percent) by address. With year of birth grouped in periods of 10 or 20 years, we uniquely and correctly identified 1 of 32 (3 percent) by name and address, 4 of 32 (13 percent) as being one of fewer than 5 names or addresses, and 16 of 32 (50 percent) as being one of fewer than 20 names or addresses.

Anecdotal wisdom suggests that re-identification experiments on heavily redacted data should fail, and this was somewhat true for people and addresses in Liberty Village and completely true for Bolinas. The differences in re-identification rates between these three communities reflect differences in the demographic makeup of the communities and the quality and availability of property data.

All three communities had populations that were fairly homogeneous with respect to age and gender. Liberty Village was predominantly Hispanic and Bolinas predominantly white. Both Atchison Village and Liberty Village were constructed in 1942 and are comprised of a few types of living units repeated many times, but homes in Atchison Village have substantially greater variation in room count and living area. Additionally, accurate property data were available for purchase in Atchison Village, whereas property data had to be inferred for Liberty Village, which is a rental complex. Liberty Village, as a rental complex, also had much higher rates of mobility during the study year, thereby increasing the pool of possible adults living in each home compared to Atchison. These factors likely contributed to the higher rates of re-identification in Atchison Village compared to Liberty Village.

Bolinas differed from both Richmond communities in several important ways. Unlike Liberty and Atchison Villages, Bolinas is not a housing development, so there is much greater variation among homes. However, the quality of the housing data, obtained 10 years after the study with 20 percent of the records having parcel changes, potentially diminished re-identification capability. Bolinas, like Liberty Village, is substantially more racially homogeneous than is Atchison Village, and the sampling fraction was lower in Bolinas (approximately 0.6 percent versus 2 percent). These factors may have contributed to the lower rate of re-identification observed in Bolinas.

These findings suggest that there is something fundamentally flawed with ad hoc redactions of data. They fail to accurately account for the quality and nature of external information. Heavily redacted data may look anonymous, but it is not necessarily so.

The number of correct re-identifications found in the HIPAA Safe Harbor–compliant data having exact year of birth is remarkable (25 percent uniquely and correctly re-identified by name). HIPAA Safe Harbor does not purport to render data with no risk of re-identification.

Instead, the wording states that there exists a "minimal risk," but the regulation itself does not directly define what a minimal level of risk may be. Prior studies found far fewer re-identifications, less than 0.05 percent of unique re-identifications [2, 3], suggesting that the notion of minimal risk defined by the HIPAA Safe Harbor was that low. Correctly and uniquely re-identifying 25 percent of the people and 28 percent of the addresses is a substantial increase in demonstrated vulnerability.

Earlier studies about vulnerabilities in HIPAA Safe Harbor data narrowly relied on demographic fields (e.g., year of birth, gender and the first 3 digits of ZIP) as the basis for matching. Our study used those and other, non-demographic fields, such as the number of rooms and baths, to link to other data sources. These novel linkages increased the rate of re-identifications.

In fact, critical to our re-identifications was the use of property and people registers. The existence of registers is not unique to household studies. The preamble to the HIPAA Privacy Rule makes reference to Sweeney's earliest re-identification in which hospital data were matched to a voter list registry to re-identify the medical record of William Weld, then Governor of Massachusetts [44]. Sweeney's focus on demographics in that seminal example led to a focus on demographic fields in the HIPAA Privacy Rule itself. However, direct matching on demographic fields is not the only vulnerability. Instead, a series of registries can be used to link to other fields in the HIPAA Safe Harbor data before making the final link to a register of named individuals. In our study, the de-identified data were linked to real estate tax data to learn candidate addresses and then matched to the demographics of people associated with those addresses. While tax registries are not generally applicable to medical data, comparable registries in the medical data context today include prescriptions and disease-specific marketing data [45].

Extending HIPAA from healthcare to property data, as we did in these experiments, allowed us to match the HIPAA-compliant study data to identifiable property data using property fields that were present in both data. If all health data were covered by HIPAA, then it would be reasonable to believe that any other dataset containing the same medical fields would also be covered by HIPAA and therefore re-identification attempts would only be able to match medical fields to datasets that had the same redacted demographics, and no names or addresses. However, not all health data is covered by HIPAA, so following this same approach it is possible to link HIPAA-compliant health data with identifiable health data using medical fields. In prior work, Sweeney et al. surveyed flows of health data and found that about half of the more than 2,000 flows of health data they documented were not covered by HIPAA [46]. Among these, they found that 33 states collected and shared hospital discharge data publicly. Because these statewide datasets are not covered by HIPAA, 30 of the publicly available versions used standards weaker than HIPAA for redaction. In other work, Sweeney correctly re-identified records in one state's hospital discharge dataset by using details from newspaper stories to associate names to records [47]. Once re-identified, the records could

theoretically be further matched to HIPAA-compliant data on medical and demographic fields, and thus be used to re-identify the HIPAA-compliant data.

There are many other forms of health data that could also be used to re-identify HIPAA compliant health data. Disease specific marketing lists, for example, include patient names, addresses, and diseases [45]. In a survey of mobile apps, Zang et al. found that personal health monitoring and assistance apps often collect disease specifics, including the date of onset and severity of symptoms, along with the person's name and phone number [48]. A medication refill reminder app contains medication information, from which diagnoses—and even severity of the disease—can be inferred. Datasets of subscribers to health websites and disease discussion lists may include disease information along with names and email addresses. There are many possible sources of health data that include names and contact information as well as medical information, and any of these can be used to re-identify related HIPAA-compliant data.

Our study used three geographical areas whose total population was about 3,000 adults. The HIPAA prescription for reporting geography is the same for data having 3,000 people as it is for populations having up to 20,000 people. No ZIP codes appear. Still, knowing that the data came from three known communities narrowed consideration to a 2 percent sample drawn from 3,000 people.

More generally, there may be a false belief that the HIPAA Safe Harbor only applies to large, datatsets. However, the regulation is silent about the size and attribution of the dataset, which may contain revealing information. For example, if a small rural hospital releases a HIPAA-compliant dataset containing patient-level information, then recipients of the dataset may make inferences about the patients' residences (e.g., ZIP code) based on the nae and location of the hospital. If most of the patients reside in the same ZIP code, then even with no or a redacted ZIP code, a recipient of the data can still infer the full ZIP code for most patients. Similarly, while the regulation requires dates to be reported in years, more specific temporal information can sometimes be inferred. If a hospital releases a dataset daily about its emergency room visits from the day before, then exact visit date can be inferred even though only year is reported .

We use the HIPAA Safe Harbor standard to de-identify data that are not health records. Similar to how IRBs use clinical ethics to deal with all other scientific research ethics, researchers often assume that complying with HIPAA Safe Harbor requirements automatically ensures re-identification protection for their subjects and adds legal protection for themselves (by having chosen to adhere to HIPAA).

Earlier studies about vulnerabilities in HIPAA Safe Harbor data only reported unique identifications, and in so doing did not help develop scientific intuition about re-identification risks more generally. A static value, such as the number of unique re-identifications, describes how well one re-identification strategy performed on one set of

data. But how do we generalize the experience? Was it a fluke, or is it indicative of serious problems? A single number is not as useful as knowing the trajectory of small group re-identifications. How many people were re-identified as one of 2 possible named people, as one of 3 possible named people, and so on? As the number of small group re-identifications grows, so may the robustness of the re-identification risk grow.

In this study, we used the robustness of small group re-identifications to determine whether the re-identifications, even the unique ones, were likely to be correct. In Liberty Village and Bolinas, unique and small-group re-identifications resulted, but we discounted them because of the nature of the small-group re-identifications. For example, unique re-identifications and no other small group re-identifications resulted from Liberty Village data that had birth years in 10- and 20-year ranges and computer-assigned gender and race. Matching records to a homogeneous community foretells the existence of many small group re-identifications. Because none appeared, the Attackers did not believe the isolated unique re-identifications to be correct, and those re-identifications were confirmed not to be correct. Group re-identifications can be a useful aid in understanding re-identification risks.

On the other hand, re-identifications of the same kind of data for Bolinas yielded many small group re-identifications, as expected when matching records for a homogeneous community; however, the poor data quality foretells many noisy matches. Therefore, the Attackers did not believe those re-identifications were reliable, and again, the re-identifications were confirmed not to be correct.

Our results are not necessarily the worst case for re-identifying the data. Many fields in the HIPAA Safe Harbor–compliant data were unused in our experiment. Prior publications referenced chemical distinctions between the communities that were less obviously useful to the Attackers, as non-experts in environmental health. A re-identification expert may often lack domain-specific expertise that limits performance.

However, the opposite is true too: a re-identification expert may know much more than our Attackers. Data analytic companies are one of the top acquirers of publicly available hospital data [49]. Health, environmental, or legal data analytics companies whose data products benefit from re-identifying the de-identified dataset may be highly motivated and very knowledgeable about the de-identified data and therefore able to perform more re-identifications.

Our efforts did not use link analysis, deep learning or statistical matching algorithms, which are commonly used by data analytic companies to construct personal data profiles from disparate data sources [50]. Instead, we used manual and simple matching approaches. We acknowledge that more robust re-identifications may be possible using our same data and re-identification strategy with more sophisticated linking techniques.

Overall, there may exist other re-identification strategies and other data sources that may yield even more re-identifications than we demonstrated. Despite these limitations, we can state that the re-identification rate is at least as high as demonstrated here.

The original data that were the subject of our study was collected more than 10 years ago, and our effort required finding or constructing registers relevant to 2006. If the subject data had been more contemporary, then additional readily available sources of data could have been used for re-identification. For example, the HES data contained information about pets, appliances, and lawn care. If the HES data were more recent, we could have used contemporary marketing lists (e.g., [51]). While similar kinds of marketing lists existed in 2006, we were unable to obtain them retrospectively. We could have also used lookups on Facebook and other social media profiles for our re-identifications.

The environmental health researchers who conducted the original study consider the results to demonstrate a rate of re-identification risk that raises ethical cautions about sharing similar data. In prior work, Brown et al. reported on the challenges of doing community based participatory research that involves biomonitoring and household exposure studies. They emphasized the critical role consent agreements play in informing participants of potential harms as well as the steps taken to prevent or mitigate those harms [52]. They also describe the trust relationship between researchers and participants as imposing ethical requirements on researchers to protect the rights, well-being, and autonomy of participants because the participants alone may shoulder the harm based on decisions made by the researchers [54]. These considerations should be extended to include consideration of risks in datasets that are anticipated to be widely or publicly shared.

Beyond the ethical promise of anonymity, participants may suffer economic harm from loss of privacy. The value of real estate may be adversely impacted, and knowledge of research results may also impose a legal duty on the participant to inform government officials, landlords, tenants, and future homebuyers [54, 55]. This legal obligation may also result in financial costs. While all properties in a community may be impacted by outdoor air quality measures, measurements of indoor air or dust have the potential to pose greater costs to individual residents.

Environmental health studies often inform laws and regulations about industrial pollutants, which can cost companies billions of dollars (e.g., [56]). With so much money involved, protecting the identity and addresses of study participants is a critical shield from retaliatory action.

Of course, protecting privacy is not limited to cases of demonstrable economic harms. The protection of personal privacy has different goals and purposes, including upholding social values. Economic harms are often among the most dramatic examples of the consequences of loss of privacy, but other devastating consequences can be social, legal, political, and personal.

Our results show that the current HIPAA Safe Harbor cannot reliably anonymize data. How could data possibly be released with limited or virtually no risk of re-identification? To eliminate risk of re-identification, data must adhere to a formal property that provides a privacy guarantee. Computer scientists have introduced such models. The first formal protection model was *k*-anonymity, which guarantees that each record released will ambiguously map to at least *k* other records [20, 57]. Therefore, you cannot do better than guessing $1/k$ that any particular record belongs to a named person or location. If the HES data were *k*-anonymized, there would be no small group re-identifications less than *k* and each *k*-sized group would be indistinguishable. This guarantee would hold regardless of the amount of redaction.

The newest formal protection model is differential privacy, which uses additive noise or subsampling to enforce a mathematical guarantee of ambiguity or disassociation [58, 59]. Unlike *k*-anonymity, where the actual records of the data are changed to satisfy the *k* requirement, a differentially private approach to smaller datasets will often make a statistical model of the original data and then produce an alternative dataset that has the same statistical properties as the original data but none of the original records. New records are generated from the statistical model itself, thereby breaking the one-to-one correspondence between records in the original and anonymized datasets. While they differ from each other, both models make provable privacy guarantees. In comparison, HIPAA Safe Harbor makes no scientific privacy guarantee.

Fifteen years ago when the HIPAA Privacy Rule was promulgated, hundreds of data brokers, offering ever-increasing amounts of personal information on Americans, did not exist. Property data and other public information were not readily available electronically. Our findings suggest that the time is ripe to modernize HIPAA Safe Harbor, especially in the face of today's data rich networked society, and to so in a manner that encourages and adopts technological innovation. Formal protection models offer the privacy guarantees that patients, and research participants, deserve.

Appendix

A. Data Fields in the HIPAA Dataset

The HIPAA Dataset is a version of the original study data from the Northern California Household Exposure Study (HES) [1] that was redacted beyond the minimum requirements of

the Safe Harbor provision of the Privacy Rule in the Health Information Portability and Accountability Act (HIPAA). Dates are reported within 10 or more year ranges as decades or decade groups, and all explicit geography, such as address, city and ZIP code, has been removed.

Survey File

The Survey File is a spreadsheet with 255 fields as columns and 50 data rows. Below is a description of each field. Date fields that were reported as decades are highlighted in orange

Field name	**Field Description: Possible Values**
PrivacyID	Unique ID created for scoring
movein	Year moved to this house: reported as decade group
housbuilt	Year house was built: reported as decade group
remod	House addition/remodeled/painted inside: Yes, No or NA
remodyr	Addition/remodel/painted inside: Before/Since beginning of year or blank
work1	Kind of remodeling work done
basement	Basement or crawl space: basement, crawl space, neither
basemfin	Is basement: Finished or Unfinished
newrug	Rugs/carpets in house new within last year: Yes, No or NA
newrugair	New rug/carpet in sample collection room: Yes, No or NA
newfurn	Large furniture new within last year: Yes, No or NA
newfurnair	New large furniture in sample collection room: Yes, No or NA
garage	Garage attached to house: Yes, No or NA
winopen	# windows open for at least 1 hr in past 24 hrs
appl_gas	Appliances or heat that use natural gas: Yes, No or NA
elecheat	Has electric heat: Yes, No or NA
natgas	Has natural gas heat: Yes, No or NA
oilheat	Has oil heat: Yes, No or NA
gas_waterht	Has gas water heater: Yes, No or NA
woodstove	Has wood stove: Yes, No or NA
usedwood	Used wood stove in past 24 hours: Yes, No or NA
keroheat	Has kerosene heater: Yes, No or NA
usedkero	Used kerosene heater in past 24 hours: Yes, No or NA
woodfire	Has wood-burning fireplace: Yes, No or NA
usedfire	Used wood-burning fireplace in past 24 hours: Yes, No or NA
gasfire	Has gas-burning fireplace: Yes, No or NA
usedgfire	Used gas-burning fireplace in past 24 hours: Yes, No or NA
goven	Has gas oven: Yes, No or NA
opergoven	Gas oven operating in past 24 hours: Yes, No or NA
gstove	Has gas stove: Yes, No or NA
opergstove	Gas stove operating in past 24 hours: Yes, No or NA
elecoven	Has electric oven: Yes, No or NA
operelecoven	Electric oven operating in past 24 hours: Yes, No or NA
elecrange	Has electric range stove: Yes, No or NA
operelrange	Electric range stove operating in past 24 hours: Yes, No or NA
fanvent	Has fan over stove: Yes, No or NA
opervent	Fan over stove operating in past 24 hours: Yes, No or NA

indgrill	Has indoor grill: Yes, No or NA
operindgrill	Indoor grill operating in past 24 hours: Yes, No or NA
dishw	Has dishwasher: Yes, No or NA
operdishw	Dishwasher operating in past 24 hours: Yes, No or NA
atticfan	Has attic or window fans: Yes, No or NA
operatticfan	Attic or window fans operating in past 24 hours: Yes, No or NA
laundry	Has clothes washer in living area: Yes, No or NA
operlaund	Clothes washer in living area operating in past 24 hours: Yes, No or NA
fry_stove	Has fried food on stove: Yes, No or NA
vent_frystove	Vent fan was on while frying food: Yes, No or NA
broil_oven	Has broiled food in oven: Yes, No or NA
vent_broiloven	Vent fan was on while broiling food: Yes, No or NA
grill_indoor	Has grilled food indoors: Yes, No or NA
vent_grilling	Vent fan was on while grilling food: Yes, No or NA
bake_oven	Has baked food in oven: Yes, No or NA
vent_bakeoven	Vent fan was on while baking food: Yes, No or NA
toasteroven	Has operated a toaster or toaster oven: Yes, No or NA
vent_toaster	Vent fan was on while toasting food: Yes, No or NA
selfclean	Has cleaned the oven with self-clean heat: Yes, No or NA
vent_selfclean	Vent fan was on during the self-clean: Yes, No or NA
comp	Has computer printer: Yes, No or NA
opercomp	Computer printer operating in past 24 hours: Yes, No or NA
fax	Has fax machine: Yes, No or NA
operfax	Fax machine operating in past 24 hours: Yes, No or NA
photoc	Has photocopier: Yes, No or NA
operphoto	Photocopier operating in past 24 hours: Yes, No or NA
airfresh	Used solid air freshener in past 2 days: Yes, No or NA
airspray	Used spray air freshener in past 2 days: Yes, No or NA
hairspray	Used hair spray in past 2 days: Yes, No or NA
antipers	Used spray antiperspirant in past 2 days: Yes, No or NA
deterg	Used laundry detergent in past 2 days: Yes, No or NA
dishdeterg	Used dishwasher detergent in past 2 days: Yes, No or NA
surfclean	Used spray-on surface cleaner in past 2 days: Yes, No or NA
ovenclean	Used oven cleaner in past 2 days: Yes, No or NA
glues	Used glues or adhesives in past 2 days: Yes, No or NA
furnpol	Used furniture polish in past 2 days: Yes, No or NA
toilclean	Used toilet cleaner in past 2 days: Yes, No or NA
tileclean	Used tub or tile cleaner in past 2 days: Yes, No or NA
painthin	Used paint thinner/stripper in past 2 days: Yes, No or NA
bugkill	Used bug killers/pesticides in past 2 days: Yes, No or NA
carpclean	Used carpet cleaner in past 2 days: Yes, No or NA
spotrem	Used spot remover in past 2 days: Yes, No or NA
mothball	Used mothballs in past 2 days: Yes, No or NA
nailpol	Used fingernail polish in past 2 days: Yes, No or NA
homebus	Business operating in house: Yes, No or NA
homehobb	Workshop/hobby area in house: Yes, No or NA
everspray	House ever been treated for bugs: Yes, No or NA
sprayear	House treated for bugs in past year: Reported as decade
recentmth_treat	Most recent month treated for bugs during past year: Jan,...,Dec

numb_mthsrx	Number of months of treatment reported
sprayreason	Kind of bugs house treated for in past year
spraytype	What was house treated for bugs with in past year
treat_cat	Treatment category: Spray/Exterminator/Bomb, Bait/Stake/Borax, NoInfo
lastspray	Most recent year house treated for bugs: Reported as decade
lastsprayreason	Kind of bugs house treated for in most recent year
lastspraytype	What was house treated for bugs with in most recent year
lastsprayamt	How many times house treated for bugs in most recent year
sprayother	House treated for bugs any other years: None or NA
sprayothyr1a	Bug treatment 1, year 1: Reported as decade
sprayothyr1b	Bug treatment 1, year 2: Reported as decade
sprayothbug1	Bug treatment 1, kind of bugs treated for
sprayothtype1	Bug treatment 1, treated with
sprayothamt1	Bug treatment 1, how often
sprayothyr2a	Bug treatment 2, year 1: Reported as decade
sprayothyr2b	Bug treatment 2, year 2: Reported as decade
sprayothbug2	Bug treatment 2, kind of bugs treated for
sprayothtype2	Bug treatment 2, treated with
sprayothamt2	Bug treatment 2, how often
sprayothyr3a	Bug treatment 3, year 1: Reported as decade
sprayothyr3b	Bug treatment 3, year 2: Reported as decade
sprayothbug3	Bug treatment 3, kind of bugs treated for
sprayothtype3	Bug treatment 3, treated with
sprayothamt3	Bug treatment 3, how often
sprayothyr4a	Bug treatment 4, year 1: Reported as decade
sprayothyr4b	Bug treatment 4, year 2: Reported as decade
sprayothbug4	Bug treatment 4, kind of bugs treated for
sprayothtype4	Bug treatment 4, treated with
sprayothamt4	Bug treatment 4, how often
sprayothyr5a	Bug treatment 5, year 1: Reported as decade
sprayothyr5b	Bug treatment 5, year 2: Reported as decade
sprayothbug5	Bug treatment 5, kind of bugs treated for
sprayothtype5	Bug treatment 5, treated with
sprayothamt5	Bug treatment 5, how often
treatment_cat	Treatment category: Spray/Exterminator/Bomb, Bait/Stake/Borax, NoInfo
lawncare	Who cares for lawn: Household or Building management
lawntx	Lawn ever treated with insecticide or herbicide: Yes, No, Don't know
lawnyr	Lawn treated in past year: Yes, No, Don't know
lawnmonth	Most recent month lawn treated for bugs in last year: Jan,…,Dec
lawnmonth_num	Number of months lawn treated in last year
lawnreas	What was lawn treated for in past year
lawntype	What was lawn treated with in past year
lawntreat_cat	Lawn treatment category: Spray/Exterminator/Bomb, Bait/Stake/Borax
lawnyrlast	Most recent year lawn was treated: Reported as decade
lawnlastreas	What was lawn treated for in most recent year
lawnlastype	What was lawn treated with in most recent year
lawnoth	Lawn treated any other years: None or NA
lawnothyr1a	Lawn treatment 1, year 1: Reported as decade
lawnothyr1b	Lawn treatment 1, year 2: Reported as decade

lawnothreas1	Lawn treatment 1, treated for
lawnothtype1	Lawn treatment 1, treated with
lawnothyr2a	Lawn treatment 2, year 1: Reported as decade
lawnothyr2b	Lawn treatment 2, year 2: Reported as decade
lawnothreas2	Lawn treatment 2, treated for
lawnothtype2	Lawn treatment 2, treated with
lawnothyr3a	Lawn treatment 3, year 1: Reported as decade
lawnothyr3b	Lawn treatment 3, year 2: Reported as decade
lawnothreas3	Lawn treatment 3, treated for
lawnothtype3	Lawn treatment 3, treated with
lawnothyr4a	Lawn treatment 4, year 1: Reported as decade
lawnothyr4b	Lawn treatment 4, year 2: Reported as decade
lawnothreas4	Lawn treatment 4, treated for
lawnothtype4	Lawn treatment 4, treated with
lawntreat_cat2	Lawn treatment category for other years: Spray/…/Bomb, Bait/…/Borax
lawnpro	Ever used professional lawn care service: Yes, No, Don't know
lawnprolast	Most recent year used professional lawn service: Since start or NA
lawnprofirst	First year used professional lawn service: Reported as decade
lawnprooth	Used professional lawn service any other years: Yes, No, Don't know
lawnproyr1a	Professional lawn service 1, year 1: Reported as decade

Authors

Latanya Sweeney is Professor of Government and Technology in Residence at Harvard University, X.D. and Nancy Yang Faculty Dean of Currier House at Harvard, Director of the Data Privacy Lab at Harvard, Editor-in-Chief of Technology Science, and was formerly the Chief Technology Officer of the U.S. Federal Trade Commission. She earned her PhD in computer science from the Massachusetts Institute of Technology and her undergraduate degree from Harvard. More information about Dr. Sweeney is available at her website at latanyasweeney.org. As Editor-In-Chief of *Technology Science*, Professor Sweeney was recused from the review of this paper.

Ji Su Yoo is an experienced researcher at Harvard University's Data Privacy Lab and at the Institute for Quantitative Social Science. She graduated from Harvard College with a B.A. in Social Studies. Currently, she is interested in the intersection between government and technology and how their interaction can impact privacy and data analysis in health care. She is also interested in exposing how technology and its use in government and policy-making may exacerbate or reflect existing political and societal inequalities. Ji Su hopes to attend graduate school and to continue conducting research that will inform public interest issues. As Managing Editor of *Technology Science*, Ji Su Yoo was recused from the review of this paper.

Laura Perovich is a PhD student at the Media Lab at the Massachusetts Institute of Technology (MIT). Her work focuses on environmental health, human computer interaction, and data visualization. She was previously a researcher at Silent Spring Institute and was involved in considering how to share Household Exposure Study data with the U.S. Environmental Protection Agency. She holds a S.M. from MIT and a B.A. from Bowdoin College.

Katie Boronow is a staff scientist at Silent Spring Institute, a scientific research organization that studies environmental chemicals and women's health, with a particular focus on breast cancer. Her research leverages digital tools for reporting personal exposure results to participants in biomonitoring studies as a platform for increasing knowledge about endocrine disrupting chemicals. She holds a master's degree from Harvard University in organismic and evolutionary biology and a bachelor's degree summa cum laude from Yale University in biology.

Phil Brown is University Distinguished Professor of Sociology and Health Science at Northeastern University, where he directs the Social Science Environmental Health Research Institute www.northeastern.edu/environmentalhealth He is the author of No Safe Place: Toxic Waste, Leukemia, and Community Action, and Toxic Exposures: Contested Illnesses and the Environmental Health Movement, and co-editor of Social Movements in Health, and Contested Illnesses: Citizens, Science and Health Social Movements. He studies biomonitoring and household exposure and reporting back data to participants in collaboration with Silent Spring Institute (silentspring.org), social policy concerning flame retardants and perfluorinated compounds (pfasproject.com), and health social movements. He directs an NIEHS T-32 training program, "Transdisciplinary Training at the Intersection of Environmental Health and Social Science." He heads the Community Outreach and Translation Core of Northeastern's Children's Environmental Health Center (Center for Research on Early Childhood Exposure and Development in Puerto Rico/CRECE) www.northeastern.edu/crece and both the Research Translation Core and Community Engagement Core of Northeastern's Superfund Research Program (Puerto Rico Testsite to Explore Contamination Threats (PROTECT) www.northeastern.edu/protect. He is on the National Advisory Environmental Health Science Council, which advises the director of NIH's National Institute of Environmental Health Sciences.

Julia Green Brody, Ph.D., is executive director and senior scientist at Silent Spring Institute, a scientific research organization that studies environmental chemicals and women's health, with a particular focus on breast cancer. She co-led the Household Exposure Study, which was described in Environmental Science & Technology as the most comprehensive study of endocrine disrupting compounds in homes. The study was the first to show that consumer products and indoor environments are major sources of exposure to phthalates, phenols, and flame retardants, among other chemicals. The value of this dataset led to her interest in the potential privacy risks of sharing environmental exposure data and to her partnership with

Dr. Sweeney. Dr. Brody's research has been funded by the National Institutes of Health and National Science Foundation and was recognized by the U.S. Environmental Protection Agency with an Environmental Merit Award in 2000. Dr. Brody is an adjunct assistant professor at the Brown University School of Medicine. She earned her Ph.D. at the University of Texas at Austin.

The authors thank Oscar Zarate, Laura Borth, and Sean Hooley for help with study planning, administration and logistics. This work was funded in part by a grant from the National Institute of Environmental Health Sciences (grant 1R01ES021726).

Risk estimates of mortality attributed to low concentrations of ambient fine particulate matter in the Canadian community health survey cohort

Lauren Pinault[1*], Michael Tjepkema[1], Daniel L. Crouse[2], Scott Weichenthal[3], Aaron van Donkelaar[4], Randall V. Martin[4,5], Michael Brauer[6], Hong Chen[7] and Richard T. Burnett[8]

Abstract

Background: Understanding the shape of the relationship between long-term exposure to ambient fine particulate matter ($PM_{2.5}$) concentrations and health risks is critical for health impact and risk assessment. Studies evaluating the health risks of exposure to low concentrations of $PM_{2.5}$ are limited. Further, many existing studies lack individual-level information on potentially important behavioural confounding factors.

Methods: A prospective cohort study was conducted among a subset of participants in a cohort that linked respondents of the Canadian Community Health Survey to mortality ($n = 299{,}500$) with satellite-derived ambient PM2.5 estimates. Participants enrolled between 2000 and 2008 were followed to date of death or December 31, 2011. Cox proportional hazards models were used to estimate hazard ratios (HRs) for mortality attributed to $PM_{2.5}$ exposure, adjusted for individual-level and contextual covariates, including smoking behaviour and body mass index (BMI).

Results: Approximately 26,300 non-accidental deaths, of which 32.5 % were due to circulatory disease and 9.1 % were due to respiratory disease, occurred during the follow-up period. Ambient $PM_{2.5}$ exposures were relatively low (mean = 6.3 $\mu g/m^3$), yet each 10 $\mu g/m^3$ increase in exposure was associated with increased risks of non-accidental (HR = 1.26; 95 % CI: 1.19-1.34), circulatory disease (HR = 1.19; 95 % CI: 1.07–1.31), and respiratory disease mortality (HR = 1.52; 95 % CI: 1.26–1.84) in fully adjusted models. Higher hazard ratios were observed for respiratory mortality among respondents who never smoked (HR = 1.97; 95 % CI: 1.24–3.13 vs. HR = 1.45; 95 % CI: 1.17–1.79 for ever smokers), and among obese (BMI ≥ 30) respondents (HR = 1.76; 95 % CI: 1.15-2.69 vs. HR = 1.41; 95 % CI: 1.04–1.91 for normal weight respondents), though differences between groups were not statistically significant. A threshold analysis for non-accidental mortality estimated a threshold concentration of 0 $\mu g/m^3$ (+95 % CI = 4.5 $\mu g/m^3$).

Conclusions: Increased risks of non-accidental, circulatory, and respiratory mortality were observed even at very low concentrations of ambient $PM_{2.5}$. HRs were generally greater than most literature values, and adjusting for behavioural covariates served to reduce HR estimates slightly.

Keywords: $PM_{2.5}$, Fine particulate matter, Air pollution, Cardiovascular mortality, Respiratory mortality

Background

Ambient fine particulate air pollution ($PM_{2.5}$) is known to contribute to cardiovascular and respiratory morbidity, and is recognized as an important contributor to global disease burden [1]. Recent estimates from Global Burden of Disease suggest that ambient air pollution was responsible for nearly 2.9 million deaths per year in 2013 [2]. While ambient $PM_{2.5}$ concentrations in Canada are generally below national and international guidelines, analyses from the 1991 Canadian Census Health and Environment Cohort (CanCHEC) suggest that long-term exposure to $PM_{2.5}$ in Canada (mean = 8.9 $\mu g/m^3$) may contribute to non-accidental and cardiovascular mortality [3]. However, that study did not include individual-level information on potentially important confounding factors such as smoking and obesity and applied an indirect approach to adjust for these and other factors [3, 4]. Analysis of the United States Agricultural Health Study (AHS) cohort also supports an association between cardiovascular mortality and long-term exposure to low concentrations of ambient $PM_{2.5}$ (mean = 9.2 $\mu g/m^3$) [5]. Moreover, a recent meta-analysis of studies conducted in North America and internationally supports an association between long-term exposure to $PM_{2.5}$ and mortality, with the strongest association observed for cardiovascular mortality [6].

The WHO $PM_{2.5}$ guideline of 10 $\mu g/m^3$ was based on the lower end of the exposure distribution in previous studies [1], though there are few studies that have evaluated concentration-response associations at very low exposures. The Global Burden of Disease 2010 study [1] developed a mortality risk model for $PM_{2.5}$ over the global range of concentrations. This model incorporated a counterfactual uncertainty distribution, below which no excess risk was assumed, and was specified by a uniform distribution between 5.8 $\mu g/m^3$ and 8.8 $\mu g/m^3$. This uncertainty distribution was selected based on the lack of empirical evidence of any statistical association between ambient $PM_{2.5}$ and mortality below their counterfactual distribution. These concentrations represent the 48.9^{th} and 79.9^{th} percentiles of the exposure distribution in this study, respectively. Therefore, it is of interest to examine the shape of the concentration-mortality association at these very low concentrations, as well as the statistical strength of evidence for such an association.

In this study, we examine the relationship between long-term exposure to ambient $PM_{2.5}$ and non-accidental, respiratory, and cardiovascular mortality in the Canadian Community Health Survey (CCHS) cohort. Participants in this cross-sectional survey were enrolled across Canada between 2000 and 2008 and provided detailed individual-level information on potentially important confounding factors (e.g. smoking, obesity) that were not available for the previous analysis of $PM_{2.5}$ and mortality in the CanCHEC study [3]. As such, the primary aim of this study was to examine the relationship between very low concentrations of $PM_{2.5}$ (mean = 6.3 $\mu g/m^3$) and different causes of mortality in Canada and the impacts of adjusting for potential confounding factors. Finally, an improved, finer-scale, satellite-derived exposure model for $PM_{2.5}$ (i.e., a 1 km^2 grid) was used to reduce exposure misclassification.

Methods

Data sources

The CCHS is a national, cross-sectional survey providing information about the health, behaviours, and health care use of the non-institutional Canadian population aged 12 or older. The survey excludes full-time members of the Canadian Armed Forces and residents of Indian reserves and certain remote areas. Exclusions represent less than 3 % of the target population of Canada [7]. The annual component of the CCHS was conducted every two years from 2000/01 to 2007, after which the survey was conducted on an annual basis. The CCHS response rates are as follows: 84.7 % in Cycle 1.1 (2000/01), 80.7 % in Cycle 2.1 (2003), 78.9 % in Cycle 3.1 (2005), 77.6 % in 2007, and 75.0 % in 2008 [7]. CCHS respondents were eligible for the CCHS-mortality cohort if they gave permission to share and link their information with other administrative datasets; 86.0 % of CCHS respondents agreed to the linkage.

The Canadian Mortality Database (CMDB) is a national database that contains all deaths registered in Canada since 1950. Deaths that occurred between January 1, 2000 and December 31, 2011 were eligible for linkage. The CMDB includes data on underlying cause of death and date of death.

The Historical Tax Summary File (HTSF) is a database of annual tax returns that represent all individuals who received a tax declaration in a given year. Tax years between 1996 and 2011 were eligible for linkage. The HTSF includes postal codes, names, and dates of death (if applicable).

Linkage methodology

The creation of the CCHS-Mortality Cohort was conducted in two steps. First, using a probabilistic linkage methodology based on the Fellegi-Sunter theory of record linkage [8], eligible CCHS respondents were linked to the HTSF (using date of birth, sex, name, and postal code), in order to capture these variables and date of death, as reported on tax files between 1996 and 2011. Approximately 85 % of eligible CCHS respondents were linked to the HTSF. Alternative postal codes and names were captured through this initial linkage and were used in the subsequent linkage to the CMDB, to improve linkage results. Second, all eligible CCHS respondents

(regardless of whether they were linked to the HTSF) were also linked to the CMDB (which included underlying cause of death), using standard probabilistic linkage techniques (as described above) and followed for mortality from cohort entry (i.e., date of CCHS interview) to December 31, 2011.

Data preparation

A total of 457,300 eligible CCHS-mortality respondents were included, with 117,800 respondents in Cycle 1, 112,900 respondents in Cycle 2, 113,900 respondents in Cycle 3, and 112,700 respondents in 2007/08. CCHS respondents who were first linked to the HTSF had a greater probability to be linked to the CMDB since additional data in the HTSF (e.g., alternate postal codes, name, and date of death), were used in the probabilistic linkage. In order to reduce the probability of false-negative links, we excluded those CCHS respondents who were not linked to the HTSF ($n = 69{,}300$ respondents excluded) (Additional file 1).

Since the purpose of this analysis was to evaluate long-term effects of air pollution exposure, the study population was restricted to adults aged 25 to 90 years of age at enrollment ($n = 72{,}000$ respondents excluded). Adults older than 90 years of age were excluded from this study to ensure a sufficient sample size within all age strata. Similar to the CanCHEC study [3], immigrants living in Canada for less than 20 years (i.e., those who had arrived in Canada less than 20 years before the start date), were excluded from this study ($n = 13{,}200$ additional respondents excluded) for the following reasons. Immigrants are known to have better health and live longer than the Canadian-born population [9]. Immigrants also more frequently live in areas of greater ambient air pollution (unpublished data), and their exposure to air pollution prior to living in Canada is largely unknown. Cause-specific mortality analyses among recent immigrants were also not meaningful due to small sample sizes in the CCHS cohort (i.e., < 250 deaths). Therefore, the use of a larger cohort would be necessary to examine the health effects of air pollution on recent immigrant populations. Finally, we excluded an additional 3,400 respondents who were not linked to air pollution estimates since they live beyond the boundaries of the air pollution models (i.e., in the northern Territories) (Additional file 1). The final analytical sample was 299,500 respondents (note slight inconsistencies due to rounding). All research using human data was carried out at Statistics Canada in accordance with the *Statistics Act* to meet standards of privacy and confidentiality associated with the internal use of survey data. The record linkage project was approved by the Executive Management Board at Statistics Canada (ref. num. 003–2015).

The place of residence of respondents at the date of entry into the Cohort was mapped in Geographic Information Systems (ArcGIS v.10; ESRI 2010) through the use of Statistics Canada's Postal Code Conversion File plus (PCCF+) V.6B, which assigns geographic coordinates to postal codes based on a population-weighted random allocation algorithm [10]. Respondent locations were then spatially linked to estimates from a surface layer of $PM_{2.5}$ concentration derived by relating total column aerosol optical depth retrievals from the Moderate Resolution Imaging Spectroradiometer (MODIS) instrument to near-surface $PM_{2.5}$ using the GEOS-Chem chemical transport model. Geographically weighted regression, which includes ground monitoring data and land use information, was subsequently applied to these estimates to produce average $PM_{2.5}$ concentrations at a $0.01^\circ \times 0.01^\circ$ (approximately 1 km^2) resolution from 2004 to 2012 [11]. These models included coverage for nearly all of mainland North America. These estimates were extended to 1998 to 2003 using the inter-annual variation of Boys et al. (2014) [12], who inferred global $PM_{2.5}$ trends at $0.1^\circ \times 0.1^\circ$ resolution using satellites from 1998 to 2012. Average $PM_{2.5}$ levels were strongly correlated with ground-level observations in North America ($R^2 = 0.82$, slope = 0.97; $n = 1440$) [11]. Outliers that included $PM_{2.5}$ values >20 ug/m^3 were excluded from analysis (<1 % of respondents were excluded in this manner in any year). These outliers were likely due to inaccurate estimates of aerosol optical depth from satellite retrievals. For each year in the cohort, respondents were assigned a $PM_{2.5}$ value corresponding to the mean of the three previous years to the follow-up year; therefore, exposure always preceded response. For example, for the follow-up year 2001, we assigned the mean $PM_{2.5}$ estimates from 1998 to 2000.

Covariates and statistical methods

Standard Cox proportional hazards models [13] were used for survival analysis of non-accidental and cause-specific mortality within the cohort, from the date of interview for the CCHS to either the date of death recorded in the CMDB or the final date of the linkage project (i.e., 31 December, 2011). All models were stratified by sex and age (5-year intervals). Socioeconomic covariates included: immigrant status, visible minority status, Aboriginal status, and marital status, educational attainment, income adequacy quintile, and employment status (Table 1). Visible minority status was defined as in the *Employment Equity Act*, as "persons, other than Aboriginal peoples, who are non-Caucasian in race or non-white in colour" [14]. Income adequacy quintiles were calculated based on the ratio of household income to the low-income cut-off for their household and community size. Low-income cut-offs represent families that spend more

than 20 % of their income on food, shelter and clothing, and are adjusted for size of family and area of residence [14].

Neighbourhood socioeconomic status, including both social and material deprivation, contributes to increased risk of mortality in Canadian cities, although the presence of immigrants can reduce mortality risk [15]. Ecological (contextual) covariates were derived from the long-form Canadian Census at the Census Division (CD) and Dissemination Area (DA) geographic scale, from the 2001 Census for respondents interviewed between 2000 and 2003, and the 2006 Census for respondents interviewed during or after 2004. Census Divisions are a subdivision of the provinces and territories that usually represent communities, regional districts, or several neighbouring municipalities, and range in size from several thousand to a few million persons [14]. Dissemination Areas are the smallest geographical unit used by the Census and are delineated based on population counts based on the previous census, to target a population of 400–700 persons [14]. There were 288 CDs and 54,623 DAs in Canada as of 2006 [14]. These contextual covariates were then linked to individual respondents through a common geographic identifier (i.e., a numeric code identifying the DA or CD). For each CD and DA, the proportion of recent immigrants (<5 years residency in Canada), educational attainment (the proportion of persons aged 15 years or older who had not graduated from high school) and low income (the proportion of persons below the low-income cut-off) were derived for both Census years [16]. The proportion of recent immigrants in a region may provide a health benefit in the form of social inclusion if the resident is a member of a unified community, though it also may represent social deprivation, since recent immigrants also include persons of very low SES upon arrival in Canada (e.g., refugees or temporary workers). The other two ecological covariates (educational attainment and low income) provide a more direct estimate of neighbourhood socioeconomic status. Although broader geographic scales such as Census Tracts (CTs) are more often used to derive neighbourhood contextual variables [16], CTs were not available for rural areas. Neighbourhood covariates were therefore calculated by taking the difference between CD

and DA estimates. It was expected *a priori* that the ecological covariates would attenuate risk estimates as in previous work on CanCHEC [3].

In addition to the socioeconomic and ecological covariates, this study included four health status/behavioural covariates. Body Mass Index (BMI) was derived from the self-reported height and weight of respondents, and adjusted using correction factors that were developed for the CCHS to account for self-reporting bias in BMI data [17]. The International Standard Classification was used to categorize Body Mass Index [18], with obesity subdivided into two categories (i.e., BMI 30 – 34.9 and BMI ≥ 35) to further differentiate health risks among obese persons within the study. Smoking behaviour was categorized as never, former, or current smokers. Detailed data on smoking behaviour (e.g., number of cigarettes smoked per day) were available only for daily smokers (ca. 21.3 % of respondents) and were therefore not included. Fruit and vegetable daily consumption and alcohol consumption were also included, as in previous studies [19] (Table 1).

Survival models were examined in a sequential manner by adding all of the socioeconomic covariates in a single model, then adding in the ecological covariates to the socioeconomic models, and finally by adding the behavioural covariates to create fully adjusted models for non-accidental mortality (ICD-10 codes A-R) and mortality attributed to circulatory disease (ICD-10: I00–I99, with and without diabetes, E10–E14), including the subgroups of ischemic heart disease (ICD-10: I20–I25), and cerebrovascular disease (ICD-10: I60–I69). We also considered models for mortality due to respiratory disease (ICD-10: J00–J99), also including chronic obstructive pulmonary disease (ICD-10: J19–J46), and lung cancer (ICD-10: C33–C34). We also examined a model of socioeconomic and behavioural covariates, excluding ecological covariates. We added groups of variables in this manner to specifically examine the influence of including the behavioural variables to a model which included both socioeconomic and ecological variables, as were available in previous cohort studies in Canada [3]. Effect modification by sex, smoking behaviour (ever smoked vs. never smoked), BMI (obese: BMI ≥ 30 and obese II: BMI ≥ 35 vs. normal weight: BMI = 18.5–25), fruit and vegetable consumption (<5 servings vs. ≥ 5 servings), alcohol consumption (regular drinker vs. occasional/never/former drinker), and age (<75 years vs. ≥ 75 years) were also evaluated in separate Cox proportional hazards models, and Cochran's Q-statistic heterogeneity tests were used to evaluate significant differences in HRs among groups [20]. These covariates were chosen for effect modification analysis due to known physiological differences between these groups of respondents, and interest in previous studies [6].

To examine the shape of the relationship between non-accidental mortality hazard ratio (HR) and air pollution exposure, we fitted spline-based HR curves using the smoothing method in the R package "smoothHR" on the fully adjusted model [21]. The package uses a combination of AIC and BIC to determine the optimal degrees of freedom to use in the model [21]. We also estimated the $PM_{2.5}$ threshold concentration (T) by fitting Cox proportional hazards models to a series of newly defined $PM_{2.5}$ based variables of the form: $PM_{2.5}$ (T) = $PM_{2.5}$ − T; if PM_i > T and 0 otherwise, for T = 1 to 10. Our estimate of T is the concentration corresponding to the largest (−2) log-likelihood value (−2LL) obtained from the Cox model. Ninety-five percent confidence intervals on T were based on changes in -2LL of 3.84 units.

All descriptive statistics reported from the survey were rounded to the nearest hundred for institutional confidentiality reasons.

Results

A total of 299,500 respondents were included in the study after excluding respondents who were not linked to a tax file, respondents who were not within the 25 to 90 year age range and were not recent immigrants (i.e., < 20 years in Canada), and respondents who were not linked to air pollution estimates. Respondents were followed for mortality for up to 12 years after cohort entry (mean follow-up period (± SD) was 7.6 ± 2.7 years). The mean exposure (± SD) of respondents to $PM_{2.5}$ estimated from the 3-year moving average was 6.3 ± 2.5 μg/m^3. The $PM_{2.5}$ person-year exposure percentiles within the final study cohort were: minimum: 1.0 μg/m^3, 5th: 3.0 μg/m^3, 25th: 4.2 μg/m^3, median: 5.9 μg/m^3, 75th: 8.3 μg/m^3, 95th: 11.3 μg/m^3, and maximum: 13.0 μg/m^3. In large cities (metropolitan pop. > 1 million), $PM_{2.5}$ estimates were generally greater than in surrounding areas, and there were areas of the downtown core exceeding 8 ug/m^3 in all of these cities (Fig. 1). Mean $PM_{2.5}$ exposure increased incrementally by decreasing income quintile and was highest for respondents in the poorest income quintile (Table 1). $PM_{2.5}$ exposure was also greatest for the most highly educated respondents (Table 1). Obese respondents were exposed to less air pollution than those of increasingly lower weight classes, with the greatest exposure among respondents classified as underweight (Table 1). Hazard ratios for non-accidental mortality were calculated for all variables and ecological covariates (Table 1). Among ecological covariates for DAs and CDs, the proportion of recent immigrants, high school graduates and low income families were positively correlated with average $PM_{2.5}$ air pollution exposure (Table 2). The proportion of recent immigrants was protective for mortality at the broader landscape level (i.e., the CT), though increased HRs at the

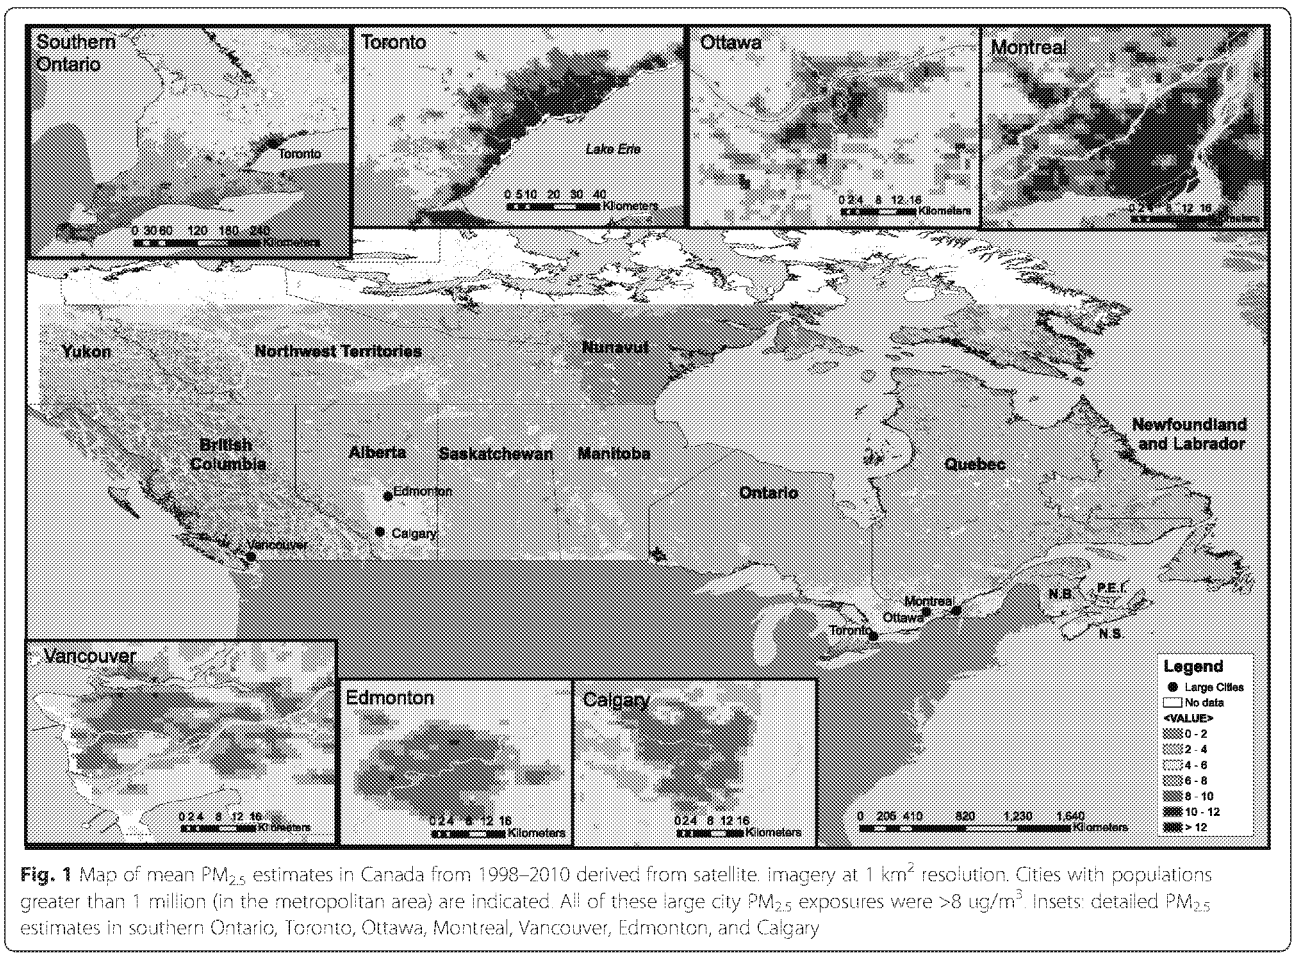

Fig. 1 Map of mean $PM_{2.5}$ estimates in Canada from 1998–2010 derived from satellite imagery at 1 km^2 resolution. Cities with populations greater than 1 million (in the metropolitan area) are indicated. All of these large city $PM_{2.5}$ exposures were >8 ug/m^3. Insets: detailed $PM_{2.5}$ estimates in southern Ontario, Toronto, Ottawa, Montreal, Vancouver, Edmonton, and Calgary

neighbourhood scale (i.e., DAs) (Table 1). Associations between all combinations of the covariates are provided in Additional file 2.

Separate Cox proportional hazards models were run for all covariates in the fully adjusted models. Immigrant status, greater educational attainment, higher income, being overweight or obese (type I), and increasing consumption of fruits and vegetables were all associated with a lower risk of non-accidental mortality (Table 1). Aboriginal status, being unmarried, being underweight or obese (type II), not employed, smoking, and not regularly drinking alcohol were associated with a greater risk of non-accidental mortality (Table 1).

Covariates were added in a stepwise manner to a Cox proportional hazards model for non-accidental mortality to assess their contribution to the model (Table 3). In

general, the addition of socioeconomic covariates improved the model fit, and resulted in a significantly increased HR from the unadjusted model (Table 3; Cochran's Q = 4.29; $p = 0.04$). The additional of behavioural covariates to the socioeconomic model reduced HRs somewhat, though not significantly (Table 3; Cochran's Q = 0.23, $p = 0.63$). The addition of ecological covariates to the socioeconomic model, particularly the percentage of recent immigrants and high school graduates, also improved model fit and significantly increased HRs (Table 3; Cochran's Q = 27.30, $p < 0.01$). The addition of behavioural covariates to create a fully adjusted model also improved model fit, though the HRs declined non-significantly from the second adjusted model (Table 3; Cochran's Q = 2.41, $p = 0.12$).

Table 4 presents the HRs and 95 % CI for Cox proportional hazard models for non-accidental mortality and mortality due to circulatory or respiratory causes. In the fully adjusted model, HR estimates for non-accidental mortality were 1.26 (95 % C.I.: 1.19–1.34) per 10 μg/m^3 increase in ambient $PM_{2.5}$. The strongest association was observed for respiratory disease mortality, with an HR of 1.52 (95 % C.I.: 1.26–1.84) per 10 μg/m^3 increase in ambient $PM_{2.5}$. In fully adjusted models, HRs were significantly greater than one for all causes of death except cerebrovascular disease and lung cancer, though the HRs were significant in the models that did not include behavioural covariates (Table 4). For all causes of death, HRs were greater in the fully adjusted model than in the unadjusted model, though were reduced after adding behavioural covariates (Table 4).

The results of effect modification by sex, age, BMI (i.e., obese vs. normal weight), fruit and vegetable consumption (i.e., < 5 or ≥ 5 daily servings), smoking (i.e., ever smoked vs. never smoked) and alcohol consumption are presented in Table 5. In a fully adjusted model, the HR for non-accidental mortality among men was 1.34 (95 % C.I.: 1.24–1.46) per 10 μg/m^3 increase in ambient $PM_{2.5}$ and was significantly greater than that of women (Cochran's Q; Table 5). The HRs for circulatory and respiratory disease mortality among men were also greater than among women, though the differences in HRs were not statistically significant (Cochran's Q; Table 5). None of the other comparisons among groups

[b]Respiratory mortality not shown; mortality for obese II: n < 200

were statistically significant (Table 5). However, the HR of respiratory disease mortality was particularly high among never smokers (HR: 1.97; 95 % CI: 1.23–3.13 per 10 μg/m^3 increase in $PM_{2.5}$) and among obese respondents (HR = 1.76, 95 % CI: 1.15–2.69 per 10 μg/m^3 increase in $PM_{2.5}$) (Table 5).

We fitted a nonparametric smoothing (spline) to examine the shape of the association between exposure and non-accidental mortality within the fully adjusted model. The relationship between the logarithm of the hazard function and $PM_{2.5}$ is presented in Fig. 2 in addition to its 95 % confidence intervals. We specified a reference concentration of 1 μg/m^3 which forces the predicted log-hazard function to equal 0 at the reference level. The smoothed curve generally increased with increasing concentration, however the confidence intervals are relatively wide making it difficult to speculate on a specific shape of the concentration-mortality association based on this graphical evidence. Our estimate of the threshold concentration was 0 μg/m^3 with an upper 95 % CI value of 4.5 μg/m^3.

Discussion

Within our cohort, exposure to $PM_{2.5}$ assigned at baseline was associated with an increased risk of non-accidental mortality and mortality due to circulatory and respiratory disease. Risks for all causes of death examined were greatest after adjusting for socioeconomic and ecological covariates, though were reduced after adjusting for smoking, alcohol consumption, BMI, and fruit/vegetable consumption. The largest hazard ratios per 10 μg/m^3 increase in $PM_{2.5}$ were observed for respiratory mortality compared to the other cause-specific estimates. Elevated risk was observed for respiratory mortality associated with air pollution among obese respondents and never-smokers, though the differences between these and reference groups were not statistically significant. We also examined the shape of the exposure-response curve, and although the lowest measured concentration of $PM_{2.5}$ was 1 μg/m^3, we found no lower threshold for response. Although this finding is potentially informative for burden assessment, it is worth noting that we did not distinguish between anthropogenic and natural sources of $PM_{2.5}$ in this study.

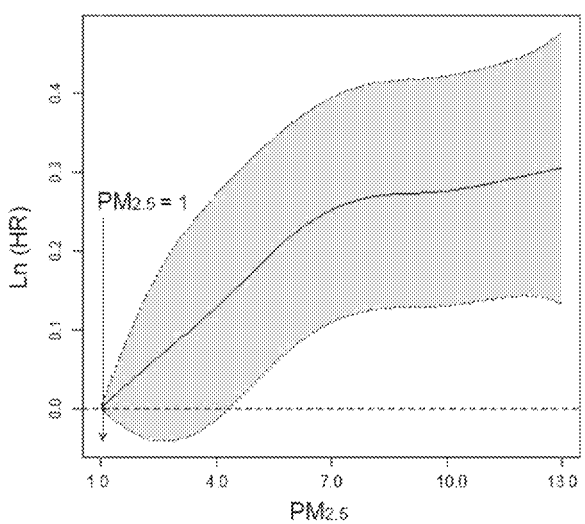

Fig. 2 Nonparametric estimates of the dependence of non-accidental mortality on $PM_{2.5}$ exposure among in-scope respondents in the CCHS-cohort linked to a $PM_{2.5}$ dataset (log hazard ratio with 95 % confidence intervals). The model was stratified by age and sex, and adjusted for all covariates (Table 1). Model predictions were made up to the 99th percentile of the $PM_{2.5}$ exposure distribution

This study adds to previous work in Canada, which has a generally lower mean $PM_{2.5}$ exposure than other countries, by providing direct adjustments for behavioural covariates (i.e., smoking and obesity) that are known contributors to mortality. This study used similar methodology to a previous study in Canada, the Canadian Census Health and Environment Cohort (CanCHEC) [3], but was unable to directly evaluate the role of behavioural covariates. In general, our HR estimates for non-accidental mortality (HR = 1.26; 95 % CI: 1.19–1.34) were greater than those in CanCHEC (HR = 1.15; 95 % CI: 1.13–1.16; Cochran's Q = 9.3, $p < 0.01$), though our estimates for circulatory death were similar (CCHS HR = 1.19; 95 % CI: 1.07–1.31; CanCHEC HR = 1.16; 95 % C.I.: 1.13–1.18; Cochran's Q = 0.1, $p = 0.8$) (all units per 10 μg/m^3 increase in $PM_{2.5}$) [3].

The fact that we found stronger associations between mortality and $PM_{2.5}$ here than were observed in the CanCHEC study [3] might be due to improvements in estimates of $PM_{2.5}$. A new $PM_{2.5}$ model developed at a much finer scale (1 km^2 grid rather than 10 km^2 grid) allowed respondents to be assigned more accurate, finer-scale estimates exposure to of $PM_{2.5}$. This improved exposure model may have a particularly strong effect on respondents who live in mid-sized cities (e.g., Calgary, Edmonton) that would otherwise have been assigned a lower, regional (i.e., rural) average (Fig. 1). However, this improvement is expected to be limited somewhat by the limitations of location error in geocoding residences based on postal code, as well as respondent mobility throughout the study area, resulting in differences in personal exposure. Another strength of this study was that it assigned exposures to respondents in the three years preceding death, thereby ensuring that exposure always preceded health effects rather than being assigned concurrently. This method also takes long-term variation of exposure into account.

In our study, HR estimates increased after the addition of ecological covariates, which differs from the

earlier CanCHEC study, in which the addition of ecological covariates served to decrease the HR estimates [3]. As described earlier, the ecological covariates used here were derived for smaller areas than in the CanCHEC study due to the absence of Census Tracts in rural areas. The methodological differences in deriving ecological covariates, particularly at a finer scale (i.e., assigning DA-level covariates rather than CT-level covariates), may also be one of the primary reasons why differences in HR estimates were observed between this study and CanCHEC, since fine scale covariates would be more spatially variable and covariates would more accurately reflect local socioeconomic conditions. Indeed, when the ecological covariates were removed from the Cox models of non-accidental mortality, the otherwise fully adjusted model provided an HR = 1.085 (Table 3), which is more consistent with the fully adjusted models in CanCHEC [3]. Ecological covariates included in this study were all positively correlated with $PM_{2.5}$ (Table 2). Given the much greater $PM_{2.5}$ exposure in urban environments, this association for recent immigrants and persons of high educational attainment is possibly due to a higher population of both in cities. The correlation with $PM_{2.5}$ was weaker for the proportion of low income families, which was consistent with the similar proportions of regional-adjusted low-income families in rural and urban environments [22].

Our HRs for non-accidental mortality were greater than those reported for all-cause mortality in other, international studies that had considered the same behavioural covariates, though were generally similar when ecological covariates were excluded from our estimates [6, 23–25]. For example, the American Cancer Society study, which included 1.2 million adults in the United States, estimated an HR for all-cause mortality of 1.06 per 10 $\mu g/m^3$ increase in $PM_{2.5}$ (95 % C.I.: 1.02–1.11) after controlling for behavioural covariates, though that study did not include ecological covariates [23]. Similarly, a global, pooled meta-analysis estimated an all-cause mortality HR of 1.06 (95 % C.I.: 1.04–1.08) per 10 $\mu g/m^3$ increase in $PM_{2.5}$ [6]. However, our results with ecological covariates were not significantly different from those of a large meta-analysis of European studies, where the pooled HR estimate for natural-cause mortality adjusted for socioeconomic and behavioural covariates (though not large-scale socioeconomic covariates) was 1.09 per 5 $\mu g/m^3$ increase in $PM_{2.5}$ (95 % C.I.: 1.03–1.14) [26]. This estimate was not significantly lower than in our study (Cochran's Q = 0.8, $p = 0.4$), where HR = 1.12 (95 % C.I.: 1.09–1.16) when scaled to a 5 $\mu g/m^3$ increase in $PM_{2.5}$.

Hazard ratio estimates for mortality due to circulatory disease (i.e., HR = 1.19) were generally consistent with those reported in the international literature, including the Harvard Six Cities study extended follow-up, which reported a HR of 1.28 per 10 $\mu g/m^3$ increase in $PM_{2.5}$ [6, 27], and a study in the U.K., which reported an HR of 1.05 per 1.9 $\mu g/m^3$ increase in $PM_{2.5}$ after adjustment for sex, age, BMI, and smoking (our study: HR = 1.03, 95 % CI: 1.01–1.05 when scaled to a 1.9 $\mu g/m^3$ increase) [28]. However, our estimate was much greater than that reported from a study in Rome (HR = 1.06, 95 % CI: 1.04–1.08), which adjusted for some individual and area-based socioeconomic covariates [24], and the Dutch Environmental Longitudinal Study (DUELS), which reported an HR of 1.09 (95 % CI: 1.06–1.12) per 10 $\mu g/m^3$ increase in $PM_{2.5}$ [25].

Our hazard ratio estimates for respiratory disease (HR = 1.52) were generally greater than those in the literature, though literature estimates for HRs vary among studies. For example, one study in Rome that used area-based socioeconomic covariates identified a non-significant HR of 1.03 for respiratory disease [24]. On the other hand, the California Teachers Study identified an HR for respiratory mortality of 1.21 [29], and the Dutch cohort (DUELS) estimated an HR of 1.18 [25], which were similar to our HR estimate for respiratory mortality prior to adjustment for ecological covariates (HR = 1.21). Another study in the UK reported an HR of 1.17 (95 % CI: 1.12–1.22) per 1.9 $\mu g/m^3$ increase in $PM_{2.5}$ [28]. Our HR estimate after adjustment for ecological covariates was lower than this study (HR = 1.08, 95 % CI: 1.04–1.12) when scaled to a 1.9 $\mu g/m^3$ increase in $PM_{2.5}$.

Our study also evaluated the role of effect modification by sex, age and behavioural covariates, and found a significantly greater HR estimate for non-accidental mortality among men than women. In a pooled European analysis of multiple cohorts, HRs were elevated among men but not women [26]. Our results are overall similar, although our generally greater HR estimates for non-accidental mortality might explain why HR was significant for both men and women. Men also had a greater HR than did women for circulatory disease mortality (though the differences were not significant), similar to the AHS cohort [5]. This finding was inconsistent with the results of a small ($n = 3,239$) cohort of white, non-smoking adults, where the relative risk of coronary heart disease mortality was elevated among women but not among men in a fully adjusted model [30]. Observed differences might be, at least in part, explained by relatively small cohort sizes.

Our HR estimates for non-accidental and circulatory mortality among obese and normal weight groups were not significantly different. Effect modification of cardiovascular mortality by obesity had previously been evaluated elsewhere in two all-female cohorts. One study identified a significantly greater HR with increasing

BMI, with an HR for obese women of 1.35 (95 % C.I.: 1.12–1.64 per 10 μg/m^3 increase in $PM_{2.5}$) [31]. The other study did not test differences statistically among groups but did report an HR of 1.99 (95 % C.I.: 1.23–3.22 per 10 μg/m^3 increase in $PM_{2.5}$) for obese women [32]. The ACS also reported a greater HR among obese men [5]. In our study, obese respondents also had a high risk of respiratory mortality (HR = 1.76; 95 % C.I.: 1.15–2.69), though possibly due to a small number of deaths (n = 500), the HR estimate was not significantly different from the normal weight population.

In our study, persons who had never smoked had a qualitatively greater risk of non-accidental and circulatory mortality from fine particulate exposure than those who had smoked, though the difference between groups was non-significant (Table 5). This finding was consistent with the literature, where a marginally greater risk of cardiovascular mortality was observed among never smokers than among current or former smokers [6, 23, 33, 34]. In a Dutch cohort, respiratory mortality was qualitatively greater among current smokers than never smokers [34], a finding that was not consistent with our study.

There were several limitations with our study that may contribute to uncertainty in our estimates. The cohort was chosen because of the inclusion of various behavioural covariates, but it is generally much smaller than that of CanCHEC, which used the Census of population (i.e., 20 % of the population of Canada) [3]. Mean estimates of $PM_{2.5}$ in Canada are generally lower than in other study countries [6], and the effect size is relatively small, requiring a large sample size to have adequate power for HR estimation. As a result, in our study the 95 % CIs were very wide in comparison to other studies [3], and we were also unable to adequately assess the shape of the concentration-response curves for other causes of death. It is also worth mentioning that our study relied on self-reported estimates for BMI and smoking. Although we were able to mathematically adjust BMI for self-reporting error based on measured BMI from another survey, it is possible that estimates of smoking may underrepresent actual smoking rates. Additionally, the follow-up period in our study was relatively short, particularly for respondents who entered the cohort in the final survey year (i.e., 2008, with a maximum of 4 years of follow-up). However, respondents entering the cohort in the first year of survey and who had remained in the cohort for the entire period were followed for a maximum of 12 years, which is comparable to the mean follow-up period (i.e., 12.6 years) in a review of other cohorts examining the same relationship [6]. The limitation of having a short follow-up period was mitigated somewhat by considering exposures that preceded the event.

In creating the cohort, 69,300 CCHS respondents were excluded since they were not linked to the HTSF (tax) file and were therefore not candidates for the probabilistic linkage. The excluded population were those who did not file a tax return, and the characteristics of this population differed somewhat from the cohort. In general, the excluded population was younger and had a lower educational attainment than the final cohort. Therefore, the cohort might be slightly biased towards higher educational attainment and those active in the labour market, though these same characteristics were used for adjustment in survival models.

Estimates of $PM_{2.5}$ exposure were assigned at baseline at the person's place of residence. Accuracy in geocoding residences was limited by the program PCCF+, which assigns residences to postal code representative points. The size of postal codes is relatively small (i.e. typically a few city blocks) in urban centres; therefore the PCCF+ program is highly accurate within these areas. However, estimates of $PM_{2.5}$ exposure in rural areas are less likely to have been assigned accurately since postal code areas can be quite large. We performed a sensitivity analysis that considered only cohort members that lived within urban areas (i.e., Census Metropolitan Areas), and despite exposures being much greater in urban areas, results were not significantly different than those reported above (HR = 1.19, 95 % CI: 1.11–1.27, Cochran's Q = 1.71, p = 0.19). Given the short follow-up period, we also did not assess mobility in this study, making the assumption that respondents did not move. By not assigning air pollution exposures based on changes to residential history, it is expected that there would be some degree of exposure misclassification associated with this limitation. A previous study using CanCHEC considered the assignment of exposures at baseline *vs.* considering mobility during the follow-up period on mortality risk attributed to $PM_{2.5}$. In general, there was very little difference in HR estimates (i.e., HR = 1.03, 95 % CI: 1.02–1.03 from baseline exposure, *vs.* HR = 1.04, 95 % CI: 1.03–1.04 for exposure considering mobility) [35]. Although about 41 % of Canadians moved within the five-year period of 2001 to 2006 [36], the majority of moves were within cities or regions of similar $PM_{2.5}$ exposures (not published). To assess this limitation, we ran a sensitivity analysis where we included only persons who had at least 3 years of residence in the same postal code. HRs for non-accidental mortality were similar to those for the entire cohort (HR = 1.28, 95 % CI: 1.19–1.37).

Finally, the cohort was developed based on a probabilistic linkage methodology to assign deaths to CCHS members. We attempted to reduce the potential for linkage error by limiting our cohort to persons linked to a tax file, since mortality rates among cohort members not linked to a tax file were substantially lower due to fewer

elements of respondent data that could be used for linkage.

Conclusions

In general, this study documented an association between non-accidental, circulatory, and respiratory mortality and fine particular matter in a cohort adjusted for socioeconomic, ecological, and behavioural covariates and exposed to a relatively low exposure distribution (mean = 6.3 $\mu g/m^3$). Although our CI were wide in the concentration-response curve, an increased risk of mortality was observed even at very low concentrations of $PM_{2.5}$ (Fig. 2), at values lower than the WHO guideline of 10 $\mu g/m^3$ [2]. Further studies on a larger cohort are needed to evaluate the shape of the concentration-response curve at these lower concentrations of $PM_{2.5}$. We also updated the results of previous Canadian studies by using an improved, finer-scale exposure model to assign $PM_{2.5}$ estimates to cohort members, which may have, in part, caused observed increases in HR estimates relative to CanCHEC [3]. Finally, this study indicates that the addition of fine-scale behavioural covariates serves to reduce the HR estimates compared to the otherwise fully adjusted survival models.

Perspective

"Transparency" as Mask? The EPA's Proposed Rule on Scientific Data

Joel Schwartz, Ph.D.

The Environmental Protection Agency (EPA) recently proposed excluding from consideration in setting environmental standards any studies whose raw, individual-level data are not publicly available. This proposal was preceded by the wholesale exclusion from the EPA's scientific advisory boards of academic scientists who receive research grants from the agency — and their replacement by industry-funded scientists. It is hard to interpret these actions as anything other than an attack on the use of hard scientific evidence to set environmental standards.

Open science has growing support, and justly so. However, studies conducted at academic institutions and involving humans, which are regulated by the Health Insurance Portability and Accountability Act (HIPAA) and institutional review boards (IRBs), must maintain a basic regard for privacy. Great progress in understanding pollution's effects has been made by adding exposure information to large cohort studies that were established to explore cardiovascular disease or cancer. Such studies have been used, for example, to analyze concentrations of metals in blood, urine, or toenails and to attribute air pollution exposure to people according to their residential address. Precisely because these studies include measurements of many potential confounding factors, it is difficult to make the data public without also making participants identifiable. Although some progress has been made in deidentifying some types of data, studies of environmental exposures present more serious issues, because often exposure levels are attributed on the basis of geocodes, and neighborhood covariates are based on public geocoded data. This practice makes it much easier to identify participants. For example, after Hurricane Katrina, a local newspaper published a map of the locations of deaths. It showed no roads, and the only geographic data included were neighborhoods. Yet researchers were able to correctly identify the residential address for most of the people who died.[1]

A cohort study of pollution rarely includes individual geocodes as covariates, but it typically controls for 15 to 20 potential confounders, usually including census-based measures of socioeconomic status (SES) and other geocoded information. If those covariates were all dichotomous, there would be more than 32,000 unique combinations. If some variables are based on publicly available geocoded data, such as census-tract measures of race, SES, population density, housing value, local air

pollution levels, and county-level data from the Behavioral Risk Factor Surveillance survey of the Centers for Disease Control and Prevention, it may be possible to identify each participant's census tract. With continuous confounders, the situation is worse. Identifiability is thus a major concern: if you know someone's age, race, sex, and other individual covariates, adding the census tract may make the participant unique, particularly if the outcome being studied is death, given that death certificates are obtainable.

This problem is well recognized: the National Academy of Sciences has reported on an "experiment to discover whether confidentiality could be preserved while opening . . . data for public review," which demonstrated that even after all participant features not required to allow other scientists to replicate a study's basic findings were deleted from study questionnaires, investigators could identify the participants.[2]

Recently, a study examined the identifiability of records from an environmental health study in Northern California. Using data considered under HIPAA to be sufficiently deidentified to be made public, they were able to correctly identify more than 25% of the participants.[3] Previously, the lead author showed that people from a supposedly anonymized hospital-admissions database could be identified on the basis of news stories. Since many obituaries are printed every day and death certificates are publicly available, the identifiability problem is vast.

In the Harvard Six Cities Study, conducted in the 1980s and 1990s, participants were recruited from one neighborhood in each city, including Watertown, Massachusetts (population, 35,000). The average number of deaths per year in Watertown is 208 — less than 1 death per day. Obviously, knowledge of the date of death would uniquely identify most participants. But even if the data made public included only the year of death, age, race, sex, and cause of death, most people could be identified from those facts.

The Canadian Community Health Survey followed 300,000 people and examined the association of exposure to fine particulate matter (particles with a mass median aerodynamic diameter of less than 2.5 μm [$PM_{2.5}$]) with mortality.[4] Because of privacy laws, the data were not given to the investigators, and analysis was performed on the computers at Statistics Canada. Yet this study is critical for the EPA to consider as it reviews the adequacy of its 12 μg-per-cubic-meter $PM_{2.5}$ standard, because essentially all the participants lived in locations with $PM_{2.5}$ levels below that standard.

The EPA's proposed rule on evidence for policymaking will exclude European and Canadian studies involving human participants from being considered by the EPA in regulating environmental pollutants. The new General Data Protection Regulation (GDPR) in the European Union (EU) defines private data as including information on a person's medical, physical, physiological, genetic, mental, economic, cultural, or social identity. Under the GDPR, such data must be controlled by a data controller who must demonstrate that any use of the data has been consented to by the individuals involved — which obviously precludes making data publicly available.

EPA leaders have argued that data can be sufficiently deidentified to be made public while still permitting reanalysis. But the number of variables included in original analyses that would have to be omitted or condensed into crude categories is so large that any reanalysis would be unable to reproduce the original results. More plausible is the EPA's argument that protected data centers could house the data and allow people to analyze them. But if the Canadian government would not allow the initial investigators to have the data mentioned above, then it's unlikely that it would agree to convey those data to an EPA computer, even with restricted access. Similar barriers probably apply to most of the cohort studies the EPA relies on: IRB and EU privacy rules are unlikely to allow transfer of data to EPA or other U.S. government computer centers.

Moreover, the "gold standard" of science is not reanalysis, but replication. In the case of $PM_{2.5}$-mortality studies, a recent meta-analysis found 53 cohorts, indicating that the results have been replicated many times by many groups in many countries.[5] Of what value, then, is a reanalysis of a minimal subset of covariates from any given study — particularly if it can't control for important covariates?

It is difficult to believe that EPA leaders do not know that few human cohort studies could comply with their requirements — and therefore difficult not to conclude that the real purpose of the proposal is to eliminate a vast body of highly relevant data from consideration, resulting in a weakening of standards that are no longer supported by "sufficient scientific evidence." This approach was

outlined in a 1996 e-mail message, revealed in tobacco litigation, from a law firm to R.J. Reynolds. Addressing possible regulation of environmental tobacco smoke (ETS), it stated, "Because there is virtually no chance of [e]ffecting change on this issue if the focus is ETS, our approach is one of addressing process as opposed to scientific substance, and global applicability to industry rather than focusing on any single industrial sector." It highlighted ozone and $PM_{2.5}$ regulations as also ripe for this approach. Subsequently, polluting industries hired actors to stage a demonstration demanding that the Six Cities Study data be made public. Combined with the recent removal of impartial scientists from the EPA's scientific review boards, the current proposal appears to be a multipronged attack on the use of scientific data to set regulatory standards.

Rules suggesting that individual personal information might be made public can also endanger wider research on cancer, heart disease, and other conditions. People may be much less likely to agree to participate in long-term epidemiologic studies if they hear that they may be identified or their data made public. The EPA has not made a decision yet on this proposal and, I believe, should be encouraged to make one that preserves scientific input into its rulemaking.

Personal Matters / Ex. 6

Email: Personal Email / Ex. 6

Mr. Andrew Wheeler
Acting Administrator
United States Environmental Protection Agency
Mail Stop 1101A
1200 Pennsylvania Ave. NW
Washington, DC 20460

Dear Acting Administrator Wheeler,

As a retired EPA toxicologist formerly associated with the Office of Pesticide Programs (OPP), I know first hand the frustrations of having to deal with epidemiological reports from the open literature.

I believe that Mr. Pruitt's directive regarding transparency in regulatory decisions especially related to epidemiological studies has merit. With this communication, I hope to provide a path forward that will produce a document that clearly indicates that the EPA conducted a thorough critical review of epidemiological studies occurring in the open literature or otherwise. The resulting document will clearly articulate the basis for its decision to allow the use of such publications to impact the risk assessment or determine that the study does not provide sufficient proof for its conclusions.

First of all, there is a great discrepancy in the review of the toxicology studies that industry is required to submit in order to register their chemical products. These studies follow strict protocol guidelines and are conducted under stringent good laboratory practices (GLP), quality assurance (QA) and animal ethics reviews as well as rigid reporting standards. These studies in the OPP have multiple layers of primary and secondary review most often by contractors at a very significant expenditure of taxpayer funds and program resources. The studies are essentially transcribed into Data Evaluation Records (DERs) that have to state what was done and what the results were since the reviewers cannot misrepresent what the study reported. The reviewers, however, can indicate study deficiencies and identify responses not already indicated by the report. The reviewers responsible for the reviews are clearly identified and responsible for their decisions.

In marked contrast, epidemiological studies appearing in the open literature (or otherwise) follow a mixed bag of study designs, GLP, QA, ethics and reporting practices. However, these studies are most often accepted at their face value without evidence of a critical review or identification of the responsible individuals.

This practice is unfair to the public. Studies used for risk assessment should have the same level of critical review no matter what their source is.

A current example is how the OPP handled chlorpyrifos that I have personal experience with. The most recent SAP review indicated problems with the original Columbia epidemiological study that should have been resolved long before several previous expensive SAP meetings were held. There are no similar DER reviews indicating the responsible reviewers provided to support the OPP's actions or attempts to use the study endpoints for risk assessment that I know of.

With the concept of a disparity in the degree of review of animal studies conducted to support the registration of a pesticide (or other chemical) and the acceptance of epidemiological studies on their face value, I am proposing that:

An Epidemiological Study Peer Review Council be established with the goal of creating a transparent document reflecting a thorough review of the study be established by EPA.

The details of this Council are in the attached document entitled "**Proposal for the Review of Epidemiology Studies from the Open Literature (or otherwise) Being Considered for a Basis for Regulatory Action: Establishment of Agency Wide Epidemiology Study Peer Review Council (ESPRC) and the resulting product Record of Epidemiology Study Review (ROESR).**"

The resulting product should provide a transparent assessment and whether or not an epidemiology study can be used for risk assessment. The responsible individuals are identified and would defend their decisions from objections from either industry or public interest groups.

I certainly hope that you will find this proposal helpful and forward it to the appropriate individuals concerned with evaluation of toxicity and risk assessment. If there are questions concerning how this Council could be implemented, please contact me. I will be happy to make a presentation on how this Council can contribute to the goal of making transparent decisions for risk assessment. Electronic copies of the proposal can be provided on request from EPA staff.

Thank you for giving this suggestion your consideration.

John D. Doherty, Ph.D.
(DABT 1982-2017)
Independent Toxicologist
Email: Personal Email / Ex. 6

PS. This proposal was presented at the afternoon session of the open meeting on Transparency held on July 17, 2018.

August 7, 2018

Subject: **Proposal for the Review of Epidemiology Studies from the Open Literature (or otherwise) Being Considered for a Basis for Regulatory Action: Establishment of Agency Wide Epidemiology Study Peer Review Council (ESPRC) and the resulting product Record of Epidemiology Study Review (ROESR).**

To: **Mr. Andrew Wheeler**
Acting Administrator
Environmental Protection Agency
Mail Code 1101A
1200 Pennsylvania Ave NW
Washington, DC 20460

From: **John D. Doherty, Ph.D.**
(DABT: 1982-2017)
Email: Personal Email / Ex. 6

As a retired toxicologist in the EPA's Office of Pesticide Programs, I believe that there is merit to Mr. Pruitt's directive that only studies where the public can review the supporting data can be used for regulatory decisions. Epidemiological studies should not be accepted based on their face value without critical evaluation of all aspects of the study. I also recognize that such supporting data may not be available because of various reasons including the confidentiality of the subjects in the study cohort.

There should be a middle ground where the Agency determines that the study can be used for regulatory decisions when all supporting data are not available. The decision to use the study in the absence of an independent review of the original data should *not be* the responsibility of one individual. The following is a proposal to justify the use of an epidemiological study when not all of the supporting data are available. Or to otherwise state clearly why the study cannot be used without the submission of additional data.

A Call for the Standardization of the Review of an Epidemiology Studies – Establishment of an Agency wide Epidemiology Study Peer Review Council (ESPRC) and the product Record of Epidemiological Study Review (ROESR).

Each epidemiology study occurring in the open literature or otherwise needs to have a supporting formal **Record of Epidemiological Study Review (ROESR)** that clearly delineates the justification for a decision to include or not include the study in the regulatory decisions for the chemical or environmental situation. The production of the ROESR will consist of the separate and independent reports of several Sub-Committees that will be integrated by the **Epidemiological Study Peer Review Council (ESPRC)** and signed by the Council Chairperson and each Council member.

It is important to have *independent* Sub-discipline committees review the study so that the biases of other sub-disciplines are minimized. The Sub-committee members should be drawn from the relevant staff throughout the Agency as well as other government agencies as needed. Each member of the Sub-committees will sign their respective Sub-committee reports.

The roles of the six suggested Sub-Committees and Council Chairperson are as follows:

1. ***Ethics Evaluation Sub-Committee.*** This sub-committee will evaluate all aspects of the ethical treatment of the individuals in the cohorts. This includes that it will identify how additional data can be provided to the Agency in a manner that will assure the identities of the individuals are protected.

2. ***Endpoint Evaluation Sub-Committee:*** This evaluation would limit its conclusions with regard to how well the character of the endpoint itself was assessed for and whether or not the effect reported is plausibly related to treatment or within normal variation. The latter includes how many subjects in a cohort are needed to make a meaningful statistical difference for the particular lesion in question.

This Sub-committee will provide commentary on the consistency of characterization of the endpoint, resolution of confounds as well as any known other chemicals or conditions that affect the normal distribution of the endpoint.

The experts in this Sub-committee will vary depending upon the endpoint claimed by the epidemiological study and consist of experts in cancer, behavioral response, or other appropriate discipline for interpretation of the significance of the endpoint.

3. Exposure Assessment Sub-Committee: The role of the exposure assessment Sub-committee is limited to determining that the methodology and reliability used to determine the exposure of the cohort is adequate and appropriate. The Sub-committee would provide commentary on whether or not exposure was supported by analytical chemical data, by oral history or otherwise. Also, if the actual persons exposed provided oral history by direct conversation, survey or by telephone. The committee will determine if indirect exposure information was provided by a relative (or friend or coworker) is reliable.

4. ***Statistical Evaluation Sub-Committee***: In the initial review of the study, the sole role of the statistical evaluation sub-committee is limited to determining if the statistical methods were/were not appropriate and adequately conducted to support the conclusion of the report. This committee would not redo the statistics at this time since the original data would be needed. Input from Sub-committees 1 (ethics), 2 (3ndpoint evaluation) and 3 (exposure assessment) that clarifies all

issues that are the responsibility of their respective disciplines would be needed before statistical reanalysis could be conducted. Thus, receipt of the original data in a manner that satisfies Sub-committees 1, 2 and 3 and well as any requests by the Statistical Evaluation Sub-committee before any statistical reanalysis would be conducted.

5. Analytical Chemistry Assessment Sub-Committee: The role of the analytical chemistry committee is limited to determining if the analytical techniques/ methodology were appropriate and adequate for the study. In some cases where no analytical chemistry data were generated, the committee will comment on the need to have included such data and/or if quantitative analysis of exposure data was even possible.

6. Animal Toxicity and Structure Activity Relationship (SAR) Assessment Sub-Committee: In most cases with chemicals, the Agency should already have a battery of standard animal toxicity studies that were required for the registration of that chemical. There may also be studies in the open literature attempting to define the toxicity of the chemical. Thus, the person(s) responsible for evaluating the animal toxicity studies would be a member of this Sub-committee. In addition, this Sub-committee will have individuals that can address the SAR issues in relation to the possibility that the chemical could affect the endpoint in question.

It should be noted here that a Record of Review (ROR) signed by at least two qualified toxicologist is needed for any publication supporting a mechanism of action for the chemical.

If the endpoint occurs in animals or has SAR correlates, such information can support the epidemiological findings. If not, it does not automatically dismiss the epidemiological findings since the effect on the endpoint may be unique to humans.

7. Council Chairperson, Council meetings and resulting product: ROESR:

The ***Council Chairperson*** should not be in the same program that has responsibility for regulating the chemical or environmental condition. That is, if the chemical is a pesticide, the Chairperson cannot be from the Office of Pesticide Programs (OPP). Representatives of OPP may still be on the Council if an epidemiological study with a pesticide is being reviewed.

At the initial **Council meeting,** the Council will discuss the conclusions of each the six Sub-committees. In some cases, the Council may determine that the association between exposure and the endpoint is otherwise strong enough to support regulatory action to protect the public health and no additional information is needed from the study authors.

During the initial meeting the Council can overrule a request for additional data made by any of the Sub-Committees. However, clear justification for overruling a Sub-Committee's decisions must be provided.

In other cases, the Council may determine that there is a definite need to require additional data supporting the study methodologies and conclusions are required. The Council would then notify the authors articulating of the need for the specific additional information.

The Council will also determine if the authors of the epidemiological report should be requested to attend a closed meeting with the Council and Sub-committee members. The purpose of the meeting will be an opportunity for the study authors to address any concerns that the Sub-committees have. This will include problems with providing any additional information that the Sub-committees requested. If the study authors refuse to attend a requested meeting, the Council will determine if the study should be rejected outright.

The Council Chairperson (or secretary of the Council) will prepare the **ROESR** product that contains the decision with supporting justification. The ROESR product would include the report of the Council with the Chairperson and Council members' signatures. Separate attachments for the *signed* Sub-Committee reports and the original epidemiological report (i.e. a publication) will also be attached. An executive summary of any meeting(s) with the study authors will also be appended.

Purpose:

The purpose of this procedure is to assure that responsible persons for each of the critical Sub-disciplines *independently* reviewed the study in terms of their expertise. The resulting ROESR that either determines that the study can be used in the absence of additional original data or the need for critical additional data is determined will be clearly indicated.

The Council Chairperson and members of the Council and the sub-discipline committees own their decisions and are responsible for defending them.

If industry or any concerned public interest groups object to the conclusions, they can address the conclusions presented in the ROESR and/or the sub-disciplines.

Therefore the decisions in the resulting ROESR should be transparent. The current system renders too much power to individuals that are sometimes not clearly identified who can profit by making career projects for themselves based on the face value of the publication.

I am well aware that an epidemiological publication (or otherwise) in the open literature is going to be controversial. However, preparing a ROESR for such studies with the several sub-disciplines all independently contributing to the Agency's determination of the conclusions in the report should greatly help to minimize controversies.

The ROESR is not a final conclusion (no documents in EPA should be considered final). It is very likely that a Science Advisory Panel will ultimately review the ROESR. Also, as new information is generated, the ROESR can be updated and the recommendations for use (or otherwise) can be adjusted as appropriate.

Washington DC 20460

Dear Sir or Madam:

I am writing about EPA's Proposed Rule:
"Strengthening Transparency in Regulatory Science."
As the EPA develops regulations governing clean air, clean water and exposure to toxic substances and pesticides, it needs to include all valid, peer-reviewed studies, even if their underlying data sets cannot be released to the public. I believe that the proposed rule's premise is faulty, because it excludes studies whose data is not publicly available. The proposed rule should be withdrawn.

I object to the fact that the scientific community was not consulted as the proposed rule was being prepared. Certainly, at least the EPA's own Science Advisory Board should be consulted.

Thank you.

Sincerely,

Margery M. Donn

Re: EPA Proposed Rule: Strengthening Transparency in Regulatory Science. 83 Fed. Reg. 18,768 (Apr. 30, 2018). Docket Number EPA-HQ-OA-2018-0259.

Dear Administrator Wheeler,

I am writing to you on behalf of Gernatt Asphalt Products, Inc. and it's 200+ employees from southwestern New York State, as members of the National Stone, Sand & Gravel Association (NSSGA). We support the above-referenced rule which will strengthen transparency in regulatory science. As active sand and gravel miners, we are intimately familiar with the myriad of existing Federal environmental regulations that govern our operations. We are also keenly aware of the importance of a healthy environment, which supports our business by providing products and jobs now, and for the future of our children and Country.

Our goal has always been to operate within the regulatory framework of whatever entity we are working within, not merely to avoid the legal ramifications of non-compliance, but also in the spirit that sound environmental regulation keeps the playing field level for everyone in the industry while promoting sustainability. The products we supply are imperative to the infrastructure that supports the well-being of every citizen and business in this Country. Many people do not make the connection between a sound and stable aggregate mining industry and our vibrant, safe, and progressive way of life. These folks assume our industry is inherently a detriment to the environment, resulting in long-term negative impacts. As a result, popular sentiment is often that more regulation of industry like ours is not only needed, but somehow heroic. This is simply not true.

That is why it is extremely important for regulations to be thoroughly vetted for their need, effectiveness, and beneficial result before they're imposed on industry like ours. The proposed transparency rule will help ensure that only scientifically sound regulatory initiatives are considered for implementation, saving producers from poorly thought out, knee-jerk type of regulations that result from over-reaction.

As an active member of the NSSGA, we fully support their comments on this issue. Please consider those comments, and our position as stated above, when considering this rule. Thank you.

Sincerely,

Richard Pecnik

Re: Docket No. EPA-HQ-OA-2018-0259, *Strengthening Transparency in Regulatory Science*

Dear Acting Administrator Wheeler,

The Association of Metropolitan Agencies (AMWA) is an organization representing the largest publicly owned drinking water utilities in the United States. Any changes in how the agency formulates rulemakings, particularly in regards to national primary drinking water regulations, significantly impact our members. EPA has published a request for comment on the proposed rule: *Strengthening Transparency in Regulatory Science* published in the *Federal Register* on April 30. AMWA applauds EPA's goal to strengthen transparency and supports this objective whenever possible, but would like to emphasize that increasing transparency in concert with the development of regulations, health advisories and guidance that protect public health and the environment is particularly important.

While EPA's objective to increase transparency is commendable, and AMWA appreciates the opportunity to provide feedback and strengthen the final rule, the current proposal is far too vague and missing key components that must be included in the final rule to ensure its understandability and appropriate implementation. For example, currently the proposal lacks definitions for many key terms, omits critical protocols and methodologies necessary to put this rule into action, and does not fully explore the implications of implementing a rule of this nature.

However, due to the importance of this proposed rule, AMWA is pleased to submit these comments for EPA's consideration. Our specific comments are provided as an attachment. If you have any questions, please contact Stephanie Hayes Schlea (schlea@amwa.net), AMWA's Manager of Regulatory and Scientific Affairs.

Sincerely,

Diane VanDe Hei
Chief Executive Officer

Attachment

cc: David Ross, Assistant Administrator for Water
Peter Grevatt, Director, Office of Ground Water and Drinking Water

General

1. AMWA agrees that any data, methodology, or models produced by EPA itself should be transparent and available to the public in a reproducible manner.
2. EPA should refrain from banning all studies from being used in the regulatory process solely due to data availability. For data that is not produced by EPA, such as in scientific journals, and particularly when dealing with sensitive data, the process of peer reviewing should often be sufficient. If multiple studies have gone through the peer review process and have come to the same conclusions, the agency should not disregard these findings simply because the raw data is not available. Raw data may not be available for a variety of reasons including privacy, age of the data, or due to a researcher's reluctance to share this information. However, an open process for justifying the use of data that is not public should be developed.
3. AMWA also encourages EPA to not base any regulatory determination on a single study, regardless of whether or not the data is publicly available. Relying on a single study, no matter how robust it may be, can bring bias to a model or regulatory decision. If EPA must base a decision off of a single study, it should be imperative that the data be publicly available as well as the reasoning and methodology behind why the study was chosen, how it is being used and why no other studies were deemed sufficient to be included.
4. EPA released a document titled *Plan to Increase Access to Results of EPA - Funded Scientific Research* in 2016 in response to a 2013 memo released by the White House Office of Science and Technology Policy (OSTP)[1]. The memorandum entitled "Increasing Access to the Results of Federally Funded Scientific Research" directs Federal departments and agencies that spend more than $100 million per year on research and development (R&D) to develop and submit a plan to OSTP to increase public access to peer-reviewed, scientific research publications and research data resulting from agency-funded R&D.[2] What is the status of this plan and what does this rule cover that this document does not regarding data funded and produced by EPA?

Definitions and Clarifications

1. According to Goodman, Fanelli, and Ioannidis (2016)[3], there is no scientific consensus for what "methodologically reproducible" is. If EPA wants to build a rule around transparency in regards to methodology, "methodologically reproducible" must be defined.

---

[1] Office of Science and Technology Policy, Executive Office of the President. (2013, February 22). Memorandum for the Heads of Executive Departments and Agencies: Increasing Access to the Results of Federally Funded Research. Retrieved from https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf

[2] Environmental Protection Agency. (2016). Plan to Increase Access to Results of EPA - Funded Scientific Research Version 1.1.

[3] Goodman, S.N., Fanelli, D., & Ioannidis, J.P.A. (2016). What does research reproducibility mean? *Science Translational Medicine*. *8*(341). pp. 1-6.

2. If the agency wants a rule focused on the raw data then EPA must better define what "data" would be included within this rule. Is it just data produced by EPA? If not, is it the methods and protocols or the actual raw data?
3. There are multiple terms that will need to be defined in the final rule. In particular, "transparency"; "data", singular versus set; and "reasonable effort/endeavor", in relation to how much work the agency must put in before justifying the use of data that can not be made available to the public.
4. EPA should also clarify what it considers to be "publicly available". A significant number of journals require a subscription or payment in order to read their articles. Does EPA consider these studies publicly available?

Methodologies and Protocols

5. EPA's proposal states, "EPA believes that concerns about access to confidential or private information can, in many cases, be addressed though the application of solutions commonly in use across some parts of the federal government." While this is reassuring, it is important that the agency outline a clear protocol that is transparent and clear and should solicit public comment on this protocol before implementing it agency-wide.
6. In an EPA news release the agency states, "[The] proposed rule is in line with the scientific community's moves toward increased data sharing…[and] is consistent with data access requirements for major scientific journals like *Science, Nature*, and *Proceedings of the National Academy of Sciences*[4]." However, those same journals have written a joint statement responding to the proposal and support "maintaining the rigor of research published in our journals and increasing transparency regarding the evidence on which conclusions are based", but caution stating, "It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes[5]." AMWA encourages EPA to consult with entities, including the journals that EPA references, that have implemented similar efforts in order to better inform the methods and protocols that should be in place for a rule of this nature.
7. Related to this, the proposed rule and Lutter and Zorn[6] (2016), which is cited in the proposal, both discuss current publishers and journals, which require authors to submit their data to public repositories. EPA should work to encourage the continuation of this, as well as

[6] Lutter, R., & Zorn, D. (2016). On the Benefits and Costs of Public Access to Data Used to Support Federal Policy Making. Mercatus Working Paper. Accessed from https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf July 12, 2018.

considering giving preference, when possible, to studies where the data is publicly available in this manner.

8. Allowing for exemptions in a rule of this nature is useful and allows for flexibility within the implementation. However, regardless of when or how the Administrator is able to exempt significant regulatory decisions on a case-by-case basis, there should be explicit and clear expectations for what may or may not qualify for an exemption. Does the exemption cover the agency's project as a whole or just a single study and/or data set? Decisions to allow an exemption should be transparent and made available to the public.

Application

1. EPA's proposal states that it is looking for comment on how to make more data and models used throughout the agency's regulatory process available to the public "over time". AMWA agrees with the idea that, regardless of the strategy used, EPA should seek to phase-in whatever requirements are justified. The agency should note that the scientific community has just recently begun data access requirements. For example, EPA's proposal cites the journal PLOS ONE as informing the development of the rule's policies. However, this journal has only been requiring this open data since 2013[7]. Therefore, while the scientific community has been moving towards the idea of "open science", the policies are still new and phasing in requirements would give the scientific community sufficient time to respond and prepare for the implications of this rule. EPA would need to ensure that there are explicit and clear milestones to be achieved throughout the process.
2. This rule should not apply to the previous record. Trying to apply this proposal to models, rules, and research that has already begun or has concluded would only serve to set current work back and complicate work already done. It makes sense to "grandfather" what has already been completed and to implement this rule in stages in order to not compromise or delay EPA's work.
3. In order for full transparency, the finished rule should apply to all stages of regulatory development. This would include full transparency in the methods, particularly in the development of models. The public does not need the individual data in order to determine if there are inherent issues within the study itself. The analysis of the data is already done multiple times throughout the publication process, via peer review. While it is useful to have the data EPA uses, it is perhaps more important to understand the methodology and reasoning behind why EPA chooses the data it does. In order to increase transparency it would be important to have the agency give a thorough explanation as to why certain studies and data sets were chosen and not others, rather than relying on public access to the individual data.

Dear Acting Administrator Wheeler:

Attached, please find a letter from nearly 80 public health, science, labor, transparency, accountability, and environmental organizations requesting that you withdraw the proposed rule entitled "Strengthening Transparency in Regulatory Science." This proposal is flawed beyond repair and in fact make it more difficult for EPA to use the best available science to protect public health and the environment. If you have any questions or are interested in meeting with our organizations about this matter, please let me know.

Sincerely,

Yogin Kothari

Re: Rescinding EPA's Proposed Rule, "Strengthening Transparency in Regulatory Science"

Dear Acting Administrator Wheeler:

The undersigned public health, science, labor, transparency, accountability, and environmental organizations urge you to withdraw the proposed rule entitled "Strengthening Transparency in Regulatory Science," issued by former EPA Administrator Scott Pruitt on April 30, 2018.[1] The ill-conceived, badly written, and unlawful proposal is flawed beyond repair and should be rescinded. Further, this proposed rule runs counter to your stated commitment to "robust and civil dialogue with the public."[2] Any further time and money spent on this proposal would be a waste of valuable public resources. EPA and OMB should focus their limited resources on protecting public health and the environment rather than continuing to consider such a flawed proposal.

In your first address to EPA staff, you emphasized that you "will seek the facts" and aim to carry out "the vital mission of protecting human health and the environment."[3] To extend the benefits of science to all people, including those communities that already bear a disproportionate burden of environmental pollution, EPA must preserve the role of science as a key input for crafting public policy.

Unfortunately, the implementation of this rule would do just the opposite, undermining the ability of the Agency to use the best available science to protect public health and the environment. The proposal will not improve the use of science at EPA, but instead would restrict the types of science the Agency may use in regulatory decisionmaking. This includes, but is not limited to, studies that rely on personal health data, confidential business information, intellectual property, or older studies where the authors or data sources may not be accessible. Restricting the use of robust and well-established scientific information prevents EPA from meeting its mission.

[3] Environmental Protection Agency (EPA). 2018. Acting Administrator Wheeler Addresses EPA Staff (News Release), July 11. Online at https://www.epa.gov/newsreleases/acting-administrator-wheeler-addresses-epa-staff, Accessed July 31, 2018.

Equally problematic, the proposed rule is not authorized by any authority delegated to EPA by Congress and is contrary to a number of statutes under EPA's authority. This includes, but is not limited to, the Clean Air Act; Clean Water Act; Toxic Substances Control Act; Lautenberg Chemical Safety Act; Safe Drinking Water Act; Federal Insecticide, Fungicide, and Rodenticide Act; and more. Substantively, the rule violates numerous public health and environmental provisions contained in these laws, as well as requirements to use the best available science or to consider all available information, while procedurally, it violates the Administrative Procedure Act and a number of other laws that set forth specific procedures EPA must follow during its rulemaking process. It also lacks an environmental justice analysis even though the rule will have the greatest impact on low-income and minority communities that benefit from protections based on the very studies the rule restricts from consideration when setting exposure limitations for pollution and toxic chemicals. Simply put, the proposal cannot withstand legal scrutiny.

The proposed rule also lacks justification and has little information on what implementation would mean for external researchers or how it would affect EPA's work to protect public health and the environment. It was developed without meaningful input from the scientific community. EPA's Science Advisory Board (SAB), tasked with reviewing the Agency's regulatory agenda and recommending actions that merit independent review, only learned about the rulemaking after it was already proposed. As a result, an SAB workgroup recommended that the advisory body review the merits of the rule because "it deals with a myriad of scientific issues for which the Agency should seek expert advice from the Science Advisory Board."[4] After a nearly unanimous vote concurring with the memo, the SAB wrote in a June 28 letter to former Administrator Scott Pruitt that "[t]he SAB urges the Agency to … request, receive, and review scientific advice from the SAB before revising the proposed rule."[5]

Numerous scientific voices have spoken out in opposition to the proposed rule, including those with standards EPA claimed were consistent with the proposed rule. For example, the editors of leading peer-reviewed scientific journals, *Science*, *Nature, Public Library of Science (PLoS), Proceedings of the National Academy of Sciences,* and *Cell* wrote:

> "[I]t does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them; rather, it is paramount that the full suite of relevant science vetted through peer review, which includes ever more rigorous features, inform the landscape of decision making. Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes."[6]

[6] Berg, J., P. Campbell, V. Kiermer, N. Raikhel, and D. Sweet. 2018. Joint statement on EPA proposed rule and public availability of data. *Science*, April 30. DOI: 10.1126/science.aau0116. Online at http://science.sciencemag.org/content/early/2018/04/30/science.aau0116/, Accessed July 30, 2018.

Among those not consulted in the crafting of this rule were the National Academies of Sciences, Engineering, and Medicine (NASEM), though EPA nonetheless frequently cited the NASEM in the proposed rule. EPA's reliance on the NASEM is misrepresented, as the Academies have held several committee meetings and carried out a series of reports detailing how scientific literature can be evaluated transparently without the full disclosure of underlying datasets.[7] In a comment on the rule, the NASEM urged EPA to seek objective and expert guidance in evaluating scientific standards at EPA and offered itself as an independent review body.[8]

Likewise, the Bipartisan Policy Center (BPC) clarified in a comment to the agency that "the proposed rule is not consistent" with its report on the use of science in policymaking that EPA cited in "substance or intent."[9] BPC supports enhanced transparency, but "the report never suggested excluding studies from consideration in developing regulation if data from those studies were not publicly available."[10]

The damage inflicted by this rule would have far-reaching consequences beyond undermining EPA's scientific research processes. It would weaken public health and environmental protections that keep people safe from toxic chemicals and hazardous pollution, and would ultimately mean less protection for communities who already bear the brunt of environmental contamination and associated health impacts.

Decision makers and the public need access to the best-available scientific evidence, and our health and safety depend on using that valuable information to make regulatory decisions. It is critical that as acting Administrator you follow through on your pledge to "seek the facts," by withdrawing this flawed proposal that would politicize science and prevent the agency from fulfilling its mission.

Mr. Andrew Wheeler
Environmental Protection Agency
1200 Pennsylvania Avenue, N.W.
Washington DC 20460

Dear Mr. Wheeler:

I am writing to express my objection to and concern about the Environmental Protection Agency's (EPA) "Strengthening Transparency in Regulatory Science" proposal (Docket ID No. EPA-HQ-OA-2018-0259). I believe that science plays a pivotal role in ensuring our health and safety, preserving our environment, and informing evidence-based policy. This new proposal would undermine the EPA's mission of preserving public health and the environment.
For the EPA to utilize the best available science to shape public health and environmental safeguards, the agency needs to have the ability to use the best research and information.

While this proposed rule promises "transparency," it reduces confidentiality and privacy protections by requiring the raw data from these studies to be made public. Consequently, the best available scientific studies in numerous public health fields, where patient privacy prohibits sharing the raw data, would be sidelined. This arbitrary rejection of data from research on air quality, public health, drinking water, hazardous waste, and so many other fields would inhibit the EPA's ability to implement science-based protections.

When policies play a role in our health, safety, and environment, the EPA needs to use the best available evidence and research when finalizing safeguards. This ill-advised proposal would significantly limit the EPA's ability to make the informed policy decisions that the agency is required to under landmark public health and environmental laws, including the Clean Air Act, Safe Drinking Water Act, and the Toxic Substances Control Act.

I urge you to reconsider this proposed rule and withdraw it immediately.

Sincerely,

Luke Breit

RE: Docket ID No. EPA-HQ-OA-2018-0259, Proposed Rule, "Strengthening Transparency in Regulatory Science"

Dear EPA Administrators:

I strongly oppose the proposed rule on "Strengthening Transparency in Regulatory Science" and urge the EPA to withdraw it. The proposed rule would make it harder to share important science, needlessly slow down scientific advancements, and put the health of our citizens and environment at risk.

While increasing the public availability of scientific data and models underlying regulatory science would be a step in the right direction, this rule would not achieve this goal.

If enacted, the proposed rule would prohibit the use of confidential data – like health studies – in EPA's rule-making processes unless that private information is made public. This policy would essentially bar the EPA from consulting most large-scale medical studies when creating rules about air pollution, toxic chemical, and water contaminants. Rather, the EPA should use the best available data and models available to it, regardless of whether these data and models are publicly available.

Additionally, if adopted, the proposed rule would make it harder, not easier, to share important scientific data by excluding studies that do not meet rigid standards set in place by this policy. Limiting the amount of science used in crucial decision making would be detrimental to the EPA's ability to ensure we have clean air and water.

Instead of leading to better or more transparent science, the EPA proposal is far more likely to lead to less science, more biased decision making and weaker public health and environmental rules. Due to these numerous issues, I urge the EPA to withdraw the proposed rule.

Sincerely,

Luke Breit

Mr. Luke W. Reif

InsideEPA: Citing Legal Flaws, States Urge EPA To Withdraw Or Clarify Science Rule

Citing significant legal flaws, state environmental agencies are urging EPA to withdraw or delay and clarify its proposed rule barring the use in major regulatory decisions of any science where the underlying raw data and models are not publicly available, arguing that the proposal is vague and the agency has not engaged with states on its content.

RE: Strengthening Transparency in Regulatory Science

The Association of Clean Water Administrators ("ACWA") is the independent, nonpartisan, national organization of state, interstate, and territorial water program managers, who on a daily basis implement the water quality programs of the Clean Water Act ("CWA"). As the primary entities responsible for carrying out CWA programs, states are very interested in any and all national regulatory or policy positions that may impact their ability to implement the CWA in their states.

The stated intent of this rule is to strengthen regulatory transparency of scientific information that the Environmental Protection Agency (EPA) uses for regulatory decision making, and to ensure that the underlying data and models are publicly available in a manner sufficient for independent validation and analysis. ACWA and the states are very supportive of scientific transparency in regulatory development. Unfortunately, the rule is vague in several areas and does not provide specific regulatory language for review and comment.

In the spirit of cooperative federalism, and before the rule is finalized, we ask that EPA host coregulatory discussions that provide more details regarding the intent, scope, and implementation processes associated with this proposal. ACWA believes these discussions will improve the quality of the comments on the rule and will contribute to an enhanced and improved final rule, should this rulemaking go forward. Further, ACWA requests that EPA issue a supplemental notice of proposed rulemaking that includes actual regulatory language. As part of this supplemental notice, ACWA also requests that EPA provide sufficient detail for an analysis of whether this new approach will achieve the results intended, while also continuing to support states efforts to implement the requirements of the CWA.

Questions Not Fully Addressed

ACWA supports use of best available science and the goals of public transparency and independent verification. States also recognize the importance of ensuring data and the models used for regulatory actions,

1634 EYE Street, NW, Ste. # 750, Washington, DC 20006
TEL: 202-756-0605

WWW.ACWA-US.ORG

provides defensible science for aquatic life and human health be made publicly available, consistent with relevant privacy laws.

In considering this rule, ACWA and states were uncertain of the potential CWA implications. For example, the National Recommended Water Quality Criteria (NRWQC) development, and the state water quality standards established based on these criteria, rely on an extensive number of scientific studies for both aquatic life protections and human health. In what way could this rule affect the use of those studies? Additionally, EPA is currently reviewing and evaluating toxicity data for several perflourinated compounds. These toxicity evaluations and resulting toxicity data are crucial, as most states do not have the resources do this on their own. States have raised questions as to whether implementation of this rule would delay these evaluations or affect the scope of what is evaluated.

Likewise, EPA has historically developed several industry specific effluent guidelines (ELGs) are periodically developed and/or updated. These technology-based standards are intended to represent the greatest pollutant reductions economically achievable for an industry and are incorporated into National Pollutant Discharge Elimination System (NPDES) permits issued by States and EPA regional offices. States raised questions regarding the number of ELGs that qualified as "significant."

During the extended comment period, ACWA was able to confirm with EPA's Office of Water (OW) three rules that met the $100 million "significant impact" threshold set out in the proposed rule in the last ten years:

1. National Primary Drinking Water Rule: Stage 2 Disinfectants and Disinfection Byproducts Final Rule published on January 2, 2006 (71 FR 388-493)

2. Cooling Water Intake Existing Facilities Rule, Final Regulations to Establish Requirements for Cooling Water Intake Structures at Existing Facilities and Amend Requirements at Phase I Facilities (aka CWA Section 316(b)) published on August 15, 2014 (79 FR 48299)

3. Effluent Limitations Guidelines and Standards for the Steam Electric Power Generating Point Source Category published on November 3, 2015 (80 FR 67837)

ACWA was also able to confirm with OW that in looking at all other less significant actions, almost all the information used has traditionally been available to share. EPA was not aware of any national recommended water quality criteria where modeling, science or data could not be shared with states or the public due to privacy issues, or because of intellectual property, confidential business information, security risk, or other potentially justifiable reason. Similarly, all information and data within the NPDES permit applications and permits can be shared, with just a few exceptions. For example, the program office may receive confidential business information from industrial facilities that use proprietary processes and studies, and sometimes there may be an instance where a model used may not be shared due to its proprietary nature. It was also noted by OW that national security related facility information is not shareable.

The proposed rule also raises questions that states believe should be considered before the rule is finalized. These questions include:

1. How would the $100 million economic threshold analysis be implemented? Would new rules be assessed differently than updates to current rules?

2. Where data masking, coding, or de-identification is not technically feasible, will EPA still consider using high quality scientific research?

3. While it appears this rule would only apply prospectively to regulations, would there be any impact to science historically used to inform regulations that have existed for years/decades? How will EPA ensure the science remains timely?

4. If EPA were to phase in the requirements or prioritize certain specific actions, will states have any role in helping identify those priorities?

5. What impact, if any, would this rule have on institutions of higher education, hospitals, and other nonprofit organizations that received EPA funding through grants and cooperative agreements?

Conclusion

Thank you for the opportunity to comment. ACWA and states support regulatory transparency but believe there are still several important questions that should be considered before EPA moves forward. As this rule is developed, ACWA requests that EPA periodically meet with states to share information the agency has learned, and to consider any intended and unintended impacts to state programs. Our members, the directors of state surface water quality programs, possess unique knowledge and insight into those clean water program areas that rely most heavily on data, scientific studies, and models. As with all ACWA comment letters, we encourage the agency to also consider recommendations provided by individual states. If you have any questions regarding this comment letter, please contact ACWA Executive Director Julia Anastasio at janastasio@acwa-us.org or (202) 756-0600.

Docket ID No. EPA-HQ-OA-2018-0259
Re: Strengthening Transparency in Regulatory Science

To Whom It May Concern:

These comments were prepared by the Association of State Wetland Managers (ASWM) in response to the April 30, 2018 *Federal Register* notice "Strengthening Transparency in Regulatory Science." ASWM represents states and tribes in promoting the sound management of wetlands and other waters. Our technical support of states and tribes includes state and federal dredge and fill permit programs including § 404 of the Clean Water Act; development of water quality standards for wetlands; § 401 Certification of federal permits and licenses; and coordination with other state and federal programs impacting aquatic resources. Thus, although we recognize the broad scope of the proposed regulation, our comments are focused on the potential impact of the proposed rule on these areas of public policy.

We are cognizant that discussion of this proposed rule has focused on the impacts of environmental contamination on public health. However, the rule as written is very broad, and also clearly extends to other CWA programs. CWA §104 – which authorizes environmental surveillance and monitoring for a wide array of programs – is included in the legislative provisions used to justify the rule. The definition of "*dose response data and models*" included in the proposed rule directly refers not only to public health but also to environmental impact. Therefore, we anticipate that the proposed rule would directly alter the programs of interest to our member states.

The stated intent of the proposed rule is "to strengthen the transparency of EPA regulatory science" by "ensuring that the data underlying [pivotal regulatory decisions] are publicly available in a manner sufficient for independent validation." ASWM strongly agrees that environmental regulatory decisions should be based on the best available science, including both peer-reviewed science and other pertinent information. However, we are greatly concerned that the proposed rule would unnecessarily limit the use of available sound science to an extent that would undermine EPA's mission to protect public health and the environment. We question whether there is a need for greater public access to raw data, given the extensive measures already in place to ensure scientific transparency.

GENERAL COMMENTS

- **Ambiguity of the proposed rule.** ASWM finds it difficult to predict the effect of the proposed transparency rule given the broad and general nature of the described intent and applicability, and lack of information regarding how it would be implemented in practice. It is impossible based on the information provided in the *Federal Register* notice to fully evaluate the potential demand on time and agency resources, and to ascertain the benefits or impediments that might result from the proposed regulation. We are concerned that the notice fails to provide sufficient detail for an analysis of whether the new approach will achieve the stated purpose without creating unintended consequences that make it difficult for states to implement clean water programs.

- **Role of Science in Decision Making.** One of the most important factors in decision-making associated with environmental issues and public health is the application of sound science. While other factors such as economics, public values, availability of technology, coordination with other laws and programs etc., are important to consider, it is science that is the most transparent and that should provide the foundation for decision makers. The application of sound science results in a fact-based decision and supports consistency and predictability in regulatory actions. It also allows decision makers to more clearly articulate and defend their decisions.

- **Need for the proposed rule.**
  EPA solicits comments on how this proposal can be "promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation." In fact, ASWM believes that the Federal programs that are the province of our members already provide sufficient opportunities for public review and analysis. This is in addition to the rigorous peer review provided by the scientific publications. We therefore question the need for the rule. We find the justification for the proposed rule – the statement that "*EPA has not previously implemented [policy and guidance that has called for increasing public access to data] in a robust and consistent manner*" -- to be unconvincing. If the issue is with implementation rather than the underlying policies and guidance, then a new rule is not what is needed.

  We suggest that EPA provide documentation of the inability of the public to review important data, and the resulting environmental impact. We also request examples of how additional review by the public could improve the regulatory process without adding an unacceptable cost or delay, and/or excluding information essential to the validity of decision making.

  Existing published literature often plays a role in decision making and predicts environmental and economic impacts. Scientific journals typically have a peer review system in place to evaluate the soundness of the research submitted for publication. It is unclear when and why use of this type of information would require more transparency, as methods of data collection and analysis are clearly described to inform the results and conclusions.

- **Potential impact on third parties and grantees.**
  The proposed rule applies to scientific data gathered by third parties and grantees. EPA grant funding supports the efforts of states to conduct research and carry out their own respective regulations. It is unclear how this regulation would impact science gathered and applied independently by the states. Grant recipients are required to document their approaches for

data collection and analysis, and overall quality control. ASWM recommends that the sufficiency of existing approaches be fully considered before making substantive changes. ASWM further recommends that adequate safeguards be considered in any proposed rules to protect personal information of relevant parties.

- **Consistent treatment of data regardless of source.**
  ASWM notes that the proposed rule applies to the transparency of data used by federal agencies in rule and decision making. We recommend that federal agencies apply the same stringent standards for transparency and quality of data to all information used in decision-making regardless of its source, that is, whether provided by public agencies, the academic community, regulated entities, or other sources. Moreover, we believe that scientific transparency would be increased by requiring information regarding the entity providing financial support for the related research. Funding by federal agencies and many foundations are typically identified in research reports, but corporate and other private funders may not be. Given that funding entities may influence the formulation of scientific questions raised by the research, this information is necessary to fully understand the conclusions that may be drawn from the research.

RESPONSE TO REQUEST FOR COMMENTS IN SECTION III OF *FEDERAL REGISTER* NOTICE.

1. Effect of the proposed rule on individual programs.

- Clean Water Act definition of Waters of the United States (WOTUS).
  The proposed rule language indicates that it is generally applicable prospectively to final agency actions. However, the agencies also request comments on applicability to other stages of rulemaking. EPA is currently engaged in a very extended proposed modification to the definition of Waters of the United States (WOTUS). ASWM continues to urge expedited resolution of the various proposed revisions to the definition of WOTUS and it is unclear how the proposed rule might affect current rulemaking efforts.

  Although the definition of "*dose response data and models*" may not apply directly to the WOTUS rule, the *Federal Register* notice also indicates that EPA is considering expansion of the rule "*to cover other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulation interventions on complex economic or environmental systems.*" Given the in-depth scientific analysis undertaken to support development of the 2015 rule regarding WOTUS – based heavily on a publicly available analysis of the pertinent peer-reviewed literature – ASWM recommends completion of the WOTUS rule using the existing scientific analysis. That is, we recommend that the WOTUS rule be exempted from any application of the proposed rule regarding transparency in science. Applying the proposed rule to the information gathered to support a WOTUS rule is unnecessary given currently availability of the underlying science to the public.

- Water Quality Standards.
  It is unknown how the proposed rule would impact development of Water Quality Standards for wetlands. Please note that many states include pollutant and toxic discharge standards

among those that are applied to wetlands. The proposal should clearly address and answer this question, and also clarify the impact on grants to states.

- National Environmental Policy Act.
  The Administration is currently engaged in a multi-year effort to streamline NEPA. ASWM recommends that the proposed rule not undermine that initiative either by excluding information that does not meet the requirements or by requiring more time for the required transparency standards to be met.

2. Request for comments regarding the scope of the proposed regulation.
ASWM has based this set of comments on our understanding that the text of the proposed rule would apply to a "significant regulatory action" as defined in E.O. 12866. That definition reads as follows:

> *"...any regulatory action that is likely to result in a rule that may:*
>
> *(1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;*
>
> *(2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;*
>
> *(3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or*
>
> *(4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in this Executive order.*

- **Should the proposed rule be expanded "*...to cover other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulation interventions on complex economic or environmental systems.*"**

  ASWM supports the use of numerous types and sources of data and information in decision-making. Particularly where legal standards require consideration of a wide array of factors in reaching a regulatory decision - including not only ecological and economic factors, but practicality and alternatives to the proposal, secondary impacts, and other criteria - many types and sources of data are routinely necessary for a sound decision. However, data requirements are already defined in the rules and guidance associated with specific regulatory programs; such information is already subject to public review both in rule-making and in other program decisions such as permit approval. Use of the broadest possible range of information increases the validity and accuracy of decisions and should not be limited by overly burdensome requirements as described by the proposed rule.

- **Should the requirements in the proposed rule also apply to, "... other stages of the rulemaking process...as well as to other types of agency actions and promulgations, such**

as guidance."

ASWM believes that applying such strenuous requirements for data early in the development of a rule would restrict initial consultation with other agencies, with stakeholders, and with the public. We see no valid reason to impose such restrictions.

ASWM also opposes application of the requirements of the proposed rule to promulgation of guidance. In environmental programs, guidance often supports implementation of a rule in a practical manner at the field level. As such, it may explain how to accurately and effectively apply regulations in different geographic areas, or under other conditions that may vary from site to site such as specific soil conditions. Practical, accurate, and efficient application of regulations in the field typically depends upon guidance based not only on published science, but also on professional experience and results of field testing. It would be highly impractical to make such information available to the public in the format described by the proposed rule. On the other hand, failure to develop guidance because of lack of extensive published data would cripple implementation of necessary regulatory programs.

- **Should the scope of coverage by the proposed rule be narrowed.**

In general, we support significant narrowing of the scope of the proposed rule, if it is finalized. EPA should define a more specific category of decisions that demand the level of public access to data defined by this rule, and more fully explain how the benefit of greater public access to raw data justifies the cost of implementation.

EPA has suggested only that the scope be limited to a "major" decision under the Congressional Review Act – which is defined as "economically significant under E.O. 12866"; or, alternatively, to a regulation found to be "economically significant" under E.O. 12866 – which is essentially the same thing. ASWM fails to understand the distinction among these criteria, and that proposed in the rule. We request clarification.

- **Should the provisions of the proposed rule apply to, *"individual party adjudications, enforcement actions, or permit proceedings that EPA determines are scientifically or technically novel or likely to have precedent setting influence on future actions."* Should *"...other agency actions... such as site-specific permitting actions or non-binding regulatory determinations"* be included.**

While ASWM has concerns regarding the impact of the proposed rule in decisions on rulemaking, we have even *greater* concerns regarding the suggested application of the proposed rule to individual permit actions. Such requirements would be grossly inconsistent with sound and timely authorizations under the §404 dredge and fill permit program in particular.

Tens of thousands of actions – including numerous dredge and fill construction activities undertaken both by private landowners and public agencies – are authorized annually under §404 of the CWA, through the collaboration of EPA, the U.S. Army Corps of Engineers, and the states and tribes. The expeditious review and issuance of authorizations under this program is essential for the range of projects authorized under §404. Moreover, data collected and submitted by the applicant to support the decision, and by the regulatory agencies to inform the

decision, are both essential and collected on a case-by-case basis as needed. The level of detail of a permit specific analysis is generally commensurate with the scope of a particular project (e.g. repair of a private seawall, versus construction of an interstate highway). Regulations that subject all data to identical requirements regarding data collection, evaluation, and release would interfere with the permitting process in an unacceptable manner.

Under §404, the vast majority of permits are issued by the U.S. Army Corps of Engineers through general permits. Many associated state programs include statutory deadlines for review and approval. Thus, any delay associated with re-review of original supportive data beyond what is already provided for in the public notice process would have the effect of slowing and delaying these authorizations, at a significantly increased regulatory cost. Moreover, the exclusion of non-peer reviewed data - which is typically collected at the time of a permit application for the purpose of clarifying both the extent and limitations of adverse impacts – would undermine the accuracy of individual permit decisions. Finally, ASWM notes that there are existing options for appeal and legal recourse for applicants or permittees to question the validity of scientific data used in decision making; therefore, there is no need to apply the proposed provisions to individual cases.

3. Should the proposed rule apply retroactively to data collected prior to the effective date of the rule.

It is difficult to envision how the proposed rule could be applied retroactively to the science developed through long term experience in the implementation of various regulations and standards. Exclusion of research that was accepted as scientifically valid in the past could only result in the need to duplicate such research, adding needless cost and delay to the process of decision making. ASWM objects to this concept.

Current regulations under the CWA have evolved over decades, supported by extensive peer reviewed science and other data collected by federal agencies, state and local agencies, academic institutions, stakeholders, and the general public. Supporting data includes the results of long-term monitoring of the impact and effectiveness of previous regulations, thereby supporting adaptive management and adjustments needed to address those impacts. Reports of such studies are readily available.

4. Request for comments on additional implementation challenges.

The proposed rule itself could be defined as a "significant regulatory action" under E.O. 12866 based both on the cost to implement the action (that is, to subject all agencies and organizations that provide data to EPA to the provisions of the proposal), and on the fact that the rule could, "*...create a serious inconsistency or otherwise interfere with an action taken or planned by another agency.*" We suggest that EPA develop a comprehensive cost-benefit analysis to support this action, reflecting both the full benefit of resources protected, and the cost of any resulting delay in execution of regulatory actions.

The Congressional Budget Office consulted with EPA in recent analyses of related legislation, H.R. 1030 in 2015, and H.R. 1430 in 2017. The 2015 analysis determined that the agency would need to expend $250 million/year initially in implementation of the measure, even if the number of studies that EPA relied on was reduced by one half. The CBO determined that meeting the H.R. 1430 requirements would cost EPA an average of $10,000 per study.

5. Comments regarding the proposed authority of the Administrator to exempt regulatory decisions from the rule.

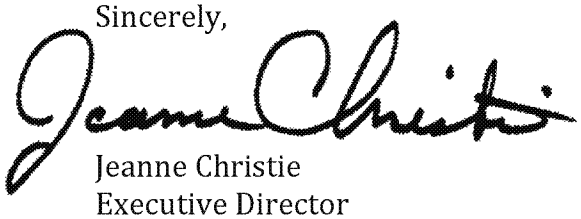
The proposed rule gives the EPA Administrator the authority to "exempt significant regulatory decisions on a case-by-case-basis" from the requirements of this new subpart. This appears to give EPA Administrators a great deal of discretionary authority now and in the future pursuant to the implementation of this rule. It is unclear why an exemption from compliance with the rule would be needed if the final rule is not excessively burdensome; how that discretionary authority will be exercised; and what, if any, standards would be applied by the Administrator in determining exemptions. In our experience, consistent application of regulations and standards is necessary to provide the clarity and predictability needed in carrying out science-based programs. This authority could be applied very differently over time as EPA leadership changes, with unintended consequences for applicant clarity or sound management of environmental resources.

SUMMARY

Given the broad scope and potential effect of the proposed rule, we recommend that an additional step be added for EPA to hold discussions with impacted states and tribes and other stakeholders to provide supplemental information to the current proposal. We also request that EPA provide a supplement to the rule to explain more fully how the proposed rule would increase transparency without delaying decision-making or excluding consideration of traditionally acceptable data and publications, given the numerous federal provisions already in place to achieve the goal of ensuring transparency.

As always, we appreciate the opportunity to review and comment on this proposal. While these comments have been prepared with input from the ASWM Board of Directors, they do not necessarily represent the individual views of all states and tribes; we therefore encourage your full consideration of the comments of individual states and tribes and other state associations. Please do not hesitate to contact me should you wish to discuss these comments.

Sincerely,



Jeanne Christie
Executive Director

Mail Code 28221T
1200 Pennsylvania Avenue, NW
Washington, DC 20460

To Whom It May Concern:

The National Association of Clean Air Agencies (NACAA) appreciates this opportunity to comment on the U.S. Environmental Protection Agency's (EPA's) proposed rule, "Strengthening Transparency in Regulatory Science," 83 Fed. Reg. 18,768 (Apr. 30, 2018). NACAA is the national, non-partisan, non-profit association of 156 local and state air pollution control agencies in 41 states, the District of Columbia and four territories. The air quality professionals in our member agencies have vast experience dedicated to improving air quality in the U.S. These comments are based upon that experience. The views expressed in these comments do not represent the positions of every state and local air pollution control agency in the country.

NACAA agrees with EPA that "the best available science must serve as the foundation of EPA's regulatory actions."[1] Indeed, reliance on best-available science is a fundamental requirement of the Clean Air Act and other environmental statutes that EPA administers. For example, the Clean Air Act requires EPA to establish National Ambient Air Quality Standards (NAAQS) at levels "requisite to protect the public health" with "an adequate margin of safety."[2] In meeting this obligation, EPA is required to develop air quality criteria that "*accurately reflect the latest scientific knowledge* useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air, in varying quantities."[3] Science-based decision making is at the very core of our shared mission to protect public health and the environment from the harmful effects of air pollution.

[1] 83 Fed. Reg. at 18,769.

[2] 42 U.S.C. § 7409(b)(1).

[3] *Id.* § 7408(a)(2) (emphasis added).

NACAA also recognizes that there is a laudable, long-term trend toward increased transparency in science – in particular, toward providing greater public access to underlying data and analytical techniques after scientific studies are published. There is much to value in this trend toward more "open science," and NACAA supports the continued development of methods that would permit the public disclosure of information on which scientific studies are based without violating, in EPA's words, "confidential or private information in a manner that violates applicable legal and ethical protections."[4] However, at the present time, complete public access to underlying data is not always possible, especially in the case of epidemiological studies based on private health data that must remain confidential. To the extent that techniques are available to anonymize such data, we support their use and we encourage their further development.

Transparency concerns, however, must not override EPA's obligation to consider the full range of peer-reviewed, sound scientific research that is available and relevant to its regulatory decisions. In NACAA's view, the proposal would likely hinder, rather than promote, EPA's use of best-available science and it would tend to diminish public confidence in the integrity of EPA's scientific decision making.

The proposal includes three main components. First, it would require EPA to ensure that the data and models underlying the scientific studies on which its regulatory actions are based are "publicly available in a manner sufficient for independent validation."[5] Second, it would impose upon the agency requirements for the analysis of dose-response models used in scientific studies upon which it relies.[6] Third, it would require EPA to conduct "independent peer review" of scientific studies used to justify its regulatory decisions.[7] Notably absent from the proposal are any details about how, exactly, the agency intends to implement those requirements, or what it might cost.

Our concerns with the proposed rule fall into two main categories: (1) its potential to restrict the scientific studies that EPA will consider in the development of health-based air quality regulations, particularly studies that are based on confidential individual health data, and (2) its vagueness, including its lack of clarity as to how EPA intends to implement the rule in a consistent, clear manner that does not compromise its obligation to protect public health and the environment. We elaborate on these concerns below.

NACAA recommends that EPA withdraw the proposed rule. Prior to proposal, a regulation with such significant ramifications for EPA's science-based decision making should be thoroughly vetted by the scientific community[8] and other key stakeholders, including the state

---

[4] 83 Fed. Reg. at 18,771.

[5] *Id.* at 18,773-74 (proposed § 30.5).

[6] *Id.* at 18,774 (proposed § 30.6).

[7] *Id.* (proposed § 30.7).

[8] In a memorandum dated May 12, a Science Advisory Board (SAB) Work Group Chair indicated that EPA made no effort to seek the input of its own scientific advisors and that Work Group members were only made aware of the proposal "via the *Federal Register* and news articles." The Work Group concludes that the action warrants further review by the SAB and lays out a number of specific concerns with the proposal, all of with which NACAA concurs

and local air agencies that rely on the scientific integrity of EPA's regulations to protect public health and the environment from the harmful effects of air pollution.

I. EPA Has Not Established that the Proposed Rule Is Necessary or Reasonable

EPA has not adequately explained the purpose and rationale for the proposed rule. The agency suggests that both the "integrity" and "validity" of its decision making will be strengthened by requiring full public disclosure of the data and models underlying the scientific studies on which it relies. The logical implication is that EPA believes those characteristics are currently lacking. The agency does not explain how it reached that conclusion, or what particular "problems" the rule is intended to solve. EPA never explains why, specifically, it believes that existing policies and tools for vetting scientific research are insufficient, why this rule (or any rule) is the best way to address those deficiencies, or why the proposal would better serve and protect the public than its existing policies and practices.

Public access to underlying data and models can be beneficial. However, full public access is not necessary to assure the validity of scientific studies. Rather, the most effective assurance of scientific validity and accuracy is the process of peer review itself, a process to which the vast majority of scientific information on which EPA relies has already been subject. There are many steps involved in converting scientific information into policy. Scientists collect data, analyze them, create a model to test theories, compare the model to the data, and then adjust the model. When the results of a scientific study are submitted for publication, the uncertainties, assumptions, parameters and theories utilized by the scientists are laid out in the publication. Peer review analyzes all these components to establish validity. The process of peer review has been rigorously developed over centuries. If EPA believes the peer review process is flawed, it is incumbent on the agency to explain exactly *why* it believes the process is inadequate and how its proposal specifically addresses those inadequacies.

The proposal does not acknowledge that EPA already has institutional mechanisms to review and vet scientific information through panels of scientific experts. The primary function of EPA's Science Advisory Board (SAB) is to review the quality and relevance of scientific and technical information being used by EPA or proposed as the basis for EPA regulations. With respect to the Clean Air Act in particular, EPA's Clean Air Scientific Advisory Committee (CASAC) provides independent advice to the EPA Administrator on the technical bases for the NAAQS. By ignoring the existence of these bodies in the proposed rule, EPA suggests that it does not trust its own scientific advisors. This tends to undermine public confidence in EPA decision making, rather than to bolster it.

The U.S. Court of Appeals for the District Columbia Circuit has affirmed EPA's use of non-public data in support of NAAQS, and in so doing it characterized as "persuasive" EPA's approach to data availability, which the court quoted as follows:

---

warrant serious consideration. *See* Memorandum to Members of the Chartered SAB and SAB Liaisons from Alison Cullen, Chair, SAB Work Group on EPA Planned Actions for SAB Consideration, "Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN" (May 12, 2018).

> If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment. [S]uch data are often the property of scientific investigators and are often not readily available because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].[9]

Now, EPA indicates that it intends to reverse this policy and adopt one that would expressly preclude it from using studies based on such "non-public data."[10] It is inappropriate for EPA to undertake such a consequential policy change without explaining why it believes the concerns it expressed above are incorrect or no longer valid.

II. The Proposed Rule Could Have Serious, Adverse Effects on the Nation's Air Program

Another concern is that, if enacted, the rule would serve to bar EPA's consideration of relevant scientific literature in the establishment of air regulations designed to protect human health and the environment. Taking one key example, many commenters have opined that the landmark Harvard School of Public Health "Six Cities" epidemiological study, which established the strong association between fine particulate matter pollution and mortality, would not meet the requirements of the proposed rule because it relies on human health data subject to patient confidentiality agreements that were entered into decades ago. EPA should publicly confirm that it would consider existing literature such as the Six Cities Study in future rulemakings, should the proposed rule be enacted.

Unfortunately, EPA suggests in footnote 3 of the proposal that it would exclude such studies from consideration. There, EPA cites two D.C. Circuit cases that upheld its reliance on data that is protected from widespread view by third parties in setting NAAQS for lead and fine particulate matter, respectively, and states, "EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions." NACAA is concerned by the clear implication that EPA will discard rigorously vetted scientific literature such as the Six Cities Study, withdrawing from its legal obligation and stated intention to rely on the best available science.

The proposal would also allow the EPA Administrator to grant exemptions to the rule's requirements on a case-by-case basis if he or she determines it is "not feasible" to make underlying data publicly available or to conduct independent peer review of scientific studies. However, this provision does not alleviate concerns about the potential exclusion of relevant data, because the rule does not include any criteria for how the Administrator would make such a determination. Making the EPA Administrator the ultimate arbiter of what scientific literature should be considered by the agency, based solely on his or her determination of what is or is not "feasible," would have the effect of interjecting the appearance of politics into what should be a

[9] *Am. Trucking Ass'ns., Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002).

[10] 83 Fed. Reg. at 18,769 n.3.

fair and unbiased scientific assessment. It is an opportunity for arbitrary decision making and is insufficient to protect against the exclusion of relevant, valid scientific studies.

III. Requiring EPA to Conduct "Independent Peer Review" of Scientific Studies Is Unnecessary and Would Be Difficult to Implement

The proposed rule would require EPA to conduct "independent peer review" of scientific studies underlying its significant regulatory decisions, such as the establishment of health-based air quality standards. EPA's in-house peer reviewers would also be tasked with articulating "the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results."[11]

It is difficult to provide meaningful comments on this aspect of the proposal because EPA has included no details about how the "independent peer review" requirement would be implemented. The fact that EPA has requested comment on "which parts of the Agency should be responsible for carrying out these requirements" suggests that it has not worked out a plan for this fundamental provision. Peer reviewers must be experts in their fields of scientific study. Would EPA have to hire new experts, and if so, how many and in what fields? How much would this cost? More fundamentally, why should scientific literature that has already undergone peer review and been vetted by EPA's science advisory panels be subjected to an additional layer of government peer review? These key questions should have been considered, and the answers made public, prior to the rule's proposal.

IV. The Proposed Rule Should Not Be Applied Retrospectively

EPA requests comment on whether the requirements of the proposed rule should be applied retrospectively, should the agency decide to adopt it. Specifically, it asks whether for regulatory programs like the NAAQS, in which future significant regulatory actions may be based on the administrative records from previous reviews, the rule should apply to that previous administrative record. This would be inappropriate. To apply such a rule retroactively would create significant regulatory uncertainty by calling into question existing regulatory standards as well as the permits, state implementation plans and other decisions that are based on those standards. Moreover, the rule should not be applied to data and models underlying studies that have already been completed or are currently underway.

V. The Rule Could Be Extremely Costly to Implement

EPA has not estimated the costs of implementing the proposed rule. The preamble states only that "EPA believes the benefits of this proposed rule justify the costs," while providing no information to support that belief. Considering that the rule would require the agency to assemble an in-house group of experts to conduct independent peer review of scientific studies, and to devote staff resources to ensure that data and other information underlying the studies are publicly available in a format sufficient to allow others to replicate their results, it is reasonable to expect those costs could be very high.

---

[11] 83 Fed. Reg. at 18,774.

The Congressional Budget Office (CBO) was able to estimate the costs of implementing proposed legislation on which we understand the proposed rule to be based, namely, H.R. 1430, the Honest and Open New EPA Science Treatment (HONEST) Act of 2017. CBO estimated that "[i]f EPA continued to rely on as many scientific studies as it has used in recent years to support its covered actions," the agency would need to spend at least $100 million dollars per year to upgrade the format and availability of those studies' data to the level required by the bill.[12] Such high costs would reduce the number of scientific studies EPA can consider, which is contrary to the intent and literal language of the Clean Air Act to consider the best available science. We recognize that the proposed rule is somewhat narrower in scope in that its requirements apply to what EPA characterizes as "pivotal regulatory science," but that does not explain why EPA could not provide a cost estimate for the proposed rule when CBO was able to do so for the HONEST Act.

* * * * * *

For all the foregoing reasons, NACAA respectfully requests that EPA withdraw the proposed rule. If the agency intends to update its approach to transparency and reproducibility, it should do so in consultation with the National Academy of Sciences and its own scientific advisors. The implementation details should be worked out in advance, not left to speculation. In the spirit of cooperative federalism, EPA should also consult from the earliest stages with the state and local agencies that are responsible for implementing our nation's environmental laws.

If you have any questions about these comments, please do not hesitate to contact me or Karen Mongoven at NACAA. We can be reached by phone at (202) 624-7864 or by email at mkeogh@4cleanair.org and kmongoven@4cleanair.org.

Sincerely,

Miles Keogh

Washington, DC 20460
Attention: Docket ID No. EPA–HQ–OA–2018–0259

Re: *Proposed Rule on Strengthening Transparency in Regulatory Science*

Dear Acting Administrator Wheeler:

The Northeast States for Coordinated Air Use Management (NESCAUM) offer the following comments on the U.S. Environmental Protection Agency's (EPA's) Proposed Rule, published in the Federal Register April 30, 2018 and entitled "Strengthening Transparency in Regulatory Science" (83 FR 18768-18774). NESCAUM is the regional association of air pollution control agencies representing Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont.[1] We submit these comments out of our concern that failure to consider the best available science will endanger public health.

The EPA invokes "strengthening transparency" as a primary driver for the proposal, yet fails to describe how a perceived lack of transparency has hampered past rulemakings. It provides no examples of where "EPA has not previously implemented these policies and guidance in a robust and consistent manner" nor what are the specific "agency culture and practices regarding data access" that require changing. Furthermore, when EPA was legally challenged after setting the 1997 ozone and fine particulate matter ambient air quality standards, the court in *American Trucking Assns. v. EPA* [283 F.3d 355 (D.C.Cir. 2002)] differentiated the substantial difference and administrative hardship between reliance on peer-reviewed scientific studies cited in a rulemaking record rather than on the raw data underlying those studies:

> If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment.... [S]uch data are often the property of scientific investigators and are often not readily available

[1] These comments reflect the majority view of NESCAUM members. Individual member states may hold some views different from the NESCAUM states' majority consensus.

> because of ... proprietary interests ... or because of [confidentiality] arrangements [with study participants].

In light of the court's holding, and without additional clarity from EPA, we are having difficulty identifying the problem EPA seeks to address with this Proposed Rule. Therefore, as explained below, we request that the Agency withdraw it.

The proposal is too vague as written to provide the public with a meaningful opportunity to comment

The Proposed Rule, as written, lacks credible specificity and is overly vague in its terms and scope. Under the Administrative Procedures Act (APA), a federal regulatory agency must publish notice of either the substance of a proposed rule or a "description of the subjects and issues" covered by a proposed rule (5 U.S.C. § 553(b)(3)). In Fertilizer Institute v. EPA, 935 F.2d 1303 (D.C.Cir. 1991), the court observed that it "has consistently interpreted that requirement to mean that an agency's notice must 'provide sufficient detail and rationale for the rule to permit interested parties to comment meaningfully'" [*citing* Florida Power & Light Co. v. United States, 846 F.2d 765, 771 (D.C.Cir. 1988), cert. denied, 490 U.S. 1045 (1989)]. As such, EPA is required to articulate the specifics of its proposed rulemakings in a manner that provides a valid opportunity for public comment.

In this proposal, EPA solicits comment across a long list of topic areas, but fails to provide the Agency's own "sufficient detail and rationale" on the solicited comment areas, in contravention to APA § 553(b)(3). Commenters are left in the position of speculating on EPA's views and on those of other commenters that would presumably shape EPA's final rule. It is well settled law that this approach fails to provide adequate notice for informed public comment. In Fertilizer Institute v. EPA, the court held "Commenting parties cannot be expected to monitor all other comments submitted to an agency." In commenters' trying to anticipate potential rule revisions in response to comments from others, the court has also stated, "the EPA must *itself* provide notice of a regulatory proposal. Having failed to do so, it cannot bootstrap notice from a comment" [Fertilizer Institute v. EPA, at 1312, *quoting* Small Refiner Lead Phase-Down Task Force v. EPA, 705 F.2d 506, 547 (D.C.Cir. 1983) (emphasis in original)].

EPA must describe how the proposed text in sections 30.5, 30.7, and 30.9 affect current practice

Without clearly articulated and appropriate bounds, the Proposed Rule can restrict the scientific literature that is the basis for reviews of the National Ambient Air Quality Standards (NAAQS). Along with the changes to the NAAQS review process outlined in EPA's May 9, 2018 "Back to Basics" memo[2] and the recent requirement that members of the Clean Air Science Advisory

[2] Memorandum from E. Scott Pruitt, EPA Administrator, to [EPA] Assistant Administrators, *Subject: Back-to-Basics Process for Reviewing National Ambient Air Quality Standards* (May 9, 2018). Available at https://www.epa.gov/sites/production/files/2018-05/documents/image2018-05-09-173219.pdf (accessed May 21, 2018).

Committee and related panel members not receive any current EPA funding,[3] the Proposed Rule would constrain both the range of expertise and body of scientific literature that is available to be considered in these reviews, undermining the NAAQS. This will impede setting NAAQS levels with an adequate margin of safety necessary for public health protection, as required by the Clean Air Act, by preventing EPA from relying on scientific studies previously utilized to set them. Members of EPA's Science Advisory Board (SAB) have recently expressed similar concerns, stating that "The proposed rule does not include any assessment of the impact of data restrictions on existing or future regulatory programs."[4]

Sections 30.5 and 30.7 of the Proposed Rule respectively say: "the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation," and "EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions[.]" The approaches for "independent validation" and "independent review" are not described. Would EPA's staff scientists conduct these validations and reviews, or would EPA contract this out to third parties? How would EPA determine that third parties have the necessary qualifications and resources to perform these validations and reviews? Would peer reviewers be anonymous, or will their names and reviews be made public?

Without the above listed information elements, commenters are left to guess at the scope and potential impact of EPA's proposal as it applies to "independent validation" and "independent review." For example, a recent study that is likely to be considered "pivotal regulatory science" for the current PM NAAQS review is by Di, *et al.*, "Air pollution and mortality in the Medicare population."[5] This study of chronic effects, along with a complementary study on acute effects,[6] uses 460,310,521 person years of follow-up and has billions of data points. The computational resources necessary to replicate or validate the analysis are available only at large institutions like the Harvard-MIT Data Center.[7] How does EPA's proposal on independent validation and review apply to a study like this?

The Proposed Rule in section 30.5 also includes qualifying language that "The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner

consistent with law and protection of privacy, confidentiality, national and homeland security is not possible." If EPA concludes this "is not possible," does EPA then discard the science, or does it proceed in incorporating its consideration in recognition of other legitimate concerns limiting release of some, or even all, the underlying data and methodologies? This is an instance where clear examples of how the proposal applies to "pivotal regulatory science" would be most useful. Possible examples are the Harvard Six Cities Study[8] and the American Cancer Society Study[9] of particulate air pollution and mortality, and their reanalysis sponsored by the Health Effects Institute (HEI).[10] The original two studies are subject to medical history confidentiality requirements of the study subjects. The HEI effort maintained those confidentiality requirements while conducting an independent reanalysis that largely confirmed the original two studies' results. Are these examples in line with EPA's Proposed Rule, or are there other unidentified issues that would lead EPA to discard studies like these if subjected to this Proposed Rule?

Adding to the vagueness of sections 30.5 and 30.7, section 30.9 would provide the Administrator with broad authority to exempt regulatory decisions from the proposed disclosure provisions "on a case-by case basis if he or she determines that compliance is impracticable." The Proposed Rule lists several general considerations, but fails to provide specific criteria for determining when "compliance is impracticable." This creates the potential for inconsistent application, and leaves the public with no salient points upon which to provide comments. In addition to lacking specific criteria for evaluating what is "impracticable," the Proposed Rule does not describe the process that will be used to determine whether or not a regulatory decision is eligible for such an exemption, nor whether the basis of the Administrator's decision for such an exemption will be publicly disclosed. Lacking clear guidelines for transparent decision-making, the Administrator's discretion would appear to be unbounded and haphazard in application, with an undisclosed rationale.

EPA has provided no meaningful cost estimate for the Proposed Rule

Should EPA impose additional undefined peer review requirements on "pivotal regulatory science," EPA has failed to provide a regulatory impact assessment of costs from imposing such requirements. The costs are likely quite significant, however, based on a Congressional Budget Office (CBO) cost estimate[11] of a similar legislative proposal in H.R. 1430 "Honest and Open New EPA Science Treatment (HONEST) Act of 2017" passed in the House on March 29, 2017. Depending on the scope of "peer review" under this Proposed Rule, costs can be inferred from the CBO analysis to range "between a few million dollars per year to more than one hundred million dollars per year over the 2018-2022 period to ensure that data and other information

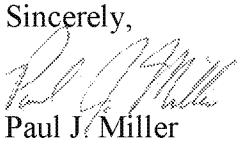
underlying studies are publicly available in a format sufficient to allow others to substantially reproduce the results of studies." EPA has provided no relevant information specific to this proposed rulemaking in order to evaluate the value of the additional costs this rule imposes beyond current practice, nor can we weigh potential foregone benefits should an overly broad application of this proposal limit the use of the best available science in setting public health standards and preventing adverse health outcomes.

Conclusion

EPA's proposal has far-reaching consequences on the future use of science by the agency. These consequences, however significant they may be, are indeterminate in light of the proposal's vagueness. The proposal fails to clearly articulate the problem EPA seeks to address, the specific Proposed Rule requirements, and the rule's potential benefits and costs. These are well understood and basic elements that federal regulatory agencies must include to ensure informed public comment. Given these elements are completely missing from this proposal, EPA should withdraw it.

Sincerely,



Paul J. Miller
Deputy Director and Chief Scientist

COMMENTS BY THE TEXAS COMMISSION ON ENVIRONMENTAL QUALITY REGARDING STRENGTHENING TRANSPARENCY IN REGULATORY SCIENCE PROPOSED RULE

EPA DOCKET ID NO. EPA-HQ-OA-2018-0259

I. Summary of Proposed Action

On April 30, 2018, the United States Environmental Protection Agency (EPA) published a proposed rule in the *Federal Register* (83 FR 18768) titled *Strengthening Transparency in Regulatory Science*. The EPA provided a 30-day public comment period, ending on May 30, 2018. On May 25, 2018, the EPA extended the public comment period to August 16, 2018 (83 FR 24255). This proposed rule (hereafter referred to as the proposed data transparency rule) would establish an EPA policy that would only allow scientific data that is publicly available and independently verifiable to be used as the basis for significant regulations. The EPA specifically requested comment on numerous details related to the proposed data transparency rule's scope and implementation.

II. Comments

A. General Comments

The Texas Commission on Environmental Quality (TCEQ) appreciates the EPA's intention to provide greater transparency to the broader community of scientists, regulators, regulated entities, and interested members of the public who rely on and are impacted by the EPA's regulations. We encourage the EPA to interact with experts in each of these areas throughout the development process to ensure that all the opportunities and challenges presented with this proposed data transparency rule are fully realized and considered.

The TCEQ appreciates the EPA's commitment to having a strong scientific foundation for environmental regulations. We agree that many of the EPA's environmental regulations impact the daily lives of Americans and the importance of maintaining their trust through our shared scientific integrity cannot be overstated. The proposed rule emphasizes the need for major environmental regulations to be comprehensive, unbiased, and transparent. Because this is the first of its kind both within the EPA and among federal agencies, we hope that the EPA considers this proposed data transparency rule to be one step toward a longer conversation about these shared objectives.

The proposed data transparency rule language was silent on several important technical considerations, presumably to allow the public an opportunity to shape the rule. However, the lack of specific policy design has led to confusion among experts and particularly the media about the real consequences of this proposed rule. Numerous news articles have decried the expected significant loss of scientific studies that this rule may cause to be excluded from future analyses. In contrast to this view, the proposed data transparency rule could be used to continue to drive scientific investigation by allowing researchers from different backgrounds to re-analyze important datasets. Critical review, reanalysis, and replicable results are cornerstones of science. Further, the global scientific community has already been discussing the importance of the availability of de-identified data for reanalysis since at least 2010 (IOM 2012). It is also consistent with the EPA's Enterprise Architecture and Quality System for Environmental Data

and Technology that is committed to improving data quality and promotion of data sharing. Several journals (e.g., Public Library of Science (PLoS), the Annals of Internal Medicine) already have a publication condition that requires authors to make their data available upon request. In addition, many repositories already exist for sharing certain data, including clinical trial data. Just a few examples include the Yale University Open Data Access (YODA) project, the Harvard Library Dataverse Project, Dryad, and the Health and Medical Care Archive. Although there may be challenges to gathering, storing, and releasing de-identified data, a thoughtfully implemented data transparency rule could build upon the scientific community's growing trend and compel current and future generations of scientists to share their data, leading to stronger scientific understanding and more meaningful regulations.

The potential opportunities and challenges of the proposed data transparency rule are numerous and should be vetted through existing experts. Rather than collect and respond to numerous disjointed comments, it would benefit the EPA and the rule to engage the expertise of the many organizations that have vast experience with collecting, storing, and sharing confidential information. As such, the TCEQ strongly encourages the EPA to convene a work group or review panel of experts to help in guiding the agency on several of the important details that are needed to make this proposed data transparency rule succeed. The work group should comprise diverse perspectives, including members from other federal agencies (e.g. the United States Department of Health and Human Services; the Health Services Advisory Group; the National Academies of Sciences, Engineering, and Medicine; the National Institutes of Health) and institutional review boards who would best be able to discuss the most recent and relevant methods for collecting and sharing health data from human studies. The work group should also examine economic and environmental modeling data, the extent to which data should be replicable, necessary privacy restrictions, exception criteria, and the potential for inadvertent bias due to the proposed data transparency policy. The EPA should then provide a more explicit proposed data transparency rule for public inspection and comment. Taking these steps will lead to a more thoughtful and meaningful policy that promotes and is led by scientific research while providing necessary regulatory transparency.

B. Specific Comments

Governance

The TCEQ strongly encourages the EPA to give governing authority for granting exceptions to the proposed data transparency rule, as well as the oversight of raw data collection, storage, and access to an external entity or entities to ensure independence and objectivity.

The proposed data transparency rule solicits public comment on key implementation details, such as criteria for granting exceptions to the rule, how to ensure an appropriate balance of regulatory transparency and data protection, and a data sharing platform. Consistently and thoughtfully granting exceptions will be one of the most crucial steps in ensuring the success of the data transparency rule, and more importantly the ongoing success of using science to inform policy. The true tone of this proposed rule will be set through exception determinations that either exclude certain evidence or justify using non-accessible data. Exceptions will also ensure that regulatory action continues to take place in the event that the EPA has a statutory requirement to make a decision using data that are not available (e.g., an older study for which the original dataset no longer exists) or cannot be released (e.g., confidential business information). Because the EPA has a vested interest in the outcome of such a decision, the TCEQ recommends that exception decisions rest with an external, third-party entity, such as the EPA's Science Advisory Board or a new cross-disciplinary board. As with many ethical determinations, organizational independence provides greater trust that decisions were reasonable, objective,

and unbiased. The governing entity could keep abreast of upcoming regulations and determine whether the pivotal scientific methods, data, or models used in the regulation's assessment document(s) would be subject to this proposed data transparency rule. Over time, the entity could develop a list of pivotal scientific articles, methods, data, or models that could then be available to the public on an open access website. Documenting pivotal works would help ensure consistent application of the rule and guide researchers in further framing and building their own research agendas. To be successful, the governing entity should be given limited authority to enforce its exclusion determinations. The balance between data privacy and regulatory transparency would best be respected through both this governing body and the prioritization of regulatory actions that fall under this rule.

Depending upon the identity and role of this governing entity, the same body or a separate third-party entity should oversee the storage of the data and grant access to qualified researchers. Other organizations already have infrastructure and policies in place to handle sensitive information, and it makes sense to use these existing capabilities, rather than attempting to re-create them at the EPA. In addition to the convenience, though, the independence of the entity that would grant access to the data also ensures that the EPA is not put in the paradox of collecting data to ensure data transparency and then possibly having to reject requested access to that data. More specific comments related to data accessibility are provided in the last section of this document.

Scope and Timing

The EPA should focus this proposed rule on a narrow set of actions that includes "major" or "economically significant" regulations and should apply data transparency rule requirements to documents that inform a proposed rule so that the public has adequate time to evaluate the data. This will better ensure timely regulatory action, as well as balance the need for confidentiality with regulatory transparency.

Although transparency is important throughout all regulatory actions, increasing levels of transparency can concomitantly complicate the review process, particularly when the data include sensitive personal information or confidential business information. The additional scientific and legal review, considerations, analyses, and approvals necessary to validate pivotal studies will likely lengthen the rule development and external review process.

The challenge, then, is to balance the need for regulatory transparency with preservation of sensitive information *and* the need for timely regulatory action. This can be accomplished in part through restricting the scope of the proposed data transparency rule to those actions that have the greatest impact on public health and regulated entities. Specifically, those rules that are considered "major" under the Congressional Review Act or "economically significant" under Executive Order 12866. Regulatory actions outside of this scope (e.g., site-specific permitting actions) may still impact the public, though the impact is much less than that of major or economically significant rules.

In order to have meaningful public involvement in the development of major rules, the EPA should apply the requirements from this data transparency rule as early in the process as is scientifically practical. Waiting until a final rule (or even a proposed rule, in the case of some rule-makings) to notify the public of pivotal research would leave no time to determine whether data could be accessed or for the public to review or comment on the revised analysis, should the EPA exclude a key study or be granted an exception from this data transparency rule. Further, if subsequent post-rule validation attempts prove unsuccessful, the EPA would then be put in the difficult position of repealing a rule that would likely have already cost state governments and regulated entities capital and resources to implement. To ensure that the goal of greater

transparency does not stymie the EPA's already extensive scientific review of available literature, the EPA should continue its existing evaluation process of surveying all possible materials first and providing its technical support documents or assessment documents for public inspection. Once available studies have been reviewed, pivotal scientific evidence (e.g., articles, models, etc.) can be identified and either retrieved or granted an exception through a standardized review process conducted by the third-party governing authority. A subsequent draft of the technical support or assessment document should then be provided if the exclusion of pivotal evidence required additional review or reliance on other, formerly non-pivotal, scientific evidence.

The proposed data transparency rule should also apply to scientifically or technically novel guidance, and the resulting guidance document should be made available for public comment.

If the EPA chooses to issue guidance that includes new scientific or technically novel approaches and intends to impose compliance on state, tribal, and local governments and grantees tasked with implementing environmental quality rules, the guidance document should be subject to this proposed data transparency rule and should be made available for public review and comment. Allowing this opportunity for public involvement safeguards the larger goal of regulatory transparency, as operational guidelines can often be just as impactful as official regulatory actions.

The EPA should consider pivotal scientific research as rules are formally reviewed, rather than retrospectively.

The EPA requested comment on whether the proposed data transparency rule should be applied retroactively to rules that have already been promulgated. Retroactive application of this proposed rule to existing rules would be infeasible due to the volume of significant environmental rules already in place and the time and expertise it would take to reanalyze the technical and legal aspects of these rules while maintaining oversight of ongoing agency business. Fortunately, for the most part, retroactive application is likely unnecessary. Many of the EPA's significant rules have already been implemented and are on a statutorily-mandated review cycle. Once the EPA solidifies the requirements of this proposed data transparency rule, they should commit to applying the new transparency standards to pivotal scientific studies, both old and new, that justify agency actions on rules as they are formally reviewed on their existing cycle. In a separate analysis, the EPA should evaluate whether any rules that are not on a review cycle should be re-evaluated through the lens of this data transparency rule and the EPA should receive feedback on their determinations from the public and any applicable review boards or entities.

The EPA should consider using an upcoming major or significant rule-making as a test case to help solidify how the intent of the data transparency rule could be thoughtfully implemented before phasing in the final data transparency rule.

Because the proposed data transparency rule offers limited implementation details, it is difficult to provide meaningful comment on the potential intentional and unintentional consequences of its enactment. Rather than promulgate an untested final rule that could potentially impact all agency actions, the EPA should consider choosing a major upcoming rule-making as a test case. Ideally, the test case would help sketch out more specific guidelines for data transparency rule implementation that could then be vetted with an external, cross-disciplinary work group and provided for public review and comment. As stated above, once more solidified guidance is available the EPA should phase in the final data transparency rule by ensuring that data transparency guidelines are followed during the formal review process for new and existing major rules.

Dose-Response Models

The TCEQ applauds the proposed rule language relating to consideration of dose-response models and uncertainty, rather than relying on default assumptions.

The TCEQ strongly supports the EPA considering multiple dose-response models based on information such as biological plausibility, mode of action, mechanism of action, etc. that is relevant to the selection of the most scientifically-appropriate model(s). Biologically-based models (e.g., the formaldehyde CIIT model) should be explicitly included for consideration in addition to those listed in the proposal (i.e., linear, threshold, and U-shaped, J-shaped, bell-shaped). Deviations from the use of default models should be evaluated on a case-by-case basis and have adequate scientific justification for use of an alternative model better supported by the chemical-specific data. Adequate scientific justification to include an alternative model in an assessment should not be an ever-changing and insurmountable standard, but rather should be based on an objective evaluation of the scientific weight-of-evidence of relevant and robust data. This approach is consistent with regulatory agencies encouraging new research to generate data to replace conservative defaults. Strong, science-based regulations should always be guided and driven by the actual data at hand as opposed to mere defaults.

Definitions

Where possible, the EPA should be explicit about important definitions, including "publicly available," "pivotal regulatory science," "dose response data and models," and "validation."

The lack of explicit definitions in the proposed data transparency rule has caused confusion and uncertainty among experts outside the EPA. The broadest, and likely unintentional, interpretation of several key terms used in this proposed rule could completely stall or alter the existing state of the EPA's scientific and regulatory process. A hasty and incorrect assumption made by many has been that this concern makes the entire proposed rule faulty and unworkable. Some of this confusion will be cleared with more detailed implementation information; however, the EPA should also provide more explicit definitions of key terms wherever possible.

Perhaps one of the more frequently used terms that has caused the most confusion is "publicly available." Outside the context of this proposed rule, "publicly available" generally means that information is available without restriction to anyone who wants it. While this level of accessibility is acceptable for most information, it becomes problematic for sensitive personal information, personal health information, or confidential business information. In order to meet existing privacy and confidentiality laws that protect this type of information, increased accessibility tends to come with reduced refinement (i.e., less detailed information) in the data. For many health studies, data could become so unrefined as confidential data are removed from the dataset in order to become publicly available that results would be incomparable to those in the original study, and therefore not replicable or verifiable. The Institute of Medicine (IOM) defines and provides examples of three varying forms of data sharing that the EPA should consider in better framing their intended accessibility of health and study data (IOM 2015). The TCEQ recommends that the EPA strongly consider implementing a formal request and approval process for qualified researchers to obtain access to data that is protected by confidentiality laws, rather than aiming for all data to have unrestricted access. This process would still allow identifiable or fairly refined de-identified data to be re-evaluated by experts external to the EPA or the original study authors, while protecting the privacy of the study participants or businesses who created the model or dataset.

Other definitions that would be helpful in framing the proposed rule include "pivotal regulatory science," "dose response data and models," and "validation." Although "pivotal regulatory science" is likely intended to mean just the key study or studies underlying a regulatory analysis, it could be argued that supporting studies (i.e., those that help to build the weight of evidence or describe the mode of action) are also pivotal to the analysis. In addition, it is unclear what the term "dose response data and models" includes. This term could mean anything from summary data to specific calculations and code, which matters for the potential sensitivity of the information. Finally, the EPA should define what it means to "validate" study results. This could be interpreted to mean that the study must be repeated (i.e., a new group of human subjects are exposed in a controlled experiment or are assessed in an observational setting) or simply that the statistics and models are recalculated from the existing data. Further, the EPA should determine what level of validation is necessary for pivotal regulatory science so that it can be consistently applied.

The TCEQ applauds the EPA's intention to make regulatory science more transparent.

Tom and Cheryl –

Attached are the two controls that were assigned to OSP but that should probably be reassigned to OSA to respond to. Additionally, these comments will need to be put into the docket, and I think you all have been handling that.

Irving – can you get these reassigned to OSA for the response?

Thanks,
Kacee

Washington DC 20460

Dear Sir or Madam:

I am writing about EPA's Proposed Rule:
"Strengthening Transparency in Regulatory Science."
As the EPA develops regulations governing clean air, clean water and exposure to toxic substances and pesticides, it needs to include all valid, peer-reviewed studies, even if their underlying data sets cannot be released to the public. I believe that the proposed rule's premise is faulty, because it excludes studies whose data is not publicly available. The proposed rule should be withdrawn.

I object to the fact that the scientific community was not consulted as the proposed rule was being prepared. Certainly, at least the EPA's own Science Advisory Board should be consulted.

Thank you.

Sincerely,

Margery M. Donn

Andrew R. Wheeler, Acting Administrator
U.S. Environmental Protection Agency
1200 Pennsylvania Avenue, NW
Washington, D.C. 20460

Re: EPA Proposed Rule: Strengthening Transparency in Regulatory Science. 83 Fed. Reg. 18,768 (Apr. 30, 2018). Docket Number EPA-HQ-OA-2018-0259.

Dear Administrator Wheeler,

I am writing to you on behalf of Gernatt Asphalt Products, Inc. and it's 200+ employees from southwestern New York State, as members of the National Stone, Sand & Gravel Association (NSSGA). We support the above-referenced rule which will strengthen transparency in regulatory science. As active sand and gravel miners, we are intimately familiar with the myriad of existing Federal environmental regulations that govern our operations. We are also keenly aware of the importance of a healthy environment, which supports our business by providing products and jobs now, and for the future of our children and Country.

Our goal has always been to operate within the regulatory framework of whatever entity we are working within, not merely to avoid the legal ramifications of non-compliance, but also in the spirit that sound environmental regulation keeps the playing field level for everyone in the industry while promoting sustainability. The products we supply are imperative to the infrastructure that supports the well-being of every citizen and business in this Country. Many people do not make the connection between a sound and stable aggregate mining industry and our vibrant, safe, and progressive way of life. These folks assume our industry is inherently a detriment to the environment, resulting in long-term negative impacts. As a result, popular sentiment is often that more regulation of industry like ours is not only needed, but somehow heroic. This is simply not true.

That is why it is extremely important for regulations to be thoroughly vetted for their need, effectiveness, and beneficial result before they're imposed on industry like ours. The proposed transparency rule will help ensure that only scientifically sound regulatory initiatives are considered for implementation, saving producers from poorly thought out, knee-jerk type of regulations that result from over-reaction.

As an active member of the NSSGA, we fully support their comments on this issue. Please consider those comments, and our position as stated above, when considering this rule. Thank you.

Sincerely,

Richard Pecnik

Hi Nan,

EPA mail tends to block zip files. So what we've received is txt files that say the zip files have been blocked. If you change the .zip to .zzz on the file and try resending, we might receive them. We will just change the .zzz to .zip after we receive them.

Subject: Public Comment - July 17 Hearing (1 file)

Good afternoon,

Attached is a condensed (zipped) public comments folder that includes scanned copies of oral testimonies submitted, scanned copies of written comments submitted to the docket box, final speaker, attendee and press lists, scanned copies of the original check-in/sign-in sheets.

Please note that I plan to follow up with the court reporters to see if they received any copies (while at the hearing) that were not provided to us (or that we are missing).

Please let me know if you have any questions or concerns.

Thank you and have a great day.

Statement of Lynn R. Goldman, MD, MS, MPH

July 17, 2018

Submitted to: the US Environmental Protection Agency
Comments on EPA Proposed Rule: "Strengthening Transparency in Regulatory Science"

I am a pediatrician and an epidemiologist and have been Dean of the Milken Institute School of Public Health at the George Washington University since 2010. From 1993 through 1998, I served as Assistant Administrator for Toxic Substances at the US Environmental Protection Agency leading what is now known as the Office of Chemical Safety and Pollution Prevention. While serving in that position, I was responsible for the implementation of the nation's pesticide and chemicals laws. I am a member of the National Academy of Medicine. My comments represent my expertise as an environmental health scientist, and a former EPA official, and not the views of any one organization.

This NPRM suffers from lack of involvement of the scientific community, either within or outside of the EPA. No clear justification is given for why it is needed. The proposed rule is a dramatic departure from how the EPA and other US regulatory agencies, as well as the scientific community, use science for the development of dose response assessments. It ignores a number of adverse downstream consequences including: risking disclosure of personal information of people volunteering for human subjects' research; delaying EPA decision-making; exacting unknown but probably considerable costs to the research community and to the EPA; and making best available science unavailable to the EPA. It creates no regulatory authority or any other mechanism for the EPA to compel submission of data from academic scientists and industry, other than those that already are accessible under the Information Quality Act of 2001, nor a mechanism for access to industry data claimed as Confidential Business Information. It creates an unfortunate precedent for EPA in the creation of science policy by rulemaking, thus freezing EPA's risk assessment processes in the future and breaking the important separation between risk assessment and risk management that has been fundamental to science based decision-making.

Lack of Justification for the Proposed Rule:

First, why does EPA think that this proposed rule is necessary? No justification is given in the preamble. In 2013, our paper in *Environmental Health Perspectives* documented the use of the Information Quality Act for requests for raw data.[1] We found little evidence for unfulfilled demand for more access to raw data. If, during that ten year period, EPA had accumulated datasets for all raw data for all dose response assessments that had been conducted, it would have been a tremendous waste in terms of 1) *delays* in EPA conducting assessments until data

[1] Goldman, L.R. and Silbergeld, E.K. Assuring access to data for chemical evaluations. Environ Health Perspect, 121(2):149-52, 2013.

were obtained; 2) *costs* to the academic community in preparing datasets and extensive meta data files for EPA for all of their studies; 3) *expenditure* of agency staff resources in EPA compelling the submission of the data from academics; and 4) *EPA staffing and funds* for establishing and maintaining systems to house, protect and make available the raw data.

The proposal ignores the "systematic review" methods for review of evidence that have been developed, refined and improved over a number of years in the context of IRIS, pesticides, toxics, and priority air pollutants. The application of such methods has been reviewed and improved upon by the National Academy of Sciences[2] and the National Toxicology Program[3]. Of note is no authoritative body of experts has ever recommended requiring "raw data" in order to perform or review dose response assessments. As a corollary, they have never concluded that scientific findings should be disregarded if "raw data" for dose response assessments are not available.

Costly to EPA and the Research Community

While at EPA I learned that risk assessment activities at EPA are extensive; not only the flagship IRIS program, but several regulatory programs are actively engaged in performing more than 1,000 risk assessments per year (a 1996 estimate). Such assessments are required under a number of EPA's statutes, for example: premarket notification for chemicals; assessments of priority air standards; pesticide tolerances; drinking water MCLs; and assessment of existing chemicals risks. The burdens for these assessments under the proposed rule are likely to be considerable. The proposal does not consider, across hundreds of assessments performed annually, the costs to the U.S. EPA and researchers, the significant time and paperwork burdens for researchers, and major regulatory delays that will occur when EPA is waiting for data to be made publicly available, which may not ever happen. It does not address how EPA could compel the submission of such data in the context of weak regulatory authority for research conducted in the past; studies not funded by the U.S. government; and/or research conducted abroad. It seems unaware of the Paperwork Reduction Act that tilts against information gathering from private parties. The U.S. EPA is further constrained by industry confidential business information (CBI) claims for regulatory testing data under U.S. chemical and pesticide laws; even when the EPA receives raw data from industry, it provides only data summaries to the public. For whatever data it could obtain, EPA would have to establish a public data repository for this information that would securely house not only the data (especially personal health information and/or CBI) but also a number of unique meta data elements required to understand the data.

[3] Rooney AA, Boyles AL, Wolfe MS, Bucher JR, Thayer KA. 2014. Systematic review and evidence integration for literature-based environmental health science assessments. Environ Health Perspect 122:711–718; http://dx.doi.org/10.1289/ehp.1307972

Risk of Disclosure of Personal Information for Human Subjects

To manage risks of disclosure of sensitive human data, the EPA would have to perform checks to assure that no personal health information would be in public data sets. We live in a day when not only name&date of birth, name&address, social security number and/or medical record number can be used to identify person but when massive quantities of "big data" are on the web. Most recently, the renowned geneticist Craig Venter and colleagues reported identified persons using their genetic code alone.[4]

Sound Science Will be Excluded from EPA Regulatory Decisions

The predictable result of this proposal is that EPA will be forced to exclude studies that should be included in a systematic review. For years, both Congress and successive administrations have required the EPA to use the best science for its decisions. Directing EPA scientists to exclude key studies is not consistent with good scientific practice and is contrary to years of effort to improve the base of knowledge underpinning EPA's decisions. While the NPRM includes a provision for the EPA to waive this requirement, it provides no clear criteria for such waivers and appears to be a process that would allow arbitrary and capricious application of the proposed rule.

Reversal of EPA Science Policy and Precedents

The proposal seems to attempt, via a single rulemaking, to overturn years of well-thought EPA science policy guidelines and precedents in the selection and application of dose-response models for toxicity assessment. It misrepresents the recommendations of prior expert reviews such as the so-called NAS "Silver Book"[5] and the Bi-Partisan Commission review[6]. It is oblivious to NAS conclusions that thresholds of chemical exposure for chemical effects are the exception rather than the rule. The NPRM seems to naively assume that single studies are used to inform risk assessors of the possible shape of dose response curves. That was true at one time, but today, the first step of the dose-response modeling process is to evaluate all of the scientific information to gain a biological understanding of how each type of toxicity or response (adverse effect) occurs, the "mode of action". This is not done via modelling of raw data from a single study. When data do not prove mode of action, EPA often applies default assumptions such as low dose linearity for carcinogens. According to the NAS "Silver Book", often noncancer

---

[4] "Here, we show that phenotypic prediction from WGS data can enable reidentification without any further information being shared. If conducted for unethical purposes, this approach could compromise the privacy of individuals who contributed their genomes into a database. In stratified analyses, we see that risk of reidentification correlates with variability of the cohort. Although sharing of genomic data is invaluable for research, our results suggest that genomes cannot be considered fully deidentifiable and should be shared by using appropriate levels of security and due diligence." From: Christoph Lippert, Riccardo Sabatini, M. Cyrus Maher, Eun Yong Kang, Seunghak Lee, et al. Genomics of physical traits, PNAS Sep 2017, 201711125; DOI: 10.1073/pnas.1711125114

[5] National Research Council. 2009. Science and Decisions: Advancing Risk Assessment. Washington, DC: The National Academies Press. https://doi.org/10.17226/12209.

[6] Bipartisan Commission. Improving the Use of Science in Regulatory Policy, Washington, DC. 2009

effects (such as, lead and other neurotoxic substances) also have no practically identifiable thresholds. More fundamentally, this NPRM for the first time opens the door to EPA's scientific practices being determined by regulators, and not scientists. This is a rush down a slippery slope that would replace a scientific process with a political one and would freeze the science in procedures that may be dubious today but certainly will not be scientifically defensible in the future. This is a breach of the fundamental notion of separating risk assessment from risk management.

Conclusion

In conclusion, the proposed rule would cause significant delays in how EPA uses science to make hundreds of regulatory decisions every year. It would overturn years of precedent, as well as advice from scientific experts outside of EPA. It would be burdensome, for the agency and researchers alike.

I strongly urge the EPA Administrator (1) not to use the agency's regulatory authority to prescribe specific risk assessment processes; and (2) not undertake changes in EPA's science policies without leadership from EPA scientists and full engagement of the science community.

What is at stake is no less than the public's confidence in the integrity of EPA's science and decisions.

Comments on EPA Proposed Rule
Strengthening Transparency in Regulatory Science

Abigail Omojola, Breast Cancer Prevention Partners

My name is Abigail Omojola and I am here on behalf of Breast Cancer Prevention Partners to speak in strong opposition to the proposed rule and to urge the EPA to withdraw it immediately.

Breast Cancer Prevention Partners is a national organization committed to preventing breast cancer by eliminating exposures to chemicals and radiation that have been linked to an increased risk of the disease. We take great care and pride in ensuring that all of our public education, programs and policy advocacy are based on a strong foundation of peer-reviewed science.

Contrary to its stated intent, the proposed rule under consideration today would *not* serve to provide the public with greater "confidence in and understanding of" EPA's regulatory decisions. Rather, it would deeply undermine the ability of the EPA to use all the best available science in its regulatory decisions, which, in turn, will negatively impact public health. In fact, it is hard *not* to come to the conclusion that the proposed rule is a strategy to disregard many studies that have shown negative impacts of chemical exposures on public health.

Breast cancer is a disease with complex causation and often a long latency period. Only about 10% of breast cancer diagnoses can be attributed solely to genetics. Breast cancer risk is a web of interactions between environmental exposures, genetics and lifestyle characteristics. Much of the data showing the connection between unsafe chemical exposures and breast cancer risk comes from laboratory studies. However, epidemiological studies, and in particular longitudinal studies, provide unique insights and important corroboration of these findings.

The proposed rule's requirement that underlying data must be made public before the EPA can consider a study in agency decision-making will have the practical impact of eliminating many of these critical studies from the regulatory process. Epidemiological studies involve the collection of extensive and detailed individual health data and researchers have an ethical obligation to protect the confidentiality of that data. The elimination of these studies will result in less scientifically sound conclusions and, most importantly, the public health benefits they would provide.

An example of the kind of study this proposed rule could eliminate from the EPA's regulatory process is the National Institute of Environmental Health Sciences' Sister Study. From 2003 to 2009, the Sister Study enrolled 50,000 women whose sisters had breast cancer. Those women will be followed for a minimum of 10 years to study how genes and the environment interact to impact the risk of developing

breast cancer, leading to a greater understanding of ways to prevent both breast cancer and other diseases. It does not serve the public interest to hinder the EPA's ability to use this type of research in their regulatory decisions.

This proposed rule will not only undermine the use of previously conducted epidemiological studies; it will also damage the ability of researchers to conduct future studies. Recruitment of study participants will be severely undermined if people fear their personal information may be made publicly available. This is particularly true for vulnerable communities that are both disproportionately exposed to toxic chemicals and have historical reasons to distrust researchers. Yet, it is the exposures experienced by these communities, and the resulting health effects, that we most need to understand and address.

The integrity of scientific methodology is thoroughly reviewed at many points in the processes of designing, conducting and publishing scientific research. The competitive grant process; Institutional Review Board requirements; peer-review prior to publication; the expertise and judgment of career EPA scientists when considering the strength and relevance of studies included in EPA decisions; and finally review of those decisions and the underlying science by EPA's Science Advisory Board; all provide more than sufficient opportunities to assess the soundness of scientific studies. This proposed rule is not only damaging, it is unnecessary.

On behalf of the 1 in 8 women who will be diagnosed in their lifetime and the 40,000 lives that are lost each year in the U.S. to breast cancer, the EPA has an obligation to take action to *prevent* this devastating disease. This proposal takes a hard step away from that goal.

Thank you for the opportunity to provide this public comment urging the EPA to withdraw this misguided and damaging proposed rule.

Testimony of Physicians for Social Responsibility

1111 14th Street NW
Washington DC 20005

Re: Proposed Rule: Strengthening Transparency in Regulatory Science
Docket ID: EPA-HQ-OA-2018-0259
Presented by: Alan H. Lockwood, MD, FAAN, FANA
Date: July 17, 2018
Location: U.S. Environmental Protection Agency Headquarters
William Jefferson Clinton East Building, Main Floor Room 1153
1201 Constitution Avenue NW
Washington, D.C. 20460

Thank you for this opportunity to speak on behalf of Physicians for Social Responsibility (PSR). I am a board-certified neurologist and an elected fellow of the American Neurological Association and the American Academy of Neurology, and Professor Emeritus of Neurology at the University at Buffalo. PSR is a 501(c)(3) scientific and educational organization headquartered in Washington DC with over 30,000 physicians, medical students, and others across the country. Our mission is to protect human life from the gravest threats to health and survival.

We submit this testimony in strong opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." The proposed rule would change the standards for the inclusion of studies used by the Agency and lead to the abolition or weakening of virtually all protections under the purview of the Agency.

Under the misleading veil of "transparency," the proposed rule could force investigators to invade the confidentiality of research participants and make confidential and private data open to all. A similar concern was voiced by the current SAB writing, "there are also sensitive situations where public access may infringe on legitimate confidentiality and privacy interests ..." The rule could replace evidence-based decision-making with arbitrary determinations based on political considerations.

Peer-reviewed research has led to important gains in health:

Air pollution. The CAA protects us from air pollution and is arguably the most health-protective law in effect. I have written extensively about this in The Silent Epidemic[1]. Peer-reviewed studies link air pollutants with leading causes of death in the US including heart disease, stroke, and respiratory diseases. Additional studies link particulates to Alzheimer's disease and Type II Diabetes. Seminal studies include:

- The Harvard Six Cities Study that involved 8,111 adults followed for between 14 and 16 years showing a clear link between pollution and mortality[2].
- The Women's Health Initiative study involving 65,893 post-menopausal women that demonstrated a link between particulates, and cardiovascular disease and stroke mortality[3].
- I attended closely to the study of 1,705 neurologist-confirmed strokes showing that a transient increase in $PM_{2.5}$ was associated with a statistically significant increase in strokes even though levels were within limits "generally considered safe" by the EPA[4].

A congressionally mandated report prepared by the EPA projected that by 2020 CAA provisions will

save two trillion dollars per year in adverse health impacts[5]. Many savings will positively impact the budgets of state and federal agencies at a time of ballooning deficits.

Safe drinking water. EPA rules provide significant protection for the developing brains of children by establishing limits on lead. Lead impairs brain development and has adverse effects on behavior and cognition. Other data link arsenic levels in drinking water to Type II diabetes and cancer.

Natural gas production. Natural gas production, particularly "fracking" harms health due to human proximity to wells, pumping stations, and contamination of water supplies and contributes to climate change.

Protecting privacy. Protecting the privacy of research participants is a keystone of biomedical research and one with which I have had years of personal experience as a member then chairman of the Buffalo VA institutional review board. Peer-reviewed journals require authors to affirm their adherence to federal privacy protections as a pre-condition for publication. This standard should not be abolished.

PSR's mission is to "to protect human life from the gravest threats to health and survival." To protect the scientific integrity of the EPA and protect health we oppose the deceptively named proposal, "Strengthening Transparency in Regulatory Science."

On behalf of Physicians for Social Responsibility

Alan H. Lockwood MD, FAAN, FANA

Emeritus Professor of Neurology and Nuclear Medicine
University at Buffalo, Senior Scientist, Past President, and Member, Board of Directors, PSR

I'm Andrew Bergman, and I'm speaking today as the special environmental advisor at the Project On Government Oversight, but I'm also currently a Ph.D. student in applied physics at Harvard University.

While the proposed "Strengthening Transparency in Regulatory Science" rule uses the words "transparency" and "reproducibility" to project lofty goals, it's real effect will be to undermine the way that the EPA is able to rely on and even-handedly assess scientific studies for use in the rulemaking process. I'm here today to urge EPA to withdraw this rule.

My colleague, Sean Moulton, has just addressed ~~will focus on~~ how the proposed rule conflicts with the EPA's regulatory process, and the statutory requirements underlying that process, but the rule will also have a direct impact on how the EPA approaches science.

The rule fails to properly address its two key considerations that will have a major impact on how it is implemented. First, the rule states that data relied on in making regulations must be made publically available, but it doesn't suggest a mechanism for how personally identifiable information or confidential business information would be handled.

This is an incredibly important issue, as so many studies that EPA uses rely on this type of confidential data. Yet it's reasonable to conclude from the rule that, if it goes into effect, the EPA will no longer be able to use most longitudinal human health studies to craft public safeguards, even though those studies have been conducted by reputable researchers at academic institutions, and peer reviewed to ensure validity. Instead, they will be left with industry studies that more often use animal test subjects, which don't have any personal privacy concerns.

Second, while the rule refers to replicability of scientific findings, the background information supporting the rule focuses on scientific studies' reproducibility, which has a wholly different meaning in a scientific context. But because the rule itself says it must be possible to "replicate" studies' findings, we should assume that the rule intends the strongest possible meaning: that it must genuinely be possible to conduct all studies used in rulemaking again, from scratch, and obtain the same findings.

The Agency uses many studies, however, such as those that link leaded gasoline to brain damage in children or a study that found a link between fine particulate air pollution and premature deaths, that examine dangerous real world exposures and cannot, of course, be safely repeated. Just because they can't—or shouldn't—be repeated, however, doesn't mean we should ignore the vital insights they provide. The knowledge we have gained from these tragedies can and should be used to help safeguard the public in the future.

Without knowing the details of how these two provisions, central to the rule, will be implemented, commenters can't even begin to assess the wide-ranging outcomes of this rule. We can conclude that the result will be that large swaths of studies will be arbitrarily ruled out for use in future rulemakings.

The rule's constraints on the use of scientific studies mean that even the use of studies that don't end up being haphazardly tossed out by this rule will be hindered substantially. The CBO found that a policy very similar to the proposed rule, when it was proposed as legislation, would significantly reduce the number of studies that EPA is able to rely on when issuing and proposing rules without a substantial input of funding—a major loss when Agency scientists already have the tools to conduct thorough assessments of studies they rely on.

The rule also puts the Agency in a position where it's forced to serve as an independent reviewer of all scientific data underlying studies it uses, which will again hamstring Agency scientists who have limited resources. When the EPA was sued over air quality standards for particulate matter and ozone during the George W. Bush administration, the U.S. Court of Appeals for the District of Columbia Circuit said a requirement to make public underlying data for the key studies used in rulemaking would be "impractical and unnecessary."

The three judge panel said: "If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment ..." Essentially, the judges concluded that a policy like the proposed rule wouldn't serve the Agency's purposes at all.

Instead of arbitrarily slicing out broad types of studies from being cited in rulemaking, why not continue to give Agency scientists the ability, as they have had for decades, to comprehensively assess and compare the scientific evidence presented in a study and give weight to each study as a result of careful deliberation.

If the EPA wants to address the accessibility of scientific studies and data, an important issue to scientists as well as members of the public, it should acknowledge that those efforts, which might include building a new public-facing platform or carefully considering certain types of standards, will amount to a years-long process and will require an enormous investment of Agency time and funding. That type of proposal shouldn't be made in a brief proposed rule and should only be made if extensive studies demonstrate that there is a real need for an update to how scientific studies are used in Agency rulemaking.

The proposed "Strengthening Transparency in Regulatory Science" rule, instead, gestures toward an unsubstantiated set of concerns. It's hard to conclude that its purpose is to do anything other than undermine Agency scientists' ability to use scientific studies and data to craft regulations, under EPA's statutory mandates, that protect public health. For this reason, I urge you again to withdraw the rule.

Thank you for your time and for the opportunity to comment on this important proposal.

EPA Hearing Oral Statement on the Proposed Rule, Strengthening Transparency in Regulatory Science, Docket ID No. EPA-HQ-OA-2018-0259 - July 17th, 2018

My name is Antonia Herzog and I am a scientist with a doctorate in Physics. I work in the Environment and Health Program at Physicians for Social Responsibility, a nonprofit organization based in Washington, DC with chapters in multiple states across the country and over thirty thousand members and activists around the country. Our mission is to protect human life from the gravest threats to health and survival; we number environmental pollution among those key threats.

PSR would like to express its strong opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." This proposed rule could arbitrarily exclude many important scientific studies—including thousands of public health and epidemiological studies—that the agency uses to make informed policy decisions regarding major public health and environmental laws. While it pretends to be about "transparency", the policy actually will limit the agency's ability to use the best available science thereby weakening protections for public health and the environment. In essence it could censor and block much of the peer reviewed scientific research that has allowed us to address many serious environmental health threats over the decades.

EPA's proposed rule would place crippling restrictions on the use of data the Agency would accept in the rulemaking process by ultimately requiring investigators to divulge personal information about the participants in research studies. Scientific studies that failed to meet this criterion would not be acceptable to the Agency. At present, this kind of information must be kept confidential according to the generally accepted rules that govern the conduct of research that must be adhered to by agencies of the federal government and institutions that receive federal funds.

As an example, the Clean Air Act, a bedrock environmental law that protects us from dangerous air pollutants, is such a critical health protection that would be endangered under this proposed rule because it relies on a longitudinal epidemiologic study of thousands of individuals. This includes the National Ambient Air Quality Standards (NAAQS) in the Clean Air Act. These standards address six major classes of common air pollutants, including standards for fine

particles (PM 2.5), and are the backbone of the U.S. air quality management system.

The Clean Air Act specifies that new or revised NAAQS be based on scientific criteria that "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." EPA has relied largely on community epidemiology and controlled human studies in establishing the specific pollutant levels and averaging times for NAAQS. If these studies were excluded by the EPA restrictions it would greatly reduce the availability of information that has proved to be significant in assessing the consistency and coherence of the evidence upon which the standards are based and would certainly weaken the scientific basis for maintaining or strengthening the current standards. If the proposed rule is approved, we could lose the Clean Air Act's sweeping improvements to the air we breathe that we've benefited from over the last several decades thereby, putting thousands of lives that are saved each year at risk, because EPA will no longer be able to use key scientific research.

PSR's mission is very similar to EPA's stated mission "to protect human health and the environment." To accomplish these objectives, we must protect the scientific integrity of the EPA. Physicians for Social Responsibility thus, strongly opposes the EPA's deceptively named proposal, "Strengthening Transparency in Regulatory Science."

Brittany Meyer - Michael J Fox Foundation for Parkinson's Research
EPA "Transparency Rule" Testimony as prepared for oral delivery
07/17/2018

My name is Brittany Meyer and I am the Associate Director of Public Policy at the Michael J. Fox Foundation for Parkinson's Research. I am here on behalf of the nearly one – million people with Parkinson's disease in the United States who rely on the Environmental Protection Agency to safeguard their health and inform them about potential hazards in the environment.

Over the past ten years, we've learned a lot about the mechanisms of Parkinson's disease and now know that the condition is caused by both genetic and environmental factors. It is now very clear that when coupled with a genetic risk factor, exposure to several chemicals, most notably solvents and certain pesticides, can trigger the disease. Just eight weeks ago, a study out of Canada suggested low-level exposure to pesticides disrupts cells in a way that mimics the effects of mutations known to cause Parkinson's.[1] More research is needed to fully understand the mechanisms at work and how to prevent them.

Many of the studies used to identify risk factors for Parkinson's disease are investigated via large population based epidemiology studies and will be impacted by EPA's proposal. I am going to highlight one clear example- though along with my health and science colleagues here today, we can provide hundreds of examples of studies that could impacted.

A 2009 study used GPS to estimate participants' well-water contamination exposure from agricultural pesticides. The results showed that consuming water from a private well located in an area with historical pesticide use resulted in an increased risk of Parkinson's disease.[2] Due to the nature of wells — typically serving a relatively limited number of people within a very small radius — the detail needed to perform the study renders proper de-identification impossible. All one needs to know is that a certain person lives near a particular well along with a demographic detail such as their age, gender, race, etc., and privacy is at great risk.

Data from studies like this cannot be de-identified to the degree needed to protect patient's identification while still providing the amount of specificity needed to help a scientist trying to replicate the results. Obtaining consent is not a solution. Some people make the choice to not disclose their Parkinson's diagnosis for a variety of reasons including privacy concerns, fear of prejudice or retaliation at work, and others. It is simply unreasonable to put people in the position of outing their diagnosis or to decline to participate in a study that could someday find a cure for their condition. Additionally, people who are willing to sign away their privacy and those who are not are different in ways we cannot predict or control for in study analysis.

The Michael J. Fox Foundation believes in open, reliable, and replicable science. We fund approximately 90 million dollars in research per year and hold our funded scientists to the highest standards. Our contracts require studies to be peer reviewed and most require data to be

as available as possible while protecting precious health data. We echo the call of our fellow public health groups here today and the nearly seventy public health, science, academic, and medical groups who signed on to a joint statement calling for the rule to be abandoned for the sake of science and for our health. Thank you.

CLEAN AIR TASK FORCE

Comments of James Duffy, Clean Air Task Force, Associate Attorney
at Strengthening Transparency in Regulatory Science Public Hearing
July 17, 2018, Washington DC

Good afternoon, my name is James Duffy and I am an associate attorney with Clean Air Task Force. CATF seeks to help safeguard against the worst impacts of climate change by working to catalyze the rapid global development and deployment of low carbon energy and other climate-protecting technologies, through research and analysis and public advocacy leadership.

EPA's Proposal, at best, is a solution in search of a problem – the Agency has failed to identify a need for further review of the already, extensively peer-reviewed public health and environmental science it uses in decision-making. Nor has it made the case that underlying health data must be made more public that current statutes and practice allow. The only thing transparent about the Proposal, is that it is an attempt to undermine EPA's use of the "best available science" by placing arbitrary limits on the ability to consider the best studies.[1] As the professor cited multiple times in the Proposal recently said, if the Proposal is finalized, "science will be practically eliminated from all decision-making processes," so that public health and environmental "regulation would then depend … on opinion and whim."[2]

Banning the use of fully peer-reviewed studies because their underlying data must be kept confidential would eliminate the consideration of vital information in critical public health decision-making. That is not only unnecessary, it also represents a significant shift in decades-long policy, without justification.[3] As the D.C. Circuit has held when considering this very question: "requiring agencies to obtain and publicize the data underlying the studies on which they rely would be impractical and unnecessary."[4] Congress has clearly spoken, moreover, mandating that Agencies must consider *all* relevant science.[5]

It is well understood, and has been for decades, that many of the most important public health studies are those based on actual patient information. Because that information must be kept highly confidential, and because making even some of the patient's details public would allow them to be identified, the information must be kept private.[6]

But that does not mean those studies can't be - or haven't been - verified. For example, the Harvard Six-Cities Studies, linking fine particulate matter and mortality, have been extensively re-analyzed by independent institutions, including by researchers under the auspices of the Health Effects Institute. This reanalysis confirmed the studies essential findings while keeping confidential the underlying data.[7]

There are already several ways in which the public can access the studies that EPA uses, and in some cases their underlying data, without the release of confidential information - including the Freedom of Information Act, which provides an avenue to request raw data, including a process ensuring that sensitive data is protected.

The Proposal puts EPA in the untenable position of either violating its mandate to consider all relevant science or violating confidentiality laws.

Additionally, the Proposal is impermissibly scattershot, vague and confusing. It is insufficiently formed to allow for meaningful comment – it seems more like a request for ideas about how to discredit the best available science, than for how to make it more accessible.[8] For example, the Proposal claims that it is consistent with the Data Quality Act and HIPAA, as well as various Executive Orders, but each of these contains checks on the release of confidential information. In fact, the longstanding OMB Guidelines, stemming from the Data Quality Act, recognize peer review as a *per se* marker of objectivity, and the Harvard Six Cities Studies reanalysis as the gold standard for reproducibility.[9]

Finally, in violation of Executive Order 12,866, the Proposal fails to perform any analysis regarding the impact this rulemaking could have on the environment, public health or science generally - or even on what it would cost to implement. Because the Agency does not have authority to undertake this effort, and because it would undermine consideration of relevant science in its public health and environmental rulemakings, it should be abandoned.

As a retired EPA toxicologist, I know first hand the frustrations of having to deal with epidemiological reports. However, I believe epidemiological reports are valuable but more critical initial review is needed. Today I hope to present a path forward.

The animal studies required to support the registration of a pesticide follow strict, quality assurance, good laboratory practices, ethics and reporting standards. Multiple layers of primary and secondary reviewers are identified and sign the review documents.

Epi reports have a mixed bag of standards for GLP, quality assurance, ethics and reporting. They are often accepted at their face value without documentation of independent review. There is no way to verify the procedures or results presented and the EPA reviewers are not identified.

This is unfair to the public!

Historically, I would like to mention two situations where a more critical initial evaluation would have prevented social or medical problems.

The first is the book "The Kallikak Family" published in 1912 by Henry Goddard. This book was the foundation of "eugenics" and was "well received" at first but serious social consequences resulted. However, closer examination revealed that much of the interviewing reflected the biases of the interviewers. Goddard later regretted writing the book.

The other is the association of vaccinations with autism that could not be verified. The publisher retracted the original

publication. However, within the past year there was an increase in measles in Minnesota because people feared autism from vaccinations.

With the concepts of disparity in the review of animal versus epidemiological studies and the need to provide a more critical initial review of epi reports, I am proposing that:

An Epidemiology Peer Review Council with the goal of creating a transparent document reflecting a thorough review be established by EPA. This Council will consist of six independent sub-committees with relevant experts as follows:

1. **Ethics**: All aspects of assuring the personal safety and identities of the individuals in the cohorts are protected. Will state clearly why individual protected personal data is or is not needed to make a decision.
2. **Endpoint evaluation:** Relevant experts knowledgeable about the endpoint will discuss factors like how many in a cohort are needed to make a meaningful difference. Identify what is known about how this endpoint can be altered by environment and any known chemicals.
3. **Exposure evaluation**
4. **Statistical evaluation**
5. **Analytical Chemistry**
6. **Animal Toxicity and Structure Activity Correlations**

Each sub-committee will articulate why additional date are or are not needed.

The Council will consist of qualified individuals from EPA, FDA or other agencies and consultants as needed. The Council will consider the reports of the six sub-committees and make their

recommendations especially with regard to additional data needed to support transparent regulatory decisions.

The report of the Council will append each of the six sub-committee reports as well as any dissenting opinions.

The Council owns the decisions and since all responsible individuals will be identified, the report is thus transparent. SAPs may further review the Council report.

In conclusion, controversies associated with epidemiological reports may not be eliminated but the Council should contribute to minimizing these controversies.

John D. Doherty, Ph.D.
(DABT 1982-2017)

Statement of Lynn R. Goldman, MD, MS, MPH

July 17, 2018

Submitted to: the US Environmental Protection Agency
Comments on EPA Proposed Rule: "Strengthening Transparency in Regulatory Science"

I am a pediatrician and an epidemiologist and have been Dean of the Milken Institute School of Public Health at the George Washington University since 2010. From 1993 through 1998, I served as Assistant Administrator for Toxic Substances at the US Environmental Protection Agency leading what is now known as the Office of Chemical Safety and Pollution Prevention. While serving in that position, I was responsible for the implementation of the nation's pesticide and chemicals laws. I am a member of the National Academy of Medicine. My comments represent my expertise as an environmental health scientist, and a former EPA official, and not the views of any one organization.

This NPRM suffers from lack of involvement of the scientific community, either within or outside of the EPA. No clear justification is given for why it is needed. The proposed rule is a dramatic departure from how the EPA and other US regulatory agencies, as well as the scientific community, use science for the development of dose response assessments. It ignores a number of adverse downstream consequences including: risking disclosure of personal information of people volunteering for human subjects' research; delaying EPA decision-making; exacting unknown but probably considerable costs to the research community and to the EPA; and making best available science unavailable to the EPA. It creates no regulatory authority or any other mechanism for the EPA to compel submission of data from academic scientists and industry, other than those that already are accessible under the Information Quality Act of 2001, nor a mechanism for access to industry data claimed as Confidential Business Information. It creates an unfortunate precedent for EPA in the creation of science policy by rulemaking, thus freezing EPA's risk assessment processes in the future and breaking the important separation between risk assessment and risk management that has been fundamental to science based decision-making.

Lack of Justification for the Proposed Rule:

First, why does EPA think that this proposed rule is necessary? No justification is given in the preamble. In 2013, our paper in *Environmental Health Perspectives* documented the use of the Information Quality Act for requests for raw data.[1] We found little evidence for unfulfilled demand for more access to raw data. If, during that ten year period, EPA had accumulated datasets for all raw data for all dose response assessments that had been conducted, it would have been a tremendous waste in terms of 1) *delays* in EPA conducting assessments until data

[1] Goldman, L.R. and Silbergeld, E.K. Assuring access to data for chemical evaluations. Environ Health Perspect, 121(2):149-52, 2013.

were obtained; 2) *costs* to the academic community in preparing datasets and extensive meta data files for EPA for all of their studies; 3) *expenditure* of agency staff resources in EPA compelling the submission of the data from academics; and 4) *EPA staffing and funds* for establishing and maintaining systems to house, protect and make available the raw data.

The proposal ignores the "systematic review" methods for review of evidence that have been developed, refined and improved over a number of years in the context of IRIS, pesticides, toxics, and priority air pollutants. The application of such methods has been reviewed and improved upon by the National Academy of Sciences[2] and the National Toxicology Program[3]. Of note is no authoritative body of experts has ever recommended requiring "raw data" in order to perform or review dose response assessments. As a corollary, they have never concluded that scientific findings should be disregarded if "raw data" for dose response assessments are not available.

Costly to EPA and the Research Community

While at EPA I learned that risk assessment activities at EPA are extensive; not only the flagship IRIS program, but several regulatory programs are actively engaged in performing more than 1,000 risk assessments per year (a 1996 estimate). Such assessments are required under a number of EPA's statutes, for example: premarket notification for chemicals; assessments of priority air standards; pesticide tolerances; drinking water MCLs; and assessment of existing chemicals risks. The burdens for these assessments under the proposed rule are likely to be considerable. The proposal does not consider, across hundreds of assessments performed annually, the costs to the U.S. EPA and researchers, the significant time and paperwork burdens for researchers, and major regulatory delays that will occur when EPA is waiting for data to be made publicly available, which may not ever happen. It does not address how EPA could compel the submission of such data in the context of weak regulatory authority for research conducted in the past; studies not funded by the U.S. government; and/or research conducted abroad. It seems unaware of the Paperwork Reduction Act that tilts against information gathering from private parties. The U.S. EPA is further constrained by industry confidential business information (CBI) claims for regulatory testing data under U.S. chemical and pesticide laws; even when the EPA receives raw data from industry, it provides only data summaries to the public. For whatever data it could obtain, EPA would have to establish a public data repository for this information that would securely house not only the data (especially personal health information and/or CBI) but also a number of unique meta data elements required to understand the data.

[3] Rooney AA, Boyles AL, Wolfe MS, Bucher JR, Thayer KA. 2014. Systematic review and evidence integration for literature-based environmental health science assessments. Environ Health Perspect 122:711–718; http://dx.doi.org/10.1289/ehp.1307972

Risk of Disclosure of Personal Information for Human Subjects

To manage risks of disclosure of sensitive human data, the EPA would have to perform checks to assure that no personal health information would be in public data sets. We live in a day when not only name&date of birth, name&address, social security number and/or medical record number can be used to identify person but when massive quantities of "big data" are on the web. Most recently, the renowned geneticist Craig Venter and colleagues reported identified persons using their genetic code alone.[4]

Sound Science Will be Excluded from EPA Regulatory Decisions

The predictable result of this proposal is that EPA will be forced to exclude studies that should be included in a systematic review. For years, both Congress and successive administrations have required the EPA to use the best science for its decisions. Directing EPA scientists to exclude key studies is not consistent with good scientific practice and is contrary to years of effort to improve the base of knowledge underpinning EPA's decisions. While the NPRM includes a provision for the EPA to waive this requirement, it provides no clear criteria for such waivers and appears to be a process that would allow arbitrary and capricious application of the proposed rule.

Reversal of EPA Science Policy and Precedents

The proposal seems to attempt, via a single rulemaking, to overturn years of well-thought EPA science policy guidelines and precedents in the selection and application of dose-response models for toxicity assessment. It misrepresents the recommendations of prior expert reviews such as the so-called NAS "Silver Book"[5] and the Bi-Partisan Commission review[6]. It is oblivious to NAS conclusions that thresholds of chemical exposure for chemical effects are the exception rather than the rule. The NPRM seems to naively assume that single studies are used to inform risk assessors of the possible shape of dose response curves. That was true at one time, but today, the first step of the dose-response modeling process is to evaluate all of the scientific information to gain a biological understanding of how each type of toxicity or response (adverse effect) occurs, the "mode of action". This is not done via modelling of raw data from a single study. When data do not prove mode of action, EPA often applies default assumptions such as low dose linearity for carcinogens. According to the NAS "Silver Book", often noncancer

---

[4] "Here, we show that phenotypic prediction from WGS data can enable reidentification without any further information being shared. If conducted for unethical purposes, this approach could compromise the privacy of individuals who contributed their genomes into a database. In stratified analyses, we see that risk of reidentification correlates with variability of the cohort. Although sharing of genomic data is invaluable for research, our results suggest that genomes cannot be considered fully deidentifiable and should be shared by using appropriate levels of security and due diligence." From: Christoph Lippert, Riccardo Sabatini, M. Cyrus Maher, Eun Yong Kang, Seunghak Lee, et al. Genomics of physical traits, PNAS Sep 2017, 201711125; DOI: 10.1073/pnas.1711125114

[5] National Research Council. 2009. Science and Decisions: Advancing Risk Assessment. Washington, DC: The National Academies Press. https://doi.org/10.17226/12209.

[6] Bipartisan Commission. Improving the Use of Science in Regulatory Policy, Washington, DC. 2009

effects (such as, lead and other neurotoxic substances) also have no practically identifiable thresholds. More fundamentally, this NPRM for the first time opens the door to EPA's scientific practices being determined by regulators, and not scientists. This is a rush down a slippery slope that would replace a scientific process with a political one and would freeze the science in procedures that may be dubious today but certainly will not be scientifically defensible in the future. This is a breach of the fundamental notion of separating risk assessment from risk management.

Conclusion

In conclusion, the proposed rule would cause significant delays in how EPA uses science to make hundreds of regulatory decisions every year. It would overturn years of precedent, as well as advice from scientific experts outside of EPA. It would be burdensome, for the agency and researchers alike.

I strongly urge the EPA Administrator (1) not to use the agency's regulatory authority to prescribe specific risk assessment processes; and (2) not undertake changes in EPA's science policies without leadership from EPA scientists and full engagement of the science community.

What is at stake is no less than the public's confidence in the integrity of EPA's science and decisions.

Testimony of Walter Tsou, MD, MPH
Executive Director of Physicians for Social Responsibility Philadelphia. July 17, 2018

My name is Dr. Walter Tsou. I serve as Executive Director of Philadelphia Physicians for Social Responsibility and a past president of the American Public Health Association. Thank you for the opportunity to testify on "Strengthening Transparency in Regulatory Science". As many of my colleagues have noted today, while the goal of transparency in how studies are conducted and the ability to reproduce scientific results are important, it can offer a politically motivated Administration a convenient excuse for eliminating or ignoring scientific studies that may go against the wishes of a powerful industry group. All one has to do is demand the data sets be handed over for "further scrutiny" or demand that the study be repeated before basing a regulation on the study in question.

The very nature of longitudinal public health studies where health and toxins intersect are by design, large, expensive and require years or decades before results are found. Sample sizes can often number in the tens of thousands to millions of data points and may need to be collected over many years before a statistically significant finding is identified. For example, Curry, et al studied in Pennsylvania babies who lived within 1 kilometer of active fracking wells. She had to review over 1.1 million birth records before demonstrating the relationship between living close to gas wells and low birth weight babies. Because these studies are so big, they are often too expensive to repeat. In our state of Pennsylvania, scientific research on fracking is actively stymied or suppressed. In a state where billions are made on gas drilling, only one part time contractor at the Health Department collects data on health complaints from fracking. Those who do have health complaints have to sign non-disclosure agreements and not cooperate with any research in order to get life saving water to drink. This extortion practice is common in the industry in order to suppress any health studies on the dangers of fracking. If the transparency regulation was in place, all health studies on fracking would be simply not considered because the research could not be conducted due to non disclosure agreements.

Today there is no reputable scientist that doesn't believe in the harmful effects of smoking. The health studies on smoking were 15 years in the making before the Surgeon General released his landmark report. And except for a handful of EPA administrators, there is no reputable scientist who doesn't believe that climate change is real and is man made. The studies on climate change and health have been known since Exxon wrote about it in 1977. If these transparency rules were in place when the EPA was founded, smoking would still be in airplanes and no one would have heard of "greenhouse gases" or "global warming", the greatest threat to our planet's existence.

Since the founding of the EPA, independent scientific research has been the foundational basis of your mission. Science is the cross before the corporate devil. This transparency rule would destroy the confidential nature of research and make the burden of conducting research more difficult and expensive. Finally, the real purpose of these rules is to reverse regulations on industries who have been harmful to public health. We should let science speak the truth and the EPA should hear from all scientific studies, not just the ones the industry wants you to listen to. Thank you.

Public Testimony to US EPA

RE: Proposal to "Strengthen Transparency in Regulatory Science"

FROM : Albert Donnay, MS, MHS, Donnay Detoxicology LLC, albert@donnaydetox.com

My name is Albert Donnay, and my comments are based on experience gained from over 40 years of working on regulatory science as an environmental health engineer and toxicologist, as a research scientist, public health activist, clinician, consultant, and peer-reviewer for academic journals, environmental groups, and government agencies at all levels, including EPA.

EPA's proposal to "Strengthen Transparency in Regulatory Science" does not include any examples of regulations that have been undermined by a lack of such transparency, so I'd like remind to everyone of what is at stake, and what happened the first time EPA, Congress and environmental groups had to decide whether it was ok to base regulatory standards on published scientific studies whose archives were no longer available for review. They got the answer right then, and I hope they'll get it right again now.

It was May 1983, and EPA was about to publish a new NAAQS for carbon monoxide based on 9 studies by a distinguished cardiologist at the VA, Dr. Aronow, when the Washington Post reported that he had been barred by FDA a year earlier for submitting a "wave of false medical experiments" after he admitted "fudging" his lab reports in human drug studies. Although EPA's head of Air Quality Planning and Standards said the agency had "no reason to believe anything was wrong" with Aronow's CO studies--whose data Aronow claimed "Are excellent and can't be questioned"--EPA nevertheless appointed a special team of agency and outside scientists to review his work "when we read that Aronow had done some kooky things."

A month later, the Post reported the shocking results under the headline "EPA Probe criticizes a study used in air-quality standard." The team "could not resolve the issue of possible falsification of data" because "no data were available"--Aronow told them he had discarded the archives of all his CO studies after first storing them in his garage and then offering it to EPA because "they didn't want it."

The investigators noted "considerable concerns about the validity of the results reported.... Raw data were lost or discarded, adequate records were not maintained, available data were of poor quality, quality control was non-existent"--while Aronow's published results were consistently too good to be true. They found it "rather remarkable" that in 10 years of research his papers showed "not even one missing data point." They concluded that EPA "cannot rely on Dr. Aronow's data due to the

concerns we have noted" and recommended that the agency commission new research to attempt to replicate Aronow's findings. Congressional hearings and a GAO investigation followed, after which Administrator Ruckelshaus agreed that EPA would not rely on any of Aronow's studies in future rulemakings, but only on studies whose archives were still available for review.

In coordination with the California air Resources Board and the Health Effects Institute, EPA commissioned a series of new controlled human exposure studies on CO. and since 1994 has based the CO NAAQS exclusively on just 6 of them, all of which published their individual results in de-identified form so they would be available for public review in perpetuity. And it is a good thing they did since all the larger archives of these studies were eventually discarded by their authors without being offered to EPA. This history shows that EPA can and should base regulations solely on studies whose methods and data are available for review.

To base regulations on studies that can't be re-analyzed is not science and there is no need for it. Even federal rules that are based only on older epidemiology studies–like the last PM NAAQS rule in 2013 that cited just six—could and should be based on more recent research that better reflect current air quality. Over 500 studies a year are now published on particulate epidemiology and many are in high quality journals that require authors to make all their de-identified data and methods available-- at least to reviewers if not to all readers via the posting of supplemental material.

Given EPA's interest in basing regulations on more transparent research, EPA should start requiring all of the researchers it funds, both intramural and extramural, to publish their results in such journals. Hopefully this will prompt less rigorous journals that don't require the posting of supplemental material to update their policies.

The Aronow scandal shows EPA cannot rely exclusively on traditional peer-review to detect misconduct. He duped reviewers at 11 leading journals as well as EPA staff and their scientific advisors on the CASAC who also reviewed his studies before recommending that 9 be cited as the basis for the CO NAAQS. Unfortunately, despite all this publicity, none of Aronow's CO studies were retracted and EPA has started citing them again, most recently in its 2010 Integrated Science Assessment of the CO literature. EPA's proposal to strengthen transparency in regulatory science could stop this from happening again, which is why I support it and encourage my colleagues to do so as well.

# # #

Dr. Andrew Rosenberg Union of Concerned Scientists

Good morning. I am Dr. Andrew Rosenberg, Director of the Center for Science and Democracy at the Union of Concerned Scientists. We advocate for the role of science in public policy. I am here today to ask that you rescind this proposed rule because it would only restrict EPA's ability to use the best available science to fulfill its mission of protecting public health and the environment, while doing nothing to improve transparency in decision-making.

First and foremost, this proposal is fatally flawed because it provides almost no justification or analysis of the impacts of the proposed change in policy. There is no cost benefit analysis of the rule with respect to the agency and external researchers, nor how it would affect EPA's mission-critical work.

Additionally, the proposal would effectively prevent the EPA from using many kinds of scientific studies vital to its decision-making. This includes, but is not limited to, studies that rely on personal health data, confidential business information, intellectual property, or older studies where the authors or data sources may not be accessible. Without the ability to use this scientific information, EPA would be unable to meet its mission and statutory obligations . This proposal would make it significantly harder for EPA to use the best available science to protect the public, including from:

- Harmful emissions of hazardous air pollutants, particulate matter and ozone
- Exposure to dangerous chemicals in commerce
- Drinking water contaminated with toxic chemicals such as PFAS or lead

Further, CBO has calculated that such restrictions would substantially increase costs and burdens to an agency that is already experiencing budget cuts, reorganizations, and understaffing, thus undermining the ability of EPA to make decisions based on science.

The proposed rule could also prevent the agency from addressing the impacts of dangerous chemicals at low concentrations where direct measurements are very difficult. This would have the effect of leaving Americans unprotected even when there was clear indication of harms to human health.

I have over 30 years of experience in government service, academia, and non-profit leadership. I have authored or reviewed 100s of peer reviewed scientific papers. As part of my government service, I worked as a scientist and in a policy position at a regulatory agency. In universities as a faculty member and dean. I understand how agencies use science in policymaking, how research at universities is conducted, and how these entities incorporate best practices of transparency into their scientific work. As a frequent peer reviewer I do not review the raw data for studies, since that would tell me little. I review the research questions, the methods, the summarized data, the results and conclusions in order to assess the quality of the work. EPA's proposed rule would do nothing to improve transparency for scientists, policy-makers or the public. Crafting the rule without consulting with the scientific community is a fatal error for this proposal. Even the agency's own Science Advisory Board has noted the need to consult with scientists in any further development of this proposal.

A further fatal flaw is that the proposed rule would replace scientific evidence with political judgement. The rule would grant the EPA administrator broad authority to exclude individual studies or entire decisions from being subject to its provisions. Decisions on what science to rely on should be made by the agency's scientific experts based on established criteria for best available science.

Five minutes is not enough time to cover all of the problems with this proposal. At best, this proposed rule is a misguided attempt at transparency. At worst, it is a backdoor attempt to prevent EPA from protecting public health.

UCS supports real transparency reforms . We support scientific integrity policies that prevent political interference in scientific analyses and reporting. We do not believe researchers should be put in the absurd position of choosing between protecting study participant privacy or informing the EPA 's efforts to protect public health and safety.

On behalf of the Union of Concerned Scientists and our 500,000 supporters I urge the EPA not to move forward with this rulemaking and to continue to allow the agency's scientists and policy analysts to use the best science available to inform their work.

EPA Hearing on Transparency in Data July 17, 2018
Testimony of Anne Mellinger-Birdsong, MD, MPH, FAAP

Hello. Thank you for allowing me to speak today. My name is Anne Mellinger-Birdsong. I am a Fellow of the American Academy of Pediatrics and a specialist in environmental public health. I have worked at city, county, state, and federal public health agencies and at Indian Health Service facilities.

I am here to speak in opposition to this proposed rule and to state that this proposed rule is unnecessary and would harm EPA's ability to evaluate health impacts of environmental pollutants. It should not be finalized or implemented.

This proposal has wording that makes it appear noble and well meaning. But it is a wolf in sheep's clothing. This proposal will severely hamper EPA's ability to use past and future research on health effects of human exposure to environmental chemicals and toxicants.

Both the Health Insurance Portability and Accountability Act (HIPAA)(1) and 45 CFR 46 Federal Regulations on Protection of Human Subjects(2) address privacy as a concern of people who participate in research.

It is not as simple as redacting data personally identifiable information redacted, as EPA officials stated when announcing this proposed rule. If the database is open to the public, it not only has to have personal identifiers redacted, it also has to not include information that can be used to figure out who a person is that participates in a study. For example, studies that examine air pollution contain research on heart attacks. If the data contains information about person X, age Y, in town A, who had a heart attack in July 2015, that might be sufficient information to identify who person X was. So even though the data does not contain name, birthdate, medical record number or other personal identifiers, people could still use the data to figure out who person X is. Therefore HIPAA and Human Subjects rules would prevent this data from being publicly available, and this rule would prohibit this study from being used.

All environmental studies require information on exposure to the substance or chemical being studied. Many studies do this by using residence zip code or census tract. Studies also use information on travel or commuting routes, school, or work locations. So again, residence data combined with age group data and disease information (asthma attack, hospital admission, etc.) could be used to identify people in studies. Some studies look at death due to exposures, others look at illness, symptoms, or hospital admissions of living people. Living people require more protections of their identity than studies of deceased people. Studies of children have even more human subjects protections.

People who participate in studies have concerns about the trustworthiness of the researchers and institutions, as noted by Carter et al in British Medical Journal (3). They also have concerns that private companies will not use their health data for marketing or other purposes that might be considered exploitive.

And as noted by Damschroder et al in Social Science & Medicine (4), people's trust in the researchers was the most powerful determinant of the kind of control they want over their medical records.

This proposed rule would eliminate consideration of many major studies on the health impacts of environmental pollutants. An example of one would be the 6 Cities study of air pollution and mortality published in 1993 (5). Probably the Children's Health Study conducted in southern California (6) would also be eliminated.

It would also likely decrease people's willingness to participate in future studies of environmental exposures, due to concerns about trust and privacy.

This rule is unnecessary. There are already HIPAA compliant and IRB approved methods to transfer data between researchers so that studies can be evaluated and verified, and to determine if findings can be replicated.

This rule would severely hamper EPA's ability to use already published scientific studies. It would also severely hamper future research on health effects of environmental exposures.

So I ask: why was a rule was proposed that would eliminate use of scientific studies and hamper future research, when the rule is completely unnecessary. This rule should not be finalized or implanted.

I will end with a quote by Carnegie Mellon University engineering professor M. Granger Morgan, who chaired EPA's Science Advisory Board under Republican President George W. Bush. He said the policy 'is an attempt by people who aren't interested in using science to find the truth "to raise doubts about what at this stage is very clearly established and well-reviewed science."'(7)

PSR® Physicians for Social Responsibility

1985 NOBEL PEACE PRIZE

United States Affiliate of International Physicians for the Prevention of Nuclear War

Comments of Barbara Gottlieb
to the U.S. Environmental Protection Agency
Concerning "Strengthening Transparency in Regulatory Science"
Docket ID No. EPA-HQ-OA-2018-0259

July 17, 2018

Good morning. My name is Barbara Gottlieb. I am the director for environment and health at Physicians for Social Responsibility, a physician-led, nationwide organization that works to protect human life from the gravest threats to health and survival. I'm here to express Physicians for Social Responsibility's opposition to the proposed rule, "Strengthening Transparency in Regulatory Science."

The U.S. EPA plays a critical role in keeping our nation and our families safe from environmental exposures that can cause illness and death. We thank you for that – and we count on you for it. Because your role is vital to our health and well-being, the nation relies on you to formulate and enforce the most effective protections possible, based on the best available science. The medical and scientific studies that underlie the EPA's decisions must be objective, vetted, and present a full and accurate assessment of the threats to health posed by the pollutants under study.

To provide those full and accurate assessments, studies need to relate exposure levels to actual health outcomes in real human beings, and to amass large data bases so that researchers can draw valid conclusions.

In order to have reliable data and large sample sizes, researchers frequently study the records of patients treated in hospitals. Hospital records, of course, include personal identifiers, and disclosure of those identifiers would violate privacy and confidentiality laws. Thus, the best available data for many health studies cannot be – in the literal sense – fully and openly shared.

However, to refuse to consider scientific studies simply because they include personal identifiers would be a great mistake. First of all, it is not necessary. Reviewers wanting to reproduce a study in order to validate it can arrange to have confidential access to key data. Furthermore, scientists can assess the merits of published research without seeing its data directly by considering such publicly released features as the study's research design, the methods used for data collection and analysis, and comparisons with previous results.

Furthermore, to exclude credible peer-reviewed scientific studies because the personal identifiers cannot be released under the law, is to exclude from the EPA's consideration many important and valid studies. This would greatly hamper our ability to understand the impacts of serious, even deadly, environmental pollutants. Several of my colleagues will testify later today to the potential impact of this proposed rule on our understanding of pollutants from coal-fired power plants, and children's exposure to lead in drinking water. I would like to bring your attention several other studies that also might be lost to consideration, yet are vitally important. These are studies that reveal statistical correlations between exposure to emissions from hydraulic fracturing ("fracking") for oil and gas, and serious impacts on health. I will mention three:

1. A study by University of Pennsylvania and Columbia University researchers and published in 2015 in the journal *PLoS ONE*, found that drilling and fracking activity was associated with increased rates of hospitalization in Pennsylvania. The study examined hospitalization data between 2007 and 2011 and found that inpatient prevalence rates surged for people living near shale gas wells, in regard to hospitalizations for cardiology, neurology, cancer, skin conditions, and urological problems. In communities with the most wells, the rate of cardiology hospitalizations was 27 percent higher than in control communities with no fracking.[1] These findings obviously are of great concern; we would not want them to be lost to the EPA as it considers regulation of emissions from fracking sites and infrastructure. Yet because the data include patients' names, diagnoses and addresses, this valuable study could under the proposed rule be excluded from EPA consideration.

2. Another study conducted in Pennsylvania, this one between 2005 and 2012, found that living near fracking operations significantly increases asthma attacks. This study was conducted by researchers at Johns Hopkins University and was based on a study of 35,000 medical records of people with asthma in north and central Pennsylvania.[2] Again, 35,000 medical records. This is just the sort of study that we want EPA to base its health-protective regulations on: a robust and objective database, conducted by researchers at a respected institution and published in the *Journal of the American Medical Association Internal Medicine*. Yet should the proposed rule be adopted, this study could be disallowed because its 35,000 medical records cannot easily and efficiently be stripped of personal identifiers.

3. One final study. This study, by the Johns Hopkins Bloomberg School of Public Health and other researchers, used data from the Geisinger Health System on 9,384 pregnant women and their 10,496 newborns between January 2009 and January 2013. Looking at 40 counties in north and central Pennsylvania, the researchers developed an index for proximity to fracking wells based on distance from the women's homes, stage of drilling and depth of wells dug, and the amount of gas that was produced at those wells during the pregnancies. They found that pregnant women who lived near active fracking operations in Pennsylvania were at a 40 percent

[2] Rasmussen, S. G., Ogburn, E. L., McCormack, M., Casey, J. A., Bandeen-Roche, K. Mercer, D. G., & Schwartz, B. S. (2016). Association between unconventional natural gas development in the Marcellus Shale and asthma exacerbations. JAMA Internal Medicine. Advance online publication. doi: 10.1001/jamainternmed.2016.2436

increased risk of giving birth prematurely.[3] Let me remind us that premature birth is the leading cause of infant death in the United States. So we're talking about health data that indicate that fracking operations could put newborn babies at risk of death. This study was published in the peer-reviewed journal *Epidemiology*.

Our country, our families, should have the benefit of these studies to assess the health implications of unconventional oil and gas development activities. Similarly, we should have the benefit of many robust scientific studies, on a range of critical health issues, that use data that cannot be released publicly in full because it includes personal identifiers. To exclude that body of peer-reviewed research findings would be to weaken the scientific record and undercut the accuracy and the strength of EPA's regulatory process. For that reason, Physicians for Social Responsibility opposes the proposed rule, "Strengthening Transparency in Regulatory Science." Thank you.

---

STATEMENT OF ROBERT SUSSMAN ON EPA's PROPOSED RULE ON TRANSPARENCY IN REGULATORY SCIENCE -- July 17, 2018

My name is Bob Sussman. I'm a former EPA official in the Clinton and Obama Administrations and am now a consultant and attorney. I'm here today representing Safer Chemicals Healthy Families, which leads a coalition of 450 organizations and businesses united by a common concern about toxic chemicals in our homes, places of work, and products we use every day.

I believe that EPA proposal we are discussing today is flawed and misconceived. In the name of "transparency," it will burden EPA scientists with unnecessary and costly procedures that run counter to the Agency's long-standing obligation to base public health decisions on the best available science.

The unspoken premise of the proposal is that unless EPA can guarantee full public access to a study's underlying data, the study must be deemed unreliable and should play no role in assessing a pollutant or chemical's effects on human health. This premise ignores the many ways in which the scientific community, regulators, and the public have traditionally determined the quality and relevance of study results.

Study reports typically explain the protocols used to gather data, the methods used for data analysis, the doses or exposure concentrations at which effects were and were not observed, the nature, severity, and incidence of such effects, and any unusual occurrences that may affect interpretation of the results. This information plays an important role in the peer review process, informing the judgment of independent reviewers as to whether a study is worthy of publication in the scientific literature. Agency reviewers likewise consider these indicators of reliability in deciding how much weight a study deserves in making judgments about hazard and risk. In its narrow focus on a single criterion for study acceptability, the proposal departs from this comprehensive, multi-faceted approach for determining the "best available science" to inform decision-making.

In principle, no one disputes the benefits of improving access to underlying data for research on chemicals and pollutants. The goals of "open science" have received support from several organizations and leading scientific journals and

research institutions have adopted practices and policies to maximize data access. These voluntary efforts, however, do not justify the unprecedented step of requiring EPA to guarantee access to the underlying data for every study it may use for decision-making and to forfeit the ability to consider a study if this requirement has not been met.

EPA scientists working on risk and hazard assessments collect and review thousands of studies. Published reports of these studies typically do not include all underlying data. In such cases, EPA would need to contact the researcher, ascertain the nature and extent of underlying data, and put in place a mechanism for the public to access the data. Analyzing House legislation that would impose similar obligations on EPA, the Congressional Budget Office and EPA staff concluded that the costs of implementation would be at least $250 million a year. Moreover, rather than devoting time and effort to assuring access to underlying data, EPA staff may follow the path of least resistance and simply drop many studies from consideration, shrinking the body of scientific evidence on which decisions are based.

Even with diligent effort by EPA, there are many reasons why disclosure of data sufficient to replicate a study may be impossible. For epidemiology and other studies of human cohorts, privacy protections will often block release of individual medical records. Industry-conducted studies may contain confidential business information (CBI) required to be withheld by law. For studies based on human exposure measurements, replication may be impossible because exposure conditions have changed. Studies attempting to capture the impacts of one-time events like spills or plant explosions will also be inherently unreproducible. And for older studies predating digital technology, retrieving full study records may be difficult or impossible.

The EPA proposal duly notes these obstacles to study replication and provides that exemptions may be granted on a case-by-case basis where "compliance is impracticable." But an exemption process will add to the considerable cost and effort required to implement the proposed rule and may result in disputes and even litigation over whether exemptions are justified.

Is the damage it will inflict on the quality and timeliness of EPA science justified by the benefits of the proposed rule? EPA leaders have painted a bleak picture of

EPA reliance on "secret science" developed behind "closed doors" "based on data that has been withheld from the American people." But is this the reality?

EPA science assessments generally include an exhaustive and critical review of relevant studies and a full explanation of how they are being interpreted. Extensive information about each study is typically part of the public record, even if all underlying data may not be included. EPA assessments are normally subject to public comment and independent peer review. And members of the regulatory community are free at any time to replicate studies they deem flawed or to independently seek access to underlying data and reanalyze them. In short, the "problem" that the proposed rule seeks to fix is largely imaginary.

In conclusion, the Agency's leadership needs to fundamentally rethink this proposed rule. The stakes for EPA science and the protection of public health are simply too high to finalize this deeply problematic and unnecessary proposal.

Comments of Daniel Greenbaum, President
Health Effects Institute (HEI)
July 17, 2018

HEI Comments on Proposed Rule EPA–HQ–OA–2018–0259; FRL–9977–40–ORD

HEI is pleased to have the opportunity to present these brief oral comments. We are preparing and will submit more detailed written comments

1. HEI has a longstanding commitment to the principles being addressed by this proposal: producing science of the highest integrity and quality, with special attention to issues of reproducibility and transparency. This includes:

    - Rigorous research and statistical design – Subject to competition, continuous oversight, data quality assurance audits, and more
    - Extensive efforts to test all findings against a wide range of different statistical techniques and assumptions
    - Intensive and independent peer review, with *all* results published
    - An active *Data Access Policy* for nearly 20 years to ensure access to underlying data for all HEI-funded studies.

2. Reproducibility is a critical challenge for science: can the results of an important study be reproduced? In HEI's view the most effective way to test the reproducibility and validity of scientific results is not necessarily to simply reproduce the same results in the same data sets -- because that also reproduces all the weaknesses and limitations of the original study. Rather, it is most important to answer the question: *Are the results consistent when tested in other independent studies*:

    - That use new and different data not affiliated with the original studies?
    - Have different investigators applying the same and/or alternative statistical techniques?
    - And test the sensitivity of the results against a wide range of possible other explanations, e.g. smoking behavior, socioeconomic status, access to medical care, and more.

3. In a limited number of cases, where there are not comparable studies in other datasets, it may be useful to gain access to the original study data and analytic codes to allow for independent evaluation: *Can the original results be replicated? And are they robust to a wide range of alternative assumptions, models and potential confounders?*

- This is the approach that HEI applied in its independent, rigorous reanalysis of the Harvard Six Cities and American Cancer Society Studies (see attached description of the Reanalysis):
- This approach can – and did – provide comprehensive assurance of the quality, integrity, and validity of the original results
- However, this is a highly cost-intensive and time-consuming endeavor which should only be applied in cases where there are one or just a few studies in a given area.

4. HEI also agrees with the continuing need to enhance transparency and data access, but would note that these issues are not new, and have been addressed now for over 15 years by administrations from both parties and by the scientific community:

    - This has included Guidelines for the Information Quality Act adopted by the Office of Information and Regulatory Affairs (OIRA) in 2002, numerous actions by the scientific community and journals to enhance access, and most recently the requirements for enhanced data access across the Federal Government promulgated by the Office of Science and Technology Policy (OSTP) in February 2013
    - We would strongly urge EPA to review the progress already made under these several major initiatives, and to carefully consider whether or not there are additional efforts that could further enhance transparency, *before* proceeding with a final rule.

5. Finally, access to private medical information is essential to conducting high quality and reproducible air quality and health research:

    - There are of course longstanding federal rules for protecting the privacy of individual medical information of the subjects of studies (HIPPA, Common Rule, etc.)

    - Gaining access to data from older studies may be difficult, given the privacy commitments that were made to study subjects in the past.

    - However, there *are* today several means to make such data available to investigators with appropriate privacy protections (e.g. Medicare, Federal Research Data Centers) and many investigators have been taking advantage of these.

    - Although it is possible, as some have suggested, to create a "depersonalized" data set by stripping all personal identifiers, such as address, date of birth, etc.
        - *It is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied*, i.e. where they live, and what are the sources and levels of their air pollution exposure?

Thank you for this opportunity to testify – we look forward to submitting our detailed written comments and would welcome the opportunity to further assist EPA in these efforts to ensure the widest array of quality science is available for decisions.

ATTACHMENT: The HEI Reanalysis Statement

HEALTH EFFECTS INSTITUTE

STATEMENT

Synopsis of the Particle Epidemiology Reanalysis Project

BACKGROUND

Epidemiologic work conducted over several decades has suggested that long-term residence in cities with elevated ambient levels of air pollution from combustion sources is associated with increased mortality. Subsequently, two prospective cohort studies, the Six Cities Study (as reported in Dockery et al 1993) and the American Cancer Society (ACS) Study (as reported in Pope et al 1995) estimated that annual average all-cause mortality increased in association with an increase in fine particles (all particles less than 2.5 μm in median aerodynamic diameter [$PM_{2.5}$]).

As part of the Six Cities Study, Dockery and colleagues (1993) had prospectively followed a cohort of 8,111 adult subjects in northeast and midwest United States for 14 to 16 years beginning in the mid-1970s. The authors found that higher ambient levels of fine particles and sulfate (SO_4^{2-}) were associated with a 26% increase in mortality from all causes when comparing the most polluted to the least polluted city, and that an increase in fine particles was also associated with increased mortality from cardiopulmonary disease. The relative risks in all-cause mortality were associated with a difference (or range) in ambient fine particle concentrations of 18.6 μg/m^3 and a difference of ambient sulfate concentrations of 8.0 μg/m^3, comparing the least polluted city to the most polluted city.

In the much larger ACS Study, Pope and colleagues (1995) followed 552,138 adult subjects in 154 US cities beginning in 1982 and ending in 1989 (3 cities did not overlap between the 151 and 50 cities studied, resulting in a total of 154 cities). Again, higher ambient levels of fine particles were associated with increased mortality from all causes and from cardiopulmonary disease in the 50 cities for which fine particle data were available (sampled from 1979 to 1983). Higher ambient sulfate levels were associated with increased mortality from all causes, cardiopulmonary disease, and lung cancer in the 151 cities for which sulfate data were available (sampled from 1980 to 1982). The difference between all-cause mortality in the most-polluted city and the least-polluted city was 17% and 15% for fine particles and sulfate, respectively (with a range of 24.5 μg/m^3 for fine particles and of 19.9 μg/m^3 for sulfate).

Both of these studies came under intense scrutiny in 1997 when the EPA used the results to support new National Ambient Air Quality Standards for fine particles and to maintain the standards for particles less than 10 μm in median aerodynamic diameter (PM_{10}) already in effect. Members of Congress and industry, the scientific community and others interested in regulation of air quality scrutinized the studies' methods and their results. Some insisted that any data generated using federal funding should be made public. Others argued that these data had been gathered with assurances of confidentiality for the individuals who had agreed to participate and that the concept of public access to federally funded data did not take into account the intellectual property rights of the investigators and their supporting institutions. To address the public controversy, Harvard University and the ACS requested that the Health Effects Institute organize an independent reanalysis of the data from these studies. Both institutions agreed to provide access to their data to a team of analysts to be selected by HEI through a competitive process.

APPROACH

To conduct the reanalysis, the HEI Board of Directors, with support from the EPA, industry, Congress, and other stakeholders, appointed an Expert Panel chaired by Dr Arthur Upton from the University of Medicine and Dentistry of New Jersey and former Director of the National Cancer

This Statement, prepared by the Health Effects Institute, is a summary of a research project conducted by the Reanalysis Team, led by Dr Daniel Krewski at the University of Ottawa. The following Special Report contains the detailed Investigators' Report (Summary, Introduction, and Parts I and II), Commentary on the project prepared by a special panel of the Institute's Health Review Committee, and Comments on the Reanalysis Project by the Original Investigators (Drs Douglas W Dockery, C Arden Pope III et al).

Institute. The Expert Panel selected competitively a Reanalysis Team—led by Dr Daniel Krewski of the University of Ottawa—and oversaw all aspects of the team's work. They were assisted in their oversight efforts by a broad-based Advisory Board of knowledgeable stakeholders and scientists who, in the project's early stages, provided extensive advice to the Expert Panel on the key questions to be analyzed. The final results of the Reanalysis Team were intensively and independently peer reviewed by a Special Panel of the HEI Health Review Committee, which was chaired by Dr Millicent Higgins of the University of Michigan.

The overall objective of what became the Particle Epidemiology Reanalysis Project was to conduct a rigorous and independent assessment of the findings of the Six Cities and ACS Studies of air pollution and mortality. This objective was met in two parts. In *Part I: Replication and Validation*, the Reanalysis Team sought to replicate the original studies via a quality assurance audit of a sample of the original data and to validate the original numeric results. In *Part II: Sensitivity Analyses*, they tested the robustness of the original analyses to alternate risk models and analytic approaches.

RESULTS AND IMPLICATIONS

PART I: REPLICATION AND VALIDATION

- An extensive audit of the study population data for both the Six Cities and ACS Studies and of the air quality data in the Six Cities Study revealed the data to be of generally high quality with a few exceptions. In both studies, a few errors were found in the coding and inclusion of certain subjects; when those subjects were included in the analyses, they did not materially change the results as originally reported. Because the air quality data used in the ACS Study could not be audited, a separate air quality database was constructed for the sensitivity analyses described in Part II.
- The Reanalysis Team was able to replicate the original results in both studies using the same data and statistical methods as used by the Original Investigators. The Reanalysis Team confirmed the original point estimates: For the Six Cities Study, they reported the relative risk of mortality from all causes associated with an increase in fine particles of 18.6 $\mu g/m^3$ as 1.28, close to the 1.26 reported by the Original Investigators. For the ACS Study, the relative risk of mortality from all causes associated with an increase in fine particles of 24.5 $\mu g/m^3$ was 1.18 in the reanalysis, close to the 1.17 reported by the Original Investigators.

PART II: SENSITIVITY ANALYSES

Once the original results of the studies had been validated, the Reanalysis Team sought to test an array of different models and variables to determine whether the original results would remain robust to different analytic assumptions.

- First, the Reanalysis Team used the standard Cox model used by the Original Investigators and included variables in the model for which data were available from both original studies but had not been used in the published analyses (eg, physical activity, lung function, marital status). The Reanalysis Team also designed models to include interactions between variables. None of these alternative models produced results that materially altered the original findings.
- Next, for both the Six Cities and ACS Studies, the Reanalysis Team sought to test the possible effects of fine particles and sulfate on a range of potentially susceptible subgroups of the population. Although different subgroups did show some variation in their estimated effects, the results were not statistically significant with one exception. The estimated effects of fine particles did appear to vary with educational level; the association between an increase in fine particles and mortality tended to be higher for individuals without a high school education than for those who had completed high school or for those with more than a high school education.
- In the ACS study, the Reanalysis Team tested whether the relationship between ambient concentrations and mortality was linear. They found some indications of both linear and nonlinear relationships, depending upon the analytic technique used, suggesting that the

issue of concentration-response relationships deserves additional analysis.

- In the Six Cities Study where data were available, the Reanalysis Team tested whether effect estimates changed when certain key risk factors (smoking, body mass index, and air pollution) were allowed to vary over time. One of the criticisms of both original studies has been that neither analyzed the effects of change in pollutant levels over time. In general, the reanalysis results did not change when smoking and body mass index were allowed to vary over time. The Reanalysis Team did find for the Six Cities Study, however, that when the general decline in fine particle levels over the monitoring period was included as a time-dependent variable, the association between fine particles and all-cause mortality dropped substantially, but the effect continued to be positive and statistically significant.
- Using its own air quality dataset constructed from historical data to test the validity of the original ACS air quality data, the Reanalysis Team found essentially the same results.
- Any future analyses using the sulfate data should take into account the impact of artifactual sulfate. Sulfate levels with and without adjustment differed by about 10% for the Six Cities Study. Both the original ACS Study air quality data and the newly constructed dataset contained sulfate levels inflated by approximately 50% due to artifactual sulfate. For the Six Cities Study, the relative risks of mortality were essentially unchanged with adjusted or unadjusted sulfate. For the ACS Study, adjusting for artifactual sulfate resulted in slightly higher relative risks of mortality from all causes and cardiopulmonary disease compared with unadjusted data. The relative risk of mortality from lung cancer was lower after the data had been adjusted.
- Because of the limited statistical power to conduct most sensitivity analyses for the Six Cities Study, the Reanalysis Team conducted the majority of its sensitivity analyses using only the ACS Study dataset with 154 cities. In that dataset, when a range of city-level (ecologic) variables (eg, population change, measures of income, maximum temperature, number of hospital beds, water hardness) were included in the analyses, the results generally did not change. Two exceptions were that associations for both fine particles and sulfate were reduced when city-level measures of population change or sulfur dioxide were included in the model.
- A major contribution of the Reanalysis Project is the recognition that both pollutant variables and mortality appear to be spatially correlated in the ACS Study dataset. If not identified and modeled correctly, spatial correlation could cause substantial errors in both the regression coefficients and their standard errors. The Reanalysis Team identified several methods for dealing with this, all of which resulted in some reduction in the estimated regression coefficients. The full implications and interpretations of spatial correlations in these analyses have not been resolved and appear to be an important subject for future research.
- When the Reanalysis Team sought to take into account both the underlying variation from city to city (random effects) and the spatial correlation between cities, only sulfur dioxide as a city-level variable continued to decrease the originally reported associations between mortality and fine particles or sulfate. This effect was more pronounced for sulfate.
- When the Reanalysis Team conducted spatial analyses of sulfur dioxide, the association between sulfur dioxide and mortality persisted after adjusting for sulfate, fine particles, and other variables.
- As a result of these extensive analyses, the Reanalysis Team was able to explain much of the variation between cities, but some unexplained city-to-city variation remained.

CONCLUSIONS

The Reanalysis Team designed and implemented an extensive and sophisticated series of analyses that included a set of new variables, all the gaseous copollutants, and the first attempts to apply spatial analytic methods to test the validity of the data and the results from the Six Cities Study and the ACS Study. Overall, the reanalyses assured the quality of the original data, replicated

the original results, and tested those results against alternative risk models and analytic approaches without substantively altering the original findings of an association between indicators of particulate matter air pollution and mortality.

At the same time, the reanalyses did extend and challenge our understanding of the original results in several important ways.

- The Reanalysis Team identified a possible modifying effect of education on the relation between air quality and mortality in that estimated mortality effects increased in the subgroup with less than high school education.
- The use of spatial analytic methods suggested that, when the analyses controlled for correlations among cities located near one another, the associations between mortality and fine particles or sulfate remained but were diminished.
- An association between sulfur dioxide and mortality was observed and persisted when other possible confounding variables were included; furthermore, when sulfur dioxide was included in models with fine particles or sulfate, the associations between these pollutants (fine particles and sulfate) and mortality diminished.

In reviewing these results, the Special Panel of the HEI Health Review Committee identified the following factors to consider when interpreting the results from the Reanalysis Team.

- The inherent limitations of using only six cities, understood by the Original Investigators, should be taken into account when interpreting results of the Six Cities Study.
- The Reanalysis Team did not use data adjusted for artifactual sulfate for most alternative analyses. When they did use adjusted sulfate data, relative risks of mortality from all causes and cardiopulmonary disease increased. This result suggests that more analyses with adjusted sulfate might result in somewhat higher relative risks associated with sulfate.
- Findings from spatial analyses applied to the ACS Study data need to be interpreted with caution; the spatial adjustment may have overadjusted the estimated effect for regional pollutants such as fine particles and sulfate compared with the effect estimates for more local pollutants such as sulfur dioxide.
- After the Reanalysis Team completed its spatial analyses, residual spatial variation was still noticeable; this finding suggests that additional studies might further refine our understanding of the spatial patterns in both air pollution and mortality.
- No single epidemiologic study can be the basis for determining a causal relation between air pollution and mortality.

In conclusion, the Reanalysis Team interpreted their findings to suggest that increased relative risk of "mortality may be attributed to more than one component of the complex mix of ambient air pollutants in urban areas in the United States". The Review Panel concurs. In the alternative analyses of the ACS Study cohort data, the Reanalysis Team identified relatively robust associations of mortality with fine particles, sulfate, and sulfur dioxide, and they tested these associations in nearly every possible manner within the limitations of the datasets. Future investigations of these issues will enhance our understanding of the effect of combustion-source air pollutants (eg, fine particles, sulfate, and sulfur dioxide) on public health.

Subject Environmental Protection Agency 07/17/2018.

"Strengthening, Transparency and Regulatory Science."

EPA-HQ-00-2018-25

I am Dr. Harvey Fernbach, a member of the national board of Physicians for Social Responsibility. Thank you for the opportunity to present my perspective on "Strengthening, Transparency and Regulatory Science." I agree with the strong opposition to this proposal expressed in the 06/01/2018 joint letter of the American Academy of Pediatrics and American College of Obstetrics and Gynecology to former administrator Pruitt as well the 05/31/2018 testimony to the EPA's Science Advisory Board by Lynn Goldman, M.D., formerly of EPA and now Dean of the GW School of Public Health.

The proposal's title is disingenuous since its purpose is clearly aimed at impeding the EPA from getting more peer reviewed environmental studies in a world that is creating a huge number of new chemicals for industry household products and pharmaceuticals. Why would the EPA's political leadership not want to add to the studies? I know they are on the "drill baby drill" ilk, but why would they want to expose themselves and the public to possible adverse health effects of these

new pollutants? Additionally, why is the EPA curtailing the activities of their staff scientists who are so experienced? The public is angered about these negative activities which is turning the Environmental Protection Agency into a misnomer. Perhaps this is why the former head of the EPA was so security conscious.

Many of us here are also interested in transparency in this regulatory agency! For example, the agency knows all the studies of climate change/global warming that has led almost 100 percent of climate scientists to conclude human activity is a significant cause of this development. What is not clear is the derivation of this shameful madness to pollute, make seas rise, melt glaciers, cause animal extinction, raise CO2 level, bring on extreme weather, human migration from crop failures, existential threat to human life and as reported by the Pentagon, more wars.

How can the President and the EPA's leaders knowing the human suffering they are inflicting through their pretend denial keep on doing it? Perhaps the motivation to cause such irreversible sickness and destruction is a cruelty that goes beyond simply wanting to help the fossil fuel industry. Sooner or later, we will see the EPA's terrible behavior as a crime against humanity or at best, depraved indifference.

I urge and plead with the EPA to come to its senses, apologize and get back to their true noble mission and make up for lost time. It is not yet too late!

Proposed Rule "Strengthening Transparency in Regulatory Science"

Docket No. EPA-HQ-2018-0259

Comments from
Janice Nolen, MA
National Assistant vice President, Policy
American Lung Association

July 17, 2018

Thank you for the opportunity to provide comments. My name is Janice Nolen and I am the National Assistant Vice President for Policy for the American Lung Association. The American Lung Association turns 114 years old this year. For more than a century, we have fought to save lives by protecting lung health and preventing lung disease. We oppose the proposed rule.

Many years ago in the early 1980s, my mother-in-law asked me to help her recruit participants in a major new study that they were doing. She worked for the American Cancer Society and they were looking to create a huge database of ordinary Americans who would be willing to provide them with confidential information about their health and medical experiences and would allow them to track for years to come. I was so pleased that two men from my church choir in Nashville agreed to participate. They completed the forms and other paperwork, and became two of the more than half a million participants in the Cancer Prevention Study II.

Fast forward a few decades and I learned that their data were now part of a landmark study—the American Cancer Society study--that revealed the risks to human health from breathing air pollution that I and my colleagues at the Lung Association were working hard to clean up. Their data and private health and medical data from hundreds of thousands of others were pointing the way to the need to clean up emissions from power plants, from diesel engines and fuels and many other sources. I never dreamed when my mother-in-law first made her request that EPA scientists and other researchers would mark that study as one of two seminal studies that helped reshape our understanding of the health risks from particulate matter air pollution. None of us then would have ever dreamed that the information these two men provided would have helped to identify and underline the threat to human life posed by the microscopic particles in the air we breathe.

Furthermore, that study and the Harvard 6 Cities study became examples of not only groundbreaking research, but of how questions about that research can be, reviewed and resolved without having to lose the entire study. Unfortunately, that is an example that this proposal clearly fails to acknowledge.

These two studies with decades-old patient data, and others in the long list of studies that found evidence of harm from industrial emissions or unique events that no one or hopes to replicate—like gulf oil spills— clearly appear to be targets of this proposed rule. Studies that have long been targets of industry polluters and their allies remain so in this proposal.

Once published, these studies raised alarms in the public health community about the increased likelihood of premature death from particulate matter in widespread parts of the nation. The studies raised alarms within industries about the increased likelihood that their polluting sources would have to clean up their emissions. Industry kicked in the messaging developed by the tobacco industry to

challenge the science using the same arguments we have in this proposal. I have in my office a page from a 1999 U.S. News and World Report article on the challenges to these studies that could have been written this year.

Scientists are working to become more transparent in their research. More researchers use publicly available information. But some studies cover populations that are so limited in size or specialized in their characteristics that those data should not be posted on the web for all the world to see. Anyone who has an account on Facebook should have a visceral knowledge of how important keeping confidential data confidential can be.

Meanwhile, EPA could readily review historical data and studies in ways that respect patient confidentiality and the gifts of data from people like my two choir member friends.

So far, EPA has failed to show any reason that changes are needed in the current system. Failed in its own transparency on this issue in fact, since EPA has not sought SAB review of this and not provided sufficient rationale for why EPA needs this change, much less how they would use this rule going forward.

We request EPA to withdraw this proposal. Thank you.

U.S. Environmental Protection Agency

Public Hearing on the Proposed "Strengthening Transparency in Regulatory Science" Rule

July 17, 2018

Testimony of Jodi Feld
Chief Scientist
Environmental Protection Bureau
Office of New York State Attorney General
Barbara D. Underwood

Testimony of Jodi Feld on EPA's Proposed "Strengthening Transparency in Regulatory Science" Rule

Good day. My name is Jodi Feld; I am Chief Scientist with the New York Office of the Attorney General's Environmental Protection Bureau. I am one of seven full-time scientists at the office; the only state Attorney General's office in the nation that employs on-staff scientists.

On behalf of New York Attorney General Barbara D. Underwood, I thank you for the opportunity to speak on the proposal by the Environmental Protection Agency (EPA) to limit use of science by the Agency in developing regulations.

While Attorney General Underwood with other Attorneys General will be submitting extensive, detailed comments on the proposal at a later date, I would like to provide brief comments on it today on her behalf.

* * *

Ostensibly proposed to strengthen the foundation of EPA's regulatory actions, the "Strengthening Transparency in Regulatory Science" proposal would do the opposite. It would exclude from EPA decision-making relevant, probative scientific studies, models, and other information that have been validated by peer review simply because not all underlying data are available to the public.

The Office of the New York Attorney General strongly opposes the proposal. It is vague, poorly reasoned, deeply flawed, and violates fundamental legal requirements for a valid rulemaking.

The proposal broadly and squarely conflicts with core EPA statutory duties, violating the very federal laws the Agency is required to uphold.

Moreover, it is bad science. Owing to its total absence of independent scientific input, the proposal departs abruptly from the best practices of the scientific community and ignores the well-established reasons why public sharing of all study data is not possible.

The result of the proposed rule would be to profoundly weaken EPA's science, its regulatory decision-making, and, ultimately, its protection of public health and the environment in New York and elsewhere across the nation.

Congress and the courts have rejected virtually identical efforts to limit EPA's use of science. We urge EPA to abandon this damaging, misguided effort as well.

The Proposed Rule is Bad Science

As mentioned previously, as far as we are able to determine, the proposed rule was developed with a total absence of independent scientific input. It is perhaps unsurprising, then, that as a scientific matter; the rule also makes very little sense.

The fundamental premise of the proposed rule is that only studies for which the underlying data are publicly available are valid for decision-making.

However, the proposal offers no rationale for this premise, nor evidence that EPA's current approach to selecting studies for decision-making is resulting in scientifically unsound regulations – or those that are overly protective of public health and the environment.

Hence, at its core, the proposal is a solution in search of a problem.

Enforcing "transparency" as the paramount determinative of scientific validity at EPA would represent an abrupt and unprecedented break from well-established best practices of the scientific community.

The scientific community recognizes what the proposal ignores: that there are often very good reasons – such as the protection of personal privacy and confidentiality, and proprietary interests and property rights – why some research data simply cannot be made fully available to the public.

Within the scientific community, the validity of research are judged on multiple grounds, including how well studies are designed, how clearly data are collected, how carefully analyses are described, and how thoroughly findings of related studies are cited.

In other words, within the scientific community, studies are validated through rigorous expert peer-review – they are not summarily judged invalid and discarded simply because all underlying data cannot be fully shared.

The Proposed Rule Would Directly Harm States and our Residents

EPA asserts that the proposed rule would not affect states, so there are no federalism implications. Nothing could be further from the truth.

EPA standards and regulations are of fundamental importance to states, and actions that affect these standards and regulations directly impact us.

For example, EPA standards – such as National Ambient Air Quality Standards – not only form the backbone of New York's efforts to ensure the quality of our air, water, and

land, and protect the health, safety, and welfare of our residents, but also serve as a backstop to prevent pollution from out-of-state sources from undercutting our efforts.

Further, many states' environmental laws and regulations explicitly adopt EPA standards, or at the very least, require an express justification for any deviation.

Even those states – such as New York – that are not statutorily required to apply federal standards may not always have the institutional capacity to develop their own standards and thus, must rely on the standards set by EPA.

As such, the proposed rule – which would undermine EPA standards and regulations by undermining their scientific basis – would likely have direct, damaging impacts on New York and other states' ability to protect the health and environment of their residents.

These impacts would be felt most starkly by our most vulnerable – the young, the elderly, and the sick – and those living in communities that have borne a disproportionate share of environmental hazards, including communities of color and low-income communities.

The Proposed Rule Is Unfounded and Unsupported, and Contrary to Federal Law

The proposed rule's direct and damaging impact on New York and the residents of our state is aggravated by the proposal's failure to meet the most fundamental of legal requirements for a valid rulemaking.

The proposal is exceedingly vague, creating many more questions than it answers. For example, the actual parameters of the rule are unclear, the alternatives under consideration are open-ended, and critical information, such as its actual cost, is entirely missing.
