Ban On "Secret Science" In EPA Regulation Makes Sense

Editorial
March 26, 2018
http://newsok.com/article/5588210/ban-on-secret-science-in-epa-regulation-makes-sense

The Environmental Protection Agency has announced it will now base new regulations only on the findings of scientific studies whose data and methodology are made public so they can be subjected to independent review. That's a sound move in line with basic scientific transparency and professionalism.

Yet it's being treated as a sign of impending apocalypse by some on the left, which says much about the questionable validity of that group's policy prescriptions.

In an interview with The Daily Caller News Foundation, Administrator Scott Pruitt said the EPA will end its use of studies that do not publish underlying data, only conclusions. "Otherwise, it's not transparent. It's not objectively measured, and that's important," Pruitt said.

In the past, the EPA has advanced air-quality regulations that imposed massive costs based primarily on the findings of two studies done in the 1990s that linked fine particulate pollution to premature death. Neither study made associated data public.

U.S. Rep. Lamar Smith, R-Texas and chairman of the House Committee on Science,

Space and Technology, has long criticized the use of “secret science” and authored legislation to curtail its use by regulators. Last year, Smith said the EPA had “routinely relied on questionable science based on nonpublic information that could not be reproduced, a basic requirement of the scientific method.”

“Americans deserve to see the science for themselves,” Smith said. “If the EPA has nothing to hide, why not make the scientific data it uses for its regulations publicly available? What was the EPA hiding?”

That will strike most people as a fair question. But to some activists, the idea that science should involve review and scrutiny is apparently anathema. In response to a prior effort to ban “secret science” at the EPA, Andrew Rosenberg, director of the Union of Concerned Scientists' Center for Science and Democracy, said transparency would “gut the EPA at the expense of public health and safety.”

That same group has claimed release of data would require publicizing the confidential patient data of individuals. But Steve Milloy, publisher of JunkScience.com and a senior fellow at the Energy and Environmental Legal Institute, notes that California already makes similar data available in its “Public Use Death Files,” and that has been accomplished without violating patient privacy.

Other critics object that there are costs involved in scrubbing data sets so patient privacy is protected. Perhaps, but that doesn't mean the public should be kept in the dark about the data and methods used to justify literally billions in new regulatory burden.

Scientific studies are as susceptible to human error and even outright fraud as any other endeavor — particularly when such studies are used in the political realm. Facilitating transparency and independent review will reduce the chances of bad science harming Americans with half-baked regulations, and should enhance the case for regulations when the underlying science has withstood independent scrutiny.

Given the stakes for public health and the national economy, Americans must be assured government regulations are based on sound science, not someone's “trust me” assurances.

Ken Cuccinelli: Scott Pruitt Leads the Way on Regulatory Rollback

Real Clear Policy
Ken Cuccinelli
March 26, 2018
https://www.realclearpolicy.com/articles/2018/03/26/pruitt_leads_the_way_on_regulatory_rollback_110563.html

This month, the Environmental Protection Agency released its EPA Year in Review for 2017-2018. To call it impressive would be a gross understatement. With Administrator Scott Pruitt leading the charge, the agency has shown unrivaled commitment to carrying out the president's agenda of deregulation.

Before taking over at the EPA, Pruitt was as a leading opponent of regulatory overreach by the agency. As general of Oklahoma, for instance, he dissolved the Environmental Protection Unit and instead created a Federalism Unit to fight President Obama's aggressive regulatory agenda. He brought more than a dozen lawsuits against the EPA, fighting such rules as the Cross State Air Pollution Rule and the Clean Water Rule, and successfully challenging the Clean Power Plan.

Now, as EPA administrator, Pruitt is taking even more direct action and doing so in a cooperative and transparent manner. When Office of Management and Budget Director Mick Mulvaney discussed the deregulation effort at the Conservative Political Action Conference last month, he highlighted the rules that were top priority for the administration's regulatory roll back: the Waters of the United States rule and the Clean Power Plan. Both fall within Pruitt's jurisdiction at the EPA. No surprise that action on EPA regulations has moved to the forefront of the administration's agenda.

From his first days at the agency, Pruitt took steps to facilitate cooperation with the states on environmental

policy. Federalism is an essential principle of American governance, and Pruitt has put this principle into practice. During his first year, Pruitt travelled to 30 states to discuss the EPA's work, personally meeting with 34 governors — Democrats and Republicans — as well as over 350 stakeholder groups. This level of personal involvement is nearly unparalleled, even inside an administration with such a clear focus on deregulation. And it is paying dividends.

The EPA Year in Review booklet is nearly 40 pages long, outlining the regulatory rollback, increased transparency, and government reform measures accomplished in the last year alone. This includes finalizing 22 deregulatory actions and savings of more than $1 billion in regulatory costs, which previously fell on Americans' shoulders. By comparison, a similar document out of the Department of Labor, headed by Secretary of Labor Alexander Acosta, is only four pages long.

As he says in a letter at the front of the EPA Year in Review, Administrator Pruitt "look[s] forward to working together to accomplish even more progress in 2018." We applaud Mr. Pruitt's accomplishments in his first year as head of EPA, and hope that his success provides an example to other agencies. Executive agencies can take the lead on growing the economy by freeing Americans from excessive regulatory burdens. This, the EPA — with Pruitt at the helm — has proven.

Ken Cuccinelli is the Director of the FreedomWorks Foundation Regulatory Action Center.

Subject: EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Calif. looks to cancel coffee cancer warnings

Published: Friday, August 17, 2018

California might create an exemption for coffee that would reverse a court decision requiring cancer warnings.

The Los Angeles Superior Court ruled in March that state law requires the warnings because of the presence of the chemical acrylamide, which is a byproduct of roasting coffee.

Courts' Rejection Of EPA Rule Delays Poses Test For Wheeler's Agenda

EPA's recent court losses in cases undoing implementation delays for two major Obama-era rules create additional legal complications for acting agency chief Andrew Wheeler's agenda, as he faces new pressures to implement regulations that were previously on hold unless the agency can find a rationale to further delay them.

EPA Receives Conflicting Comments On Proposed Lead Dust Rule Update

EPA's proposal to strengthen its 2001 lead paint dust hazard standards is spurring conflicting reactions, with healthy housing groups, environmentalists and some states urging the agency to significantly tighten its standards for protective measures in some locations, though home builders say more data is necessary to ensure the proposal is viable.

EPA Drops Plan To Weigh First Responders' Asbestos Risk, Citing Legacy Use

EPA has dropped an early plan to consider risks of asbestos exposures to firefighters and other first responders due to its policy of excluding legacy uses from consideration for possible regulation under the revised toxics law, a move that is drawing protest from a group representing the workers and highlights the controversy around the policy decision.

Industry Backs EPA's Plan For Narrow Asbestos Analysis, Sparking Clash

The power industry is supporting EPA's narrow approach for assessing the health risks of exposure to asbestos, especially its decision to preclude legacy uses, setting up a clash with critics who say the agency should broadly assess all risks as part of an effort to ban the mineral.

Experts Say OMB, Not EPA, Should Make Any Cost-Benefit Review Updates

Several experts say the White House Office of Management & Budget (OMB) -- or some other interagency process -- should be responsible for any new policies to establish greater "consistency" in cost benefit analysis, rather

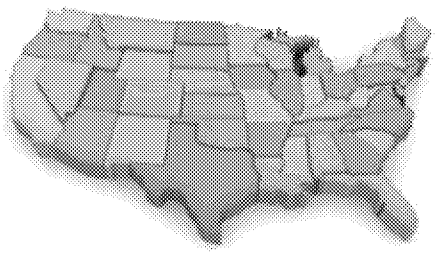
States push for broad TSCA evaluations, despite preemption considerations

Excluded conditions of use face potential state-level action

17 August 2018 / TSCA, United States



State attorney generals have written to the EPA urging it to broaden the scopes of TSCA risk evaluations, even though such an approach could limit their ability to act on those substances. But states are also poised to fill any 'gaps' left from uses omitted from the agency's assessments.

The attorney generals' 3 August letter came in response to the consultation on the agency's 'problem formulations'. These refine the scopes of the assessment the agency is set to conduct on the first ten substances subject to risk evaluation under the law.

Co-signed by attorneys from nearly a dozen states historically active in chemicals management – including California, Vermont and Washington – the letter argues that the scopes reflected in the agency's 'problem formulations' represent an "unlawfully restrictive application of TSCA, [which] ignores that Congress intended for the EPA to assess a chemical in its entirety".

As drafted, the problem formulations would "produce deeply flawed risk evaluations" that would make it impossible for the EPA to fulfil its statutory mandate to protect against unreasonable risks, they say.

And they call on the EPA to issue revised scopes for the risk evaluations to address the agency's "fatally flawed" approach to identifying the conditions of use.

TSCA preemptive effects

The attorney generals' push for more robust assessments comes despite the fact that such an action would, in turn, result in broader preemption of the actions that states can take under the reformed TSCA law.

Outside of certain exemptions (see box), states may not act once the EPA has taken a final action on a substance – either by finalising a risk management rule to address identified risks, or by making an affirmative finding that the substance does not pose a substantial risk.

Crucially, this preemptive effect extends only to the uses of substances that the agency evaluates under its risk evaluations. Any condition of use excluded or missed from its final risk evaluation will then be on the table for states to regulate, if they wish.

Ken Zarker, pollution prevention and regulatory assistance manager at Washington state's Department of Ecology, told Chemical Watch the state is closely monitoring the early evaluations. But with regard to the potential for these to omit certain uses, he said: "We would certainly fill any gaps, as states."

"The more that EPA narrows these scopes, it's going to give the states broader abilities to act where the gaps exist," he said. "We still have that ability, and states can move a lot quicker if we need to."

However, he added that the state would prefer to see "a strong federal system".

Business considerations

Martha Marrapese, a partner with law firm Wiley Rein, told Chemical Watch that this potential for states to act leaves companies with an evaluated substance in an "interesting" position in relation to the uses the EPA includes in its evaluations.

If the EPA evaluates the substance and makes an affirmative finding that it does not pose an unreasonable risk, Ms Marrapese said, then states will be blocked from acting. But for any use the EPA doesn't evaluate, "the states will still have the abilities to regulate themselves, to the extent they're not preempted by other federal laws".

A company might argue that their use of a substance is safe or results in negligible exposure and therefore should be excluded from the assessment, she said. But "the downside to that is if it's not part of EPA's risk evaluation, those companies are still going to be fighting that battle on a state-by-state basis".

"If you believe you have a safe use, it benefits you to have it be part of EPA's risk evaluation", because then states will be preempted from acting, she added.

The problem formulations consultation closed on 16 August. The EPA must finalise its risk evaluations by December 2019.

Preemption: A critical issue

Preemption arose as a critical issue during efforts to negotiate the Lautenberg Act, which amended TSCA in 2016. One of industry's motivations for coming to the negotiating table was to put in place a stronger federal system that would combat the myriad state regulations appearing on chemicals of concern.

TSCA preempts state action on a chemical-specific basis. Final action by EPA on a substance – whether by determining it does not present an unreasonable risk, or by imposing a risk management regulation to address identified risks – blocks states from imposing their own restrictions. This extends only to those uses evaluated by the agency.

There are, however, exemptions. Activities that are not preempted include:

- actions already taken by states before 22 April 2016;
- past or future actions taken under laws that were in effect before 31 August 2003 (which effectively safeguards California's Proposition 65 law);
- information-seeking requirements, such as reporting, monitoring or disclosure rules; and
- most state regulations imposed under water quality, air quality, waste treatment or disposal laws.

States may also seek a waiver to impose restrictions on a substances following final EPA action.

US toxics agency releases final profile for two diisocyanates

17 August 2018 / Built environment, Risk assessment, United States

The US Agency for Toxic Substances and Disease Registry has released its final toxicological profile for toluene diisocyanate (TDI) and methylene diphenyl diisocyanate (MDI).

Both substances are used in many polyurethane household products, including furniture cushions, carpet padding and waterproof sealants. Neither occurs naturally in the environment.

In products such as cushions the diisocyanates are cured and, the report says, consumers are unlikely to be exposed through this route.

Exposure to TDI can occur in the air, though, from products such as adhesives, sealants, coatings, paints, craft materials and insulating foam.

The ATSDR profile, which includes a public health statement, says asthma and symptoms of asthma have been observed in some individuals who are particularly sensitive to the substances.

The public health statement points to research by the Department of Health and Human Services that considers TDI as "reasonably anticipated to be a human carcinogen". It also notes that the International Agency for Research on Cancer (Iarc) classifies TDI as possibly carcinogenic to humans.

On MDI, the statement says there is limited data on whether it can cause cancer. It points out that Iarc has found that the substance is not classifiable as carcinogenic to humans.

In July, the EU's human biomonitoring project, HBM4EU, which aims to harmonise the exposure assessment method, added diisocyanates to its second list of priority substances. In March, Echa's Socio-economic Analysis Committee (Seac) adopted final Opinions on restrictions proposed on the use of diisocyanates in the workplace.

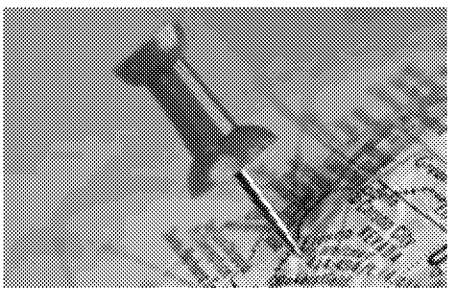
California proposes change to furniture fire safety regulation

Amendment could reduce reliance on flame retardants

17 August 2018 / Built environment, United States



The US state of California is considering an amendment to its flammability regulations, which would eliminate the need for flame retardant use in upholstered furniture designed for public places.

A proposal by the California Bureau of Electronic and Appliance Repair, Home Furnishings and Thermal Insulation (Bearhfti) would remove all reference to Technical Bulletin (TB) 133 from the California Code of Regulations.

This is a standard for furniture intended for public occupancies that seat 10 people or more. It applies to venues such as restaurants, prisons, hotels, churches. hospitals and care homes.

TB 133 includes an open flame test designed to simulate conditions "typical of arson or incendiary fires or common accidental fires in public buildings", and is typically met through the use of flame retardants.

'Unnecessary health risks'

According to a notice of proposed change by Bearhfti, TB 133 is "a redundant test standard that causes confusion within the industry and presents unnecessary health risks".

The proposed regulatory action is projected "to lower costs of upholstered seating furniture used in public buildings and reduce the need for flame retardants in component materials," the document continues.

Also, it says the action is anticipated to "improve public health by reducing exposure to carcinogenic organohalogen flame retardants".

If the proposal to remove reference to TB 133 is adopted, it would also remove labelling requirements for upholstered seating furniture meeting TB 133.

Manufacturers would instead have to comply with the California upholstered furniture flammability standard, TB 117-2013, which requires a smoulder-resistance test that can more readily be met without the use of flame retardants.

Members of the public are invited to submit comments about the proposal in writing to Bearhfti. A public hearing about the proposed amendment will take place on 17 September.

Industry view

David Panning, technical services director at the Business and Institutional Furniture Manufacturers Association (Bifma), said its members are "very supportive of California repealing the TB 133 regulation".

He added that "the scientific community is very concerned about the use of fire retardant chemicals to meet TB 133" because of the associated health risks.

But the North American Flame Retardant Alliance (Nafra) insists the use of flame retardants is important to ensure the safety of public spaces.

"Fire-related fatalities and injuries associated with upholstered furniture are among the most serious fire problems in the US, and this proposal would reduce the fire safety standard for furniture," a spokesperson told Chemical Watch.

National action

In October last year, the city of San Francisco, California banned the sale of upholstered furniture and children's products containing flame retardant chemicals. The law is due to go into effect in January 2019.

More than a dozen US states have banned some categories of flame retardants and many more are considering legislation to restrict their use.

On a national level, the Consumer Product Safety Commission (CPSC) voted in September last year to ban the use of organohalogen flame retardants in furniture and several other household product categories. The CPSC plans to make a decision next year on whether to adopt California's TB 117-2013 as a national flammability standard for residential upholstered furniture.

Subject: Morning Energy: Spotlight on FERC at Pro summit — Hitching a ride on the 'minibus' — 'Secret science' out in the open

By Kelsey Tamborrino | 07/17/2018 05:43 AM EDT

With help from Emily Holden, Anthony Adragna, Colin Wilhelm and Darius Dixon

SEE YOU THERE: Today's the day — POLITICO Pro is hosting its second annual Pro summit, featuring one-on-one conversations with newsmakers across the policy landscape, including two sessions on energy.

FERC Commissioner Cheryl LaFleur will sit down this afternoon with our own Darius Dixon, before the regulatory body is deadlocked next month following the exit of GOP Commissioner Rob Powelson. LaFleur, a Democrat, has served under presidents from both parties and experienced the agency in almost every configuration — whether it has all five commissioners in place, or just one. There's no shortage of topics to chew over: the potential impact of an Energy Department coal and nuclear rescue plan, the heated rhetoric against states that stand in the way of pipelines, and whether FERC is "on the wrong side of history" when it comes to climate change. Darius' interview with LaFleur starts around 2 p.m.

Also on tap: California Air Resources Board Chairwoman Mary Nichols, Murray Energy CEO Bob Murray and the Council on Foreign Relations' Amy Myers Jaffe will participate in a panel this morning on America's "energy future." Nichols, for one, has been heavily involved in discussions with the Trump administration over car rules that the White House is considering rolling back. Expect questions related to the administration's efforts to pare back regulations and increase oil, gas and coal production — and an in-depth conversation on what that means for free market forces and renewables.

See the full agenda here and watch the livestream here.

WELCOME TO TUESDAY! I'm your host, Kelsey Tamborrino. Citizens' Climate Lobby's Brett Cease was first to correctly identify the two presidents who threw out the first pitch at an All-Star game in D.C.: Franklin D. Roosevelt in 1937 and John F. Kennedy in 1962. For today: Which state or states have just one consonant in its spelling? Send your tips, energy gossip and comments to ktamborrino@politico.com, or follow us on Twitter @kelseytam, @Morning_Energy and @POLITICOPro.

JUST RELEASED: View the latest POLITICO/AARP poll to better understand Arizona voters over 50, a voting bloc poised to shape the midterm election outcome. Get up to speed on priority issues for Hispanic voters age 50+, who will help determine whether Arizona turns blue or stays red.

HITCHING A RIDE ON THE 'MINIBUS': The House Rules Committee late Monday made 70 amendments to the EPA and Interior title of the spending minibus, H.R. 6147 (115). The amendments focus on blocking a host of Obama-era environmental regulations even as the Trump administration is in the process of rolling back many of those. Some of the amendments that caught ME's eye:

— **Diesel emissions grants:** Rep. Gary Palmer's amendment would eliminate the popular bipartisan Diesel Emissions Reduction Grant program used to retrofit diesel engines like those in school buses,

— **WOTUS:** Rep. Don Beyer's amendment would remove language blocking the Obama administration's Waters of the U.S. regulation,

— **Obama-era methane rule:** Rep. Markwayne Mullin's amendment would block enforcement of the Obama-era regulation aimed at curbing methane emissions from new oil and gas sources, which the Trump administration is already reconsidering,

— **Social cost of carbon:** Another amendment from conservatives would bar the use of the social cost of carbon in rulemakings,

— **Trailer efficiency:** Reps. Barry Loudermilk and Morgan Griffith's amendment would bar EPA from applying stricter fuel efficiency and greenhouse gas emissions standards to certain truck trailers,

— **Chesapeake Bay:** Rep. Bob Goodlatte's effort would limit EPA's ability to go after states that miss Chesapeake Bay cleanup milestones,

— **Ozone:** Rep. Glenn Grothman's amendment would block implementation of EPA's 2015 tightened ozone standard,

— **Coal ash:** A Democratic amendment would block the Trump EPA from visiting an Obama-era coal ash regulation,

— **Endangered Species Act riders:** Several measures would bar the administration from issuing or enforcing Endangered Species Act rules relating to species like the lesser prairie chicken and Preble's meadow jumping mouse,

— **Attorney fees:** An amendment from Reps. Jason Smith and Greg Gianforte would block attorney fees from being awarded in any Clean Air Act, Clean Water Act or Endangered Species Act settlement, and,

— **Inspectors general:** Nothing related to former Administrator Scott Pruitt was made in order, but the House will consider an amendment from Rep. Raúl Grijalva that would increase the budget of the Interior Department's inspector general by $2.5 million.

Read the full list of amendments made in order to the measure here.

'SECRET SCIENCE' OUT IN THE OPEN: EPA's controversial proposal to consider only research with publicly available data gets a public hearing at agency headquarters today starting at 8 a.m. Nearly 70 health, medical, academic and science groups — including the American Lung Association, American Heart Association, American Medical Association and American Academy of Pediatrics — oppose the plan, which they say could hamstring public health and environment protections.

EPA's Science Advisory Board voted unanimously to review the proposal, which Pruitt said was meant to bolster transparency. Paul Billings, national senior vice president of advocacy at the American Lung Association, called the rule a "coordinated effort to ignore the science that is inconvenient to the EPA's agenda," and compared it to lobbying efforts by the tobacco industry in the 1990s to exclude studies that showed secondhand smoke could kill.

What's at stake? The proposal could move forward quickly enough to allow EPA to roll back certain air quality standards currently under review. According to the Natural Resources Defense Council, the plan could undercut computer models meant to test chemicals under the new Toxic Substances Control Act and could toss

out landmark studies that relied on personal health records following extraordinary events, including when Hiroshima and Nagasaki victims were tested over time to find out the effects of radiation on humans.

The meeting will run until 8 p.m. or an hour after the last of more than 100 registered speakers has commented. Speakers, aside from many environment and public health groups, include the American Petroleum Institute, the U.S. Chamber of Commerce, the American Chemistry Council, FreedomWorks Foundation and climate science critic Steve Milloy. Dan Byers of the Chamber of Commerce's Global Energy Institute is expected to applaud the agency's efforts and commend EPA for going through the formal public comment and rulemaking process. "It is one thing to be cavalier about transparency principles when their application has little or no import to public policy, but federal rules that impact millions of people and billions of dollars should be held to a higher standard," he is expected to say. Also registered are Reps. Paul Tonko, Suzanne Bonamici and Dan Lipinski. Comments can be submitted until Aug. 16.

Related reading: Competitive Enterprise Institute senior fellow Angela Logomasini looks at the science transparency rule in analysis published today. "The rule is actually far more modest and flexible than depicted by its critics, and its goals are in fact achievable," Logomasini writes. Read it here.

FOR THE RECORD: The House Rules Committee meets at 3 p.m. this afternoon to formulate a rule on an anti-carbon tax resolution, H. Con. Res. 119 (115), that calls a tax on carbon released from fossil fuels "detrimental to the United States economy." The Rules panel will tee up a vote later this week on the resolution, which is led by Majority Whip Steve Scalise and would put a range of lawmakers — most notably the Climate Solutions Caucus — on the record on the issue.

WHERE'S ZINKE? Interior Secretary Ryan Zinke will deliver remarks this morning at the first meeting of the "Made in America" Outdoor Recreation Advisory Committee. The committee is tasked with advising the secretary on "public-private partnerships across all public lands, with the goal of expanding access to and improving infrastructure on public lands and waterways." See the meeting agenda.

AMERICA'S PLEDGE STILL WORKING ON PLEDGES: Michael Bloomberg and California Gov. Jerry Brown, the co-chairs of climate organization "America's Pledge," have unveiled a preview of the report they will release at the Global Climate Action Summit in San Francisco in September, detailing "bottom-up" opportunities for climate action sans federal leadership. The list is familiar: boosting renewables, accelerating coal retirements, retrofitting buildings for energy efficiency, electrifying building energy use, accelerating electric vehicle adoption, phasing out HFCs, preventing methane leaks at the wellhead, reducing methane leaks in cities, reducing emissions from land and starting carbon markets.

Vice Chairman Carl Pope said the group still plans to debut a quantitative analysis outlining what state and local governments are already doing, what they have committed to and what they are keying up. "We have every reason to believe the rest of the world is watching this very closely," Pope said, noting that the U.N.'s top climate official, Patricia Espinosa, mentioned the group and summit by name at the Vatican earlier this month. Read it here.

ESA GETS ITS DAY: Proposed tweaks to the Endangered Species Act will be front and center at a Senate Environment and Public Works hearing this morning. The hearing will feature testimony from Wyoming Gov. Matt Mead, Colorado Parks and Wildlife's Bob Broscheid and Virginia's Secretary of Natural Resources Matthew J. Strickler, and will focus on a discussion draft released by Chairman John Barrasso earlier this month aimed at changing the statute. **If you go:** The hearing kicks off at 9:45 a.m. in 406 Dirksen. Livestream here.

TAKEN BY STORMWATER: The House on Monday passed by voice vote H.R. 3906 (115), the Innovative Stormwater Infrastructure Act of 2017, which would "establish centers of excellence" for stormwater control infrastructure. The legislation, introduced last year by Democratic Rep. Denny Heck, directs EPA to create a

stormwater infrastructure funding task force to make recommendations on the availability of public and private funding for stormwater infrastructure.

DOE ISSUES FIRST TRIBAL LOAN GUARANTEE: The Energy Department will issue its first solicitation for the Tribal Energy Loan Guarantee Program today. The program provides up to $2 billion in partial loan guarantees to support energy development in Native American and Alaska Native communities. According to DOE, today's solicitation marks more than $40 billion in energy infrastructure loans and loan guarantees from DOE's Loan Programs Office in five areas.

HOUSE PANEL TO HOLD GRID HEARING: House Natural Resources will hold a hearing on July 25 on Puerto Rico's electric grid recovery and possible improvements to make it more efficient and resilient to future hurricanes. On top of the devastation caused by Hurricane Maria last year, Puerto Rico's electric utility owes bondholders $9 billion, and most of its leadership departed last week after clashes with Gov. Ricardo Rosselló over executive compensation and political control of the utility, which is quasi-governmental.

MAKING THE GRADE: The Environment America Research & Policy Center is out today with its state-by-state report card, "Renewables on the Rise," which details increases in solar, wind, energy efficiency, electric vehicles and battery storage. The report says the U.S. now produces almost six times as much renewable electricity from wind and solar than it did in 2008. It also found that in March of last year, wind and solar produced 10 percent of the United States' electricity — marking a first. On the state level, the report said California, Arizona, North Carolina, Nevada and Texas saw the greatest total increases from 2008 until 2017 in solar energy generation. See the report here and a state-by-state interactive map here.

YOU DOWN WITH TIP? A bipartisan group of four senators wrote to Energy Secretary Rick Perry on Monday in support of the Western Area Power Administration's Transmission Infrastructure Program, which was axed under the Trump administration's fiscal 2019 budget proposal. "TIP is one of the few federal programs that directly supports new and upgraded electric transmission," according to the letter, signed by Sens. Catherine Cortez Masto, Martin Heinrich, Dean Heller and Cory Gardner.

HOUSE PLANS FLOOD INSURANCE VOTE: The House is planning to vote next week to extend the National Flood Insurance Program, ahead of its July 31 expiration, sources familiar with the matter tell Pro Financial Services' Zachary Warmbrodt. There are already a few options on the table for the program: one from Financial Services Chairman Jeb Hensarling, who has been trying to put together an extension bill that includes reforms, and a new bill introduced by Scalise and Rep. Tom MacArthur that would reauthorize the program through Nov. 30. Read more.

FOR YOUR RADAR: Republican Sen. Chuck Grassley introduced bipartisan legislation on Monday targeting price fixing by OPEC. The bill would amend the Sherman Act to make oil-producing and exporting cartels illegal, and was co-sponsored by Sens. Amy Klobuchar, Mike Lee and Patrick Leahy . "It's long past time to put an end to illegal price fixing by OPEC," Grassley said in a statement. Read the legislation here.

MAIL CALL! National Rural Electric Cooperative Association CEO Jim Matheson sent a letter to the leadership of the Energy and Commerce Environment Subcommittee on Monday in support of legislation to reform the New Source Review permitting program.

— **More than 100 Democrats** signed onto a letter to members of both House and Senate Armed Services committees today to urge them to oppose any provisions to the National Defense Authorization Act that would "have widespread, negative consequences for the conservation of our imperiled wildlife and public lands." Read the letter here.

— **Iowa's congressional delegation** invited acting EPA Administrator Andrew Wheeler to their state to discuss the Renewable Fuel Standard. Read it here.

What role will Hispanic voters over 50 play in Arizona this Fall? Read POLITICO Magazine's new series "The Deciders" which focuses on this powerful voting bloc that could be the determining factor in turning Arizona blue.

House plans vote to keep flood insurance program going Back

By Zachary Warmbrodt | 07/16/2018 06:49 PM EDT

The House is planning to vote next week to extend the National Flood Insurance Program before leaving town ahead of the program's July 31 expiration, sources familiar with the matter said.

House Financial Services Chairman Jeb Hensarling (R-Texas) has been trying to put together an extension bill that includes reforms, sources said. Another option is a new bill introduced by House Majority Whip Steve Scalise (R-La.) and Rep. Tom MacArthur (R-N.J.) that would reauthorize the program through Nov. 30.

In a statement, Scalise said it was important to keep working on a long-term flood insurance reauthorization but that his bill would take concerns about a lapse off the table for the remainder of hurricane season.

While the House has passed a five-year reauthorization and overhaul, the Senate hasn't reached agreement on its own bill amid disputes over how to retool the program. It's unclear if the Senate would be able to pass anything other than a clean, short-term reauthorization at this stage. Sources said Sen. John Kennedy (R-La.) was planning to try to hotline an extension through January.

Pruitt Heads to the Hill • Pompeo, Macron and Merkel • Colorado River Battles

Posted: Apr 23, 2018, 6:30 AM EDT

By Chuck McCutcheon

Scott Pruitt won't be inside his soundproof phone booth, or have bodyguards as a buffer, when he sits down before lawmakers this week.

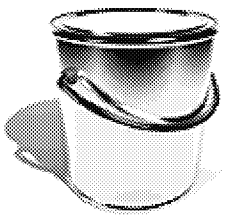
The EPA administrator is scheduled to appear Thursday before the House Energy and Commerce energy panel, then head to the House subcommittee that controls his agency's spending. Pruitt has only made a handful of appearances before Congress, so members of both parties have lots of questions.

EPA Administrator Scott Pruitt speaks during a recent interview. EPA Administrator Scott Pruitt speaks during a recent interview. Photographer: Andrew Harrer/Bloomberg via Getty Images

Among the issues drawing questions: The installation of the $43,000 booth and whether bodyguards went with him to Disneyland and the Rose Bowl.

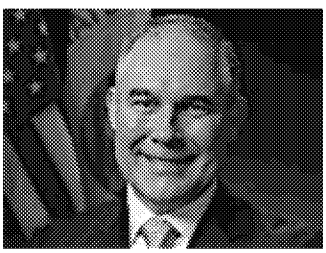
Both have stirred controversy and jump-started investigations—along with Pruitt's unorthodox $50-per-night rental of a Capitol Hill bedroom from a lobbyist, his frequent trips to his home state of Oklahoma, and what one ex-aide has described as a practice of retribution against EPA workers who challenge the administration. Abby Smith is covering.

EPA Lead Paint, Soil Standards Need Work by June: Adviser



The Environmental Protection Agency hasn't conducted extensive reviews of its lead paint and lead-in-soil standards, which a federal court has ordered it to either update or justify by June, an agency adviser said April 19.

Pruitt Moving Again to Change the Way EPA Uses Science (1)



Snapshot

• Pruitt previously told Bloomberg News that agency should rely only on science where data is publicly available

• EPA in 2017 estimated similar open data policy would bar 95 percent of studies it relies on

By Patrick Ambrosio

EPA Administrator Scott Pruitt is taking another step toward changing how the agency uses science.

The White House Office of Management and Budget is reviewing a proposal that aims to strengthen the "transparency and validity" of the science the Environmental Protection Agency uses to support its regulatory decisions, according to

the office's website. OMB's review, typically one of the final steps before a proposal is released for public review, started April 19.

There are no details on what's included in the proposal, but Pruitt told Bloomberg News in March that the EPA should rely on science that is "very objective, very transparent, and very open." He raised concern about third-party research where the underlying data isn't public.

"That's not right," Pruitt said in March. "The methodology and data need to be a part of the official record—the rulemaking—so that you and others can look at it and say, 'Was it wisely done?'"

Researchers and environmental advocates told Bloomberg Environment that such a policy could severely limit the data the agency considers when it regulates everything from drinking water and air quality to pesticides. Some EPA staff agree: The agency in 2017 told the Congressional Budget Office that similar open data requirements would limit usable studies by 95 percent.

"The policy is still being developed," EPA spokesperson Liz Bowman said in an April 20 statement emailed to Bloomberg Environment. "It's important to recognize that Administrator Pruitt believes all Americans deserve transparency, with regard to the science and data that's underpinning regulatory decisions being made by this Agency."

Pruitt's goal is similar to that in legislation (H.R. 1430) that House Science and Technology Committee Chairman Lamar Smith (R-Texas) introduced, which would require the EPA to base its regulatory decisions on data that's publicly available and substantially reproducible.

Last year, Pruitt barred scientists who receive EPA grants from serving on agency advisory panels, citing conflicts of interest. That policy affected many members of the EPA's advisory panels, including a panel that reviews the science backing national air quality standards, who either left or had to relinquish their grants.

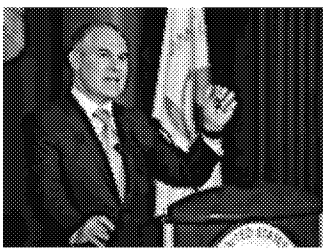
Pruitt's $43,000 Soundproof Phone Booth Started More Modestly



Snapshot

• Agency staff authorized most expensive rush job option

• Higher budgets approved as scale of project mushroomed

By Jennifer A. Dlouhy

In the beginning, it was supposed to be just a secure telephone line.

But over the course of four months last year, that phone line destined for the office of Environmental Protection Agency Administrator Scott Pruitt morphed from a no-more-than $13,500 project into a $43,000 privacy booth, complete with silenced ventilation and "noise-lock" paneling to keep conversations from being overheard, according to documents obtained by Bloomberg News.

The documents, including purchase requisition forms and email correspondence, add another element to the portrait emerging about Pruitt's spending habits at the agency. They also illustrate some staff unease with the purchase as the scale of the project grew and costs mushroomed.

Just one month into the project, on June 28, 2017, Gayle Jefferson, the director of the EPA's facilities management and services division, confided to colleagues: "The secure room for the administrator appears to be taking on a life of its own."

EPA spokesman Jahan Wilcox said that "Administrator Pruitt simply requested a secure phone line but never asked for a soundproof booth, nor did he have knowledge of its purchase."

Role of Career Staff

"As required by law," Wilcox added, "career EPA employees authorized the purchase and installation."

The documents obtained by Bloomberg News do not capture verbal conversations; they contain electronic communication and may be incomplete. From the documents alone, it is impossible to verify the scope of the initial phone line request or know whether Pruitt and other political appointees ever encouraged a more elaborate project.

Pruitt's soundproof phone booth—installed a few floors up from another secure telecommunications center in the same Washington building—is drawing scrutiny from lawmakers, the White House and the EPA's inspector general. Pruitt is already under fire for other spending—including pricey first-class travel—and his unorthodox $50-a-night rental of a bedroom in a Capitol Hill condominium from a lobbyist last year.

Appropriations Law

Earlier this week, the Government Accountability Office concluded the EPA violated an appropriations law by failing to tell Congress about the planned telecommunications booth purchase, since advance notification was required when spending more than $5,000 to furnish or redecorate an agency head's office.

The GAO also said the EPA ran afoul of the Antideficiency Act, a measure prohibiting federal agencies from spending government funds in advance or in excess of an appropriation. Career officials within the EPA's Office of General Counsel had concluded the phone booth purchase—like other approved spending on biometric locks—did not need to be reported to Congress.

The documents obtained by Bloomberg News show the heavy role played by career officials who have purchasing power—and suggest political appointees without the authority to approve acquisitions were less involved.

A July 6, 2017 calendar invite to discuss the status of a "secure communication room for the administrator" included roughly two dozen career EPA employees and one political appointee: former Deputy Chief of Staff Kevin Chmielewski.

Costs Ballooned

EPA officials seeking bids for the project initially estimated a privacy booth would cost $13,500 on a July 24, 2017 requisition form. Another $11,500 was added on Aug. 17, and an additional $570 was included on Aug. 23 as the staff closed in on a final vendor. That $25,570, including a $1,000 after-hours delivery charge, was just for the booth itself;

total costs ballooned to $43,000 after prep work and installation, including leveling a concrete floor to insert the pre-fabricated steel box.

Former Assistant Deputy Chief of Staff Reginald Allen—who had the top career post in the EPA—sent booth costs of $24,570 to Chmielewski on Aug. 23, adding that he was waiting for an estimate for the floor from Jefferson's team. Another email says funding was being handled by Allen's office.

Different Options

At one point, EPA staff considered four different options for the booth purchase, ranging from $20,560 for a standard delivery that could take three months to their ultimate choice: a rush job in less than half the time with a $24,570 price tag.

Chmielewski and Allen did not respond to requests seeking comment. Chmielewski told lawmakers he was put on leave after refusing to retroactively approve first-class travel for one of Pruitt's top aides. And Allen has been reassigned.

The staff realized the project would draw attention on Sept. 27, when an acquisition manager warned Allen: "Just wanted to give you a heads up that the booth made it to the news." While "it is a legal purchase," the manager said, it "will be scrutinized."

Allen responded that the requirement to "speed delivery" came from Chmielewski and Pasquale Perrotta, the special agent in charge of Pruitt's protective detail, who has justified other spending in the name of protecting the administrator. "They must address any questions or concerns," Allen said.

EPA Floats 'Secret Science' Ban Rule, Signaling Possible Internal Fixes

EPA has sent for White House review a proposed rule to increase the transparency of regulatory science, advancing Administrator Scott Pruitt's controversial efforts to ban the use of "secret science" in a move that suggests officials have

addressed at least some internal concerns that such a policy could violate statutory protections of medical privacy and trade secrets.

EPA sends 'secret science' plan to White House

Sean Reilly, E&E News reporter

Published: Friday, April 20, 2018

EPA headquarters in Washington. Claudine Hellmuth/E&E News

EPA yesterday sent a proposed rule to the White House Office of Management and Budget with the announced purpose of "strengthening transparency and validity in regulatory science," according to the RegInfo.gov site.

The proposal appears to be a concrete step toward restricting the types of scientific research that EPA officials can use in crafting new regulations. The proposal was not listed on EPA's latest semiannual regulatory agenda, and agency press aides did not respond to an emailed request for more information this morning.

"We need to make sure their [scientists'] data and methodology are published as part of the record," EPA Administrator Scott Pruitt told *The Daily Caller*, a conservative news outlet last month, in an article that the agency later distributed as a news release. "Otherwise, it's not transparent. It's not objectively measured, and that's important."

Wheeler sworn in

Kevin Bogardus, E&E News reporter

Published: Friday, April 20, 2018

EPA Deputy Administrator Andrew Wheeler shakes hands with Administrator Scott Pruitt this morning after being sworn in to the position.

Andrew Wheeler has officially joined EPA as its new No. 2.

Wheeler was sworn in this morning as the agency's deputy administrator.

"Glad to give a warm welcome to Andy Wheeler this morning," Administrator Scott Pruitt said in a tweet today.

Pruitt added the two looked forward to working together to advance President Trump's "agenda of regulatory certainty & environmental stewardship" at EPA.

CHEMICAL WATCH ARTICLES

Turkey adds benzyl cyanide to substances subject to import control

23 April 2018 / Substances of concern, Turkey

Turkey has added phenylacetonitrile (benzyl cyanide) to the list of hazardous chemicals and mixtures subject to import controls.

The substances on the list are deemed harmful to human health and require special permission from the Ministry of Health before they can be imported into the country.

The amendment was published in Turkey's *Official Gazette* on 14 April. It became effective immediately.

Echa says the substance is fatal if inhaled, toxic if swallowed and toxic in contact with skin, according to the classification provided by companies in REACH registrations.

It is used as an intermediate for a variety of compounds, including pharmaceuticals and other types of drugs.

MINNESOTA

May 15, 2018

The Honorable E. Scott Pruitt, Administrator
U. S. Environmental Protection Agency
1200 Pennsylvania Avenue NW
Mail Code 1101A
Washington, D.C. 20460

Re: Comments regarding the U.S. Environmental Protection Agency's proposed rule, "Strengthening Transparency in Regulatory Science", published April 30, 2018 at 83 FR 18768, Docket ID No. EPA-HQ-OA-2018-0259

Dear Administrator Pruitt:

The Minnesota Pollution Control Agency (MPCA) and Minnesota Department of Health (MDH) are deeply disappointed in, and troubled by, the U.S. Environmental Protection Agency's (EPA) proposed rule, "Strengthening Transparency in Regulatory Science," published April 30, 2018, at 83 FR 18768, under Docket ID No. EPA-HQ-OA-2018-0259. This proposed rule to "strengthen transparency" does not provide transparency or clarity at all — rather, it causes confusion and mistrust, and it will threaten the lives of real people. EPA should withdraw this dangerous proposal.

As regulatory agencies whose missions are to protect and improve Minnesota's environment and human health, the MPCA and MDH are appalled by the specious and brazen attack on health sciences research and the field of epidemiology. The proposed rule was clearly designed to undermine and disparage the important epidemiological studies that support public health protection from all pollutants, be they in the air, water, or soil. Simply stated, the proposal was written with the intent to cast doubt on EPA's prior judgement of, and dependence on, health research – and to create suspicion significant enough to deter future use of health-based studies in regulatory decision-making. EPA's proposal flagrantly ignores the reasons for the privacy of health data used for epidemiological studies. Privacy of health data is a foundational ethic for the medical and health science research fields.

While nothing in the proposed rule compels disclosure of personal identifying information (e.g., name, address), disclosure of analytic data sufficient to fully replicate study analysis would effectively breach confidentiality requirements upheld by public and private research through Institutional Review Boards (IRB). It is well documented that privacy assurances are essential to including people in health studies.

From a risk assessment perspective, not including epidemiology studies in regulatory science is not sound or prudent. Laboratory, toxicology, and epidemiology are complementary and necessary pieces of understanding and quantifying effects of a pollutant on human health. Excluding evidence from one of these three essential disciplines threatens the science basis for regulatory decisions and actions. The proposed rule would put regulators tasked with protecting human health in an impossible situation of relying primarily on animal models or in-vivo models that cannot be directly extrapolated to human dose-response estimates.

Minnesota supports open data access and is a national leader in science and regulatory transparency. Our agencies are at the forefront of making environmental and health surveillance data available, providing technical assistance for using data, and engaging partners across communities and research institutions

around effective dissemination and data utilization. Our agencies host multiple platforms for accessing high-quality health surveillance and environmental monitoring data, while protecting privacy and providing essential risk communication and prevention strategies. Detailed data are similarly available for research uses, under the approval and guidance of state IRBs.

Based on the lack of meaningful information and articulated or demonstrated need for the proposed rule, EPA has not made the case for a new regulation at 40 CFR Part 30.

The promulgation of this proposed rule would set a dangerous and potentially life-threatening precedent regarding the use of health-based data, modeling, and research in regulatory decision-making. As proposed, the rule is arbitrary, capricious, unethical, and intellectually dishonest. The EPA should immediately announce that it is withdrawing this proposal.

Our agencies will be submitting additional, substantive comments to the rulemaking record.

Sincerely,

John Linc Stine, Commissioner
Minnesota Pollution Control Agency
520 Lafayette Road
St. Paul, Minnesota 55155

Jan Malcolm, Commissioner
Minnesota Department of Health

Subject: Morning Energy, presented by the National Rural Electric Cooperative Association: Where in the world is Rick Perry? — Pressure mounts to call Pruitt before EPW — BLM to hold ANWR hearing

By Kelsey Tamborrino | 06/15/2018 05:42 AM EDT

With help from Alex Guillén

WHERE IN THE WORLD IS RICK PERRY? The Energy secretary will confer with his G-20 counterparts today in Bariloche, Argentina, while he attends the second meeting of the Energy Transitions Working Group. Perry will participate in ministerial sessions and other bilateral meetings to discuss international energy challenges and solutions, according to DOE. The G-20 has described today's confab as discussions of "public policies to help promote transitions towards more flexible, more transparent and cleaner energy systems."

Much like the G-7 of last week, the summit will close with all nations signing onto a joint communique that outlines the energy chiefs' agreements. (You can watch the press conference here .) Since the agenda is prioritizing, among other things, "the lowering of inefficient subsidies to fossil fuels," ME is guessing Perry's not going to be any happier than President Donald Trump was in Canada last week given his push to prop up struggling coal power plants in the U.S. For his part, Perry has pitched Trump's "energy dominance" commitment before on an international stage, including ramping up natural gas and oil exports. ME will also be watching to see how Perry handles issues related to climate change.

The Paris climate agreement cast a shadow over last year's G-20 summit, where the president isolated himself from other nations on the issue. Just last week, Trump said the U.S. would not sign onto the G-7 communique in Canada because of trade concerns. And of course Trump has already promised to pull the U.S. out of the Paris accord, so the U.S. instead would only commit to "strengthen the world's collective energy security, including through policies that facilitates open, diverse, transparent, liquid and secure global markets for all energy sources."

IT'S FINALLY FRIDAY! I'm your host Kelsey Tamborrino, and Entergy's Rob Hall was the first to identify all four baseball teams former Kentucky Sen. Jim Bunning played for: the Detroit Tigers, Philadelphia Phillies, Pittsburgh Pirates and Los Angeles Dodgers. Now for something completely different: What was the name of the first pet cow former President William Howard Taft brought with him to the White House? Send your tips, energy gossip and comments to ktamborrino@politico.com, or follow us on Twitter @kelseytam, @Morning_Energy and @POLITICOPro.

POLITICO will be reporting from inside the World Gas Conference June 25 - June 29. Sign up now for our pop-up conference newsletter to receive on-the-ground insights and information every afternoon from POLITICO Pro Energy Editor Matt Daily.

Join Pro subscribers, expert reporters and key decision-makers from the executive branch, federal agencies and Congress for a full day of incisive policy conversations on July 17. Speakers include: Rep. Joe Crowley (D-N.Y.), Chairman, House Democratic Caucus, Kevin McAleenan, Commissioner, U.S. Customs and Border Patrol, and others. Register today.

WOTUS TO OMB TODAY: EPA Administrator Scott Pruitt will send the Waters of the U.S. rewrite to the Office of Management and Budget today, the administrator confirmed in a tweet. "In keeping w/ @POTUS's promise, we have stopped the 2015 #WOTUS rule & I just announced to folks in Lincoln that a much more reasonable #WOTUS rule will be sent to OMB tomorrow," he said Thursday. "Time to provide farmers & ranchers nationwide w/ regulatory certainty!" Pruitt discussed the new WOTUS rule at a roundtable discussion with Nebraska farmers on Thursday, where he said the agency will release "a back to the basics" rule that doesn't reinterpret the Clean Water Act, according to a reporter from the Lincoln Journal Star who attended.

WILL HE OR WON'T HE? Several GOP senators are pressing for an oversight hearing for Pruitt, Pro's Anthony Adragna reports. Pressure is mounting for the Environment and Public Works Committee to call on the administrator to discuss his ever-growing number of ethics scandals. On Thursday, three more Republicans — Shelley Moore Capito (W.Va.), Roger Wicker (Miss.) and Dan Sullivan (Alaska) — echoed Jim Inhofe and Joni Ernst's call for Pruitt to return to their committee for the first time since January.

"The policies that the administrator has moved forward on have really reaped a lot of benefits in terms of job creation in my state on the energy side, but it just seems like things keep cropping up, so I would agree with Sen. Inhofe," Capito told POLITICO. Chairman John Barrasso told Anthony, however, he still had "no immediate plans" to call Pruitt back before his committee. Read more.

BARRASSO WANTS MORE MONEY FOR EPA IG: The Senate Appropriations Committee on Thursday voted for a bill that would keep funding for EPA Inspector General Arthur Elkins at $50 million next year, but Barrasso says he will push for more money. "The EPA's Inspector General requested $62 million," Barrasso told ME in a statement. "I'd like to get as close as possible to that amount. I will continue to work with the Senate Appropriations Committee to get the Inspector General the funding he needs." Elkins said earlier this year that his current budget simply isn't cutting it — and that was before his office opened many of its ongoing probes into Pruitt. The Senate bill could hit the floor sometime this summer, which would be the next opportunity to amend it.

THE UNION PERSPECTIVE: John O'Grady, the president of AFGE Council #238 that represents more than 8,000 EPA workers, told reporters this week the administration is "just beginning to start the real attacks on the unions," citing recent executive orders weakening the influence of government unions and making it easier for agencies to fire civil servants. Asked about Pruitt, O'Grady said people within the agency are "disgusted" by the administrator, and the "almost daily" drip of scandals that would get any one else fired. "It's discouraging that the person that's supposed to be leading the agency that is dedicated to protecting human health and the environment is a person that apparently lacks basic ethical values," he said. "He is making a laughingstock out of his own party as far as I'm concerned and certainly out of this country."

WHITE HOUSE MOVING ON AUTO REGS: The White House Office of Information and Regulatory Affairs will meet with the Alliance of Automobile Manufacturers and the California Air Resources Board as part of the next round of discussions on fuel efficiency standards, Reuters reports. Officials will meet with the automakers trade group and CARB separately before unveiling the administration's proposal to reverse rules aimed at increasing fuel efficiency, participants told the news outlet. The plan is expected to be made available for public comment later in June or July, and point toward freezing requirements at 2020 levels. Read more.

NOMS: Trump said Thursday he intends to make Dan Simmons the permanent head of the Energy Department's energy efficiency and renewable energy office, where he's been for more than a year already. Simmons became EERE's principal deputy assistant secretary on May 1,2017, after working on Trump's DOE transition and beachhead teams, Pro's Darius Dixon reports.

BLM'S FRIDAY HAPPY HOUR? Those wishing to speak today at Bureau of Land Management's scoping meeting on drilling lease sales in the Arctic National Wildlife Refuge will have to face the luck of the draw — and probably skip the rest of their Friday night plans.

The final public meeting on the environmental impact statement for oil exploration on the coastal plain of ANWR kicks off at 4:30 p.m. at the National Housing Center. The meeting with begin with a brief presentation, with speakers set to speak at 5 p.m. and general public comments running from 6:30 until 9 p.m. The public comment, BLM said , will be chosen at random. "We anticipate there will be more speakers than time available for public testimony," said acting BLM Alaska State Director Karen Mouritsen in a statement, justifying that a random drawing would ensure "we hear from a sampling of views from all who attend." The agency also noted it will accept public comment through other means up until Tuesday. The agency wouldn't say whether it has taken this approach to public comment before.

Expect some protests: Subhankar Banerjee, a professor at the University of New Mexico, said he will attend today's meeting, after signing onto a letter this week with fellow academics that called attention to the biological, cultural and climate impacts of drilling in ANWR. Having spent more than 20 years studying the area, he told ME that the particular area of ANWR is one of the most biologically diverse nurseries in the world. BLM's scoping process is "absolutely unreal," Banerjee said, and he pointed out that although BLM held various meetings in Alaska on the lease sales, today's meeting is the only one in the contiguous U.S. "This timeline is inappropriate," he said. "Who is going to show up on a Friday evening?"

— **Gwich'in leaders and conservationists will hold a rally** at 4 p.m. outside of the hearing, where Alaska Wilderness League's Kristen Miller said 150 to 200 people are expected to attend. Speakers at the rally will include League of Conservation Voters' Gene Karpinski and Union of Concerned Scientists' Joel Clement, among others.

RELATED TIMELINE: The Energy Information Administration said Thursday development of ANWR would increase U.S. crude oil production after 2030, based on three resource estimate values. "In all three cases, production from ANWR does not start until 2031 because of the time needed to acquire leases, explore, and develop the required production infrastructure," EIA said.

DEMOCRATS CALL OUT MOUNTAINTOP STUDY: Eight Democratic senators signed a letter asking Interior Secretary Ryan Zinke why a National Academies of Sciences, Engineering and Medicines study on the health effects of mountaintop removal mining was stopped. Earlier this week , Interior's Office of Inspector General found that "officials were unable to provide specific criteria, used for their determination whether to allow or cease certain grants and cooperative agreements" on the study. In Thursday's letter, the senators call on Zinke to explain the reasoning behind ending the study, as well as provide an accounting of the taxpayer money spent. Read it here.

APPROVAL NEEDED: Guidelines posted to the U.S. Geological Survey and obtained by The Washington Post show that scientists at the agency were told to submit their presentation titles for review by DOI in order to get approval to attend two major conferences. The Post writes: "The USGS's Office of Administration told employees they will have to provide a detailed 'attendee justification' when applying for travel approval for the annual meetings of the American Geophysical Union in Washington and the Geological Society of America in Indianapolis later this year." Read more.

COURT VACATES LEASES IN SANTA FE FOREST: The U.S. District Court for the District of New Mexico on Thursday vacated oil and gas leases in the Santa Fe National Forest for BLM's failure "to quantify and analyze the impacts of downstream greenhouse gas emissions on the environment." The federal court sent

the leases back to the BLM and U.S. Forest Service to perform further analysis of the impacts of oil and gas drilling to the forest, it said. Read the opinion here.

MAIL CALL! NAAQS IT OUT: Democratic Reps. Don Beyer and Marcy Kaptur led a letter from 71 Democrats to Pruitt expressing concern over a May memorandum on the National Ambient Air Quality Standards process. The Democrats urged Pruitt "to withdraw the improper charge to [the Clean Air Scientific Advisory Committee] at once, and to make clear that CASAC — and EPA — will remain focused exclusively on the adverse public health effects that the Clean Air Act and a unanimous Supreme Court confirm are the only relevant statutory considerations during the health standard-setting processes." Read it here.

— **The ranking members** of the Homeland Security, Transportation, Natural Resources and Energy and Commerce committees joined Thursday to send a letter to FEMA Administrator Brock Long on his agency's decision to end the Army Corps of Engineers' mission to help rebuild the grid in Puerto Rico. "FEMA's decision to scale back the Federal presence in Puerto Rico is troubling given that approximately 10,000 Americans still lack power, eight months after the storm," they write. Read it here.

— **More than 30 green groups signed onto** to two letters opposing a draft bill currently being floated in the House that would penalize coastal states that prohibit offshore drilling. Read the letters here and here.

NATURE CONSERVANCY JOINS IN: The Nature Conservancy announced Thursday it has joined the Carbon Capture Coalition as a member, recognizing in a statement that "a wide range of technologies must be developed and deployed to achieve greenhouse gas emission reductions necessary to avoid the worst impacts of climate change." The Carbon Capture Coalition was co-founded by the the Center for Climate and Energy Solutions and the Great Plains Institute in 2011 to advocate for carbon capture, use and storage.

MOVERS/SHAKERS: White House assistant press secretary Kelly Love, who handled issues related to energy and EPA, will depart today to join the Energy Department, two officials told Bloomberg. Love also handled media questions related to agriculture, legislative affairs and the Justice Department, and handled media for Donald Trump Jr., Ivanka Trump and Eric Trump during the campaign, Bloomberg reports. Stories from POLITICO Pro

Trump splits with other G-20 leaders on climate change Back

By Andrew Restuccia | 07/08/2017 10:13 AM EDT

President Donald Trump emerged from the G-20 summit in Germany isolated from every other major economy on climate change, but the White House nonetheless scored small victories during the meeting.

After a tense round of negotiations, G-20 nations on Saturday reached a compromise on climate change, the last remaining issue of contention at the summit. Every country except the United States declared that the Paris climate change agreement is "irreversible" and must be implemented "swiftly." The U.S., on the other hand, declared its intention to pull out of the 2015 deal, which has won the backing of nearly 200 nations.

Several countries, including France, had objected to the United States' insistence on mentioning fossil fuels in the G-20's joint communique, leading to an eleventh-hour round of talks.

In the end, the United States appeared to win that fight, keeping the reference to fossil fuels, while pairing it with a call to use renewable energy.

"The United States of America states it will endeavor to work closely with other countries to help them access and use fossil fuels more cleanly and efficiently and help deploy renewable and other clean energy sources, given the importance of energy access and security in their nationally-determined contributions," the joint communique says.

Administration officials hailed the language as a victory, with one telling POLITICO the U.S. "scored big."

Supporters of the Paris climate agreement disagreed.

"It's nearly unprecedented to have text in a document like this one referring to what only one country believes. In that respect, it's a vacuous victory for the U.S., since it only confirms what everyone already knew they believe," said former State Department climate change adviser Andrew Light. "If anything, it only indicates the knots this administration will tie itself into in order to try to simultaneously appear to be appeasing their base and not alienating the rest of the world."

The United States also used the G-20 communique to underscore its intention to withdraw from the Paris climate deal and scrap former President Barack Obama's domestic emissions reduction plan (known in United

Nations parlance as a "nationally determined contribution"), while stressing that it hopes to continue working with other countries.

"The United States of America announced it will immediately cease the implementation of its current nationally-determined contribution and affirms its strong commitment to an approach that lowers emissions while supporting economic growth and improving energy security needs," the text says.

Foreign diplomats hope this language leaves room for the United States to remain in or rejoin the Paris deal if Trump writes a new domestic climate plan that reflects his priorities.

The 19 other G-20 nations all underscored their support for the Paris agreement and endorsed a broad German-backed climate and energy plan, which includes a detailed road map for reducing emissions.

The unity is a coup for German Chancellor Angela Merkel, who sought to minimize disagreements among the rest of the G-20 amid U.S. opposition to the Paris agreement. There had been some speculation that Saudi Arabia and Turkey might object to certain portions of the climate language, but Merkel and other leaders worked to ensure they were on board.

Still, that language was weakened slightly in the final negotiations, as part of what one diplomat called a "tit-for-tat" with the United States. A previous draft version of the text said countries "agree" that the Paris deal is "irreversible." The final version uses less firm language, a seemingly minor tweak that caught the attention of some U.S. officials and foreign diplomats.

"The Leaders of the other G20 members state that the Paris Agreement is irreversible," the communique says.

G-20 countries similarly insisted that the United States use the word "state" to characterize its position, worrying that stronger language could imply broader agreement among other nations.

The U.S. has been an outsider on climate change at international talks since Trump took office.

At the May G-7 meeting in Italy, the U.S. declined to join other countries in backing the Paris deal, saying it was in the process of reviewing its policies. After Trump's June announcement that he intends to withdraw from the Paris agreement, the U.S. position was relegated to a footnote in a joint statement released after a G-7 environment ministers meeting in Germany last month.

GOP pressure mounts for Pruitt oversight hearing Back

By Anthony Adragna | 06/14/2018 05:18 PM EDT

Several Senate Republicans — including the chamber's second in command — voiced support Thursday for bringing EPA Administrator Scott Pruitt before the Environment and Public Works Committee for an oversight hearing to discuss his ever-growing number of ethics scandals.

Three more EPW Republicans — Shelley Moore Capito (W.Va.), Roger Wicker (Miss.) and Dan Sullivan (Alaska) — joined their colleagues Jim Inhofe (Okla.) and Joni Ernst (Iowa) in pressing for Pruitt to return to their committee for the first time since January. Their comments add pressure on Chairman John Barrasso (R-Wyo.) to request that Pruitt make another appearance amid a stream of scandals.

News emerged Wednesday that Pruitt had pressed his staff to ask GOP donors to help find a job for his wife, Marlyn, who later secured a position at a conservative legal group — news that prompted some conservatives to call for his ouster.

"The policies that the administrator has moved forward on have really reaped a lot of benefits in terms of job creation in my state on the energy side, but it just seems like things keep cropping up, so I would agree with Sen. Inhofe," Capito told POLITICO.

"I'm always happy with oversight opportunities," Sullivan said.

But Barrasso told POLITICO he had "no immediate plans" to call Pruitt back.

Congressional Republicans have expressed concern for months about Pruitt's conduct, but they have stopped short of calling for his resignation, deferring to President Donald Trump. Meanwhile, Democrats on the panel have repeatedly demanded Barrasso call Pruitt to testify.

White House press secretary Sarah Huckabee Sanders said Thursday "certainly we have some areas of concern in some of these allegations" but declined further comment on whether the latest revelation about Pruitt had affected the administration's thoughts on his fate.

Majority Whip John Cornyn (R-Texas) told POLITICO Pruitt's future rests with the president, but he said he favored holding an oversight hearing.

"The drip drip drip is not helpful — at all," he said.

Lisa Murkowski (R-Alaska), who oversees the Appropriations subcommittee responsible for funding EPA, also said an oversight hearing was appropriate given the continuing revelations.

"You all keep asking me questions about him," she told POLITICO. "I don't have the answers for him. I think he needs to answer."

The calls for Pruitt's appearance come one day after leading conservatives, including Fox News host Laura Ingraham and National Review, called for his resignation. Inhofe, a longtime ally of the EPA chief, told Ingraham on her radio show Wednesday the allegations "upset me as much as they upset you," and he later urged Barrasso to hold a hearing to address the issues.

Pruitt has also drawn rebukes from Ernst and Chuck Grassley (R-Iowa) for his moves to excuse several refineries from complying with biofuels blending requirements under the Renewable Fuel Standard.

"I support Sen. @JimInhofe's call for a hearing on EPA Administrator Pruitt's scandals; and I continue to urge the President to take a hard look at Mr. Pruitt's actions - as I do not feel that Mr. Pruitt is serving @RealDonaldTrump's best interests," Ernst added later in a tweet.

Not all EPW Republicans backed the call for Pruitt's appearance, though several said they would support such a move if Barrasso pursued it.

"If the chairman says that we should do that, then I would be supportive," Mike Rounds (R-S.D.) told POLITICO.

Darius Dixon contributed to this report.

Trump issues orders making it easier to fire federal employees Back

By Lorraine Woellert | 05/25/2018 05:10 PM EDT

President Donald Trump on Friday issued a series of executive orders to weaken the influence of government unions and make it easier for agencies to fire civil servants.

The orders will standardize agency rules to make it easier and quicker to remove poorly performing employees. They also direct federal agencies to renegotiate their labor contracts and cap the amount of paid time that workers can take off to conduct union-related business.

"The president is fulfilling his promise to promote more efficient government by reforming our civil service rules," Andrew Bremberg, director of the president's Domestic Policy Council, told reporters. "These executive orders will make it easier for agencies to remove poor-performing employees and ensure that taxpayer dollars are more efficiently used."

The changes could save taxpayers more than $100 million a year, the White House estimated. It referenced a 2015 Government Accountability Office report that found it can take a year or more to dismiss a permanent federal employee.

The largest federal employee union condemned Friday's orders.

"This is more than union busting — it's democracy busting," said J. David Cox Sr., president of the American Federation of Government Employees. "This administration seems hellbent on replacing a civil service that works for all taxpayers with a political service that serves at its whim."

In addition to hemming in union power, the executive orders could be abused to reduce accountability or punish whistleblowers, said Nick Schwellenbach, director of investigations at the nonprofit Project on Government Oversight.

"Weakening civil service protection laws would make the government less effective and put us all at risk, " he said. "It would impede Congress's ability to conduct oversight of the executive branch: Congress's best sources of information are the employees inside agencies, and without robust protections and due process, more sources will remain silent."

The executive orders are Trump's latest salvo against the government workforce, which he has promised to reform as part of his "drain the swamp" agenda.

They direct agencies to charge rent to employees who use federal office space for union activity and to stop covering travel expenses for non-agency business.

Preference given to long-tenured workers will be eliminated. The common practice of agency gag orders, in which managers promise to keep silent about employees in exchange for their resignations, will be eliminated. Civil servants whose performance isn't up to par will get 30 days to show improvements.

Agencies will be required to report disciplinary activity to the Office of Personnel Management for publication. They are also directed to negotiate new contracts with unions, which also will be made public. Unions will be charged for the use of agency office space.

The use of "official time" — legally sanctioned time off for labor-related activities — will be capped at 25 percent of an employee's working hours.

Republicans on the House Oversight and Government Reform Committee found this week that more than 12,500 employees took advantage of official time in 2017. The Department of Veterans Affairs was among the worst offenders, the House panel found. There, 472 employees spent 100 percent of their working hours on labor-management-related business in fiscal 2017, according to the GOP report. Those employees included a VA nurse anesthetist and dentist each making more than $190,000 a year.

The moves are sure to be challenged by labor groups and Democrats, who have accused the administration of targeting labor for political purposes.

Meanwhile, worker complaints to the Federal Labor Relations Authority are piling up because the agency has been without a presidentially appointed general counsel since November. The vacancy has prevented labor complaints cases from
being prosecuted.

A senior administration official said on Friday that the White House had no announcement to make on the labor relations appointment.

DOE beachhead member lands senior EERE post Back

By Darius Dixon | 05/01/2017 05:30 PM EDT

The Institute for Energy Research's Daniel Simmons will take up a leading post at the Department of Energy as the acting assistant secretary for the Office of Energy Efficiency and Renewable Energy, the agency said in an email to staff today.

DOE said Simmons, a former vice president for policy at the libertarian-leaning IER, would take the role of principal deputy assistant secretary for the office effective today. However, without an EERE assistant secretary who has been nominated and confirmed by the Senate, Simmons can only hold the position on a temporary basis.

DOE confirmed Simmons' appointment.

Simmons was a member of President Donald Trump's transition and beachhead teams at DOE. Before joining IER, he directed the Natural Resources Task Force at the American Legislative Exchange Council.

Steven Chalk, who had served in the position for the past few months, will now return to his role as the deputy assistant secretary for operations, according to the email.

White House to tap Simmons as permanent EERE head Back

By Darius Dixon | 06/14/2018 05:39 PM EDT

President Donald Trump intends to make Dan Simmons the permanent head of the Energy Department's energy efficiency and renewable energy office, after more than a year as its top official.

The White House announced it plans to nominate Simmons to be the assistant secretary for EERE, a division that often takes a backseat to other offices under Republican administration. EERE is one of the largest accounts within the agency and its top job is one of the few remaining vacancies among the brass at DOE. Simmons became EERE's principal deputy assistant secretary on May 1, 2017, after working on Trump's DOE transition and beachhead teams.

Before joining the administration, Simmons was the vice president for policy at the libertarian-leaning Institute for Energy Research, which regularly attacked the Obama administration's renewable energy programs. He also directed the Natural Resources Task Force at the American Legislative Exchange Council.

WHAT'S NEXT: Simmons' nomination falls to the Senate Energy and Natural Resources Committee.

Pruitt changes NAAQS review to consider 'adverse' effects of standards Back

By Alex Guillén | 05/10/2018 10:13 AM EDT

EPA Administrator Scott Pruitt today directed the agency to change the review process for a critical air quality program to include the potential "adverse" effects of tighter standards.

In a memo signed Wednesday, Pruitt directed the Clean Air Scientific Advisory Committee, which advises on National Ambient Air Quality Standards issues, to provide advice on background pollution concentrations and the "adverse public health, welfare, social, economic or energy effects" from setting and achieving NAAQS standards.

The Supreme Court has previously ruled that EPA cannot consider implementation costs when setting NAAQS standards. Pruitt's memo argues that such information, even if not used to set a standard, can provide "important policy context for the public, co-regulators and EPA."

Pruitt also committed EPA to finish reviews of two controversial standards before the end of President Donald Trump's first term.

Even as EPA continues internal deliberations over revising the 2015 ozone standard, Pruitt committed the agency to meeting the October 2020 deadline to again review the standard. He also directed EPA to complete its review of the particulate matter standard by December 2020.

The memo also:

— Calls for "more efficient ways" to conduct the scientific and policy assessments that underlie NAAQS reviews;

— Requests a "clearer distinction" between the scientific conclusions and the "wider range of policy concerns" that Pruitt considers in setting standards;

— Urges CASAC members who disagree with the panel's consensus to "share their own individual opinions;" and

— Advises EPA to issue implementation rules and guidance concurrent with NAAQS revisions.

WHAT'S NEXT: The memo directs EPA to begin work on the next ozone review in order to complete it by October 2020.

Subject: Morning Energy: Where do biofuels stand? — This week: Pruitt faces the Hill — Macron heads to Washington

By Kelsey Tamborrino | 04/23/2018 05:42 AM EDT

With help from Eric Wolff and Annie Snider

YOU CAN'T ALWAYS GET WHAT YOU WANT: Despite efforts by President Donald Trump to settle a long-running dispute between ethanol backers and the refining industry, progress on a biofuels deal has stalled. Instead, the administration has taken a piecemeal approach to the policy, pushing for an expanded market for higher blends of ethanol, while handing out exemptions to the Renewable Fuels Standard to small refiners.

Trump, for his part, has huddled multiple times with members of his Cabinet, industry and lawmakers from both corn belt and oil states, Pro's Eric Wolff reports. But so far, there's been little progress in striking a grand deal. At odds are the independent refiners, who say they feel financial stress from the RFS, and the agriculture sector, which is anxious to expand the market for corn ethanol.

Trump has promised to allow year-round sales of 15 percent ethanol blends of gasoline, while EPA Administrator Scott Pruitt has so far granted more than two dozen temporary waivers to small refineries that exempt them from the mandate requiring them to blend ethanol with gasoline. "After 18 months of pursuing various regulatory forms of relief and a handful of Oval Office confabs, the merchant refiners ended up with [an increase in E15] taking even more market share away from them in return for some small refiner hardship waivers — and some of them did not even get that," one oil refining source told Eric.

And Pruitt's controversies stemming from his first-class flights, security spending and condo rental from a lobbyist, have left the EPA chief unable to make an aggressive case for instituting price caps many refiners want on the biofuel credits, according to an administration source. Read more here.

Democrats weigh in: House Energy and Commerce ranking member Frank Pallone and Agriculture ranking member Collin Peterson sent this letter to the president on Friday, expressing concern with the waivers issued by Pruitt to small refineries, writing it "undermines the goal of the RFS program, creates uncertainty and economic hardship in the agricultural community, and gives unfair advantage to specific facilities within the refining sector."

GOOD MONDAY MORNING! I'm your host Kelsey Tamborrino, and Entergy's Rob Hall was first to correctly answer that former Senate Majority Leader Robert Taft's father served as a Supreme Court chief justice. ICYMI: Check out the event videos and highlights from last Tuesday's event on how private businesses can address clean energy and build a more sustainable future.

PRUITT HEADS TO THE HILL: Thursday's the day: Pruitt is scheduled to face questions from two House committees for the first time since his swirling scandals emerged in March. He'll appear before both the House Appropriations Committee and the Energy and Commerce Committee to discuss his agency's budget request for fiscal 2019, but of course lawmakers are planning to take Pruitt to task over his ethics and spending issues. "Members are going to have questions about how things are going at the EPA and how the money is being spent," E&C Chairman Greg Walden told POLITICO last week. "And we will. We should. He'll have to answer those."

Not least on the list of questions: POLITICO's Theo Meyer and Eliana Johnson were first to report this weekend that the lobbyist, J. Steven Hart, whose wife rented a $50-per-night condo to Pruitt, also lobbied the agency while Pruitt was leading it, according to a Friday filing by his firm. That news comes despite the denials from both Hart and Pruitt that the lobbyist did not have any business before the agency. Hart announced his resignation from his lobbying firm Williams & Jensen hours before the disclosure was published. He was already planning to retire in November, but moved up his departure in the wake of the revelation that his wife had been Pruitt's landlord.

An EPA official acknowledged on Saturday that Pruitt had met with Hart, who attended a meeting with a former meat-processing executive concerned about Trump's proposal to cut spending on a Chesapeake Bay cleanup program. But the official argued that the meeting didn't meet the definition of lobbying. The disclosure, meanwhile, says Hart lobbied the EPA on issues "relating to support for EPA Chesapeake Bay Programs." A spokeswoman for House Oversight Chairman Trey Gowdy, who is already probing the administrator, told POLITICO that "the Committee has already been looking into this matter." Read more.

The hits keep coming: The Associated Press reported on Friday that state records show how, as Oklahoma's attorney general, Pruitt ordered investigations agents from his office to work as his driver and bodyguard. And a separate report from The New York Times probed how Pruitt bought a historic house in Oklahoma from a top lobbyist with the help of a shell company.

— **Another Republican called on Pruitt to resign** this weekend, marking at least four current Republican lawmakers to do so. "Yes EPA Administrator Scott Pruitt should resign. Wrong fit from start for agency dedicated to protecting our environment," New Jersey Rep. Frank LoBiondo tweeted . "#EarthDay2018 reinforces our need to promote pristine planet via clean air & water, leaving it better for future generations. Requires leadership & balance."

NOW THAT'S A MISTAKE: Three days after releasing a raft of communications between top EPA personnel to the Union of Concerned Scientists under the Freedom of Information Act, the agency removed them from its electronic library Friday. Among the documents were emails POLITICO cited on Thursday that show political officials developing a new scientific transparency policy were more concerned with the impact it could have on the agency's ability to consider industry data when reviewing pesticides and toxic chemicals for safety than they were about potentially excluding studies on the effect of pollution on public health, as many scientists have warned. EPA sent the policy, based on legislation from House Science Chairman Lamar Smith (R-Texas), to the White House for interagency review Thursday.

EPA did not respond to requests for comment over the weekend, but Yogin Kothari with UCS said the agency told him it accidentally released documents with private information and privileged attorney-client communications. His group removed emails it considered to fit that description and posted the rest on its website.

XCEL NOT SO INTO MARKETS AFTER ALL: Colorado utility Xcel Energy blew a hole in Southwest Power Pool's plans for a western power market when the company announced late Friday it had dropped out of the Mountain West Transmission Group. SPP had been working with the informal group of power providers for months to try and join the power market — and SPP had advanced the effort as recently as last month. Xcel

didn't respond to a request for comment, but the press release said there were "limited benefits" in the effort and "increasingly uncertain costs."

Perhaps most intriguing to ME is the company's point that "Xcel now sees few opportunities for westward expansion of the RTO which might have added to the value proposition." SPP faces competition from both California's already established energy-imbalance market that includes utilities in the Pacific Northwest and Nevada, and a nascent joint project between eastern market operator PJM Interconnection and western reliability manager PEAK. Xcel's press release did not say if it had engaged with either of these other projects.

MR. MACRON HEADS TO WASHINGTON: French President Emmanuel Macron makes his first official visit to Washington this week, where he'll meet with the president and deliver an address to a joint meeting of Congress. Macron and his wife will be hosted by the president and first lady at a private dinner tonight and the two leaders will participate in a bilateral meeting on Tuesday.

Officially, the two heads of state are set to discuss ongoing issues in Syria, the Iran deal and trade tensions. But keep an ear out for climate mentions, too. Macron has been critical of Trump's announcement that he would remove the U.S. from the Paris climate agreement.

Ahead of his meeting with Trump, Macron appeared on "Fox News Sunday," where he was asked whether he believes Trump will serve his full term. "I never wonder that," Macron said. "I mean, I work with him because both of us are very much at the service of our country in both side. And for me, that's why — even when we have some disagreements on climate and on some issues, I think the most important thing is to — I mean, just to remind that we are at the service of our people, that's our legitimacy."

FROM BLOOMBERG WITH LOVE: Special envoy to the U.N. for climate action Michael Bloomberg pledged to help cover the U.S. financial commitment to the Paris climate accord on Sunday. Appearing on CBS, the former New York City mayor announced he would foot the $4.5 million bill to the U.N. Climate Change Secretariat under the 2015 agreement that was struck by former President Barack Obama.

"America made a commitment. And as an American, if the government's not going to do it, we all have a responsibility, and I'm able to do it," he said on CBS. "So yes, I'm going to send them a check for the monies that America had promised to the organization." Bloomberg will also make more funding available should the U.S. government fail to produce funds for its share of the U.N. climate budget in 2019, according to a press release announcing the action.

READY FOR TAKEOFF: Rep. Jim Bridenstine will be sworn-in at 2:30 p.m. today as the new NASA administrator. After the swearing-in ceremony, Vice President Mike Pence and Bridenstine will speak live with three NASA astronauts currently living on the International Space Station.

MAIL CALL! Senate Democrats sent a series of letters Friday, calling on the administration and agency heads to share documents related to the Koch brothers' role in influencing policy in the Trump era. The letters cite specific actions for which the Koch network has taken credit, including shrinking national monuments, exiting the Paris climate change agreement and streamlining of infrastructure permitting. "Americans have a right to know if special interests are unduly influencing public policy decisions that have profound implications for public health, the environment, and the economy," the senators write. The letters, led by Sen. Sheldon Whitehouse, come before Senate floor speeches this week from Democrats that are expected to detail the influence of the Koch brothers network. Read the letter to the White House here, EPA here and Interior here.

IN CELEBRATION OF EARTH DAY: The president touted his administration's rollback of "unnecessary and harmful regulations," and pointed toward a "market-driven economy" as an essential tool in environmental protection. "A healthy environment and a strong economy go hand in hand," a White House presidential message said. "We know that it is impossible for humans to flourish without clean air, land, and water. We also

know that a strong, market-driven economy is essential to protecting these resources." Trump said for that reason, his administration is "dedicated to removing unnecessary and harmful regulations that restrain economic growth and make it more difficult for local communities to prosper and to choose the best solutions for their environment."

REPORT OUT ON DOE BUDGET: The Information Technology and Innovation Foundation is out with a new report today analyzing the Energy Department's budget for research, development and demonstration. The report details how the administration's current budget proposal for fiscal 2019 would "impose the largest single-year decrease" in DOE history. "R&D spending as a share of sales in the U.S. energy industry is only 0.4 percent, compared with 8.5 percent in aerospace and defense, 9.8 percent in computers and electronics, and 2.4 percent in the automotive industry," the report finds. Read it here.

MOVER, SHAKER: Holly Burke last week joined the League of Conservation Voters as communications coordinator. She previously worked for American Bridge.

— **Jennifer Talhelm,** formerly communications director for Sen. Tom Udall, is moving to the Western Resource Advocates and will be based in Santa Fe.

QUICK HITS

— She tried to report on climate change. Sinclair told her to be more "balanced," BuzzFeed.

— Oil is fast approaching $70. Is the economy ready for it? The Wall Street Journal.

— EPA sources: Pruitt aide tried to back-date departure after congressional interview request, CNN.

— Environmental review for mine project expected this week, Associated Press.

— America's nuclear headache: old plutonium with nowhere to go, Reuters.

— Perched on a platform high in a tree, a 61-year-old woman fights a gas pipeline, The Washington Post.

HAPPENING THIS WEEK

MONDAY

11:30 a.m. — Verizon discussion on "Celebrating Earth Day: The Power of Next-Gen Networks to Advance Environmental Sustainability," 1300 I Street NW

TUESDAY

8:00 a.m. — American Fuel & Petrochemical Manufacturers holds security conference, New Orleans

10:00 a.m. — Senate Energy and Natural Resources Committee hearing on the president's proposed budget request for FY 2019 for the Forest Service, 366 Dirksen

10:00 a.m. — Senate Foreign Relations Committee hearing on nominations, including Jackie Wolcott to be representative to the International Atomic Energy Agency, 419 Dirksen

10:00 a.m. — The Bipartisan Policy Center webcast "Can America's Infrastructure Withstand the Next Natural Disasters? Lessons Learned from Previous Disasters."

3:00 p.m. — Woodrow Wilson Center book launch discussion with author Barry Rabe on pricing carbon, 1300 Pennsylvania Ave NW

5:00 p.m. — Johns Hopkins University's Energy, Resources and Environment presentation on "Cities as Innovation Centers: Investing in Resilient Infrastructure," 1619 Massachusetts Avenue NW

WEDNESDAY

10:00 a.m. — Senate Commerce Committee hearing on "Enhancing the Marine Mammal Protection Act," 253 Russell

11:30 a.m. — The World Resources Institute forum on "activism for energy," 10 G Street NE

12:30 p.m. — Olympians brief Congress about impact of climate change on winter sports, hosted by Sens. Michael Bennet and Susan Collins, 538 Dirksen

2:00 p.m. — Resources for the Future webinar on "What Research Says on Key Fracking Debate Issues."

2:00 p.m. — House Natural Resources Committee hearing on "The Weaponization of the National Environmental Policy Act and the Implications of Environmental Lawfare," 1324 Longworth

3:30 p.m. — Bloomberg Government and the Norwegian-American Chamber of Commerce conversation on "Investing In A Sustainable Energy Future," New York City

6:30 p.m. — The Carnegie Institution for Science lecture on the sustainable use of the ocean, 1530 P Street NW

THURSDAY

8:00 a.m. — Water Leaders summit on "Building an Innovative Future for Water Policy and Technology in America," 215 Capitol Visitors Center

8:30 a.m. — George Mason University's Center for Energy Science and Policy symposium on "Energy-Water Nexus," Fairfax, Va.

9:00 a.m. — Colorado State University hosts symposium on "Water in the West," Denver

10:00 a.m. — The U.S. Energy Association forum on "fostering the deployment of CCUS technologies," 1300 Pennsylvania Ave NW

10:00 a.m. — The House Energy and Commerce Committee hearing on EPA's budget request, 2323 Rayburn

10:00 a.m. — House Natural Resources Oversight Subcommittee hearing on "Examining the Critical Importance of Offshore Energy Revenue Sharing for Gulf Producing States," 1324 Longworth

10:00 a.m. — The Center for Strategic and International Studies' Energy and National Security Program discussion on "Challenges to Ukrainian Energy Reform and European Energy Security," 1616 Rhode Island Avenue NW

11:30 a.m. — The Atlantic Council discussion on "From an Oil Company to an Energy Company," 1030 15th Street NW

1:30 p.m. — Information Technology and Innovation Foundation release on "Closing the Innovation Gap in Grid-Scale Energy Storage," 1101 K Street NW

2:00 p.m. — House Appropriations Interior, Environment, and Related Agencies Subcommittee hearing on EPA's fiscal 2019 budget, 2007 Rayburn

2:00 p.m. — House Natural Resources Committee hearing on H.R. 5317 (115) and H.R. 211 (115), 1324 Longworth

2:00 p.m. — Senate Appropriations Energy and Water Development Subcommittee hearing on the Nuclear Regulatory Commission's proposed budget for FY 2019, 430 Dirksen

2:30 p.m. — The Center for a New American Security event on how lower oil prices have reshaped geopolitical calculations for U.S. policymakers, 1152 15th St NW

FRIDAY

12:00 p.m. — Women's Council on Energy and the Environment discussion on wholesale electricity pricing, 888 First Street NE

12:00 p.m. — The Nuclear Information and Resource Service, and U.S. Climate Action Network discussion on "Climate Justice and Nuclear Power in South Africa," 1200 G Street NW

Stories from POLITICO Pro

Failure to strike biofuels deal opens door for smaller ethanol moves Back

By Eric Wolff | 04/23/2018 05:01 AM EDT

President Donald Trump's long-sought biofuels deal between the agricultural and refining industries appears to be turning into a piecemeal policy cobbled together through EPA that expands the market for corn ethanol while granting exemptions from the program to many small oil processors.

Trump has huddled several times with members of his Cabinet, refining and ethanol industry players, and lawmakers from both corn-belt and oil states. But so far, there's been little progress in striking a grand deal that would relieve the financial pain that some independent refiners say the Renewable Fuel Standard is causing them while acceding to agriculture-sector pressure to expand the market for corn ethanol.

Instead, Trump has promised to allow year-round sales of 15 percent ethanol blends of gasoline while EPA Administrator Scott Pruitt has handed out more than two dozen temporary waivers to small refineries that exempt them from the mandate requiring them to blend ethanol with gasoline.

"After 18 months of pursuing various regulatory forms of relief and a handful of Oval Office confabs, the merchant refiners ended up with [an increase in E15] taking even more market share away from them in return for some small refiner hardship waivers — and some of them did not even get that," said a source with an oil refining company.

For over a year, refiners have urged the administration to put a cap on the price of the biofuel credits that refiners must buy to meet their RFS compliance levels. But the move has been sharply opposed by ethanol and corn interests, as well as Sen. Chuck Grassley (R-Iowa), who as recently as last month called a potential cap "CATASTROPHIC to ethanol."

But the prices for biofuel credits, called Renewable Identification Numbers, have fallen since Pruitt's EPA began issuing at least 25 compliance waivers. Although that's angered biofuels supporters who complain it has sapped demand for ethanol, they see the administration's plan to drop the Clean Air Act rules that have barred E15 sales in the summer in some states as a boon.

"Right now we're going to have anywhere from a billion- to a billion and a half-[gallon] reduction in [ethanol] demand because of [RFS] waivers given so far," Sen. Mike Rounds (R-S.D.) told POLITICO. "I think we're moving in the right direction, but we want to make sure we get the [E15] waiver in place."

At a meeting with Midwestern senators and governors April 12, Trump announced his plan to expand E15 sales. But Trump also said there were efforts to set a transition period for the two years "where we will have a little bit of complexity," an apparent reference to refiners' worries that an increase in the number of RINs from higher E15 sales won't help push down prices for the credits in the near term.

The expansion of E15 sales came after an early April meeting at the White House, where Agriculture Secretary Sonny Perdue urged Trump to give corn farmers something to offset the ethanol demand drop they were seeing from the refinery compliance waivers, as well as the decline expected because of China's retaliatory import tariffs put in place after Trump announced his trade penalties, according to an administration source. The Washington Post reported Trump spent much of the meeting discussing the controversies around Pruitt's condo rental from a lobbyist and heavy spending on first-class travel and round-the-clock security.

Trump's discussion of Pruitt's controversies left the EPA chief unable to make an aggressive case for instituting price caps on RINs, according to an administration source, and have put him in a generally weakened position inside the White House.

And that may have killed the effort to establish RIN price caps, and given traction to the piecemeal EPA actions on E15 and the temporary compliance waivers, according to both administration and industry sources.

"[The oil industry] got what they wanted with the small refinery waivers, so we should get what we want," said Rob Walther, vice president of federal affairs for the ethanol producer POET.

Refiners, who over the last several months have sought and received RFS waivers for the 2016 and 2017 compliance years, are now expected to be pushing for the same exemptions for 2018 before they even know what their final liability for the year is.

Separately, a debate has grown over how EPA has been able to issue so many waivers to refiners this year. Though an EPA spokeswoman says the agency continued to use the same process it had under the Obama EPA to grant those exceptions, oil and ethanol industry sources acknowledge it has made crucial changes that make it far easier to get out from under the biofuel mandates.

In particular, EPA is relying on report language congressional appropriators added to 2016 and 2017 government funding bills that called on EPA to loosen its requirements for determining if a refinery should be awarded a waiver. EPA has also softened its definition of what constitutes economic hardship for a refinery as a result of a ruling from the U.S. Court of Appeals for the 10th Circuit last year.

That decision, in the case of *Sinclair Wyoming Refining v. EPA*, said the agency's test for defining economic hardship as whether a refiner was about to be pushed into bankruptcy had been too severe.

EPA has also taken a more aggressive interpretation of the law, saying it would no longer grant only partial waivers. Instead, the agency is now granting full-volume waivers to qualifying small refineries, according to an industry attorney.

The American Petroleum Institute, which represents the biggest oil companies, has opposed the waivers, and ethanol producers are furious at the use of the congressional report language to loosen the standards for receiving them. Monte Shaw, executive director of the Iowa Renewable Fuels Association, said his group has asked allies on the Appropriations Committee to consider writing their own language into future appropriations reports reversing the previous guidance.

Other groups think EPA is relying too much on that congressional guidance that is not included in the law.

"The report language does not override the plain reading of the statute," said Bob Dinneen, CEO of the Renewable Fuels Association. "While the court's decision in *Sinclair* might suggest EPA views these waivers differently, EPA has turned 180 degrees in its interpretation of the statute, and essentially now requires no demonstration of economic hardship. That's not what either the statute or the court required."

EPA staff has begun work trying to figure out how to best implement the expansion of E15 sales, which corn growers see as pivotal for the program's near future. But ethanol producers and their allies are looking ahead to the long term, in which E25 and E30 provide the octane for smaller, high-efficiency engines that get far higher fuel efficiency than current models.

"We have to move to the point to emphasize the need for octane, for these small engines that become more important in meeting CAFE standards in coming years," Rounds said. "That's where ethanol really shines."

Lobbyist whose wife rented to Pruitt lobbied EPA despite denials Back

By Theodoric Meyer and Eliana Johnson | 04/20/2018 06:43 PM EDT

The prominent lobbyist whose wife rented a condominium to Environmental Protection Agency Administrator Scott Pruitt lobbied the agency while Pruitt was leading it, contrary to his and Pruitt's public denials that he had any business before the agency, according to a Friday filing by his firm.

The disclosure from the lobbying firm Williams & Jensen contradicts Pruitt's public statement last month that the lobbyist, J. Steven Hart, had no clients with business before the EPA, and came hours after Hart's resignation from the firm.

An EPA official acknowledged on Saturday that Pruitt had met with Hart, who attended a meeting with a former meat processing executive concerned about President Donald Trump's proposal to cut spending on a Chesapeake Bay cleanup program. But the official argued that the meeting didn't meet the definition of lobbying.

A second EPA official, agency spokesman Jahan Wilcox, told POLITICO: "We have no knowledge of any facts that precipitated Williams & Jensen electing to make this filing."

The disclosure is the latest sign of one-time allies distancing themselves from Pruitt, whose job is in jeopardy because of multiple investigations into his stewardship of the agency, ranging from spending on a 20-person security team and first-class travel to the installation of costly office furniture and a soundproof phone booth. The Government Accountability Office said earlier this week that the purchase of the booth, which cost $43,000, violated federal law . And the staff of House Oversight Chairman Trey Gowdy (R-S.C.) has interviewed a former EPA political appointee who alleges that Pruitt lied about not knowing about steep raises given to two of his top aides.

When asked late Friday about Hart's lobbying activities, a Gowdy spokeswoman told POLITICO that 'the Committee has already been looking into this matter.'"

Sen. Sheldon Whitehouse (D-R.I.) said in a statement Saturday that any evidence of deception about Pruitt's relationship with the lobbyist-turned-landlord would bode ill for the EPA administrator.

"It doesn't get much swampier than an agency head getting a sweetheart deal on rent from a lobbyist with business before his agency, but someone lying about it afterwards does make it worse," Whitehouse said. "The laundry list of Pruitt scandals grows."

Hart announced he would resign from Williams & Jensen hours before the firm filed a disclosure showing that he lobbied the EPA for Smithfield Foods in the first quarter of 2017. While Hart, the chairman and former chief executive of the firm, has disputed that the contact he had with Pruitt and Pruitt's chief of staff, Ryan Jackson, constituted lobbying activity, the disclosure indicates otherwise.

Hart lobbied the EPA on issues "relating to support for EPA Chesapeake Bay Programs," according to the disclosure.

Pruitt told Fox News earlier this month that "Hart has no clients that have business before this agency."

Smithfield paid Williams & Jensen, which has lobbied for the company for years, $70,000 to lobby on a variety of matters in the first quarter, according to the disclosure filing. Hart also lobbied Congress on trade, agriculture and food safety issues on Smithfield's behalf during the first quarter, alongside other Williams & Jensen lobbyists.

But Smithfield said Hart's lobbying of the EPA "was not undertaken at the direction of or on behalf of Smithfield Foods."

"These activities were conducted at the request of a then former executive and current Smithfield Foundation board member, Dennis Treacy, in his personal capacity," the company said in a statement. "Mr. Treacy is associated with several environmental organizations and is a member of the Chesapeake Bay Commission."

Treacy had been Smithfield's chief sustainability officer, as well as president of the nonprofit Smithfield Foundation, and before that had led Virginia's Department of Environmental Quality.

The first EPA official, who spoke on condition of anonymity, said Pruitt and Jackson, his chief of staff, met with Treacy and Hart on July 11 for 20 minutes in Pruitt's office. That's backed up by a chain of agency emails obtained by POLITICO, which show Treacy requesting a meeting in May to discuss his "focused and unique view of environmental protection" with Pruitt, and one finally being scheduled for July 11.

On July 10, Hart wrote to Jackson that he wanted to attend the meeting at Treacy's request. Hart added that Treacy "is a good guy and can be trusted. He is coming in as the business rep on the Chesapeake Bay Foundation — another of your controversies."

But the disclosure filed by Williams & Jensen indicates that Hart's lobbying work took place in the first three months of this year, not in 2017.

The official said Hart set up the meeting as a "personal introduction" but that Treacy used a Smithfield email address, which may have prompted Williams & Jensen to consider the meeting lobbying activity on behalf of Smithfield. Treacy wanted to talk about the president's proposed budget cuts to EPA's spending on Chesapeake Bay, the subject of one of the nation's premier ecosystem restoration projects, the official said.

The official said Pruitt discussed his meeting with Hart with EPA staff before going on Fox News for an interview this month, where Pruitt maintained that Hart had no clients with business before the agency. But "it has been clear in [Pruitt's] mind for months now this was a personal introduction of an individual who was supportive of the administration, who wanted to meet the administrator."

Smithfield Foods has had a tangled history with Chesapeake Bay: In 1997, a federal judge slapped the company with a record $12.6 million fine for violating the Clean Water Act by dumping hog waste into a bay tributary. But Smithfield is now listed as a corporate partner of the nonprofit Alliance for the Chesapeake Bay.

Pruitt's rental of the Capitol Hill condo — a relative bargain at $50 a night — had attracted criticism even before the filing because Hart has lobbied on energy issues in the past. Hart is also a past political donor to Pruitt, contributing a total of $4,366 in cash and in-kind services to the former Oklahoma attorney general's campaigns and leadership PAC.

Pruitt's lease originally had J. Steven Hart's name printed on it as the landlord, but someone crossed it out and wrote in the name of his wife, Vicki. Public records show Vicki Hart's name on both the mortgage and deed. (Vicki Hart is also a lobbyist but works primarily on health care issues.)

Hart was already planning to retire in November but moved up his departure in the wake of the revelation that his wife has been Pruitt's landlord.

"Considering the last couple of weeks, I think it is easier on my family and the firm to expedite my departure," Hart wrote on Friday afternoon in an email to family and friends that was obtained by POLITICO.

Williams & Jensen confirmed Hart's departure.

"Mr. Hart informed the firm of his decision to resign today," the firm said in a statement on Friday. "We are grateful to Steve for his 35 years of service and we wish him and his family well in all of their future endeavors."

Hart did not respond to a request for comment. But he was sharply critical of the news coverage of the Pruitt scandal in the email he sent on Friday.

"As you know, these days I am no more an energy lobbyist than I am an astronaut," Hart wrote. "But, why let the facts get in the way of a good story?"

After leaving the firm, Hart wrote that he was "looking forward to devoting myself to an independent legal practice, some strategic business counseling for a few clients, golf, and shooting (not in that order)."

Alex Guillén and Emily Holden contributed to this report.

Third Republican calls on Pruitt to resign Back

By Alex Guillén | 04/05/2018 03:34 PM EDT

Rep. Elise Stefanik (R-N.Y.) today called on EPA Administrator Scott Pruitt to resign, becoming at least the third Republican to do so even as more conservative lawmakers come to Pruitt's defense.

"I'm going to make news today," Stefanik said at a town hall meeting in South Glens Falls, about 45 miles north of Albany, according to The Saratogian. "I think Scott Pruitt should resign. I fundamentally disagree with how Pruitt has handled the EPA."

Reps. Carlos Curbelo and Ileana Ros-Lehtinen, both Florida Republicans, earlier this week called for Pruitt's ouster, as have a number of Democrats. Pruitt is facing increased scrutiny for ethics issues including the $50-per-night rent he paid to rent space in a condo from a lobbyist last year.

Meanwhile, conservative Republicans like Sens. Rand Paul (R-Ky.) and Ted Cruz (R-Texas) have come to Pruitt's defense today.

"Why do Obama and his media cronies want so badly to drive @EPAScottPruitt out of office?" tweeted Cruz.

Pruitt "is likely the bravest and most conservative member of Trump's cabinet," tweeted Paul. "We need him to help @realDonaldTrump drain the regulatory swamp."

EPA emails show industry worries slowed new science policy Back

By Annie Snider | 04/19/2018 05:01 PM EDT

EPA's rollout of a controversial new transparency policy that would severely restrict the scientific research the agency can rely on when drafting new regulations has been slowed down by political officials' fears that it could have major unintended consequences for chemical makers, according to newly released EPA documents.

The issue of scientific transparency has been high on the agenda of House Science Chairman Lamar Smith (R-Texas), who has found strong support from EPA Administrator Scott Pruitt — much to the consternation of public health advocates and green groups, who view the effort as backdoor attack on the agency's ability to enact environmental regulations.

Since Pruitt announced plans for the new policy last month, researchers and public health proponents have raised alarms that it could restrict the agency's ability to consider a broad swath of data about the effects of pollution on human health. But documents released under the Freedom of Information Act show that top EPA officials are more worried the new restrictions would prevent the agency from considering industry studies that frequently support their efforts to justify less stringent regulations.

Emails between EPA officials obtained by the Union of Concerned Scientists show that Nancy Beck, the top political official in the agency's chemicals office who came to the agency after serving as a key expert for the chemical industry's lead lobbying group, voiced major concerns after she received a draft of the not-yet-released policy on Jan. 31.

The new scientific transparency directive is expected to require that the raw data for all studies EPA relies on be publicly available, and that the studies be peer-reviewed. But Beck said these requirements would exclude a great deal of industry data about pesticides and toxic chemicals that her office considers when determining whether a substance is safe or must be restricted.

It costs companies "millions of dollars to do these studies," Beck wrote in an email to Richard Yamada, the political official in EPA's office of research and development who is spearheading work on the new scientific policy and is also a former staffer for the House Science Committee chairman.

"These data will be extremely valuable, extremely high quality, and NOT published," Beck wrote. "The directive needs to be revised."

Moreover, much of this data, Beck noted, is considered proprietary by companies. It is dubbed confidential business information, and even though EPA can consider it as part of its regulatory review, the data cannot legally be made public.

Yamada replied to thank Beck for the heads up. "Yes, thanks this is helpful - didn't know about the intricacies of CBI," he wrote. "We will need to thread this one real tight!"

The term "confidential business information" primarily applies to industry information. That data is separate from the personal medical information that public health researchers worry could block consideration of their work.

Yogin Kothari, a lobbyist for the Union of Concerned Scientists, said the emails show the Trump administration's EPA has been "trying to stack the deck in favor of the industries they're supposed to be regulating."

"They want to potentially create exemptions for industry, but if you look at this entire set of documents ... you will see that there's not a single consideration for the impacts on public health data, on long-term health studies, on studies that EPA does after public health disasters like the BP oil spill," he said.

EPA spokeswoman Liz Bowman emphasized the policy is not yet finalized.

"These discussions are part of the deliberative process; the policy is still being developed. It's important to understand; however, that any standards for protecting [confidential business information] would be the same for all stakeholders," she said in a statement.

The emails indicate Pruitt wanted the new science policy rolled out at the end of February, and teased his plans in an interview with conservative outlet The Daily Caller in mid-March. But the agency has yet to finalize the policy.

The transparency directive has its origins in legislation introduced by Smith during the Obama administration, that had the backing of a number of industry groups, including the American Chemistry Council. The House Science Committee chairman frequently charged that the Obama EPA used "secret science" to justify "costly new regulations."

Although versions of the measure were approved by the House multiple times, the Senate never took it up. CBO estimated that one version of Smith's legislation would cost EPA $250 million a year, at least in the initial years, and a leaked staff response to questions from the budget office said a later version would be even more costly, would endanger confidential medical and business information, and "would prevent EPA from using the best available science."

But Smith found an ally in Pruitt. The emails indicate that Smith met with Pruitt in early January and show that Pruitt's staff quickly began working on a directive to "internally implement" the legislation.

Industry's backing for the new scientific approach began to waiver under the Trump administration, though. When a top American Chemistry Council scientist testified before Smith's committee in February 2017, she emphasized the need to protect industry information if the transparency initiative moved forward.

"One of the things that we do need to take into consideration as making that data publicly available is that there are adequate protections for confidential business information to ensure that we keep innovation and competitiveness available for the marketplace," Kimberly White told the committee.

Industry has historically claimed that a wide range of information about chemicals, ranging from the processes by which they are produced, to the locations of manufacturing plants, to their very identities, must be kept confidential in order to keep competitors from learning trade secrets. Environmental and public health advocates argue that industry claims this exemption in many cases where it's not necessary and that it often keeps important health and safety information from public view.

The issue was a key point of debate when Congress considered a major overhaul of the nation's primary chemical safety law passed 2016 and has reemerged as Pruitt's EPA sets about implementing the law.

Asked for comment on EPA's new effort to implement the scientific transparency approach internally, American Chemistry Council spokesman Scott Openshaw said the group looks forward to reviewing the directive once it's finalized.

"It is critical that any final directive properly protect confidential business information and competitive intelligence," he said in a statement.

The internal emails show that EPA political staff were particularly attuned to this concern. In a Feb. 23 email to colleagues, Beck forwarded language from a 2005 White House document that laid out narrow exemptions from its requirement that all "important scientific information" disseminated by the federal government go through peer review.

"[Y]ou may need to tweak but hopefully there is something helpful here that can be borrowed/adopted," she wrote.

Richard Denison, lead senior scientist for the Environmental Defense Fund, said that EPA's access to industry data is indeed important to its ability to review the safety of new chemicals and pesticides, but said the internal EPA communications show that Pruitt's EPA wants to "have their cake and eat it too" with the new directive.

"They're trying to force peer review studies done by academic scientists to disclose every last detail, while at the same time allowing industry studies to be kept private or aspects of those to still be kept private," he said.

He pointed out that the concerns Beck raised about the burden the new policy would place on industry are the very same ones that the CBO report said the policy would place on EPA.

France's Macron arrives for 'celebration' of unlikely friendship with Trump Back

By Nicholas Vinocur and Michael Crowley | 04/22/2018 09:45 PM EDT

PARIS — French President Emmanuel Macron will receive full state honors in Washington this week, nine months after he rolled out a literal red carpet for Donald Trump on Paris' Avenue des Champs Elysées.

The three-day visit is likely to feature more displays of public affection between two leaders who talk on the phone constantly and closely coordinated recent airstrikes against Syria. Despite the U.S president's enormous unpopularity in his country, Macron virtually never criticizes Trump in in public and calls him a "friend." Trump in turn reportedly even scribbled a love note to the 40-year-old French president last July.

This week's visit will be "something of a celebration of the relationship," a senior Trump administration official said.

Few would have predicted such talk just after Macron's May 2017 election defeat of the nationalist insurgent Marine LePen, whom Trump implied he supported. Macron's dark-horse win was seen as a rebuke to the western nationalist movement of which Trump has become a symbol. And while the French adored President Barack Obama as a suave intellectual, Trump is seen as the embodiment of a gauche American.

But rather than denounce Trump as many French politicians have, Macron has sought to win Trump over with flattering words. In an interview with "Fox News Sunday," Macron stressed his similarities with Trump, saying both he and the president could be called a "maverick" whose election had been unexpected.

The two men hardly see eye to eye on policy, and are expected to debate the Iran nuclear deal, Syria and trade policy, among other sensitive topics.

But Macron and Trump have worked closely together as Paris takes a larger leadership role on international issues — at a time when Britain is sidelined by political chaos and a weakened German Chancellor Angela Merkel's relationship with Trump is cool at best.

"Macron has become Trump's main European interlocutor when it comes to addressing international crises," Alexandra de Hoop Scheffer, senior transatlantic fellow at the German Marshall Fund, wrote in a recent policy paper.

Macron and Trump will share a private dinner Monday evening, followed by a bilateral meeting early Tuesday. They'll then meet with Cabinet members before a state dinner at the White House. On Wednesday, Macron will address a joint session of Congress.

In their private talks, the two men are likely to focus on security issues, including a fast-approaching decision point for the Iran nuclear deal. French officials say they share some of Trump's concerns about the July 2015 pact brokered by President Barack Obama, but are urging Trump not to abandon the agreement in mid-May, when Trump has threatened to reimpose sanctions on Tehran.

Macron has sought common ground with Trump by saying the current deal is flawed and that he might be willing to crack down on Iran's ballistic missile program. But Trump wants much stronger measures that French officials worry could abrogate the deal entirely. A Trump official said the deal would be "a major topic of discussion" during Macron's visit.

The official also said the two leaders "will discuss, probably in some detail, the way ahead in Syria."

In a televised debate last week, Macron said he had changed Trump's mind on the U.S. presence in war-torn Syria: "President Trump said the USA's will is to disengage from Syria. We convinced him that it was necessary to stay," the French leader said.

The White House quickly denied that characterization, and Macron later said he never meant the countries should maintain an indefinite military presence in the country.

But on Sunday, Macron told Fox News that he would urge international cooperation during his address to Congress, warning that Iran would benefit from a U.S. and European abandonment of Syria. "We are very much attached to the same values, and especially liberty and peace," Macron said of America and France.

Trade will also be on the agenda, after Macron and Merkel — who's due to fly into Washington on April 27, a few days after Macron leaves — both vowed to tell the U.S. president that Europe would not stand for his recent steel tariffs. U.S. officials may in turn complain to Macron's entourage about a French-led proposal to slap a 3-percent tax on U.S. internet giants.

Despite the menu of issue differences, officials on both sides sought to lower expectations for specific results from the meeting.

"It's largely symbolic," an aide to Macron said.

"I think what the President would like to hear from President Macron is his counsel and his point of view and his perspective," said the Trump official. "Whether we will actually solve, or come to closure, or a full detailed agreement on some of the issues that we've touched on is difficult to say at this remove."

As they work together internationally, Trump and Macron are both fending off political threats at home. A year into his presidency, the French president's sheen as a political prodigy and savior of European liberalism has been dulled by grinding rail strikes and sagging poll numbers.

Macron wants Trump to stand at his side as the European Union's soon-to-be sole military power with a permanent seat on the United Nations Security Council, nuclear capability and the will to intervene where others will not.

The April 14 strike on Syria's chemical facilities bolstered the burgeoning Franco-American relationship, French officials say. Macron and Trump spoke repeatedly during the crisis — and no fewer than seven times over the past month, according to accounts from the Elysée presidential palace.

While Britain also joined the strikes, Merkel barely featured in the Syrian discussions. Characteristically for intervention-averse Germany, she did not order participation in the strikes, commenting on them after the fact as "necessary and appropriate."

Once the missiles had hit their targets, Macron seized on a chance to drive home his point: While others may waver, France remains a red-blooded beacon of Western power. Paris had intervened in Syria for the "honor of the international community," he told the European Parliament in Strasbourg

One outstanding question about the Macron-Trump relationship that fascinates commentators in Europe: Does the French president really like Trump, or is he just "playing him"?

European commentators suggested as much last summer when, during Trump's visit to Paris, Macron mimicked his guest's signature thumbs-up move to TV cameras.

There may be no definitive answer. Macron is a one-time stage actor who loves to quote classical French playwrights from memory and, as he told a pair of French interviewers last weekend, has "no friends."

Quizzed about Macron's apparent affection for Trump, the French president's aides say he has concluded that befriending Trump and avoiding any direct criticism of the U.S. president that could inflame his temper are the best ways of keeping Trump — and the United States — on his nation's side.

Trump's EPA wants to stamp out 'secret science.' Internal emails show it is harder than expected

Science Magazine

The emails also reveal that an **EPA** political appointee — a former chemical industry executive — raised concerns about the science overhaul. The Washington Post: Many Mocked This Scott Pruitt Proposal. They Should Have Read It First.

When Environmental Protection Agency Administrator Scott Pruitt proposed a rule last month to improve transparency in science used to make policy decisions, he was roundly criticized by interest groups and academics. Several researchers asserted that the policy would be used to undermine a litany of existing environmental protections. Former Obama administration EPA officials co-wrote a New York Times op-ed in which they said the proposal "would undermine the nation's scientific credibility." The Economist derided the policy as "swamp science." But there is a lot to cheer about in the rule that opponents have missed. A careful reading suggests it could promote precisely the kind of evidence-based policy most scientists and the public should support.

The Washington Examiner: EPA Won't Redo Obama's Report On Risks From Deadly Paint Stripper

The Environmental Protection Agency announced Thursday that it would not seek to redo an Obama administration report that listed the numerous health risks from exposure to the paint stripper chemical methylene chloride. The EPA is "not re-evaluating the paint stripping uses of methylene chloride and is relying on its previous risk assessments," the agency announced. The paint stripping chemical has caused dozens of deaths, and environmentalists have called on EPA Administrator Scott Pruitt to ban the substance as a public health concern. The agency also said it plans to finish the regulatory process for the chemical that started under the Obama administration in 2016. It expects to send a final determination on the chemical "shortly" to the Office of Management and Budget for review.

The Associated Press: Action 'shortly' on solvent after Pruitt and families meet

The Environmental Protection Agency is promising quick action on new restrictions for a widely sold solvent used for paint stripping. Thursday's announcement comes after EPA administrator Scott Pruitt met with families of men who died after using products with the compound methylene chloride. The Obama administration in its last days proposed banning most consumer sales of methylene chloride. Lawmakers last month accused Pruitt of putting the rule on hold. Pruitt met Tuesday with families of a 31-year-old man and 21-year-old man who died after using paint-strippers.

The Washington Post: Mothers Lobbied Scott Pruitt To Ban A Toxic Chemical. Two Days Later, EPA Signaled It Would.

Environmental Protection Agency chief Scott Pruitt has met with few environmental groups throughout his tenure. More often, he has conferred with industry representatives. But this week, the EPA chief agreed to meet with a different sort of lobbyist: the mothers of two men who died from exposure to paint strippers containing a toxic chemical. The result: Two days later, the EPA signaled on Thursday it will follow through on an Obama-era proposal to ban paint strippers containing a toxic chemical — leaving Democratic lawmakers, environmental groups and the families of victims cautiously optimistic they won Pruitt over, Brady Dennis and I reported Thursday.

Politico: Pruitt changes NAAQS review to consider 'adverse' effects of standards

EPA Administrator Scott Pruitt today directed the agency to change the review process for a critical air quality program to include the potential "adverse" effects of tighter standards. In a memo signed Wednesday, Pruitt directed the Clean Air Scientific Advisory Committee, which advises on National Ambient Air Quality Standards issues, to provide advice on

background pollution concentrations and the "adverse public health, welfare, social, economic or energy effects" from setting and achieving NAAQS standards. The Supreme Court has previously ruled that EPA cannot consider implementation costs whGasen setting NAAQS standards. Pruitt's memo argues that such information, even if not used to set a standard, can provide "important policy context for the public, co-regulators and EPA."

Oil & Gas Journal: Pruitt Signs Memo Outlining NAAQS 'Back To Basics' Review Process

US Environmental Protection Agency Administrator E. Scott Pruitt signed a memorandum describing a "back to basics" process for reviewing the federal Clean Air Act's National Ambient Air Quality Standards (NAAQS). The memo assures that EPA and its independent science advisors take a transparent, efficient, and timely approach, he said on May 10. The memo's principles will reform the process for setting NAAQS in a manner consistent with cooperative federalism and the rule of law, Pruitt maintained. "Getting EPA and its advisors back on track with CAA requirements, statutory deadlines, and the issuance of timely implementation rules will assure that we continue the dramatic improvement in air quality across our country," he said.

National News Highlights 5.11.18

The New York Times: Israel And Iran, Newly Emboldened, Exchange Blows In Syria Face-Off

The tense shadow war between Iran and Israel burst into the open early Thursday as Israeli warplanes struck dozens of Iranian military targets inside Syria. It was a furious response to what Israel called an Iranian rocket attack launched from Syrian territory just hours earlier. The cross-border exchanges — the most serious assaults from each side in their face-off over Iran's presence in Syria — took place a little more than a day after the United States withdrew from the Iran nuclear agreement. Israel's defense minister said that Israeli warplanes had destroyed "nearly all" of Iran's military infrastructure in Syria after Iran launched 20 rockets at Israeli-held territory, none reaching their targets. Iran struck shortly after President Trump pulled out of the nuclear agreement, raising speculation that it no longer felt constrained by the possibility that the Americans might scrap the deal if Iran attacked Israel.

The Associated Press: Trump's High-Risk Doctrine? Swing For The Bleacher Seats

The way President Donald Trump sees it, why go for a solid single when you can swing for a home run? Trump's upcoming summit with North Korea's Kim Jong Un is only the latest example of the president's go-big strategy. From tax reform to international trade to foreign policy, Trump has pursued a high-risk, high-reward approach that advisers say can help produce results on longstanding problems — and that critics warn could trigger dangerous repercussions all the way from a trade war to global conflict. Drawn to big moments and bigger headlines, Trump views the North Korea summit as a legacy-maker for him, believing that the combustible combination of his bombast and charm already has led to warmer relations between North and South. As he welcomed home three Americans who had been detained in North Korea, Trump early Thursday used a televised, middle-of-the-night ceremony to play up both his statecraft and stagecraft.

Many Mocked This Scott Pruitt Proposal. They Should Have Read It First.

By Robert Hahn, 5/10/18

When Environmental Protection Agency Administrator Scott Pruitt proposed a rule last month to improve transparency in science used to make policy decisions, he was roundly criticized by interest groups and academics. Several researchers asserted that the policy would be used to undermine a litany of existing environmental protections. Former Obama administration EPA officials co-wrote a New York Times op-ed in which they said the proposal "would undermine the nation's scientific credibility." The Economist derided the policy as "swamp science."

But there is a lot to cheer about in the rule that opponents have missed. A careful reading suggests it could promote precisely the kind of evidence-based policy most scientists and the public should support.

Critics typically argue that the proposed regulation would suppress research that contains confidential medical records and therefore scientists could not share underlying data publicly for privacy reasons. Such restrictions, these critics say, would have excluded landmark research, such as Harvard University's "Six Cities" study, which suggested that reducing fine particles in the air would dramatically improve human health and helped lead to more stringent regulation of fine particles in the United States.

These concerns are likely the result of rhetoric surrounding the rule. Pruitt describes the regulation as an attempt to end "secret science" at the agency. Conservatives have long prioritized the need for making all data and statistical models used in regulatory decision-making available for independent scrutiny, with the intent to limit the use of studies that cannot be replicated. Breitbart went even further, characterizing the action as "a massive victory for both Pruitt and President Trump in their war on the Green Blob."

But it appears that few defenders or opponents of the proposal have actually read the proposed EPA regulation, which is only seven pages long. Both sides distort the regulatory text.

Here's what the rule would actually do. First, it would require the EPA to identify studies that are used in making regulatory decisions. Second, it would encourage studies to be made publicly available "to the extent practicable." Third, it would define "publicly available" by listing examples of information that could be used for validation, such as underlying data, models, computer code and protocols. Fourth, the proposal recognizes not all data can be openly accessible in the public domain and that restricted access to some data may be necessary. Fifth, it would direct the EPA to work with third parties, including universities and private firms, to make information available to the extent reasonable. Sixth, it would encourage the use of efforts to de-identify data sets to create public-use data files that would simultaneously help protect privacy and promote transparency. Seventh, the proposal outlines an exemption process when compliance is "impracticable." Finally, it would direct the EPA to clearly state and document assumptions made in regulatory analyses.

Here's what the EPA's rule wouldn't do: nullify existing environmental regulations, disregard existing research, violate confidentiality protections, jeopardize privacy or undermine the peer-review process.

The costs of compliance with EPA regulations are substantial. A draft report from the White House Office of Management and Budget suggests that significant EPA regulations imposed costs ranging from $54 billion to $65 billion over the past decade. These rules also realize substantial public-health and environmental benefits estimated to range from $196 billion to $706 billion over the decade.

Given the stakes for both the cost of compliance with EPA regulations and the real risks that pollution poses to public health and the environment, this rule should be read closely by critics and supporters for what it actually says. Just as transparency in science and evidence are essential, so, too, are intellectual honesty and accurate policy communication.

Taking steps to increase access to data, with strong privacy protections, is how society will continue to make scientific and economic progress and ensure that evidence in rule-making is sound. The EPA's proposed rule follows principles laid out in 2017 by the bipartisan Commission on Evidence-Based Policymaking — humility, transparency, privacy, capacity and rigor — and moves us toward providing greater access to scientific data while protecting individual privacy.

Instead of throwing stones, the scientific community should come together to offer practical suggestions to make the rule better. For example, the rule should recognize the incentives for scientists to produce new research. Scientists need to have time to produce and take credit for their research findings. Thus, there will inevitably be a trade-off between the production of new insights and the sharing of data with others, including regulators.

The EPA should also establish use restrictions and a secure data infrastructure so that confidential business and personal data are adequately protected. Finally, it should set procedures to evaluate the effectiveness of this rule. Done right, this could improve government policy not only in the United States but also around the world.

It's still hard to tell how this rule will affect EPA decisions, but one thing is clear: The rule will make the evidence by which we make policy decisions more transparent. The policy might not be perfect, but its benefits will likely far outweigh its costs.

Robert Hahn is a visiting professor at Oxford University's Smith School of Enterprise and the Environment and a non-resident senior fellow at the Brookings Institution. He recently served as a commissioner on the U.S. Commission on Evidence-Based Policymaking.

EPA Won't Redo Obama's Report On Risks From Deadly Paint Stripper

By John Siciliano, 5/10/18

The Environmental Protection Agency announced Thursday that it would not seek to redo an Obama administration report that listed the numerous health risks from exposure to the paint stripper chemical methylene chloride.

The EPA is "not re-evaluating the paint stripping uses of methylene chloride and is relying on its previous risk assessments," the agency announced.

The paint stripping chemical has caused dozens of deaths, and environmentalists have called on EPA Administrator Scott Pruitt to ban the substance as a public health concern.

The agency also said it plans to finish the regulatory process for the chemical that started under the Obama administration in 2016. It expects to send a final determination on the chemical "shortly" to the Office of Management and Budget for review.

Pruitt recently met with the parents of children who died from exposure to the chemical solvent. Wendy Hartley and Cindy Wynne met with Pruitt a few days before Thursday's announcement.

Hartley and Wynne said they were disappointed that the visit was not followed by a commitment to ban the substance.

But Senate Democrats said Thursday's announcement should be greeted with optimism that the EPA is moving ahead with a ban on the chemical.

Sen. Tom Carper of Delaware, the top Democrat on the Senate Environment and Public Works Committee, took the announcement to mean that the EPA "intends to finalize a ban on methylene chloride."

Carper, an outspoken critic of Pruitt, said the announcement "is welcome news, especially after the agency previously delayed finalization of this proposed ban indefinitely."

Nevertheless, Carper is "encouraged" that the EPA is relying on the Obama-era risk assessments, which "clearly and scientifically showed just how threatening products containing methylene chloride could be to people's health and safety."

However, "just like a law doesn't mean much if it is not enforced, intentions to finalize a ban on a deadly chemical don't mean much if that chemical stays on the shelves," he added.

Action 'shortly' on solvent after Pruitt and families meet

5/10/18

WASHINGTON (AP) — The Environmental Protection Agency is promising quick action on new restrictions for a widely sold solvent used for paint stripping.

Thursday's announcement comes after EPA administrator Scott Pruitt met with families of men who died after using products with the compound methylene chloride.

The Obama administration in its last days proposed banning most consumer sales of methylene chloride. Lawmakers last month accused Pruitt of putting the rule on hold. Pruitt met Tuesday with families of a 31-year-old man and 21-year-old man who died after using paint-strippers.

The EPA said Thursday it would act "shortly" to put the new regulation on the books.

Activist Liz Hitchcock said she and other campaigners against methylene chloride welcome the announcement. Hitchcock says she will watch the final wording of the rule closely.

Mothers Lobbied Scott Pruitt To Ban A Toxic Chemical. Two Days Later, EPA Signaled It Would.

By James Hohmann, 5/11/18

Environmental Protection Agency chief Scott Pruitt has met with few environmental groups throughout his tenure. More often, he has conferred with industry representatives.

But this week, the EPA chief agreed to meet with a different sort of lobbyist: the mothers of two men who died from exposure to paint strippers containing a toxic chemical.

The result: Two days later, the EPA signaled on Thursday it will follow through on an Obama-era proposal to ban paint strippers containing a toxic chemical — leaving Democratic lawmakers, environmental groups and the families of victims cautiously optimistic they won Pruitt over, Brady Dennis and I reported Thursday.

"I wanted to use Kevin's story to try to save more lives," one of the mothers, Wendy Hartley, told The Washington Post in an interview. Her son Kevin Hartley was a trained contractor who died last year at age 21 while refinishing a bathtub with White Lightning Low Odor Stripper near Nashville.

"We do not need any more lives lost due to this," Hartley said. "And if I could tell Kevin's story and get someone to listen to it and do something about, then I was willing to tell his story."

Since taking office, Pruitt has been laser-focused on undoing environmental and safety rules proposed by President Barack Obama's administration. But the EPA's announcement that it "intends to finalize" a proposed ban on certain uses of the chemical, called methylene chloride, would be an exception.

The chemical, used by professional contractors and do-it-yourselfers to remove paint, has been linked to dozens of deaths – including 12 people between 2000 and 2011 who specialize in refinishing bathtubs, according to a Centers for Disease Control and Prevention report.

The EPA first proposed banning the use of methylene chloride in paint and coating removal products in the waning days of Obama's second term. A year earlier, Congress had granted the EPA new powers to restrict the use of that and other chemicals in an amendment to the 1976 Toxic Substances Control Act, the nation's main chemical safety law.

But in December, the Pruitt's EPA indefinitely postponed bans on certain uses of methylene chloride and two other deadly chemicals often found in consumer products. For a time, it seemed like the ban was headed to the trash bin, along with many other Obama-era rules after President Trump's election.

That delay in December kicked off an effort to salvage it. Several Democratic lawmakers asked Pruitt about the chemical and urged him to ban it in a pair of hearings on Capitol Hill last month. Rep. Frank Pallone (D-N.Y.) asked Pruitt if he had anything to say to the people whose family members died given the lack of EPA action.

Pruitt didn't directly address that question, but he made clear that the agency hadn't abandoned its evaluation of the chemical's safety. "There has been no decision at this time," he said at the April 26 hearing.

That did little to satisfy Pallone. "Look, you say you're going to do something, but these chemicals are still on the shelves, and they make a mockery of [chemical reform] legislation that this committee works so hard on," Pallone said. "And it makes a mockery of EPA. You have the power immediately to get this chemical off the shelves. And you're not doing it. And you should do it."

The lobbying effort also continued behind the scenes. After the hearings, the Environmental Defense Fund contacted Pruitt's office on behalf of the families of Kevin Hartley and and Drew Wynne, 31, was running a cold-brew coffee business in Charleston, S.C., when he died last year while stripping paint from the floor of a walk-in refrigerator using a product called Goof Off.

The group asked for a meeting with the administrator and the EPA agreed. So this past Tuesday morning, Wendy Hartley, along with Cindy Wynne and her other son Brian Wynne, met Pruitt and several of his aides at his office in EPA headquarters.

The families brought with them photographs and the death certificates of the two men, and explained to Pruitt what happened to them.

Pruitt "was very attentive to us," Cindy Wynne told The Post in an interview earlier this week before the EPA's announcement. "He was somewhat surprised when we showed him the cans from Lowe's," where her son had purchased the paint stripper.

Her son, Brian, asked Pruitt if he agreed that methylene chloride was a problem. Pruitt responded, "I do."
But when pressed on whether he would finalize the ban, the administrator did not make a commitment, the family members said.

"We all have the same sense that for a moment there, we felt like there was positive momentum," Brian Wynne said. "And then that went out of the room pretty quickly when he was steadfast against the word 'ban.'"

In an interview after the announcement Thursday, the brother said he was now "cautiously optimistic" that Pruitt would follow through.

"This is a positive development," Brian Wynne said. "It was a surprising one. We certainly didn't see this coming in our meeting with Administrator Pruitt. But we're certainly encouraged by this sign that he seems ready to take action."
Public health and environmental groups also reserved full-throated cheers until the rule's language is made public and submitted to the White House's Office of Management and Budget, which the EPA said will happen "shortly." Sarah Vogel, EDF's vice president for health, urged the EPA to "move quickly to implement a ban, and that includes ensuring necessary administrative procedures are followed to guarantee a permanent ban and that these products are promptly removed from store shelves."

The EPA said the "meeting with the families was constructive."

"It provided the families the opportunity to share with Administrator Pruitt the circumstances in each of their cases and the Administrator the opportunity to hear directly from them," Wilcox said. "There was an exchange of ideas, and we appreciate EDF reaching out to request the meeting."

Politico

Pruitt changes NAAQS review to consider 'adverse' effects of standards
By Alex Guillen, 5/10/18, 10:13 AM

EPA Administrator Scott Pruitt today directed the agency to change the review process for a critical air quality program to include the potential "adverse" effects of tighter standards.

In a memo signed Wednesday, Pruitt directed the Clean Air Scientific Advisory Committee, which advises on National Ambient Air Quality Standards issues, to provide advice on background pollution concentrations and the "adverse public health, welfare, social, economic or energy effects" from setting and achieving NAAQS standards.

The Supreme Court has previously ruled that EPA cannot consider implementation costs when setting NAAQS standards. Pruitt's memo argues that such information, even if not used to set a standard, can provide "important policy context for the public, co-regulators and EPA."

Pruitt also committed EPA to finish reviews of two controversial standards before the end of President Donald Trump's first term.

Even as EPA continues internal deliberations over revising the 2015 ozone standard, Pruitt committed the agency to meeting the October 2020 deadline to again review the standard. He also directed EPA to complete its review of the particulate matter standard by December 2020.

The memo also:

— Calls for "more efficient ways" to conduct the scientific and policy assessments that underlie NAAQS reviews;

— Requests a "clearer distinction" between the scientific conclusions and the "wider range of policy concerns" that Pruitt considers in setting standards;

— Urges CASAC members who disagree with the panel's consensus to "share their own individual opinions;" and

— Advises EPA to issue implementation rules and guidance concurrent with NAAQS revisions.

WHAT'S NEXT: The memo directs EPA to begin work on the next ozone review in order to complete it by October 2020.

Pruitt Signs Memo Outlining NAAQS 'Back To Basics' Review Process
By Nick Snow, 5/10/18

US Environmental Protection Agency Administrator E. Scott Pruitt signed a memorandum describing a "back to basics" process for reviewing the federal Clean Air Act's National Ambient Air Quality Standards (NAAQS). The memo assures that EPA and its independent science advisors take a transparent, efficient, and timely approach, he said on May 10.

The memo's principles will reform the process for setting NAAQS in a manner consistent with cooperative federalism and the rule of law, Pruitt maintained. "Getting EPA and its advisors back on track with CAA requirements, statutory

deadlines, and the issuance of timely implementation rules will assure that we continue the dramatic improvement in air quality across our country," he said.

The reforms advance initiatives President Donald J. Trump set out in an April 12 memorandum directing Pruitt to take specific actions to ensure efficient and cost-effective NAAQS implementation, including permitting decisions for new and expanded manufacturing facilities and with respect to the Regional Haze Program.

EPA said that Pruitt's memo commits it to begin the next review of the ground-level ozone NAAQS so it can finalize any revisions by the October 2020 deadline under the CAA. It also requires that the agency complete its review of the particulate matter NAAQS by December 2020.

Responding to Pruitt's announcement, an American Petroleum Institute official noted that US ozone concentrations have fallen 17% since 2005, partly due to the oil and gas industry's investments to improve the environmental performance of its products, facilities, and operations.

"We look forward to continuing this progress in achieving our shared goals of protecting public health and the environment and meeting the nation's energy needs," API Regulatory and Scientific Affairs Senior Director Howard J. Feldman said.

Manufacturers applaud EPA for recognizing the problems that have plagued past air quality determinations and for taking strong steps to correct them, observed Ross Eisenberg, the National Association of Manufacturers VP for Energy Resources. "We hope today's announcement leads to better, more effective regulations and improved air quality," he said.

Israel And Iran, Newly Emboldened, Exchange Blows In Syria Face-Off

By Isabel Kershner and David M. Halbfinger, 5/10/18

JERUSALEM — The tense shadow war between Iran and Israel burst into the open early Thursday as Israeli warplanes struck dozens of Iranian military targets inside Syria. It was a furious response to what Israel called an Iranian rocket attack launched from Syrian territory just hours earlier.

The cross-border exchanges — the most serious assaults from each side in their face-off over Iran's presence in Syria — took place a little more than a day after the United States withdrew from the Iran nuclear agreement.

Israel's defense minister said that Israeli warplanes had destroyed "nearly all" of Iran's military infrastructure in Syria after Iran launched 20 rockets at Israeli-held territory, none reaching their targets.

Iran struck shortly after President Trump pulled out of the nuclear agreement, raising speculation that it no longer felt constrained by the possibility that the Americans might scrap the deal if Iran attacked Israel.

Israel appeared newly emboldened as well, partly because of what seemed like extraordinary latitude from Russia, Syria's most important ally, allowing the Israelis to act against Iran's military assets in Syria.

Moscow did not condemn Israel's strikes, as it had in the past, instead calling on Israel and Iran to resolve their differences diplomatically.

And Prime Minister Benjamin Netanyahu of Israel, who spent 10 hours with President Vladimir V. Putin of Russia on Wednesday, told his cabinet on Thursday that he had persuaded the Russians to delay the sale of advanced weapons to Syria.

Russia and Iran have been allies in the Syrian war, defending President Bashar al-Assad. But as the war appears to be winding down, some analysts say the aims of Russia and Iran are diverging: Moscow prefers a strong secular central government in Syria, while Tehran prefers a weaker government that would allow Iran-backed militias free rein.

Israel has conducted scores of strikes on Iran and its allies inside Syria, rarely acknowledging them publicly. But before Thursday, Iran had not retaliated, seemingly handcuffed while it awaited Mr. Trump's decision on the nuclear accord.

Even so, the Iranians have plenty to lose if the conflict continues to grow. They still seem determined to preserve the nuclear accord despite renewed American sanctions. The accord also includes Russia, China, Britain, France, Germany and the European Union.

"We see now that Netanyahu feels that Iran's capacities in Syria are vulnerable, that he can target them, that Iran's capacities to strike back are weakened — he took out some of these capacities, probably less than he claims — and that Iran has no significant way to react without risking itself," said Ofer Zalzberg, an analyst at the International Crisis Group.

Israel made it clear on Thursday that its planning for the airstrikes had been known internally as "Chess," and it looked in the aftermath as though Iran might have been baited into a trap on the Syrian game board.

Iran's rocket attack against Israel came after what appeared to have been an Israeli missile strike against a village in the Syrian Golan Heights late on Wednesday.

Early on Thursday, Iranian forces fired about 20 Grad and Fajr-5 rockets at the Israeli-controlled Golan Heights, targeting forward positions of the Israeli military, according to an Israeli military spokesman. The barrage was launched under the command of the Quds Force of the Islamic Revolutionary Guards Corps and used Iranian weapons, said the Israeli spokesman, Lt. Col. Jonathan Conricus.

Four of the rockets were intercepted by Israel's Iron Dome antimissile defense system, and the rest fell short of the Israeli-controlled territory, the military said. Indeed, by Thursday morning, Israeli life returned to routine in the Golan Heights, with children going to school.

Still, the rocket attack was a significant escalation in Iran's maneuvers in the Middle East. Though Israel has hit Iranian forces in Syria with a number of deadly airstrikes, Tehran had been restrained in hitting back, until now.

"Iran had to make a point: that it can respond, even if it's a weak response," said Joshua M. Landis, a Syria expert and director of the Center of Middle East Studies at the University of Oklahoma. "But it also revealed a weakness: Those rockets don't have any brains."

Israel said its response struck a severe blow to Iran's military capacity in Syria. In a statement, the military said the targets included what it described as Iranian intelligence sites; a logistics headquarters belonging to the Quds Force; military compounds; munition storage warehouses of the Quds Force at Damascus International Airport; intelligence systems associated with those forces; and military posts and munitions in the buffer zone between the Syrian Golan Heights and the Israeli-occupied portion.

"If there is rain on our side, there will be a flood on their side," Israel's defense minister, Avigdor Lieberman, said Thursday morning in remarks broadcast from a policy conference in Herzliya, near Tel Aviv. "I hope we have finished with this round and that everybody understood."

In all, at least 23 people were killed in the strikes, according to the Syrian Observatory for Human Rights, a Britain-based monitoring group. The Syrian Army, by contrast, said that three people had died. Israel reported no casualties on its side.

Israel said it had no intention of further escalation, and analysts looking for clues to Iran's potential response noted that its news media was largely ignoring the overnight hostilities, focusing instead on the nuclear deal. The English-language report on the airstrikes from Iran's Fars news agency made no mention of Iranian involvement.

In a sign of international concern that the conflict could escalate, however, Britain, France, Germany and Russia were quick to call for calm. "We proceed from the fact that all issues should be solved through dialogue," the Russian foreign minister, Sergey V. Lavrov, said at a news conference.

The White House condemned the missile attack on Israel, saying in a statement that it strongly supported "Israel's right to act in self-defense" and called on Iran "to take no further provocative steps."

It also inflicted new financial pain on Iran on Thursday. The Treasury Department said it had teamed with the United Arab Emirates to disrupt an Iranian currency exchange network that transferred millions of dollars, in coordination with Iran's central bank, to the Islamic Revolutionary Guards Corps. "We are intent on cutting off I.R.G.C. revenue streams wherever their source and whatever their destination," Treasury Secretary Steven Mnuchin said in a statement.

Iran has taken advantage of the chaos in Syria to build a substantial military infrastructure there. It has built and trained large militias with thousands of fighters and sent advisers from its Revolutionary Guards Corps to Syrian military bases.

Mr. Netanyahu said this week that the Revolutionary Guards had moved advanced weapons to Syria, including ground-to-ground missiles, weaponized drones and Iranian antiaircraft batteries that he said would threaten Israel's military jets.

Israel's political and security establishment has been unified and vocal in vowing to thwart Iran's efforts to entrench itself militarily across Israel's northern frontier and to build what Israeli and American officials refer to as a land corridor from Iran, through Iraq and Syria, to Lebanon.

Israel had warned Tehran that it would respond to any attack. Israel also broadcast warnings to Syria, saying that allowing Iranian entrenchment in its territory put Mr. Assad's government at risk.

The tensions between Iran and Israel have been complicated further by Mr. Trump's withdrawal from the nuclear agreement on Tuesday.

Israel had railed against the agreement, and Mr. Trump had campaigned on the promise of withdrawing from it, but European countries and many analysts had seen it as a crucial element holding back Iran and Israel, implacable foes, from all-out conflict.

As Mr. Trump announced his decision, Israel put its troops on "high alert," called up reservists, set up Iron Dome batteries and instructed the authorities in the Golan Heights to prepare public bomb shelters after detecting what it said was irregular activity by Iranian forces.

Israel's strikes early Thursday were some of the country's largest aerial operations in decades across the Syrian frontier, and by far the broadest direct attack yet on Iranian assets. "This was an operation we prepared for, and were not surprised by," Colonel Conricus said.

Israel said Russia had been informed before the overnight attack.

In recent years, Iran has helped Hezbollah, the Iranian-backed force in Lebanon, amass a huge arsenal of rockets it can use against Israel as a deterrent against Israeli strikes on Iran's nuclear program.

Israel has carried out scores of strikes against what it says are advanced weapons and convoys destined for Hezbollah. But since February, when Israel intercepted what it later called an armed Iranian drone that had penetrated its airspace

from Syria, setting off a day of heated cross-border exchanges, Israel's efforts appear to have been more focused on Iranian assets in Syria.

"Israel doesn't want another Hezbollah inside Syria, it doesn't want another Lebanon," said Andrew J. Tabler, a Syria scholar at the Washington Institute for Near East Policy. "The Israelis think they can surgically strike and not create a wider conflict. They think that Assad, working with the Russians, will have an incentive not to respond."

Trump's High-Risk Doctrine? Swing For The Bleacher Seats

By Catherine Lucey, Jonathan Lemire, and Ken Thomas, 5/10/18

WASHINGTON (AP) — The way President Donald Trump sees it, why go for a solid single when you can swing for a home run?

Trump's upcoming summit with North Korea's Kim Jong Un is only the latest example of the president's go-big strategy. From tax reform to international trade to foreign policy, Trump has pursued a high-risk, high-reward approach that advisers say can help produce results on longstanding problems — and that critics warn could trigger dangerous repercussions all the way from a trade war to global conflict.

Drawn to big moments and bigger headlines, Trump views the North Korea summit as a legacy-maker for him, believing that the combustible combination of his bombast and charm already has led to warmer relations between North and South. As he welcomed home three Americans who had been detained in North Korea, Trump early Thursday used a televised, middle-of-the-night ceremony to play up both his statecraft and stagecraft.

"I think you probably broke the all-time, in history, television rating for three o'clock in the morning," Trump told reporters on the tarmac at Joint Base Andrews.

Trump has also played the disruptor's role in recent weeks and months by withdrawing the U.S. from the Iran nuclear deal, imposing sweeping tariffs on allies and announcing he's moving the U.S. embassy in Israel to Jerusalem, which is claimed by both Israelis and Palestinians.

It's all a sharp contrast to his play-it-safe predecessor.

"You hit singles, you hit doubles; every once in a while we may be able to hit a home run," President Barack Obama said of his own foreign policy. "But we steadily advance the interests of the American people and our partnership with folks around the world."

Not all of Trump's attention-grabbing gambits have worked — and the potential risks going forward are daunting.

His push to overturn Obama's landmark health care law ended in a humiliating defeat for the Republicans. His decision to impose new tariffs on steel and aluminum imports has left global markets in a state of flux and unnerved some of America's closest allies about the potential for a trade war. And his withdrawal from the international nuclear agreement with Iran, with strong support from Israel, has escalated tensions in the already volatile region.

Critics say Trump sometimes focuses on bold gestures first — and fallout later.

For now, scoring a diplomatic win with Pyongyang has become Trump's top focus.

His outside-the-box approach to North Korea — complete with ominous taunts of raining "fire and fury" on the North while belittling its leader as "Little Rocket Man" — alarmed many global capitals and much of Washington's national security establishment, increasing worries about nuclear war.

But Trump believes it brought Kim to the negotiating table, with a summit between the two men now set for June 12 in Singapore.

Trump told one confidant that he now believes a deal with North Korea, rather than in the Middle East, could be his historic victory. White House officials also believe that a triumph on the Korean Peninsula — something that has eluded the United States for generations — could bolster Trump's approval ratings, help inoculate him against the investigations swirling around him and maybe even trickle down to help Republicans in this fall's midterm elections.

While some White House aides characterized Trump's moves as evidence of bold thinking, there is also concern that he has little sense of the potential repercussions from some of his big moves, believing that if things don't work out, that he can always just reverse course.

In the early months of his administration, Trump latched on to the belief that he could be the president to bring peace to the Middle East. Fond of the idea of making history, the president told advisers he was driven to accomplish something that his predecessors could not and believed that his negotiating skills and strong relationship with Israeli Prime Minister Benjamin Netanyahu could lead to the unprecedented achievement, according to four White House officials and outside advisers.

At one moment last spring, Trump mused in the Oval Office that he wouldn't even require a second term to settle things in the region, according to two people familiar with the exchange but not authorized to speak publicly about private conversations.

Though he did break with tradition to move the U.S. embassy to Jerusalem, the White House plan bogged down and the divide between Israelis and Palestinians seems as intractable as ever, prompting Trump's attention shift to North Korea. Warned by Obama days after his election that the threat posed by Pyongyang could define his presidency, Trump answered Kim's threats with bellicose warnings of his own and rallied an international pressure campaign against North Korea.

Some Republicans have suggested his efforts should bring him the Nobel Peace Prize, an idea Trump clearly savored at a recent rally in Michigan when the crowd chanted "Nobel." Asked about the chatter in the Oval Office this week, Trump said: "I want to get peace. It's the main thing. We want to get peace. That was a big problem, and I think it's going to work out well."

Then he added his catchall caveat: "We'll see."

Long before he was president, the onetime New York real estate developer and reality television star often spoke about the benefits of acting boldly. In "The Art of the Deal," he put it this way: "I like thinking big. I always have. To me it's very simple: if you're going to be thinking anyway, you might as well think big."

Trump appears to have embraced the "Great Man" theory of history, believing that individuals more than circumstances or trends alter the course of events. In his 2016 GOP convention speech, he famously declared "I alone can fix it," in referencing the nation's problems.

Trump and his team also believe that his bold tactics have the added benefit for Trump of overshadowing the threats his administration faces from the ongoing Russia probe and the legal web surrounding his personal attorney, Michael Cohen, and porn actress Stormy Daniels.

Rice University presidential historian Douglas Brinkley said Trump's diplomacy with North Korea is a "high-risk game."

"But if he pulls off the denuclearization of the North Korean Peninsula, it will be the landmark achievement," said Brinkley. "It's Trump's big going-to-China moment."

The Washington Post: Many Mocked This Scott Pruitt Proposal. They Should Have Read It First.
When Environmental Protection Agency Administrator Scott Pruitt proposed a rule last month to improve transparency in science used to make policy decisions, he was roundly criticized by interest groups and academics. Several researchers asserted that the policy would be used to undermine a litany of existing environmental protections. Former Obama administration EPA officials co-wrote a New York Times op-ed in which they said the proposal "would undermine the nation's scientific credibility." The Economist derided the policy as "swamp science." But there is a lot to cheer about in the rule that opponents have missed. A careful reading suggests it could promote precisely the kind of evidence-based policy most scientists and the public should support.

The Washington Examiner: EPA Won't Redo Obama's Report On Risks From Deadly Paint Stripper
The Environmental Protection Agency announced Thursday that it would not seek to redo an Obama administration report that listed the numerous health risks from exposure to the paint stripper chemical methylene chloride. The EPA is "not re-evaluating the paint stripping uses of methylene chloride and is relying on its previous risk assessments," the agency announced. The paint stripping chemical has caused dozens of deaths, and environmentalists have called on EPA Administrator Scott Pruitt to ban the substance as a public health concern. The agency also said it plans to finish the regulatory process for the chemical that started under the Obama administration in 2016. It expects to send a final determination on the chemical "shortly" to the Office of Management and Budget for review.

The Associated Press: Action 'shortly' on solvent after Pruitt and families meet
The Environmental Protection Agency is promising quick action on new restrictions for a widely sold solvent used for paint stripping. Thursday's announcement comes after EPA administrator Scott Pruitt met with families of men who died after using products with the compound methylene chloride. The Obama administration in its last days proposed banning most consumer sales of methylene chloride. Lawmakers last month accused Pruitt of putting the rule on hold. Pruitt met Tuesday with families of a 31-year-old man and 21-year-old man who died after using paint-strippers.

The Washington Post: Mothers Lobbied Scott Pruitt To Ban A Toxic Chemical. Two Days Later, EPA Signaled It Would.
Environmental Protection Agency chief Scott Pruitt has met with few environmental groups throughout his tenure. More often, he has conferred with industry representatives. But this week, the EPA chief agreed to meet with a different sort of lobbyist: the mothers of two men who died from exposure to paint strippers containing a toxic chemical. The result: Two days later, the EPA signaled on Thursday it will follow through on an Obama-era proposal to ban paint strippers containing a toxic chemical — leaving Democratic lawmakers, environmental groups and the families of victims cautiously optimistic they won Pruitt over, Brady Dennis and I reported Thursday.

Politico: Pruitt changes NAAQS review to consider 'adverse' effects of standards
EPA Administrator Scott Pruitt today directed the agency to change the review process for a critical air quality program to include the potential "adverse" effects of tighter standards. In a memo signed Wednesday, Pruitt directed the Clean Air Scientific Advisory Committee, which advises on National Ambient Air Quality Standards issues, to provide advice on background pollution concentrations and the "adverse public health, welfare, social, economic or energy effects" from setting and achieving NAAQS standards. The Supreme Court has previously ruled that EPA cannot consider implementation costs whGasen setting NAAQS standards. Pruitt's memo argues that such information, even if not used to set a standard, can provide "important policy context for the public, co-regulators and EPA."

Oil & Gas Journal: Pruitt Signs Memo Outlining NAAQS 'Back To Basics' Review Process
US Environmental Protection Agency Administrator E. Scott Pruitt signed a memorandum describing a "back to basics" process for reviewing the federal Clean Air Act's National Ambient Air Quality Standards (NAAQS). The memo assures that EPA and its independent science advisors take a transparent, efficient, and timely approach, he said on May 10. The memo's principles will reform the process for setting NAAQS in a manner consistent with cooperative federalism and the rule of law, Pruitt maintained. "Getting EPA and its advisors back on track with CAA requirements, statutory deadlines,

and the issuance of timely implementation rules will assure that we continue the dramatic improvement in air quality across our country," he said.

Many Mocked This Scott Pruitt Proposal. They Should Have Read It First.
By Robert Hahn, 5/10/18

When Environmental Protection Agency Administrator Scott Pruitt proposed a rule last month to improve transparency in science used to make policy decisions, he was roundly criticized by interest groups and academics. Several researchers asserted that the policy would be used to undermine a litany of existing environmental protections. Former Obama administration EPA officials co-wrote a New York Times op-ed in which they said the proposal "would undermine the nation's scientific credibility." The Economist derided the policy as "swamp science."

But there is a lot to cheer about in the rule that opponents have missed. A careful reading suggests it could promote precisely the kind of evidence-based policy most scientists and the public should support.

Critics typically argue that the proposed regulation would suppress research that contains confidential medical records and therefore scientists could not share underlying data publicly for privacy reasons. Such restrictions, these critics say, would have excluded landmark research, such as Harvard University's "Six Cities" study, which suggested that reducing fine particles in the air would dramatically improve human health and helped lead to more stringent regulation of fine particles in the United States.

These concerns are likely the result of rhetoric surrounding the rule. Pruitt describes the regulation as an attempt to end "secret science" at the agency. Conservatives have long prioritized the need for making all data and statistical models

used in regulatory decision-making available for independent scrutiny, with the intent to limit the use of studies that cannot be replicated. Breitbart went even further, characterizing the action as "a massive victory for both Pruitt and President Trump in their war on the Green Blob."

But it appears that few defenders or opponents of the proposal have actually read the proposed EPA regulation, which is only seven pages long. Both sides distort the regulatory text.

Here's what the rule would actually do. First, it would require the EPA to identify studies that are used in making regulatory decisions. Second, it would encourage studies to be made publicly available "to the extent practicable." Third, it would define "publicly available" by listing examples of information that could be used for validation, such as underlying data, models, computer code and protocols. Fourth, the proposal recognizes not all data can be openly accessible in the public domain and that restricted access to some data may be necessary. Fifth, it would direct the EPA to work with third parties, including universities and private firms, to make information available to the extent reasonable. Sixth, it would encourage the use of efforts to de-identify data sets to create public-use data files that would simultaneously help protect privacy and promote transparency. Seventh, the proposal outlines an exemption process when compliance is "impracticable." Finally, it would direct the EPA to clearly state and document assumptions made in regulatory analyses.

Here's what the EPA's rule wouldn't do: nullify existing environmental regulations, disregard existing research, violate confidentiality protections, jeopardize privacy or undermine the peer-review process.

The costs of compliance with EPA regulations are substantial. A draft report from the White House Office of Management and Budget suggests that significant EPA regulations imposed costs ranging from $54 billion to $65 billion over the past decade. These rules also realize substantial public-health and environmental benefits estimated to range from $196 billion to $706 billion over the decade.

Given the stakes for both the cost of compliance with EPA regulations and the real risks that pollution poses to public health and the environment, this rule should be read closely by critics and supporters for what it actually says. Just as transparency in science and evidence are essential, so, too, are intellectual honesty and accurate policy communication.

Taking steps to increase access to data, with strong privacy protections, is how society will continue to make scientific and economic progress and ensure that evidence in rule-making is sound. The EPA's proposed rule follows principles laid out in 2017 by the bipartisan Commission on Evidence-Based Policymaking — humility, transparency, privacy, capacity and rigor — and moves us toward providing greater access to scientific data while protecting individual privacy.

Instead of throwing stones, the scientific community should come together to offer practical suggestions to make the rule better. For example, the rule should recognize the incentives for scientists to produce new research. Scientists need to have time to produce and take credit for their research findings. Thus, there will inevitably be a trade-off between the production of new insights and the sharing of data with others, including regulators.

The EPA should also establish use restrictions and a secure data infrastructure so that confidential business and personal data are adequately protected. Finally, it should set procedures to evaluate the effectiveness of this rule. Done right, this could improve government policy not only in the United States but also around the world.

It's still hard to tell how this rule will affect EPA decisions, but one thing is clear: The rule will make the evidence by which we make policy decisions more transparent. The policy might not be perfect, but its benefits will likely far outweigh its costs.

Robert Hahn is a visiting professor at Oxford University's Smith School of Enterprise and the Environment and a non-resident senior fellow at the Brookings Institution. He recently served as a commissioner on the U.S. Commission on Evidence-Based Policymaking.

EPA Won't Redo Obama's Report On Risks From Deadly Paint Stripper

By John Siciliano, 5/10/18

The Environmental Protection Agency announced Thursday that it would not seek to redo an Obama administration report that listed the numerous health risks from exposure to the paint stripper chemical methylene chloride.

The EPA is "not re-evaluating the paint stripping uses of methylene chloride and is relying on its previous risk assessments," the agency announced.

The paint stripping chemical has caused dozens of deaths, and environmentalists have called on EPA Administrator Scott Pruitt to ban the substance as a public health concern.

The agency also said it plans to finish the regulatory process for the chemical that started under the Obama administration in 2016. It expects to send a final determination on the chemical "shortly" to the Office of Management and Budget for review.

Pruitt recently met with the parents of children who died from exposure to the chemical solvent. Wendy Hartley and Cindy Wynne met with Pruitt a few days before Thursday's announcement.

Hartley and Wynne said they were disappointed that the visit was not followed by a commitment to ban the substance.

But Senate Democrats said Thursday's announcement should be greeted with optimism that the EPA is moving ahead with a ban on the chemical.

Sen. Tom Carper of Delaware, the top Democrat on the Senate Environment and Public Works Committee, took the announcement to mean that the EPA "intends to finalize a ban on methylene chloride."

Carper, an outspoken critic of Pruitt, said the announcement "is welcome news, especially after the agency previously delayed finalization of this proposed ban indefinitely."

Nevertheless, Carper is "encouraged" that the EPA is relying on the Obama-era risk assessments, which "clearly and scientifically showed just how threatening products containing methylene chloride could be to people's health and safety."

However, "just like a law doesn't mean much if it is not enforced, intentions to finalize a ban on a deadly chemical don't mean much if that chemical stays on the shelves," he added.

Action 'shortly' on solvent after Pruitt and families meet

5/10/18

WASHINGTON (AP) — The Environmental Protection Agency is promising quick action on new restrictions for a widely sold solvent used for paint stripping.

Thursday's announcement comes after EPA administrator Scott Pruitt met with families of men who died after using products with the compound methylene chloride.

The Obama administration in its last days proposed banning most consumer sales of methylene chloride. Lawmakers last month accused Pruitt of putting the rule on hold. Pruitt met Tuesday with families of a 31-year-old man and 21-year-old man who died after using paint-strippers.

The EPA said Thursday it would act "shortly" to put the new regulation on the books.

Activist Liz Hitchcock said she and other campaigners against methylene chloride welcome the announcement. Hitchcock says she will watch the final wording of the rule closely.

Mothers Lobbied Scott Pruitt To Ban A Toxic Chemical. Two Days Later, EPA Signaled It Would.

By James Hohmann, 5/11/18

Environmental Protection Agency chief Scott Pruitt has met with few environmental groups throughout his tenure. More often, he has conferred with industry representatives.

But this week, the EPA chief agreed to meet with a different sort of lobbyist: the mothers of two men who died from exposure to paint strippers containing a toxic chemical.

The result: Two days later, the EPA signaled on Thursday it will follow through on an Obama-era proposal to ban paint strippers containing a toxic chemical — leaving Democratic lawmakers, environmental groups and the families of victims cautiously optimistic they won Pruitt over, Brady Dennis and I reported Thursday.

"I wanted to use Kevin's story to try to save more lives," one of the mothers, Wendy Hartley, told The Washington Post in an interview. Her son Kevin Hartley was a trained contractor who died last year at age 21 while refinishing a bathtub with White Lightning Low Odor Stripper near Nashville.

"We do not need any more lives lost due to this," Hartley said. "And if I could tell Kevin's story and get someone to listen to it and do something about, then I was willing to tell his story."

Since taking office, Pruitt has been laser-focused on undoing environmental and safety rules proposed by President Barack Obama's administration. But the EPA's announcement that it "intends to finalize" a proposed ban on certain uses of the chemical, called methylene chloride, would be an exception.

The chemical, used by professional contractors and do-it-yourselfers to remove paint, has been linked to dozens of deaths – including 12 people between 2000 and 2011 who specialize in refinishing bathtubs, according to a Centers for Disease Control and Prevention report.

The EPA first proposed banning the use of methylene chloride in paint and coating removal products in the waning days of Obama's second term. A year earlier, Congress had granted the EPA new powers to restrict the use of that and other chemicals in an amendment to the 1976 Toxic Substances Control Act, the nation's main chemical safety law.

But in December, the Pruitt's EPA indefinitely postponed bans on certain uses of methylene chloride and two other deadly chemicals often found in consumer products. For a time, it seemed like the ban was headed to the trash bin, along with many other Obama-era rules after President Trump's election.

That delay in December kicked off an effort to salvage it. Several Democratic lawmakers asked Pruitt about the chemical and urged him to ban it in a pair of hearings on Capitol Hill last month. Rep. Frank Pallone (D-N.Y.) asked Pruitt if he had anything to say to the people whose family members died given the lack of EPA action.

Pruitt didn't directly address that question, but he made clear that the agency hadn't abandoned its evaluation of the chemical's safety. "There has been no decision at this time," he said at the April 26 hearing.

That did little to satisfy Pallone. "Look, you say you're going to do something, but these chemicals are still on the shelves, and they make a mockery of [chemical reform] legislation that this committee works so hard on," Pallone said. "And it makes a mockery of EPA. You have the power immediately to get this chemical off the shelves. And you're not doing it. And you should do it."

The lobbying effort also continued behind the scenes. After the hearings, the Environmental Defense Fund contacted Pruitt's office on behalf of the families of Kevin Hartley and and Drew Wynne, 31, was running a cold-brew coffee business in Charleston, S.C., when he died last year while stripping paint from the floor of a walk-in refrigerator using a product called Goof Off.

The group asked for a meeting with the administrator and the EPA agreed. So this past Tuesday morning, Wendy Hartley, along with Cindy Wynne and her other son Brian Wynne, met Pruitt and several of his aides at his office in EPA headquarters.

The families brought with them photographs and the death certificates of the two men, and explained to Pruitt what happened to them.

Pruitt "was very attentive to us," Cindy Wynne told The Post in an interview earlier this week before the EPA's announcement. "He was somewhat surprised when we showed him the cans from Lowe's," where her son had purchased the paint stripper.

Her son, Brian, asked Pruitt if he agreed that methylene chloride was a problem. Pruitt responded, "I do."
But when pressed on whether he would finalize the ban, the administrator did not make a commitment, the family members said.

"We all have the same sense that for a moment there, we felt like there was positive momentum," Brian Wynne said. "And then that went out of the room pretty quickly when he was steadfast against the word 'ban.'"

In an interview after the announcement Thursday, the brother said he was now "cautiously optimistic" that Pruitt would follow through.

"This is a positive development," Brian Wynne said. "It was a surprising one. We certainly didn't see this coming in our meeting with Administrator Pruitt. But we're certainly encouraged by this sign that he seems ready to take action."
Public health and environmental groups also reserved full-throated cheers until the rule's language is made public and submitted to the White House's Office of Management and Budget, which the EPA said will happen "shortly." Sarah Vogel, EDF's vice president for health, urged the EPA to "move quickly to implement a ban, and that includes ensuring necessary administrative procedures are followed to guarantee a permanent ban and that these products are promptly removed from store shelves."

The EPA said the "meeting with the families was constructive."

"It provided the families the opportunity to share with Administrator Pruitt the circumstances in each of their cases and the Administrator the opportunity to hear directly from them," Wilcox said. "There was an exchange of ideas, and we appreciate EDF reaching out to request the meeting."

Pruitt changes NAAQS review to consider 'adverse' effects of standards

By Alex Guillen, 5/10/18, 10:13 AM

EPA Administrator Scott Pruitt today directed the agency to change the review process for a critical air quality program to include the potential "adverse" effects of tighter standards.

In a memo signed Wednesday, Pruitt directed the Clean Air Scientific Advisory Committee, which advises on National Ambient Air Quality Standards issues, to provide advice on background pollution concentrations and the "adverse public health, welfare, social, economic or energy effects" from setting and achieving NAAQS standards.

The Supreme Court has previously ruled that EPA cannot consider implementation costs when setting NAAQS standards. Pruitt's memo argues that such information, even if not used to set a standard, can provide "important policy context for the public, co-regulators and EPA."

Pruitt also committed EPA to finish reviews of two controversial standards before the end of President Donald Trump's first term.

Even as EPA continues internal deliberations over revising the 2015 ozone standard, Pruitt committed the agency to meeting the October 2020 deadline to again review the standard. He also directed EPA to complete its review of the particulate matter standard by December 2020.

The memo also:

— Calls for "more efficient ways" to conduct the scientific and policy assessments that underlie NAAQS reviews;

— Requests a "clearer distinction" between the scientific conclusions and the "wider range of policy concerns" that Pruitt considers in setting standards;

— Urges CASAC members who disagree with the panel's consensus to "share their own individual opinions;" and

— Advises EPA to issue implementation rules and guidance concurrent with NAAQS revisions.

WHAT'S NEXT: The memo directs EPA to begin work on the next ozone review in order to complete it by October 2020.

Pruitt Signs Memo Outlining NAAQS 'Back To Basics' Review Process

By Nick Snow, 5/10/18

US Environmental Protection Agency Administrator E. Scott Pruitt signed a memorandum describing a "back to basics" process for reviewing the federal Clean Air Act's National Ambient Air Quality Standards (NAAQS). The memo assures that EPA and its independent science advisors take a transparent, efficient, and timely approach, he said on May 10.

The memo's principles will reform the process for setting NAAQS in a manner consistent with cooperative federalism and the rule of law, Pruitt maintained. "Getting EPA and its advisors back on track with CAA requirements, statutory deadlines, and the issuance of timely implementation rules will assure that we continue the dramatic improvement in air quality across our country," he said.

The reforms advance initiatives President Donald J. Trump set out in an April 12 memorandum directing Pruitt to take specific actions to ensure efficient and cost-effective NAAQS implementation, including permitting decisions for new and expanded manufacturing facilities and with respect to the Regional Haze Program.

EPA said that Pruitt's memo commits it to begin the next review of the ground-level ozone NAAQS so it can finalize any revisions by the October 2020 deadline under the CAA. It also requires that the agency complete its review of the particulate matter NAAQS by December 2020.

Responding to Pruitt's announcement, an American Petroleum Institute official noted that US ozone concentrations have fallen 17% since 2005, partly due to the oil and gas industry's investments to improve the environmental performance of its products, facilities, and operations.

"We look forward to continuing this progress in achieving our shared goals of protecting public health and the environment and meeting the nation's energy needs," API Regulatory and Scientific Affairs Senior Director Howard J. Feldman said.

Manufacturers applaud EPA for recognizing the problems that have plagued past air quality determinations and for taking strong steps to correct them, observed Ross Eisenberg, the National Association of Manufacturers VP for Energy Resources. "We hope today's announcement leads to better, more effective regulations and improved air quality," he said.

Israel And Iran, Newly Emboldened, Exchange Blows In Syria Face-Off

By Isabel Kershner and David M. Halbfinger, 5/10/18

JERUSALEM — The tense shadow war between Iran and Israel burst into the open early Thursday as Israeli warplanes struck dozens of Iranian military targets inside Syria. It was a furious response to what Israel called an Iranian rocket attack launched from Syrian territory just hours earlier.

The cross-border exchanges — the most serious assaults from each side in their face-off over Iran's presence in Syria — took place a little more than a day after the United States withdrew from the Iran nuclear agreement.

Israel's defense minister said that Israeli warplanes had destroyed "nearly all" of Iran's military infrastructure in Syria after Iran launched 20 rockets at Israeli-held territory, none reaching their targets.

Iran struck shortly after President Trump pulled out of the nuclear agreement, raising speculation that it no longer felt constrained by the possibility that the Americans might scrap the deal if Iran attacked Israel.

Israel appeared newly emboldened as well, partly because of what seemed like extraordinary latitude from Russia, Syria's most important ally, allowing the Israelis to act against Iran's military assets in Syria.

Moscow did not condemn Israel's strikes, as it had in the past, instead calling on Israel and Iran to resolve their differences diplomatically.

And Prime Minister Benjamin Netanyahu of Israel, who spent 10 hours with President Vladimir V. Putin of Russia on Wednesday, told his cabinet on Thursday that he had persuaded the Russians to delay the sale of advanced weapons to Syria.

Russia and Iran have been allies in the Syrian war, defending President Bashar al-Assad. But as the war appears to be winding down, some analysts say the aims of Russia and Iran are diverging: Moscow prefers a strong secular central government in Syria, while Tehran prefers a weaker government that would allow Iran-backed militias free rein.

Israel has conducted scores of strikes on Iran and its allies inside Syria, rarely acknowledging them publicly. But before Thursday, Iran had not retaliated, seemingly handcuffed while it awaited Mr. Trump's decision on the nuclear accord.

Even so, the Iranians have plenty to lose if the conflict continues to grow. They still seem determined to preserve the nuclear accord despite renewed American sanctions. The accord also includes Russia, China, Britain, France, Germany and the European Union.

"We see now that Netanyahu feels that Iran's capacities in Syria are vulnerable, that he can target them, that Iran's capacities to strike back are weakened — he took out some of these capacities, probably less than he claims — and that Iran has no significant way to react without risking itself," said Ofer Zalzberg, an analyst at the International Crisis Group.

Israel made it clear on Thursday that its planning for the airstrikes had been known internally as "Chess," and it looked in the aftermath as though Iran might have been baited into a trap on the Syrian game board.

Iran's rocket attack against Israel came after what appeared to have been an Israeli missile strike against a village in the Syrian Golan Heights late on Wednesday.

Early on Thursday, Iranian forces fired about 20 Grad and Fajr-5 rockets at the Israeli-controlled Golan Heights, targeting forward positions of the Israeli military, according to an Israeli military spokesman. The barrage was launched under the command of the Quds Force of the Islamic Revolutionary Guards Corps and used Iranian weapons, said the Israeli spokesman, Lt. Col. Jonathan Conricus.

Four of the rockets were intercepted by Israel's Iron Dome antimissile defense system, and the rest fell short of the Israeli-controlled territory, the military said. Indeed, by Thursday morning, Israeli life returned to routine in the Golan Heights, with children going to school.

Still, the rocket attack was a significant escalation in Iran's maneuvers in the Middle East. Though Israel has hit Iranian forces in Syria with a number of deadly airstrikes, Tehran had been restrained in hitting back, until now.

"Iran had to make a point: that it can respond, even if it's a weak response," said Joshua M. Landis, a Syria expert and director of the Center of Middle East Studies at the University of Oklahoma. "But it also revealed a weakness: Those rockets don't have any brains."

Israel said its response struck a severe blow to Iran's military capacity in Syria. In a statement, the military said the targets included what it described as Iranian intelligence sites; a logistics headquarters belonging to the Quds Force; military compounds; munition storage warehouses of the Quds Force at Damascus International Airport; intelligence systems associated with those forces; and military posts and munitions in the buffer zone between the Syrian Golan Heights and the Israeli-occupied portion.

"If there is rain on our side, there will be a flood on their side," Israel's defense minister, Avigdor Lieberman, said Thursday morning in remarks broadcast from a policy conference in Herzliya, near Tel Aviv. "I hope we have finished with this round and that everybody understood."

In all, at least 23 people were killed in the strikes, according to the Syrian Observatory for Human Rights, a Britain-based monitoring group. The Syrian Army, by contrast, said that three people had died. Israel reported no casualties on its side.

Israel said it had no intention of further escalation, and analysts looking for clues to Iran's potential response noted that its news media was largely ignoring the overnight hostilities, focusing instead on the nuclear deal. The English-language report on the airstrikes from Iran's Fars news agency made no mention of Iranian involvement.

In a sign of international concern that the conflict could escalate, however, Britain, France, Germany and Russia were quick to call for calm. "We proceed from the fact that all issues should be solved through dialogue," the Russian foreign minister, Sergey V. Lavrov, said at a news conference.

The White House condemned the missile attack on Israel, saying in a statement that it strongly supported "Israel's right to act in self-defense" and called on Iran "to take no further provocative steps."

It also inflicted new financial pain on Iran on Thursday. The Treasury Department said it had teamed with the United Arab Emirates to disrupt an Iranian currency exchange network that transferred millions of dollars, in coordination with Iran's central bank, to the Islamic Revolutionary Guards Corps. "We are intent on cutting off I.R.G.C. revenue streams wherever their source and whatever their destination," Treasury Secretary Steven Mnuchin said in a statement.

Iran has taken advantage of the chaos in Syria to build a substantial military infrastructure there. It has built and trained large militias with thousands of fighters and sent advisers from its Revolutionary Guards Corps to Syrian military bases.

Mr. Netanyahu said this week that the Revolutionary Guards had moved advanced weapons to Syria, including ground-to-ground missiles, weaponized drones and Iranian antiaircraft batteries that he said would threaten Israel's military jets.

Israel's political and security establishment has been unified and vocal in vowing to thwart Iran's efforts to entrench itself militarily across Israel's northern frontier and to build what Israeli and American officials refer to as a land corridor from Iran, through Iraq and Syria, to Lebanon.

Israel had warned Tehran that it would respond to any attack. Israel also broadcast warnings to Syria, saying that allowing Iranian entrenchment in its territory put Mr. Assad's government at risk.

The tensions between Iran and Israel have been complicated further by Mr. Trump's withdrawal from the nuclear agreement on Tuesday.

Israel had railed against the agreement, and Mr. Trump had campaigned on the promise of withdrawing from it, but European countries and many analysts had seen it as a crucial element holding back Iran and Israel, implacable foes, from all-out conflict.

As Mr. Trump announced his decision, Israel put its troops on "high alert," called up reservists, set up Iron Dome batteries and instructed the authorities in the Golan Heights to prepare public bomb shelters after detecting what it said was irregular activity by Iranian forces.

Israel's strikes early Thursday were some of the country's largest aerial operations in decades across the Syrian frontier, and by far the broadest direct attack yet on Iranian assets. "This was an operation we prepared for, and were not surprised by," Colonel Conricus said.

Israel said Russia had been informed before the overnight attack.

In recent years, Iran has helped Hezbollah, the Iranian-backed force in Lebanon, amass a huge arsenal of rockets it can use against Israel as a deterrent against Israeli strikes on Iran's nuclear program.

Israel has carried out scores of strikes against what it says are advanced weapons and convoys destined for Hezbollah. But since February, when Israel intercepted what it later called an armed Iranian drone that had penetrated its airspace from Syria, setting off a day of heated cross-border exchanges, Israel's efforts appear to have been more focused on Iranian assets in Syria.

"Israel doesn't want another Hezbollah inside Syria, it doesn't want another Lebanon," said Andrew J. Tabler, a Syria scholar at the Washington Institute for Near East Policy. "The Israelis think they can surgically strike and not create a wider conflict. They think that Assad, working with the Russians, will have an incentive not to respond."

Trump's High-Risk Doctrine? Swing For The Bleacher Seats

By Catherine Lucey, Jonathan Lemire, and Ken Thomas, 5/10/18

WASHINGTON (AP) — The way President Donald Trump sees it, why go for a solid single when you can swing for a home run?

Trump's upcoming summit with North Korea's Kim Jong Un is only the latest example of the president's go-big strategy. From tax reform to international trade to foreign policy, Trump has pursued a high-risk, high-reward approach that advisers say can help produce results on longstanding problems — and that critics warn could trigger dangerous repercussions all the way from a trade war to global conflict.

Drawn to big moments and bigger headlines, Trump views the North Korea summit as a legacy-maker for him, believing that the combustible combination of his bombast and charm already has led to warmer relations between North and South. As he welcomed home three Americans who had been detained in North Korea, Trump early Thursday used a televised, middle-of-the-night ceremony to play up both his statecraft and stagecraft.

"I think you probably broke the all-time, in history, television rating for three o'clock in the morning," Trump told reporters on the tarmac at Joint Base Andrews.

Trump has also played the disruptor's role in recent weeks and months by withdrawing the U.S. from the Iran nuclear deal, imposing sweeping tariffs on allies and announcing he's moving the U.S. embassy in Israel to Jerusalem, which is claimed by both Israelis and Palestinians.

It's all a sharp contrast to his play-it-safe predecessor.

"You hit singles, you hit doubles; every once in a while we may be able to hit a home run," President Barack Obama said of his own foreign policy. "But we steadily advance the interests of the American people and our partnership with folks around the world."

Not all of Trump's attention-grabbing gambits have worked — and the potential risks going forward are daunting.

His push to overturn Obama's landmark health care law ended in a humiliating defeat for the Republicans. His decision to impose new tariffs on steel and aluminum imports has left global markets in a state of flux and unnerved some of America's closest allies about the potential for a trade war. And his withdrawal from the international nuclear agreement with Iran, with strong support from Israel, has escalated tensions in the already volatile region.

Critics say Trump sometimes focuses on bold gestures first — and fallout later.

For now, scoring a diplomatic win with Pyongyang has become Trump's top focus.

His outside-the-box approach to North Korea — complete with ominous taunts of raining "fire and fury" on the North while belittling its leader as "Little Rocket Man" — alarmed many global capitals and much of Washington's national security establishment, increasing worries about nuclear war.

But Trump believes it brought Kim to the negotiating table, with a summit between the two men now set for June 12 in Singapore.

Trump told one confidant that he now believes a deal with North Korea, rather than in the Middle East, could be his historic victory. White House officials also believe that a triumph on the Korean Peninsula — something that has eluded the United States for generations — could bolster Trump's approval ratings, help inoculate him against the investigations swirling around him and maybe even trickle down to help Republicans in this fall's midterm elections.

While some White House aides characterized Trump's moves as evidence of bold thinking, there is also concern that he has little sense of the potential repercussions from some of his big moves, believing that if things don't work out, that he can always just reverse course.

In the early months of his administration, Trump latched on to the belief that he could be the president to bring peace to the Middle East. Fond of the idea of making history, the president told advisers he was driven to accomplish something that his predecessors could not and believed that his negotiating skills and strong relationship with Israeli Prime Minister Benjamin Netanyahu could lead to the unprecedented achievement, according to four White House officials and outside advisers.

At one moment last spring, Trump mused in the Oval Office that he wouldn't even require a second term to settle things in the region, according to two people familiar with the exchange but not authorized to speak publicly about private conversations.

Though he did break with tradition to move the U.S. embassy to Jerusalem, the White House plan bogged down and the divide between Israelis and Palestinians seems as intractable as ever, prompting Trump's attention shift to North Korea. Warned by Obama days after his election that the threat posed by Pyongyang could define his presidency, Trump answered Kim's threats with bellicose warnings of his own and rallied an international pressure campaign against North Korea.

Some Republicans have suggested his efforts should bring him the Nobel Peace Prize, an idea Trump clearly savored at a recent rally in Michigan when the crowd chanted "Nobel." Asked about the chatter in the Oval Office this week, Trump said: "I want to get peace. It's the main thing. We want to get peace. That was a big problem, and I think it's going to work out well."

Then he added his catchall caveat: "We'll see."

Long before he was president, the onetime New York real estate developer and reality television star often spoke about the benefits of acting boldly. In "The Art of the Deal," he put it this way: "I like thinking big. I always have. To me it's very simple: if you're going to be thinking anyway, you might as well think big."

Trump appears to have embraced the "Great Man" theory of history, believing that individuals more than circumstances or trends alter the course of events. In his 2016 GOP convention speech, he famously declared "I alone can fix it," in referencing the nation's problems.

Trump and his team also believe that his bold tactics have the added benefit for Trump of overshadowing the threats his administration faces from the ongoing Russia probe and the legal web surrounding his personal attorney, Michael Cohen, and porn actress Stormy Daniels.

Rice University presidential historian Douglas Brinkley said Trump's diplomacy with North Korea is a "high-risk game."

"But if he pulls off the denuclearization of the North Korean Peninsula, it will be the landmark achievement," said Brinkley. "It's Trump's big going-to-China moment."

Subject: SIGNED: Strengthening Transparency in Regulatory Science

Good afternoon
Today, the Administrator signed the proposed rule "Strengthening Transparency in Regulatory Science."

This proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation.

In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

Attached is the signed and dated proposed rule. For your convenience, please go to p. 19 for the Administrator's signature.

Please contact me if you have any questions.

Sincerely,
Laura

Laura S. Johnson | U.S. Environmental Protection Agency
Special Assistant, Office of the Administrator | Cell (202) 819-4941
Office (202) 566-1273 | johnson.laura-s@epa.gov

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 30

[EPA-HQ-OA-2018-0259; FRL-XXXX-XX]

RIN 2080-AA14

Strengthening Transparency in Regulatory Science

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: This document proposes a regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation. In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

DATES: Comments must be received on or before **[insert date 30 days after date of publication in the Federal Register]**.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OA-2018-0259, at *https:// www.regulations.gov*. Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a

written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *https://www.epa.gov/dockets/ commenting-epa-dockets.*

FOR FURTHER INFORMATION, CONTACT: Tom Sinks, Office of the Science Advisor, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, Washington, DC 20460; (202) 564-0221; email address: *staff_osa@epa.gov*.

SUPPLEMENTARY INFORMATION:

Submitting CBI. Do not submit information that you consider to be CBI electronically through *https://www.regulations.gov* or email. Send or deliver information identified as CBI to only the following address using U.S Postal Service: U.S. Environmental Protection Agency, EPA Docket Center, EPA–HQ–OA-2018-0259, Mail Code 28221T, 1200 Pennsylvania Avenue, NW, Washington, DC 20460. For other methods of delivery, see https://www.epa.gov/dockets/where-send-comments-epa-dockets.

Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD-ROM that you mail to EPA, mark the outside of the disk or CD-ROM as CBI and then identify electronically within the disk or CD-ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that

includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. If you submit a CD-ROM or disk that does not contain CBI, mark the outside of the disk or CD-ROM clearly that it does not contain CBI. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 Code of Federal Regulations (CFR) part 2.

Organization of This Document. The following outline is provided to aid in locating information in this preamble.

I. General Information

A. Does this action apply to me?

This proposed regulation does not directly regulate any entity outside the federal government. However, any entity interested in EPA's regulations may be interested in this proposal. This proposal may be of particular interest to entities that conduct research and other scientific activity that is likely to be relevant to EPA's regulatory activity.

B. What action is the agency taking?

This notice solicits information and comment from the public on a proposed regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that, for the science pivotal to its significant regulatory actions, EPA will ensure that the data and models underlying the science is publicly available in a manner sufficient for validation and analysis. In this notice, EPA solicits comment on this proposal and how it can best be implemented in light of existing law and prior statements of policy that have called for increasing public access to data and influential scientific information used to inform federal regulation. EPA has not previously implemented these policies and guidance in a robust and consistent manner. This proposal will help ensure that EPA is pursuing its mission of protecting public health and the environment in a manner that the public can trust and understand.

C. What is the agency's authority for taking this action?

The Agency proposes to take this action under authority of the statutes it administers, including provisions providing general authority to promulgate regulations necessary to carry out the Agency's functions under these statutes and provisions specifically addressing the Agency's conducting of and reliance on scientific activity to inform those functions, including Clean Air Act sections 103, 301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C. 300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act section 328, 42 U.S.C. 11048;

Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609. This action is also consistent with requirements in the Administrative Procedure Act to ensure public participation in the rulemaking process. As noted in Section III below, EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.

II. Background

The best available science must serve as the foundation of EPA's regulatory actions.[1] Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA's regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in enhancing the public's ability to understand and meaningfully participate in the regulatory process.[2] In applying the best available science to its regulatory decision-making, EPA must comply with federal transparency and data integrity laws, and must also ensure that its decision-making is marked by independence, objectivity, transparency, clarity, and reproducibility. Although these standards are important in all scientific endeavors, they are of paramount importance when the government relies on science to inform its significant regulatory decisions that will affect the public. When EPA develops significant regulations using public resources, including regulations for which the public is likely to bear the cost of compliance, EPA should ensure that the data and models

[1] See Exec. Order No. 13563, 76 Fed. Reg. 3821 (Jan. 21, 2011). "Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation. It must be based on the best available science."

[2] See Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity (Mar. 9, 2009). "If scientific and technological information is developed and used by the Federal Government, it should ordinarily be made available to the public. To the extent permitted by law, there should be transparency in the preparation, identification, and use of scientific and technological information in policymaking."

underlying scientific studies that are pivotal to the regulatory action are available to the public. This proposed rule is designed to increase transparency in the preparation, identification, and use of science in policymaking.

This proposed rule is consistent with the principles underlying the Administrative Procedure Act and programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.[3] This proposed rule is also consistent with Executive Orders 13777[4] and 13783,[5] and the focus on transparency in OMB's *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies*[6] (the Guidelines) and OMB *Memorandum 13-13: Open Data Policy – Managing Information as an Asset.*[7] It builds upon prior EPA actions[8] in response to government-wide data access and sharing policies, as well as the experience of other

---

[3] EPA has the authority to establish policies governing its reliance on science in the administration of its regulatory functions. Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use non-public data in support of its regulatory actions. *See Coalition of Battery Recyclers Ass'n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass'ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002). EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.

[4] Exec. Order No. 13777, 82 Fed. Reg. 12285 (Mar. 1, 2017). Regulatory reform efforts shall attempt to identify "those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard for reproducibility."

[5] Exec. Order No. 13783, 82 Fed. Reg. 16093 (Mar. 31, 2017). "It is also the policy of the United States that necessary and appropriate environmental regulations comply with the law, are of greater benefit than cost, when permissible, achieve environmental improvements for the American people, and are developed through transparent processes that employ the best available peer-reviewed science and economics."

[6] February 22, 2002 (67 F.R 8453) *OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information* (2002) https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information.

[7] *Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset* (https://project-open-data.cio.gov/policy-memo/). "Specifically, this Memorandum requires agencies to collect or create information in a way that supports downstream information processing and dissemination activities. This includes using machine-readable and open formats, data standards, and common core and extensible metadata for all new information creation and collection efforts. It also includes agencies ensuring information stewardship through the use of open licenses and review of information for privacy, confidentiality, security, or other restrictions to release."

[8] Plan to Increase Access to Results of EPA-Funded Scientific Research; EPA Open Government Plan 4.0; Open Data Implementation Plan; EPA's Scientific Integrity Policy; Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency; ;

federal agencies in this space.[9] In particular, this proposal applies concepts and lessons learned from its ongoing implementation of the 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research to significant regulatory decisions. The proposed rule takes into consideration the policies or recommendations of third party organizations who advocated for open science.[10] These policies are informed by the policies recently adopted by some major scientific journals,[11] spurred in some part by the "replication crisis." [12]

Today, EPA is proposing to establish a clear policy for the transparency of the scientific information used for significant regulations: specifically, the dose response data and models that underlie what we are calling "pivotal regulatory science." "Pivotal regulatory science" is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.

With this notice, EPA is soliciting public comment on a proposed regulation designed to provide a mechanism to increase access to dose response data and models underlying pivotal regulatory

---

[9] For example, see related policies from the National Science Foundation, National Institute of Science and Technology, the National Institutes of Health; and the US Census Bureau, which provides secure access to data from several agencies in an environment that protects against unauthorized disclosure (https://www.census.gov/fsrdc).

[10] These include policies and recommendations from: the Administrative Conference of the United States' Science in the Administrative Process Project; National Academies' reports on *Improving Access to and Confidentiality of Research Data*, *Expanding Access to Research Data*, and *Access to Research Data in the 21st Century*; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center's Science for Policy Project.

[11] For example, see related policies from the *Proceedings of the National Academy of Sciences*, *PLOS ONE*, *Science*, and *Nature*.

[12] See: https://www.nature.com/articles/s41562-016-0021; http://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.0020124; http://science.sciencemag.org/content/343/6168/229.long; https://www.economist.com/news/leaders/21588069-scientific-research-has-changed-world-now-it-needs-change-itself-how-science-goes-wrong.; http://stm.sciencemag.org/content/8/341/341ps12.full

science in a manner consistent with statutory requirements for protection of privacy and confidentiality of research participants, protection of proprietary data and confidential business information, and other compelling interests. The proposal takes comment on how to ensure that, over time, more of the data and models underlying the science that informs regulatory decisions (over and above the dose response data and models underlying "pivotal regulatory science") is available to the public for validation[13] in a manner that honors legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification. As such this proposed regulation is designed to change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis. Regulatory determinations based on science should describe and document any assumptions and methods used, and should address variability and uncertainty. Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments. EPA's regulatory science should be consistent with the Office of Management and Budget's *Final Information Quality Bulletin for Peer Review*.[14] Robust peer review plays a critical role in independently validating key findings and ensuring that the quality of published information meets the standards of the scientific and technical community.

In addition, this proposed regulation is designed to increase transparency of the assumptions underlying dose response models. As a case in point, there is growing empirical evidence of non-

[13] EPA has not consistently followed previous EPA policy (e.g, EPA's Scientific Integrity Guidance, referenced above) that encouraged the use of non-proprietary data and models.
[14] https://www.whitehouse.gov/wp-content/uploads/2017/11/2005-M-05-03-Issuance-of-OMBs-Final-Information-Quality-Bulletin-for-Peer-Review-December-16-2004.pdf

linearity in the concentration-response function for specific pollutants and health effects. The use of default models, without consideration of alternatives or model uncertainty, can obscure the scientific justification for EPA actions. To be even more transparent about these complex relationships, EPA should give appropriate consideration to high quality studies that explore: a broad class of parametric concentration-response models with a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the exposure range; and spatial heterogeneity. EPA should also incorporate the concept of model uncertainty when needed as a default to optimize low dose risk estimation based on major competing models, including linear, threshold, and U-shaped, J-shaped, and bell-shaped models.

Across EPA programs, much of the science that informs regulatory actions is developed outside the Agency. It is the charge of regulators to ensure that key findings are valid and credible, as required by OMB's Guidelines[15] (which apply to "third party" information - e.g., non-government scientific research – if the agency use of that information provides the appearance of representing agency views). Using scientific information that can be independently validated will lead to better outcomes, and strengthen public confidence in the health and environmental protections underpinning EPA's regulatory actions.

EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of

[15] February 22, 2002 (67 F.R 8453) *OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information* (2002) https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information

the Federal government.[16] Nothing in the proposed rule compels the disclosure of any confidential or private information in a manner that violates applicable legal and ethical protections. Other federal agencies have developed tools and methods to de-identify private information for a variety of disciplines.[17] The National Academies have noted that simple data masking, coding, and de-identification techniques have been developed over the last half century and that "Nothing in the past suggests that increasing access to research data without damage to privacy and confidentiality rights is beyond scientific reach."[18] More recently, both the National Academies and the Bipartisan Commission on Evidence Based Policy[19] have discussed the challenges and opportunities for facilitating to secure access to confidential data for non-government analysts.

Considering the breadth of dose response data and models used in the development of significant EPA regulations, the requirements for availability may differ. These mechanisms may range from deposition in public data repositories, consistent with requirements for many scientific journals,[20] to, for certain types of information, controlled access in federal research data centers that facilitate secondary research use by the public.[21] EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective

and may also include: requiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.[22]

Implementation of this proposed rule will be consistent with the definition of "research data" in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in P.L. 89-487, and other applicable federal laws.

This proposed regulation is intended to apply prospectively to final regulations that are determined to be "significant regulatory actions" pursuant to E.O. 12866. The Agency's offices should be guided by this policy to the maximum extent practicable during ongoing regulatory action, even where such research has already been generated, solicited, or obtained.

III. Request for Comment

EPA solicits comment on all aspects of the proposed regulation and the bases articulated for it above. Specifically, EPA believes that it has identified appropriate sources of statutory authority for this proposed regulation in Section I(c) above, and solicits public comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.

EPA further believes that a generally applicable regulatory provision of the type proposed here is the appropriate vehicle to establish and implement the policies articulated in Section II above, in the interests of consistency, predictability, and transparency across the functions that EPA performs.

EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other

[22]These recommendations are consistent with those of Lutter and Zorn (2016). https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf.we re

policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II above. EPA solicits comment on the effects of this proposed rule on individual EPA programs, including whether certain activities are appropriate to be excepted or if other requirements would affect implementation. EPA also seeks comments on which criteria the Agency should use to base any exceptions, including whether case-by-case exceptions may be appropriate. Although the proposed regulatory text would impose requirements specifically on final regulations determined to be "significant regulatory actions" under E.O. 12866, EPA solicits comment on whether and to what extent these requirements, or other provisions and policies, should apply to other stages of the rulemaking process, including proposed rules, as well as to other types of agency actions and promulgations, such as guidance. EPA also solicits comment on whether a narrower scope of coverage would be appropriate, such as only final regulations that are determined to be "major" under the Congressional Review Act, or "economically significant" under EO 12866. EPA also requests comment on whether certain categories of regulations should be excluded from coverage, such as those that merely reaffirm an existing standard, or some other category. For instance, we request comment on whether the provisions of the proposed rule should apply to individual party adjudications, enforcement activities, or permit proceedings when EPA determines that these provisions are practical and appropriate and that the actions are scientifically or technically novel or likely to have precedent-setting influence on future actions. EPA seeks comment on whether the Agency should apply the provisions of the proposed rule to these actions or to specific types of actions within these categories. The Agency also seeks comment on whether other agency actions, beyond significant

final regulatory actions under EO 12866, should be included, such as site-specific permitting actions or non-binding regulatory determinations.

EPA solicits comment on the definitions of "*pivotal regulatory science*," and "*dose response data and models*" and how to implement such definitions.

EPA also solicits comment on how to incorporate stronger data and model access requirements into the terms and conditions of cooperative agreements and grants. EPA solicits comments on how it can build upon other federal agencies' policies regarding grantee and cooperator requirements for data access and data sharing. EPA also solicits suggestions for a platform that would enable the Agency to implement the provisions of this proposal related to increasing public access to EPA-funded data. EPA also seeks comment on methodologies and technologies designed to provide protected access to identifiable and sensitive data, such as individual health data, and on commenters experience with the use of such methodologies and technologies and their strengths and limitations. Similarly, EPA seeks comment on how to balance appropriate protection for copyrighted or confidential business information, including where protected by law, with requirements for increased transparency of pivotal regulatory science. EPA also requests comment on whether there are other compelling interests besides privacy, confidentiality, national and homeland security that may require special consideration when data is being released.

EPA solicits comment on implementation of the proposed regulation, including which parts of the Agency should be responsible for carrying out these requirements. EPA seeks comment on the effective date of a rule as well as on whether the Agency should seek to phase-in the requirements for certain significant regulatory actions or seek to prioritize specific actions. For regulatory programs, like the National Ambient Air Quality Standards program, in which future

significant regulatory actions may be based on the administrative record from previous reviews - particularly where the governing statute requires repeated review on a fixed, date-certain cycle - EPA seeks comment on the manner in which this proposed rule should apply to that previous record. EPA also solicits comments on whether and how the proposed rule should apply to dose response data and models underlying pivotal regulatory science if those data and models were developed prior to the effective date. In addition, EPA seeks comment on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could inadvertently introduce bias regarding the timeliness and quality of the scientific information available. EPA seeks comment on how to address a circumstance in which EPA has a statutory requirement to make a determination for which scientific information publicly available in a manner sufficient for independent validation does not exist. EPA also seeks comment on any additional implementation challenges not discussed in this notice that commenters may be aware of as well as suggestions for addressing them.

The proposed rule includes a provision allowing the Administrator to exempt significant regulatory decisions on a case-by-case basis if he or she determines that compliance is impracticable because it is not feasible to ensure that all dose response data and models underlying pivotal regulatory science are publicly available in a fashion that is consistent with law, protects privacy and confidentiality, and is sensitive to national and homeland security, or in instances where OMB's Information Quality Bulletin for Peer Review provides for an exemption (Section IX). The agency requests comment on whether these exemptions are appropriate, and on whether there are other situations in which specific significant regulatory actions, or specific categories of significant regulatory actions should be exempted.

EPA also requests comment on whether the disclosure requirements applicable to dose response data and models in the proposed rule should be expanded to cover other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulatory interventions on complex economic or environmental systems.

IV. Statutory and Executive Orders Reviews

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is a significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review. Any changes made in response to OMB recommendations have been documented in the docket.

EPA believes the benefits of this proposed rule justify the costs. The benefits of EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets; this is consistent with the conclusions of the National Academies[23] This action should be implemented in a cost-effective way and is consistent with recent activities of the scientific community and other federal agencies, which will help to lower costs of implementation. The proposed rule directs EPA to make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making dose response models and data underlying pivotal regulatory science used in significant regulatory decisions available to the public in a manner sufficient for independent validation, consistent with law and protection of privacy,

[23] https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities.

confidentiality, and national and homeland security. However, it does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way that complies with the law and appropriate protections is not possible.

By limiting the proposed rule to pivotal regulatory science for final significant regulatory actions pursuant to EO 12866, the proposed rule ensures that this standard for transparency affects a smaller subset of regulations which are economically significant, create inconsistency for other federal agencies, alter budgetary impacts, or raise novel legal or policy issues. One recent analysis found that: "Improvements in reproducibility can be thought of as increasing the net benefits of regulation because they would avoid situations in which costs or benefits are wrongly estimated to occur or in which regulatory costs are imposed without corresponding benefits. …" They concluded that "an increase in existing net benefits from greater reproducibility, which, if it occurred, would cover the costs of obtaining the data and making the data available."[24]

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not expected to be an Executive Order 13771 regulatory action because it relates to "agency organization, management or personnel."

C. Paperwork Reduction Act (PRA)

This action does not contain any information collection activities and therefore does not impose an information collection burden under the PRA.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities.

[24] https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of "covered regulatory action" in section 2-202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This action is not a "significant energy action" because it is not likely to have a significant adverse effect on the supply, distribution or use of energy.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard.

List of Subjects in 40 CFR Part 30

Environmental protection, Administrative practice and procedure, Reporting and recordkeeping requirements.

APR 24 2018

Dated: _____.

E. Scott Pruitt,

Administrator

For the reasons set forth in the preamble, EPA proposes to add 40 CFR part 30 as follows:

PART 30—Transparency in Regulatory Decisionmaking

1. Add part 30 to read as follows:

PART 30—Transparency in Regulatory Decisionmaking

Sec.

Authority: Clean Air Act §§ 103, 301(a), 42 U.S.C. §§ 7403, 7601(a); Clean Water Act §§ 104, 501, 33 U.S.C. §§ 1254, 1361; Safe Drinking Water Act §§ 1442, 1450(a)(1), 42 U.S.C. §§ 300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act §§ 2002(a)(1), 7009, 42 U.S.C. §§ 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) §§ 115, 311, 42 U.S.C. §§ 9616, 9660; Emergency Planning and Community Right-To-Know Act § 328, 42 U.S.C. § 11048; Federal Insecticide, Fungicide, and Rodenticide Act §§ 25(a)(1), 136r(a), 7 U.S.C. §§ 136r(a), 136w; and Toxic Substances Control Act, as amended, § 10, 15 U.S.C. § 2609.

§30.1 What is the purpose of this subpart?

This subpart directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.

§30.2 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Act or in subpart A; and the following terms shall have the specific meanings given them.

Dose response data and models means the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact. Such functions

typically underlie pivotal regulatory science that drives the size of benefit-cost calculations, the level of a standard, and/or the points of departure from which reference values (reference doses or reference concentrations) are calculated.

Pivotal regulatory science means the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.

Regulatory decisions mean final regulations determined to be "significant regulatory actions" by the Office of Management and Budget pursuant to Executive Order 12866.

Regulatory science means scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.

Research data means "research data" as that term is defined in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards.

§30.3 How do the provisions of this subpart apply?

The provisions of this subpart apply to *dose response data and models* underlying *pivotal regulatory science* that are used to justify significant *regulatory decisions* regardless of the source of funding or identity of the party conducting the regulatory science. The provisions of

this section do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses. Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.

§30.4 What requirements apply to EPA's use of studies in taking final action?

EPA shall clearly identify all studies (or other regulatory science) relied upon when it takes any final agency action. EPA should make all such studies available to the public to the extent practicable.

§30.5 What requirements apply to EPA's use of dose response data and models underlying pivotal regulatory science?

When promulgating significant regulatory actions, the Agency shall ensure that *dose response data and models* underlying *pivotal regulatory science* are publicly available in a manner sufficient for independent validation. Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security. Information is considered "publicly available in a manner sufficient for independent validation" when it includes the information necessary for the public to understand, assess, and replicate findings. This may include, for example:

(a) Data (where necessary, data would be made available subject to access and use restrictions).

(b) Associated protocols necessary to understand, assess, and extend conclusions;

(c) Computer codes and models involved in the creation and analysis of such information;

(d) Recorded factual materials; and

(e) Detailed descriptions of how to access and use such information.

The provisions of this section apply to dose response data and models underlying pivotal regulatory science regardless of who funded or conducted the underlying data, models, or other regulatory science. The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national and homeland security is not possible. Where data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section.

§30.6 What additional requirements pertain to the use of dose response data and models underlying pivotal regulatory science?

EPA shall describe and document any assumptions and methods used, and should describe variability and uncertainty. EPA shall evaluate the appropriateness of using default

assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis. EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high quality studies that explore: a broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

§30.7 What role does independent peer review in this section?

EPA shall conduct independent peer review on all *pivotal regulatory science* used to justify *regulatory decisions,* consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

§30.8 How is EPA to account for cost under this subpart?

EPA shall implement the provisions of this subpart in a manner that minimizes costs.

§30.9 May the EPA Administrator grant exemptions to this subpart?

Yes. The Administrator may grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable because:

(a) It is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security; or

(b) It is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality Bulletin for Peer Review (70 FR 2664), Section IX.

§30.10 What other requirements apply under this subpart?

EPA shall implement the provisions of this section consistent with the definition of "research data" in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in P.L. 89-487, and other applicable federal laws.

Where appropriate, data sharing agreements and state-of-the-art data-masking techniques may be employed to facilitate access to information.

Pruitt Resumes Courting Industry as Ethics Controversies Swirl

By Jennifer A. Dlouhy and Ari Natter

Posted May 9, 2018, 6:34 PM

Embattled EPA Administrator Scott Pruitt is seeking to shift the limelight away from questions about his ethics and instead focus attention on his efforts to eliminate regulations on oil drillers, farmers, home builders, and automakers.

Industry Clamors for EPA's Ear on Revising Cost-Benefit Reviews

By Abby Smith

Posted May 9, 2018, 3:08 PM

Industry groups are lining up to share their thoughts on how the EPA should evaluate the costs and benefits of regulations differently, just as the agency is poised to release an overhaul of its approach.

Asbestos Controls, Testing Flame Retardants Among New EPA Rules (1)

By Pat Rizzuto

Posted May 9, 2018, 1:23 PMUpdated May 9, 2018, 6:00 PM

The EPA would restrict some uses of asbestos and require manufacturers to generate new toxicity data for some flame-retardant chemicals under updated regulatory plans the agency released May 9.

EPA Obscures Deadline for Science Transparency Plan

By Sylvia Carignan

Posted May 9, 2018, 1:07 PM

The EPA has yet to release a timeline for its plans to increase the transparency of the scientific studies it uses to set environmental protection standards, according to the Office of Management and Budget's regulatory agenda released May 9.

House Vote Bolsters Critics' Efforts To Kill EPA Policies Under 'Review' Act

Congress has approved a first-time Congressional Review Act (CRA) resolution repealing a years-old agency guidance, a measure that appears likely to bolster efforts by deregulatory opponents, who are currently seeking a precedent-setting court ruling that would allow them to enforce the law's mandate that agencies submit such documents to Congress for approval or disapproval.

GREENWIRE ARTICLES

Half-hour of confusion at Pruitt's condo

Kevin Bogardus and Hannah Northey, E&E News reporters

Published: Thursday, May 10, 2018

EPA Administrator Scott Pruitt rented this Capitol Hill condominium from the wife of a lobbyist whose clients lobbied EPA. Kevin Bogardus/E&E News

One March evening last year, the Washington, D.C., fire department dispatched an emergency team at 5:18 p.m. — someone was reportedly unconscious.

First responders from Engine Co. 3 raced to the other side of Capitol Hill, arriving just five minutes later at a plush condo building down the street from Senate office buildings. The sequence of events as recorded by the dispatch center indicates concern over what prompted the call, according to the incident report obtained by E&E News under a public records request.

With some redacted words legible under light, the report's narrative reads, "The caller is unable to assess the patient's breathing status" and "He is still unconscious." Other notes hint at the confusion on the scene, such as "Fainting" and "Conscious, Breathing."

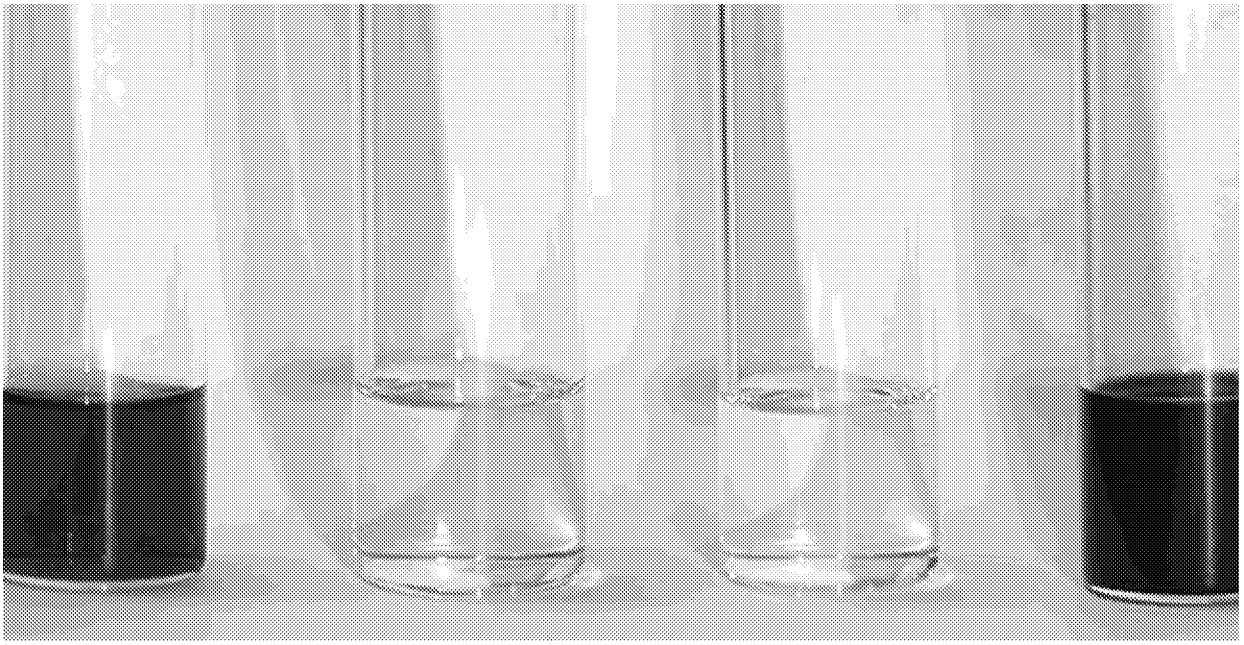
Surprise: EPA will finalize Obama curbs on paint stripper

Corbin Hiar, E&E News reporter

Published: Thursday, May 10, 2018



EPA has pledged to take action on methylene chloride. LHcheM/Wikimedia Commons

In an unexpected move, EPA said today it "intends to finalize" an Obama-era proposal that sought to restrict the sale of a deadly paint-stripping chemical.

The agency also announced it wouldn't re-evaluate "the paint stripping uses of methylene chloride and is relying on previous risk assessments," which found the chemical can trigger asphyxiation and heart attacks. The 2011 risk assessment also determined that long-term exposure can cause cancer and damage to the liver and kidneys.

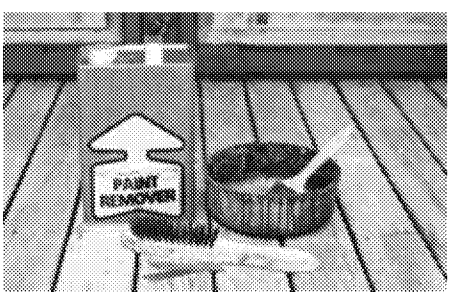
Methylene chloride campaigners meet with EPA Administrator

Pressure mounts on Pruitt

9 May 2018 / Built environment, Solvents, United States



NGO campaigners have met with EPA Administrator Scott Pruitt to request that the agency act on its proposed rule to ban methylene chloride paint strippers.

The meeting is the latest development in a months-long push for action on the paint removal products, which have caused dozens of consumer and worker deaths in recent years.

Mr Pruitt has continued to insist that the proposal – which was issued in the final days of the previous administration – has not been dropped, but rather is under review.

But NGOs and families of those who have died using the products are urging the agency act immediately.

Cindy Wynne – the mother of a South Carolina man who was killed while using a paint stripper containing methylene chloride – added that while she appreciated the meeting, Mr Pruitt's "words of consolation and explanation" are insufficient.

Meanwhile, NGO Safer Chemicals, Healthy Families is leading health advocacy groups in a "week of action" in dozens of states demanding that Lowe's home improvement stores pull the products from their shelves.

Under the organisation's Mind the Store campaign, more than 120,000 consumers have petitioned the company to stop selling the paint strippers.

Anses warns against hazardous substances in homemade toy 'slime

9 May 2018 / Children's products, France, Substances of concern

Homemade toy 'slime' can pose health risks to children as they may contain hazardous substances, the French Agency for Food, Environmental and Occupational Health and Safety has warned.

Several cases of skin damage related to the product have been reported to the agency, poison control centres and various allergy control networks, Anses said.

The slime kits have become very popular with younger children and teenagers in France, and tutorials on the internet on home fabrication have increased interest in the product.

In a joint warning with the French Directorate-General for Competition, Consumer Affairs and Fraud Control (DGCCRF), Anses said detergents and adhesives used in homemade slime contain allergenic or irritant preservatives that are not meant to be handled in large quantities, repeatedly and for a prolonged time.

Liquid adhesives – the most common ingredient – contain preservatives such as formaldehyde liberators or isothiazolinones, which are "very allergenic substances", as well as many solvents, which can cause irritation of the airways and damage to the central nervous system, Anses said.

The majority of online do-it-yourself recipes also contain boron compounds. These substances, intended for cleaning contact lenses or as detergents, are reprotoxic, may impact foetal development and "must not be manipulated by children repeatedly", it said.

The DGCCRF also conducted a survey of slime kits sold in shops. Of the 15 samples analysed, two contained a boron content exceeding the permissible limit and were withdrawn from the market. The DGCCRF will continue its market controls in 2018.

Last month, the Norwegian Environmental Directorate removed some ready-made slime products from the market, after it found they contained high levels of lead and arsenic.

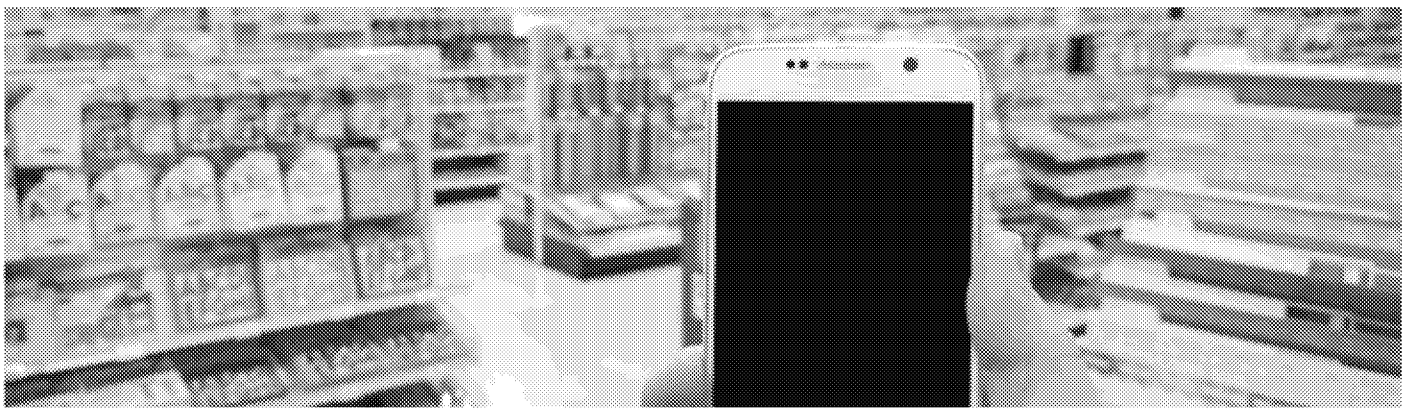
There's an app for that

The AskREACH project aims to make Article 33 of REACH work better by enabling consumers to track SVHCs in articles

Global Business Briefing, May 2018



The duty of suppliers of articles containing substances of very high concern (SVHCs) at concentrations above 0.1% w/w in an article, including – as per a European Court of Justice (ECJ) ruling in 2015 – each article "incorporated as a component of a complex product", is enshrined in REACH Article 33. What is happening in practice is quite another matter.

Article 33 stipulates that suppliers "shall provide the recipient of the article with sufficient information, available to the supplier, to allow safe use of the article including, as a minimum, the name of that substance". It also requires suppliers to provide consumers with the same information, free of charge, within 45 days of receiving a request.

Recently, representatives of industries including automotive, electronic, aerospace, apparel, furniture and chemicals began discussions on collecting and sharing material data for articles, including their chemical composition. Although they have their own material declaration systems, there is little information sharing and it is recognised that a common approach could:

- facilitate the collection and sharing of material
- composition information;
- allow companies to better identify SVHCs; and
- ensure compliance as regulations change.

This would be particularly helpful to upstream companies, which currently receive multiple requests for the same or similar information in multiple formats. An accord is some way off as there has to be agreement on such thorny issues as a common data structure, the level of detail to be communicated, data quality and data security.

When implementing legislation, says Martin Führ, professor of public law, comparative theory and legal theory at Hochschule Darmstadt University of Applied Sciences in Germany, it is important to follow the legislators' intentions as well as the letter of the law. In this case, it is clear that REACH aims to substitute SVHCs with other solutions.

Moreover, he says, Article 1, which aims for a high level of protection for health and environment, requires "a dynamic approach, involving the actors in the supply chain directly. No interference by public authorities as such is needed." Obviously the definitions in Article 33 are extremely broad.

A 'supplier' could be a producer, distributor or other actor in the supply chain. An 'article' can be tiny but, as the principle states, "once an article, always an article", as the ECJ also established in 2015. 'Placing on the market' can mean simply selling it, but also holding it as stock in an online shop or offering it free of charge, such as a paper towel in a public restroom. All in all, says Professor Führ, "it's difficult not to be a supplier of an article".

These findings are mirrored when it comes to the question who is entitled to a consumer request: REACH does not define a 'consumer'; but from a legal perspective, a consumer does not necessarily have to be a buyer. Downstream users are excluded, as they are covered by Article 32 (1), but all other natural and legal persons are entitled to ask for information - possibly including the authorities in their role as buyers of articles.

"Behind Article 33 is the duty to cooperate with other actors in the supply chain," Professor Führ says. "This is not written in the legal text but it is the precondition that the whole system works on."

For consumers to be informed, as the legislators clearly intended, there has to be transparency and traceability. This has the extra benefits of complying with product safety and liability requirements.

There are many ways to comply with Article 33. Often, they can be rather unhelpful. For example, some major electronic goods suppliers have put generic information on the internet about how some of their hundreds of products "might contain" unspecified SVHCs, saying that they all do to be on the safe side, or sending test results running to many pages, which may not refer to SVHCs or may be out of date because the candidate list has since been updated.

This will no longer be acceptable, Professor Führ says. The EU's circular economy package is on its way and a provision in that links Article 33 to a central database that Echa will host. This is due to go online in 18 months, with obligations starting after 30 months' time.

The upcoming review of the waste framework Directive is another relevant issue here. In March, a proposed amendment was added to Article 9, requiring suppliers to notify Echa of the presence of SVHCs in articles. This followed on from a European Parliament vote to adopt other proposed changes with the specific aim of ensuring a 'progressive substitution' of SVHCs.

The issue also goes beyond the EU framework. It addresses initiatives like the Strategic Approach to International Chemicals Management (Saicm) and the UN's Sustainable Development Goals (SDGs), particularly SDG 12, 'Ensure sustainable consumption and production patterns', for which targets are due in 2020. "Article 33 could have been really helpful to reaching this SDG," says Professor Führ.

Ten years on from REACH coming into force, however, implementation of Article 33 has barely begun. A report by Echa in 2016 showed very low consumer awareness of the right to request information and various studies of compliance have shown that it is not functioning properly.

For instance, in a study commissioned in Belgium by DG Environment in 2016, only 23% of the companies selling construction materials which were sent a request about the presence of SVHCs in their products replied within 45 days.

Of those which did:

- some provided a formal letter of declaration, of the kind they send to downstream users, stating that no SVHCs were present
- in their products;
- some did not understand the request or declined to provide information; and
- some said that they were not obliged to provide information because the request had not been made by a consumer.

"There are various reasons why the system does not work well," says Arno Biwer, senior R&T associate at the Luxembourg Institute of Science and Technology. "Limited awareness among consumers, retailers and suppliers about their rights and obligation; difficulties for consumers in making requests; suppliers' answers being inadequate or wrong, or just not answering. All of this leads to risks to human health and the environment."

In any case, adds Professor Führ, today's consumers see no point in asking questions in a shop that may or may not be answered 45 days later. They want answers immediately. The only viable way to address that is to use mobile apps to scan information from barcodes on the products themselves.

Denmark has already pioneered this approach and the lessons learned there are informing ongoing initiatives. The Tjek Kemien app was launched in 2014 and trialled with the country's two largest supermarkets. In 2016, there were 88 requests but in the first two months of 2018, 100m consumer visits to the Co-op generated only three requests,

according to Jakob Lamm Zeuthen, head of environment policy at the Danish Chamber of Commerce, which represents retailers.

This failure had multiple causes, he says. Consumers are mostly concerned about food and cosmetics, but these were not in the scope of the project. "The scan went to the wrong person in the company, or was lost, or the information was difficult to understand, or people lost interest after waiting for 45 days. Retailers don't want to upload SVHC details into database: they want to answer consumers directly by email, so as to maintain trust with them."

In late 2016, Mr Zeuthen adds, the Danish Consumer Council tested the information on the barcodes of 58 hardware products for the presence of phthalates from the SVHC list. Of these, 8 (31%) incorrectly stated that there were no SVHCs when there were. Usually, this was because the barcodes did not work. No answer was received in many cases and some replies were very late. Key causes of misinformation included:

- difficulty in obtaining suppliers' declarations;
- lack of understanding of how to check these declarations;
- wrong or inadequate information from producers;
- lack of understanding about what questions to ask producers;
- different results from tests on the same product by different bodies; and
- an unclear definition of articles as opposed to products.

The pressure for information is still growing, thanks in part to a press article in January 2017 about consumers buying products containing hormone-disrupting chemicals, and partly as a result of these tests. Both the press and the authorities in Denmark have been urging retailers to act.

The Danish EPA, the Chamber of Commerce, industry and building centres consequently formed a partnership that ran from September 2017 to January 2018. The aim was to solve the reasons for misinformation and help retailers in all sectors fulfil their Article 33 obligations.

Working with consultants, the partners have now created guidelines to ensure that information about candidate list articles is collected and passed through the supply chain consistently in the same format until it reaches consumers.

They have also created a tool to train purchasers in where to look for SVHCs in articles and identify those with highest risk of containing them.

Based on this experience, Mr Zeuthen concludes that what works best for companies is also likely to work better for consumers. Retailers, he agrees, would like to have an EU-wide app that takes their needs into account. He also recommends:

- creating a helpdesk to make it easier for retailers to upload information that is useful for consumers and give reminders of when to update;
- sufficient ongoing verification of data, so as to build trust and exclude misleading information. This is not a business obligation;
- keeping food and cosmetics completely outside the database and making it clear this is only about articles; and

- giving the app a name that does not overpromise - in hindsight, 'Tjek SVHCs' would have been better than 'Tjek Kemien'.

On a pan-European scale, the AskREACH project started in September 2017 and will run for five years. It is coordinated by the German Environment Agency, with 19 partners from 13 member states, including NGOs, authorities and research institutes. AskREACH will mainly produce:

- an EU-wide app for consumers, which will be adapted to each member state, in terms of language but also specific information about any aspects particularly relevant in any of them; and
- a central European database, where article suppliers and retailers can upload information of their articles via a barcode, including SVHC details and where within the article any SVHC(s) are contained.

Two apps already exist in Germany, ToxFox and Scan4Chem, and companies involved in those are part of the consortium, as well as the creators of Tjek Kemien, Mr Biwer says. Thus, AskREACH will be able to apply lessons from these projects, learning from the deficiencies of a national approach.

"The principle is similar. You scan the barcode and receive information directly from the database if available; if it is not, a request can be sent automatically to the barcode owner and the retailer to get an individual answer, and the barcode owner can update the database," he explains.

AskREACH will make the database as easy as possible to use, including:

- bulk uploading of articles;
- automatic updating of information on SVHCs if any changes are made in article composition;
- a standardised data exchange format so that information in existing internal company tools can easily be transferred; and
- compatibility with the Echa database, so that requests can be made in standardised way.

Supplier and retailer duties to the app users will be fulfilled by uploading information, because everything else will be done automatically. Different language versions will use standard sentences so that most translation is done directly.

Professor Führ, who is also involved in the project, hopes to see an additional option of declaring that there are no SVHCs in a product, in order to increase transparency and traceability. Suppliers who feed the database can benefit from the option to offer additional, more detailed information on the scanned article, such as via a link to a company website.

Currently, the project partners are benchmarking the challenges companies are facing, the tools they are using and how to adapt these if needed. Professor Führ says that there are already tools to hand that are "comprehensive, effective, reliable and flexible", as well as and capable of addressing confidential business information (CBI) issues.

The app is due to be launched in April 2019 and AskREACH is inviting companies to participate and to test the tools and give input on possible improvements. "This will give you an opportunity to have an impact early on and show your willingness to take care of consumers' concerns," says Mr Biwer.

Of course, there are technical challenges to overcome, as Professor Führ recognises. "One will be how to identify an article. The supply chain sometimes uses the same barcode for different products and different versions or batches of them. This needs to be addressed when the article identifier system is enhanced," he says.

His concluding advice is: "To all those who are covered by the definition of supplier, be prepared to address a lot of issues." There are a lot of customer demands for information and they might be driven by consumer requests once the European app is available and workable, he says.

"Be prepared for increasing awareness from investors and be aware that existing products as well as new ones are covered. At least consider how to address this, as well as updates of the candidate list and similar lists in other parts of the world."

US body seeks nominees for flame retardant hazard assessment

National Academies plan to inform CPSC OFR rulemaking

10 May 2018 / Built environment, Children's products, Electrical & electronics, Halocarbons, United States

A National Academies committee is recruiting people to help assess organohalogen flame retardants, following a request from the US Consumer Product Safety Commission (CSPC).

The National Academies of Sciences, Engineering, and Medicine's (NASEM) board on environmental studies and toxicology is forming a committee to develop a scoping plan to assess additive, non-polymeric organohalogen flame retardants (OFRs) for their potential chronic health hazards.

Their findings will ultimately be used to inform a CPSC assessment of the risk these substances pose to human health from the following four consumer products categories:

- children's products;
- upholstered residential furniture;
- mattresses; and

- the external casings of electronics devices.

The CPSC's request follows its September decision to grant an NGO petition to begin a rulemaking process under the Federal Hazardous Substances Act (FHSA). It could see OFRs banned from these applications.

To start this, the CPSC will convene a Chronic Advisory Panel (CHAP) – a group of experts charged with evaluating the scientific evidence on the substances. NASEM will provide the hazard assessment plan which the CHAP will use – together with exposure data – to complete a quantitative risk assessment.

To develop its scoping plan, the NACEM committee will:

- review existing hazard data and identify gaps;
- evaluate the potential for treating OFRs as a single class of substances, for purposes of a hazard assessment; and
- determine recommendations for how to conduct additional research to evaluate OFRs under the FHSA.

NASEM is seeking individuals with expertise in toxicology; epidemiology; pharmacology; statistics and modeling; QSAR/SAR; and risk assessment.

Nominations will be accepted through 20 May.

Belgian nano registrations 'need improvement'

10 May 2018 / Belgium, Nanomaterials, Substance registration

The quality of registrations for nanomaterials submitted to the Belgian national register needs to be improved, the country's Federal Public Service for Public Health (FPS) said.

In its first report about the nanoregister since its launch in 2015, FPS said an evaluation of submitted registrations showed quality can be improved. It added that not all potential registrants are aware of the obligation to register under a 2014 Royal Decree.

About 77% of the registrations were updated before the April 2017 deadline, the report said.

Importers submitted 56% of the registrations, while distributors and manufacturers accounted for 22% and 11% respectively.

Around a third of the 'active' accounts – those created for one or more registrations – were registered on a voluntary basis, with the remaining two thirds coming from those placing the nano substances on the market themselves, the report said.

Half of the 475 nanomaterials registrations made in 2016 concerned substances in quantities below one tonne, and would therefore be considered out of scope of REACH.

Amendments

EU member states have recently agreed on changes to REACH annexes to address specific requirements for nanomaterials.

The amendments, due to come into effect in 2020, include a provision giving Echa the legal right to request additional information on substances above ten tonnes when safety of those substances is not demonstrated.

NGOs had pressed for the provision to apply to all REACH registered nanomaterials above 1 tonne.

Substances registered to Belgian authority in quantities of more than 1,000 tonnes were:

- amorphous silica;
- calcium carbonate;
- calcium carbonate treated with stearic acid;
- carbon black;
- diiron trioxide;
- iron hydroxide yellow; and
- silicon oxide.

European action

In June last year, Echa launched its EU observatory for nanomaterials (EUON), a public website aimed at increasing transparency of information on nanomaterials on the EU market.

This comes after the Commission opted not to create an EU nano register, given delays in the introduction of new REACH information requirements for nanomaterials.

Elsewhere in Europe, Denmark, France, Norway and Sweden also require companies to report information on nanomaterials to their national inventories.

Canada clears EDTA and salts, no further action needed

10 May 2018 / Canada, Environmental Protection Act, Risk assessment

The Canadian government has finalised its assessment that ethylene diaminetetraacetic acid (EDTA) is not harmful and requires no action under the Canadian Environmental Protection Act, 1999 (Cepa). The decision also clears three EDTA salts:

- tetrasodium;
- ferric monosodium; and
- ferric ammonium.

The assessment, published on 5 May, finalises the conclusions of a draft assessment from May 2017.

EDTA and tetrasodium EDTA are used as chelating agents and preservatives in a wide range of products.

The government's assessment concluded – "on the basis of the available empirical data" – that none of the substances were carcinogenic or genotoxic.

Studies showing other adverse effects from oral exposure were "compromised" by "excessively high" doses, and the substances are "of low toxicity" at lower doses, the assessment found.

US NTP requests data on identifying developmental toxicants

Information will inform effort to develop animal testing alternatives

10 May 2018 / Alternative approaches to testing, Test methods, TSCA, United States

The US National Toxicology Program (NTP) Interagency Center for the Evaluation of Alternative Toxicological Methods is requesting data on approaches for identifying potential developmental toxicants.

Niceatm provides scientific and operational support to the Interagency Coordinating Committee on the Validation of Alternative Methods (Iccvam), which is charged with implementing a strategy for new, non-animal approaches to evaluating the safety of chemicals and medical products.

The project is required under the 2016 amendments to TSCA, which set a goal to reduce and eventually replace vertebrate animal testing under the programme.

In March, the EPA published its draft strategy for promoting the development and implementation of alternative test methods. And the agency recently issued guidelines on alternative test methods for determining skin sensitisation.

The new data request, published in the 5 May *Federal Register*, will feed into the ongoing initiative. The information "will be used to assess the state of the science and determine technical needs for non-animal test methods used to evaluate the potential of chemicals to induce adverse effects in offspring".

Niceatm specifically requested information "relevant to the development or validation of alternatives to *in vivo* developmental toxicity test methods currently used by federal agencies for regulatory and other decision contexts". It also asked for data from animal or human studies evaluating the same chemicals for comparison.

The deadline for submissions is 15 June.

Australian panel says PFAS ill-health links limited or non-existent

Concerns remain unanswered says MP from affected area

10 May 2018 / Australia, PFCs, Risk assessment

A report from Australia's Expert Health Panel for PFAS has concluded that evidence linking exposure to polyfluorinated substances (PFASs) with human disease is limited or non-existent, and that there is "no current evidence that suggests an increase in overall cancer risk".

The panel, established in October last year to advise the government, reviewed 20 Australian and international reports and reviews examining potential health effects of exposure to PFASs, as well as carrying out a public consultation.

The conclusions concur with advice from the country's health department that "there is no current evidence that supports a substantial impact on an individual's health from PFAS exposure."

PFASs are bioaccumulative substances that were present in fire-repellent foams widely used in Australian military airbases across the country from the early 1970s. The decision to phase them out was made about ten years ago.

They have been linked with long-term health problems.

The expert panel consistently found a number of health effects in reports, reviews and research. But they concluded that, even for those with the highest exposure levels, health effects were still "within normal ranges" for the whole population.

Fears not allayed, says MP

Meryl Swanson, member of parliament for Paterson, New South Wales, an area affected by contamination from PFASs, told Chemical Watch the report "in no way answered questions or allayed fears".

Ms Swanson called the report "contradictory" and cited the summary, which advises both that "important health effects for individuals exposed to PFASs cannot be ruled out based on the current evidence"; and that "evidence does not support any specific biochemical or disease screening or other health interventions for highly exposed groups in Australia, except for research purposes".

She also expressed anger at the timing of the 400-page report's release. It was dated March, but published on 7 May on the eve of the Federal budget, a particularly busy time for parliament, she said.

More available on CW+AsiaHub.

American Chemistry Council defends EPA 'secret science' proposal

Trade body backs non-linear models, increased transparency

10 May 2018 / Data, Exposure modelling, United States

The American Chemistry Council has defended aspects of the US EPA's new science transparency proposal that have come under fire from NGOs.

Formally issued late last month, the agency's proposed rule on "secret science" seeks to allow increased transparency and public validation of studies underpinning agency regulatory decisions.

Among other provisions, it proposes to "increase transparency of the assumptions underlying dose response models". NGOs have raised the alarm that discarding default linear dose models will remove health-protective assumptions and "invite literally an infinite number of model options" on which the agency can base its decision.

But the ACC argues that the EPA has this aspect of the policy right. "For far too long and far too often EPA has relied on default linear dose-response models that have frequently resulted in inflated risk estimates," the trade group said in a blog post.

These, it says, create "misperceptions and confusion about true risks and can lead to unwarranted and costly risk management decisions."

Default linear models concerns

The ACC told Chemical Watch that an example of this occurred with the draft Integrated Risk Information System (IRIS) risk assessment of formaldehyde. It says the programme's use of "overly conservative default assumptions" led it to

proposing a cancer risk value at 0.008 parts per billion – a level significantly lower than the 0.8 to 8.0ppb reported to naturally occur in humans.

The IRIS formaldehyde assessment prompted a scathing review from the National Academy of Sciences (NAS) in 2011. And industry has continued to question the science underlying the programme's conclusion.

The ACC also pointed to the case of 1,4-dioxane, in which the EPA's use of a default linear approach served as the basis for a drinking water guidance as low as 0.35ppb. The trade group said that Health Canada, the EU and other authoritative bodies have concluded the substance acts by a non-linear mechanism, resulting in a drinking water guidance of 350ppb.

The EPA's plan to consider non-linear models is not satisfying an industry 'ask', added the ACC. Instead, it is "simply a recognition by EPA that old default assumption may not always represent the most up to date science".

Transparency

Separately, the ACC's formaldehyde panel has taken aim at critics who have suggested that industry groups would attempt to use the EPA's new policy to discredit legitimate studies underpinning health protections.

"Industry does not seek access to research to discredit it nor to limit regulation," said the formaldehyde group's blog post.

"In order to help improve public confidence in the decision-making process, it is critical data be made available in a timely and transparent way to ensure decisions are based on scientifically defensible information," the post said.

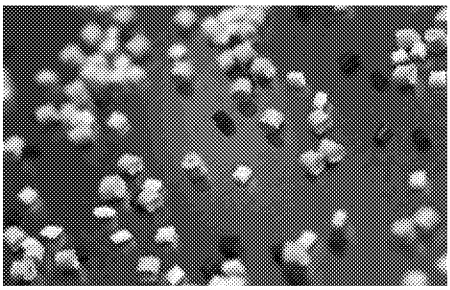
EU seeks proposals for 'polymers of concern' project

Contractor will propose criteria for use under REACH

10 May 2018 / Europe, REACH, Risk assessment, Substance registration, Substances of concern



The European Commission is seeking proposals for a project on how "polymers of concern" (PoCs) could be identified and registered under REACH, according to a call for tenders, which has opened.

REACH does not currently require registration or evaluation of polymers, but under Article 138(2) the Commission is required to review the risks they pose and the need for registration of certain types of polymer.

A 2015 study conducted for the Commission proposed two possible registration systems. The first system was based on identification of polymers of low concern (PLCs) and lower or no registration obligations for them; the second on grouping similar polymers.

According to the current call, the successful contractor will:

- propose criteria for the identification of PoCs, including the possibility of grouping based on physico-chemical properties or indication of hazard;
- estimate the potential risks to human health and the environment posed by them, compared with other substances; and
- provide a detailed cost-benefit analysis of the registration requirements for the purposes of impact assessment.

One of the primary tasks will be to "assess which registration requirements would be appropriate for PoCs under REACH". The call for tenders does not discuss registration of polymers that do not meet the PoC requirements.

The maximum budget for the project is €300,000.

Mirror image

Speaking at this week's Chemical Watch Food Contact Regulations Europe 2018 summit, Paul Ashford, managing director of Anthesis-Caleb, said the new project would be a mirror image of the 2015 study that proposed the PLC system. But it was time to ask the authorities to address the polymer identity question, Mr Ashford said.

"If you start to deal with polymers of concern, you have to decide pretty quickly what your polymer substance is," he told the audience in Brussels. "The interesting thing about the Commission's request for a proposal is that is has no mention whatsoever of any further interrogation about what a polymer substance is.

"So this is really speeding up the supply chain bit, saying [stakeholders in the supply chain] really need to engage at least with the [successful contractor], and probably with Echa as well, on this agenda to make sure there is no misunderstanding of at least where the industry has got to on this subject.

"I think the plea the supply chain would make, is it wants to do this with as many downstream user industries as possible, and understand that we are not crossing each other's purposes."

CIA urges UK government accord on Echa associate membership

High level meetings must transcend a 'temperature check'

10 May 2018 / Europe, United Kingdom

The UK Chemical Industries Association is calling for swift progress towards a "joined-up" approach between itself and the British government on a post-Brexit associate membership of Echa.

Such an approach would pave the way to advancing proposal talks at EU level, CIA head Steve Elliott has told Chemical Watch.

Ahead of a second high level meeting with UK government departments later this month, Mr Elliott said it is essential that the chemicals industry's view of associate membership "chimes" with that of Whitehall.

There is no point, he added, in the UK sector approaching European chemicals trade body, Cefic, and "trying to join the dots when we're not in line with our own government".

At the Chemical Watch Brexit conference on 17 April, Mr Elliott outlined the terms to be considered by both sides of the negotiations as part of an associate membership agreement. They are:

- recognition under EU law and acceptance by both parties of registrations, authorisations, approvals and notifications obtained by UK and EU27 companies;
- existing compliance activities to remain valid and the establishment of a process to avoid reapplications in the EU and UK;

- a mechanism to allow the UK to negotiate access to the Echa database to ensure ongoing and future compliance efforts;
- authorities carrying out assessments on products undergoing testing, registration or authorisation processes at the point of exit, to be allowed to complete them; and
- the UK to continue participating in and maintaining responsibilities under Echa's regulatory processes.

In March, the CIA and Cefic issued a joint statement, in which they called for continued UK participation in Echa. Next, if UK industry – with governmental approval – can get into a position where it is "joined up on some of the detail" with Cefic, Mr Elliott said the proposal has a better chance of support across the Channel.

'Helpful' meetings

In March, the CIA and other industry representatives took part in an inaugural meeting with various government departments to discuss Brexit topics. Subjects included associate membership and rules of origin and the impact they would have on customs arrangements.

Officials from the environment ministry (Defra), the business department (Beis) and the Department for Exiting the European Union (DExEU) attended.

The meetings, which take place every six to eight weeks, are "helpful" Mr Elliott said because it is not just one government department talking to industry. "It's also helpful that an industry like ours, which quite often has been away from the spotlight, now has quite a high profile."

The challenge, he added, is that the UK has to agree a headline deal on Brexit terms with the EU27 by October, "and if that means we've got to work up quite a level of detail then we haven't got long".

What "can't happen", he said, is for the group to do "a temperature check" each time it meets. It needs to have worked out specifics of "what's really important for our industry and our customers, so the officials who are negotiating understand what's valuable and what they could give away more cheaply in negotiations".

And what industry does not want, he said, is time wasted on negotiations from Brexit day of March next year until December 2020 – the date the tentative transition period ends, if formally agreed in the first instance.

That period, he said, "is supposed to be about preparing. The more the UK can do up front the better, to give us that period of grace to get business sorted, rather than ongoing negotiation and a lack of clarity until December 2020 and then suddenly things change overnight."

During a debate on the EU Withdrawal Bill on 8 May, Parliament's House of Lords voted through an amendment that would allow the UK to continue to participate in, or have a formal relationship with, the EU agencies after exit day.

UK government denies ban on wet wipes

10 May 2018 / Alternatives assessment & substitution, Microplastics, United Kingdom

The UK says it is not planning a ban on wet wipes, as was recently widely reported in the media, but is working with industry to find "suitable alternatives" that consumers can safely dispose.

Wet wipes, also known as wet towels or baby wipes, are small, moistened pieces of paper or cloth used for cleaning purposes. They contain plastics which, when flushed down the toilet, can block sewers and slowly break down into microplastics that in turn cause harm to marine life.

Reports across the UK media this week suggested that wet wipes would be banned as part of the government's 25-year environment plan, which aims to eliminate all avoidable plastic waste by the end of 2042.

The Department for Environment, Food & Rural Affairs (Defra) subsequently clarified the position, saying that while eliminating single-use plastic waste is one of the government's top priorities, "we have not announced plans to ban wet wipes".

Defra said it is working with manufacturers and water companies to understand which types of wet wipes cause sewer blockages, and make sure labelling on the products "is clear and people know how to dispose of them properly".

Authorities are employing tougher controls on microplastics pollution. The UK ban on the manufacture of cosmetics and personal care products containing plastic microbeads came into effect in January. A ban on sales of such products will follow on 30 June.

US EPA round-up

10 May 2018 / United States

IRIS ammonia agenda

The EPA's Integrated Risk Information System (IRIS) programme has released a preliminary agenda for its public science meeting on ammonia.

The 23 May web-based meeting will cover the IRIS Assessment Plan (IAP) non-cancer assessment for oral exposure to ammonia and ammonium salts. The programme is accepting public comments on this through 16 May.

ELAB members sought

The agency is accepting nominations to its Environmental Laboratory Advisory Board (ELAB). This is an advisory committee tasked with providing advice and recommendations to the EPA's leadership about "issues related to enhancing EPA's measurement programmes, and facilitating the operation and expansion of national environmental accreditation".

EU consultation on 'what worked well' with 7EAP

10 May 2018 / Europe

The European Commission has launched a public consultation to evaluate its 7th Environmental Action Programme – an overarching set of goals guiding the trade bloc's environment policy until 2020.

Launched in 2014, 7EAP has set out a vision for progress by 2050. This has three key objectives:

- to safeguard EU citizens from environment-related pressures and risks to health and wellbeing;
- to protect, conserve and enhance natural capital in the bloc; and
- a resource-efficient, green and competitive low-carbon economy.

The 7EAP also calls on the Commission develop, this year, a strategy for a non-toxic environment that promotes innovation and the development of sustainable substitutes, including non-chemical solutions. In October, the Commission published seven sub-studies that will form the basis of the strategy.

The consultation period will run between 3 May and 26 July, and assess "what worked well, and how it could have been better", the EU executive said.

It will focus on the "structure and strategic role" played by 7EAP and also assess the programme in terms of its "effectiveness, efficiency, relevance, coherence and added value".

All citizens and organisations are invited to comment. The evaluation will also build on contributions from the European Environment Agency (EEA), the EU Environment Implementation Review (EIR) – a tool to improve implementation of EU environmental law and policy – and consultations with member states and specific interest groups.

Post-Brexit IT failure a 'substantial risk' to UK chemicals industry

MPs say poor Defra track record could lead to disruption

10 May 2018 / Substance registration, United Kingdom

MPs have said there are "substantial risks", including disruption to the UK's chemicals industry, if the Department for Food, Environment and Rural Affairs (Defra) is unable to properly update its IT systems before the UK leaves the EU.

In March, junior environment minister Thérèse Coffey said Defra had started work on new IT capability to enable the registration and regulation of chemical substances placed on the national market.

But in a recently published public accounts committee report, MPs express doubt at "how realistic" Defra's – as well as the Department for International Trade's – plans are.

"In light of Defra's poor track record in implementing new IT systems in the past," the report says, "we have concerns over the potential for disruption to the agri-food and chemical industries if these IT systems are not ready in time and contingency plans have to be enacted".

Defra says it has has made "good progress" in developing the system, and, the report adds, is optimistic that it can deliver what's required by March 2019, "whatever the outcome of the negotiations".

Speaking at the Chemical Watch conference on 17 April, Defra's James Dancy said the department aims to make the IT system "very much the same" as Echa's, including Iuclid dossiers. He said that the government will start testing the system with industry, although no date for this has been set.

The report says the department's contingency plan, if the system is not ready in time, includes "manual workarounds". Defra said it will "fall back on to manual systems as it seeks to deliver all that it needs to for Brexit, but this could impede or at least slow down imports and exports causing severe delays at the border".

According to the report, the department has "an impossible challenge" and does not have a "clear plan" of top priorities. It must be clear, it says, about what it will "not be delivering as a result of Brexit".

At the time the report was prepared, 20 of Defra's 43 'workstreams' had an IT component. Four of them have a 'build' element in the event of a 'no deal' scenario, the report says. This includes an import control system to facilitate trade in animals and animal products. The department now has 64 workstreams.

Defra must ensure it has the "necessary resources" in place to complete its IT programmes on time and avoid "costly and embarrassing contingencies involving manual completion and submission of forms". The MP told Defra to provide a progress update by the end of June.

Department difficulties

If the Brexit transition period from exit day of 29 March 2019 to December 2020 is formally agreed, it will give Defra more time to develop these systems. But, the report warns, the department "needs to make sure that it doesn't let progress on their development slip, in case negotiations break down".

Its preparations, however, have been "hampered by the pervasive uncertainty" about the UK's future relationship with the EU. This, the report says, leaves not only departments but also businesses "in the dark" about exactly what they need to do to prepare.

In particular, the report notes, Defra has to work up options for the three different scenarios – deal, no deal or transition. This is "time-consuming and costly", it adds.

EU to assess existing policies for circular economy plan

10 May 2018 / Alternatives assessment & substitution, Europe, Substances of concern

The European Commission is planning to evaluate existing EU policies to see how they contribute to the circular economy and to identify ways to better meet the initiative's goals.

It has produced a roadmap document which will look at "the soundness and completeness" of existing EU policy and regulatory instruments. The EU executive will then develop preliminary options for further action based on evidence submitted to a public consultation. This closes on 4 June.

It will also include work undertaken in the follow-up to the refit of the EU Ecolabel, a voluntary ecolabelling scheme.

Some of the existing policy tools target specific product groups through market restrictions for the poorest performing products, the Commission said, while others restrict use of certain substances in product groups or generally – with REACH as an example.

Where multiple policy tools address the same products or product groups, the Commission will explore ways of optimising the interactions between them. It aims to generate a policy drive towards more 'circular' products, "while respecting the specificities of the different policy instruments".

Several product groups, it says, are currently not covered by EU policies even though they have a high circular economy potential, such as food and drinks, textiles, construction products/buildings, furniture and cosmetics.

In January this year, the Commission published a series of planned actions and proposed options to combat the problem of substances of concern in products and waste. The plans are included in a Communication on options to address the links between chemical, product and waste legislation and form part of the circular economy action plan.

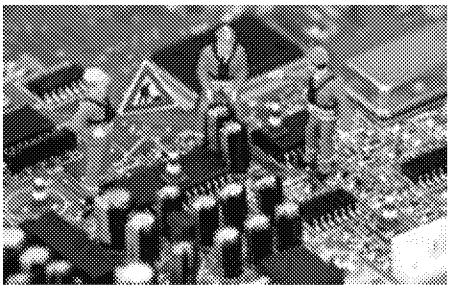
Report finds Samsung workplace link to ill-health unproven

Company not completely exonerated

10 May 2018 / Confidentiality & right-to-know, Electrical & electronics, Legal cases, Occupational hygiene, OSHA, South Korea



There is no clear evidence linking illness with workplace conditions, including exposure to harmful chemicals, at Samsung Electronics, a South Korean independent committee has reported, after completing a two-year investigation.

The committee, established in June 2016 in agreement with workers suffering from a number of illnesses and their families, investigated production lines at the company across South Korea. This included analysing 54 materials used at the company.

Workers and their families have been campaigning for a decade for compensation for diseases – including leukaemia and brain tumours – they say were caused by working at the company.

Stressing that their findings do not necessarily completely exonerate the company, the committee said it could find no link between working at the company and worker illness.

The investigation team, which reported on 24 April, said emissions of potentially dangerous substances were within legal limits; radiation exposure was no different from the general population; and although some toxic substances were found, such as toluene, these were in quantities that posed no effect to health.

Release of company environment reports blocked

The committee's report came just five days after a district court decision to suspend publication of historical workplace environmental reports from Samsung Electronics, ordered by the Ministry of Labour.

The ministry ruled in February that the reports from 2009-2017, not normally made public, should be released to meet concerns about workplace-illnesses raised in the media. However, Samsung immediately filed a motion to overturn the decision.

In South Korea, companies are obliged to conduct "work environment monitoring" by taking and analysing samples from the workplace for harmful substances under the country's Occupational Safety and Health Act (Osha). The reports for Samsung Electronics are said to contain information on workplace exposure to 190 hazardous chemical substances.

The court's decision to suspend publication was prompted by a 17 April report from a panel of semiconductor experts, convened by the Ministry of Trade, Industry and Energy (Motie). The historical reports, said the panel, contained

information on "key national technologies" because they made it possible to guess chip manufacturing technologies and processes.

International campaign

A number of international NGOs and labour groups have criticised Samsung for workplace conditions in South Korea and Vietnam and for blocking disclosure of information on workplace chemical use. Most recently on 1 May, several organisations held a "Global Day of Action Against Samsung" with petitions made to "clean up" the company.

TSCA CBI guidance documents a 'missed opportunity'

NGOs seek changes to ease access to protected information

10 May 2018 / Confidentiality & right-to-know, TSCA, United States

A coalition of NGOs says that the US EPA's draft guidance on disclosing confidential information under the new TSCA falls short of what is needed to meet real-world needs.

The comments came in response to the agency's consultation on three guidance documents that outline how certain people can access TSCA confidential business information (CBI) in emergency and specific non-emergency situations.

The EPA issued these consistent with the 2016 amendments to TSCA, which expanded the disclosure of protected information where such data could assist public officials and health professionals helping those at risk from chemical exposures.

But a coalition of 17 NGOs, spearheaded by Safer Chemicals, Healthy Families, says the documents represent a "missed opportunity".

"While dutifully paraphrasing the requirements of the law, they fail to address the larger TSCA goal of enabling front-line professionals and public officials to successfully use the new provisions to meet real-life health and environmental needs," it says.

Changes sought

Among the NGO coalition's concerns is that the intended beneficiaries of the programme, such as first responder and physicians, are unlikely to be familiar with TSCA and legal intricacies around protecting CBI.

As such, the groups recommended the EPA develop outreach and education. And they believe the agency needs to train its staff to ensure "the statutory goal of providing necessary information to officials on the ground will [not] be stymied by poor communication, delays, and bureaucratic snags."

Other NGO commenters and New York's environmental department echoed the coalition in recommending that the EPA include deadlines for how quickly it will process a request, to "avoid unreasonable delays in disclosing information".

And many also asked that the agency develop an electronic system for submitting requests and tracking their status.

More broadly, NGO the Environmental Defense Fund's comments called on the agency to modify the documents to provide an "accurate description" of the confidentiality requirements outlined in section 14 of TSCA.

"EPA needs to accept that Congress consciously chose to impose more stringent substantive and procedural standards on confidentiality claims under TSCA, and that Congress called for wider disclosure of confidential information in this context," it said.

Industry response

Industry groups largely supported the guidance documents, including provisions outlining the obligations on those requesting CBI to maintain the confidentiality of those data.

But the American Chemistry Council expressed concern the agency is not well equipped to respond quickly in emergency situations. It offered the use of its existing Chemtrec emergency response programme to facilitate implementation of this provision.

And the industry group also baulked at a statement in the guidance that suggests the EPA is generally required to release health and safety data. "While ACC agrees that the health and safety effects and results from a health and safety study must be disclosed, the underlying data is not, in fact, 'required' to be disclosed, as the guide suggests," it said.

The EDF, however, squarely disagreed that health and safety data are eligible for protection from disclosure. And it encouraged the agency to clamp down on companies "inaccurately" making overly-broad CBI claims.

Danish investigation finds fluorinated substances in cake packaging

But intentional use has decreased

10 May 2018 / Denmark, Food & drink, Food contact, Halocarbons

Tests carried out in Denmark have found fluorinated substances in paper wrappings used in ready-made cakes.

The discovery comes after a national recommendation to avoid intentionally adding them to food contact materials three years ago.

In three out of 21 baking paper and other cake packaging materials examined, fluorinated substances were detected at such high levels it is "very likely" the substances were intentionally added, the Danish Consumer Council's 'Think Chemicals' initiative said.

There is no specific EU regulation to control harmful chemical substances in paper and board food packaging. But in 2015, the Danish Veterinary and Food Administration introduced a recommendation for manufacturers not to add the substances intentionally to food packaging materials. It is, however, not legally binding.

Think Chemicals said while its tests did not measure the substances inside the cakes, other studies have shown they can migrate to the food and contribute to people's total exposure - the so-called cocktail effect.

A test in 2016 on cake wrappings had revealed intentional use of fluorinated substances. Think Chemicals said this year's retest of the same wrappings indicated their use "has generally decreased".

Investigators found that four samples which contained the substances in 2016 no longer had them.

Last year, Danish tests using a new approach to detect harmful chemicals in FCMs made from paper and board found two phthalates and bisphenol A (BPA) in pizza boxes.

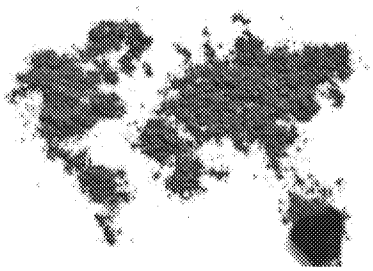
CosmeticsEurope: support regulatory compatibility, not harmonisation

Trade group says this will 'maximise compliance' worldwide

10 May 2018 / Cosmetic products Regulation, Europe, Personal care



The global cosmetics industry should not push for global harmonisation of cosmetics regulations, but instead call for compatibility, says Gerald Renner, director of technical regulatory affairs at trade group, CosmeticsEurope.

Speaking at last month's In-Cosmetics regulatory conference in Amsterdam, he said industry interest should not be in "similarly worded laws" across countries and regions.

Instead, it should push for compliance measures, such as product information and notification requirements, that are "portable" between different regulatory approaches.

"All regulations have their historical and cultural backgrounds, and it is hard to overcome that. One size does not fit all," he said.

Harmonised wording, he said, does not mean you will have the same regulatory requirements. For example, he added, many countries have the same definition of cosmetics, but how this is applied is and can be "totally different".

"We want the information and the efforts we take to support regulatory compliance in one country to be used in another," said Dr Renner.

"Whether a law calls it pre-market registration or in-market control, if we can use the same information, and it grants us quick market access, the wording really doesn't matter."

CosmeticsEurope, said Dr Renner, is working on the compatibility of regulatory 'modules' for product information and notification, as well as other requirements.

"However, these laws are implemented around the world, there should be a best practice. Whether we're talking about the Chinese, EU or Israeli approach, we should all have the same understanding of what is needed," he said.

Dr Renner's presentation provided an overview of how different countries regulate cosmetics. He compared rules in China, Taiwan, Australia, the US and India with the EU's cosmetic products Regulation. It showed that some, including China and Australia, are aligning certain measures, such as definitions and animal testing, to the EU's approach.

Echa round-up

10 May 2018 / Classification, Europe, Labelling, Microplastics, REACH

Advice on changes to joint submissions

Echa has created a webpage to help registrants identify situations in which they need to contact the agency to request changes to a joint submission once it has been created in REACH-IT. Lead registrants can make some changes themselves but some have to be made by the agency.

The webpage lists six scenarios, including lead role verification, in which such a request would need to be made.

Calls for evidence: restrictions of microplastics and oxo-degradable plastics

It is the last opportunity to provide comments to the agency's call for evidence on the use of intentionally added microplastic particles in products. The deadline is 11 May.

Meanwhile, the deadline for feedback on oxo-degradable plastics has been extended to 31 May.

Webinar: last-minute advice on REACH 2018

A reminder that Echa is running a webinar on 17 May, offering last minute advice on REACH registration with the deadline fast approaching. The event offers the opportunity to pose questions to an expert panel on all aspects of registration.

Workshop on EUSES update needs

The agency is running a workshop looking at what is needed to update Euses, the EU system for the evaluation of substances. This is a decision-support software that enables government authorities, research institutes and chemical companies to carry out a rapid assessment of the risks posed by chemicals.

The main objective is to review the state of the art in environmental exposure assessment, and discussions will be based on recent scientific developments on release estimation and fate assessment within regulatory exposure assessments, the agency says.

The workshop will provide a platform for regulators, industry, academia and other stakeholders of REACH and biocides Regulations to participate in the review.

It is planned from 4-5 June in Brussels.

Update to Echa-term database

The agency has added 45 new terms and their definitions to the Echa-term resource. This is a multilingual terminology database in 23 EU languages, where terms and their definitions can be found and downloaded free of charge.

The new terms come from:

- the *Practical guide for SME managers and REACH coordinators*;
- Iuclid material; and
- the best practices document on how to prepare registration dossiers that cover nanoforms.

Substance evaluation work translations available

- **Guide on substance evaluation**: the practical guide How to act in substance evaluation is now available in 23 languages. This describes how authorities evaluate substances and explains registrants' obligations. The guide also addresses data sharing and communication between registrants of the same substance.
- **Summary of 2017 evaluation report**: The summary and recommendations of the agency's annual progress report on evaluation under REACH are now available in 23 languages. The recommendations help new and existing registrants to comply with REACH requirements and improve the quality of their dossier.

PEG consultation on revised CLP guidance

Echa has sent draft *Guidance on labelling and packaging under CLP* (version 4.0) for Partner Expert Group (PEG) consultation. The guidance has been fully revised. The main changes are:

- alignment with a new annex to the CLP Regulation on harmonised information relating to emergency health response; and
- addition of a new section 6.2, describing the labelling of multi-component products with label examples.

REACH-IT closed 4-5 June

Echa has advised that its REACH-IT tool will be closed from Monday 4 June 00:00 (EEST, GMT+3) until Tuesday 5 June 10:00 (EEST,GMT+3) for maintenance. The tool is not accessible during this period.

Further Information:

- Joint submissions advice
- Current calls for evidence
- Registration: REACH 2018 webinar
- EUSES workshop

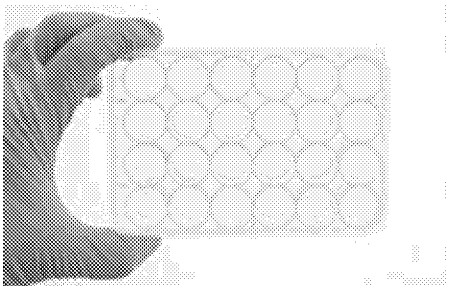
- Practical guides
- PEG consultation - draft CLP guidance (version 4.0)

Anses calls for new in vitro genotoxicity tests for titanium dioxide

Inconsistent results have prevented genotoxicity conclusion

10 May 2018 / Classification, France, Nanomaterials, REACH, Test methods



There is an urgent need for new and improved *in vitro* genotoxicity tests for titanium dioxide nanoparticles (NPs), according to the French Agency for Food, Environment and Occupational Health and Safety (Anses).

While collecting carcinogenicity information for hazard assessment of titanium dioxide, Anses found that few *in vivo* studies were good enough to reach a conclusion on genotoxicity. "The low quality of the *in vivo* dataset is likely to lead to possible false interpretation of the genotoxic profile of titanium dioxide NPs," according to a report written by a team from the agency's chemical assessment unit.

"Even if *in vivo* data are considered of higher relevance than *in vitro* data, unfortunately they are too limited to conclude on genotoxicity of titanium dioxide NPs," it writes in *Nanotoxicology*.

Numerous *in vitro* studies are available, but these also give an inconsistent genotoxicity profile, it adds.

Titanium dioxide was added to the Community Rolling Action Plan (Corap) in 2013, but its evaluation has been dogged by issues regarding the identity – the shape, size and coating - of different types of nanomaterials. The difficulties are exacerbated by the myriad uses of the substance.

France updated its Corap justification document in March 2018, stating that "in the absence of reliable *in vivo* assays, there is an essential need for further *in vitro* and *in vivo* investigations of the genotoxicity potential of titanium dioxide NPs".

Room for improvement

Anses found that most *in vitro* studies are on rutile and anatase forms of titanium dioxide. The latter is a photo-catalyst, meaning light could significantly affect test results through formation of reactive oxygen species.

"It is essential to take the effect of light into account when interpreting the *in vitro* genotoxic results obtained from NPs with photocatalytic properties," writes the Anses team.

It is also important to choose the cell line carefully and to check that the NPs don't interfere with assay function, it adds. The team calls for *in vitro* tests lasting longer than 24 hours, as well as the standard, shorter assays. This should help to identify a "large range" of DNA damage mechanisms, it suggests.

Negative genotoxic results should be confirmed by checking how the cell line responds to NP exposure and whether the NPs could prevent the test system from working as it should.

Finally, the Anses team calls for studies to be reported in detail, with access to raw data. This is "essential for an adequate explitation by regulatory bodies", it says.

Because TiO_2-NP toxicity is a "topic of interest for society", the agency expects an increase in published data. But it strongly reminds researchers that the "quality needs to be improved over quantity of data".

In 2017, Echa's Risk Assessment Committee decided that TiO_2 should be classified as a category 2 carcinogen by inhalation. Some EU member states suggest that the classification should not be directly translated into CLP but should have a split entry based on particle size or form.

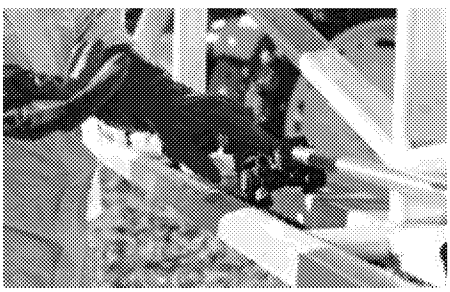
North American organisation examines presence of PFASs in apparel

Study targets 31 substances

10 May 2018 / North America, PFCs, Product testing, Textiles & apparel



A study conducted by the Commission for Environmental Cooperation, a trinational organisation created by Canada, Mexico and the US, has examined 137 articles of clothing and apparel for the presence of PFAS substances.

PFASs (per- and polyfluorinated substances) are used in a wide range of consumer products for their heat, water and oil resistant properties. According to the US EPA, the group of compounds are persistent, resist degradation in the environment and bioaccumulate.

"The degree to which they can migrate out of apparel and contact the skin or saliva of the wearer, or enter the environment, can be a concern," the study says.

It was undertaken because, although environmental monitoring data is available, only limited information exists on the substances' presence and trends in consumer products, including children's items.

The degree to which [PFASs] can migrate out of apparel and contact the skin or saliva of the wearer, or enter the environment, can be a concern, CEC study

Consequently, last summer, the CEC, established under the North American Agreement on Environmental Cooperation (NAAEC), analysed articles of clothing and performance apparel, including children's items, purchased from 27 cities across North America.

Targeting 31 PFAS compounds, it found that 97 articles, or 68.6%, showed positive results for at least one.

Of the articles tested, outdoor jackets presented the highest number of "positive hits". The most frequently detected compounds were perfluorooctanoic acid, or PFOA, (45%) and PFHxA (43%). But low concentrations of PFOS were also found, which the study says may "confirm improvements in the implementation of PFAS regulations in various sectors".

Action on PFAS

In 2009, PFOS was added to Annex B of the UN treaty, the Stockholm Convention on persistent organic pollutants (POPs). This annex requires parties to the convention to take measures to restrict the production and use of the chemicals listed.

Other PFASs have been targets of international and regional regulatory action. PFOA and PFHxS are being considered for listing under the Stockholm Convention.

US state policy experts have predicted addressing PFOA, PFOS and related substances will be the biggest emerging chemical regulation issue at state level this year.

And in December 2017, the US EPA announced a cross-agency effort to address PFASs. However, the agency has not promised regulatory action.

In Europe, the Swedish Chemicals Agency, Kemi, and Germany's federal environment agency (UBA) have submitted a joint proposal to Echa to restrict the manufacturing and placing on the market of six PFASs. And in July last year the Nordic Council, an intergovernmental cooperation body representing five countries, called for prompt regulatory action on the substance group.

In 2006, the US EPA invited eight major fluoropolymer and telomer manufacturers to participate in its PFOA stewardship programme, where they made voluntary corporate commitments to eliminate PFOA and related chemicals from emissions and products by 2015.

Manufacturers in Europe, the US and Japan have largely phased out PFOA. However, its use in other countries, particularly China, has meant that it is still finding its way into the environment.

Meanwhile, a report from Australia's expert health panel for PFAS has concluded that evidence linking exposure to PFASs with human disease is limited or non-existent.

The CEC study is part of its *Greening of Chemicals in North America* project, which aims to develop knowledge useful to chemical risk assessment and/or risk management in the three countries.

The CEC's broader mission is to address "regional environmental concerns, help prevent potential trade and environmental conflicts and promote the effective enforcement of environmental law". It says it "complements the environmental provisions of the North American Free Trade Agreement (Nafta)".

From the PFAS family

perfluorooctanoic acid (PFOA)

perfluorooctanesulfonic acid (PFOS)

Perfluorohexane sulfonic acid (PFHxS)

Perfluorohexanoic acid (PFHxA)

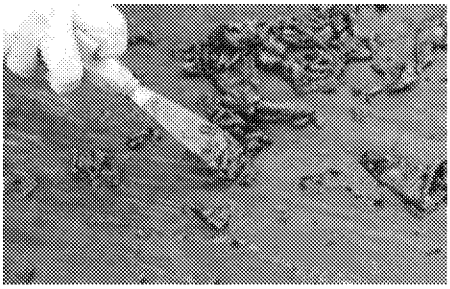
US EPA commits to act on methylene chloride paint strippers

Move follows Pruitt meeting with substance victims' families

10 May 2018 / Built environment, Solvents, United States



The US EPA has announced it will move forward with finalising its proposed rule addressing methylene chloride paint strippers.

Issued in the final days of the Obama administration, the proposal would see a prohibition on consumer and commercial paint stripping uses for methylene chloride. It also proposes to restrict or ban a replacement solvent, N-methylpyrrolidone (NMP).

The agency had suggested in recent months it would be shelving the rule. But in a statement today it said it intends to finalise the proposal. And it is working to send the finalised rulemaking to the White House Office of Management and Budget (OMB) "shortly".

However, while the statement from the EPA refers to "the methylene chloride rulemaking", it is not immediately clear if such a rule would also address NMP.

The agency also confirmed that it does not plan to reevaluate the hazard posed by paint stripping uses of methylene chloride. Instead, it will rely on its previous risk assessment, which identified a range of adverse health effects or death in workers and consumers.

The Halogenated Solvents Industry Alliance (HSIA), representing methylene chloride producers and users, had asked the agency not to adopt the rule. Instead it requested a review of paint stripping under its upcoming TSCA risk evaluation of the substance. Such an approach, it said in 2017 comments to the agency, would allow the EPA to address what the HSIA calls "serious data quality concerns" with the existing risk assessments upon which the proposal is based.

Pressure to act

The EPA's announcement comes just two days after NGO campaigners and families of those who have died using the products met with EPA Administrator Scott Pruitt to urge action on the proposal. It also comes amid an aggressive push on home improvement retailers to pull the products.

Liz Hitchcock, acting director of Safer Chemicals, Healthy Families, praised the work of the families who "have turned their grief into action".

And Sarah Vogel, vice president of health at NGO the Environmental Defense Fund, said she is "encouraged that today EPA has decided to reverse course and move forward to finalise its proposed rule". She also applauded that the agency would not be reevaluating the paint strippers.

But Dr Vogel cautioned that the statement falls short of committing to a ban. "We will delay any celebration until paint strippers containing this deadly chemical are actually off the market," she said.

Trump's EPA Targets Academics For Hiding Data Used To Ban Popular Pesticide
By Chris White, 1/26/18, 4:32 PM

The Environmental Protection Agency called out academics for using hidden data to pressure the agency into banning a widely used pesticide.

The EPA has sought data sets from a study Columbia Center for Children's Environmental Health (CCCEH) conducted that the former President Barack Obama-era agency used to justify a proposed rule in November 2015 to revoke the tolerances for chlorpyrifos, essentially banning the pesticide from use.

"Despite multiple requests, an EPA visit to Columbia, and a public commitment to 'share all data gathered,' CCCEH has not provided EPA with the data used," the agency wrote on a webpage connected to its website, which includes a list of the times the EPA has requested the data set.

The agency's Scientific Advisory Panel criticized the environmental health center's handing of the matter as well. "Some Panel members thought the quality of the CCCEH data is hard to assess when raw analytical data have not been made available, and the study has not been reproduced," the panel noted in 2016.

A panel of Ninth Circuit Court of Appeals judges ruled EPA had complied with a previous judicial order to respond to a petition filed by the Natural Resources Defense Council (NRDC) and the Pesticide Action Network North America in 2007.

The ruling was a major blow to environmentalists who have been trying for years to ban the pesticide chlorpyrifos, that farms across the country widely use to keep bugs from ruining food.

EPA denied the environmentalist petition in March to "revoke all food tolerances and cancel all registration" for chlorpyrifos. Dow Chemical, which manufacturers the chemical, applauded EPA's ruling, as did the Department of Agriculture. EPA already restricts products containing chlorpyrifos for home and agricultural use.

U.S. farms use about 6 million pounds of chlorpyrifos each year. If nothing had changed legally, the EPA would no longer have allowed trace amounts of chlorpyrifos in food, effectively banning the pesticide in the country.

Chlorpyrifos is not the only chemical to come under scrutiny recently.

Republican Reps. Lamar Smith of Texas and Andy Biggs of Arizona sent letters to the International Agency for Research on Cancer in 2017 asking the U.N.-affiliated agency to answer questions about reports they edited data showing glyphosate causes health risks.

Separate letters to the agency's Director Chris Wild from both congressmen said they are "concerned about the scientific integrity" of cancer research agency's "monograph" program that assesses whether various substances can cause cancer.

The agency's 2015 study contains crucial edits made to bolster evidence that glyphosate could cause cancer in humans, reports show.

Smith and Biggs also express concerns that research methods are not transparent. They argued in a second letter that the agency's assessment meetings, deliberations and drafts are not made public.

Subject: EPA secret science rule

Hi Nancy,

My name is David Schultz and I'm a reporter at Bloomberg Environment. My colleague Patrick Ambrosio recommended I reach out to you for a story I'm working on about the EPA's recent announcement that it would bar the use of unpublished scientific data in rulemaking.

One aspect of this announcement that we're zeroing in on is that this rule would allow the administrator to waive this requirement in the case where scientific data can't be made public for some reason. I wanted to get your opinion about whether this would give the agency too much discretion and whether it could open the EPA up to an "arbitrary and capricious" legal challenge if the agency only grants this waiver to industry-generated data.

If you have a chance, please give me a call so we can discuss this further. I'll be at 202-510-4655 for the remainder of the day.

Looking forward to speaking with you,

David

NEWS RELEASE

WWW.EPA.GOV/NEWSROOM

EPA Administrator Pruitt Proposes Rule To Strengthen Science Used In EPA Regulations

WASHINGTON (April 24, 2018) - Today, U.S. Environmental Protection Agency (EPA) Administrator Scott Pruitt signed a proposed rule to strengthen the science used in regulations issued by EPA. The rule will ensure that the regulatory science underlying Agency actions is fully transparent, and that underlying scientific information is publicly available in a manner sufficient for independent validation.

"The era of secret science at EPA is coming to an end," **said EPA Administrator Scott Pruitt.** "The ability to test, authenticate, and reproduce scientific findings is vital for the integrity of rulemaking process. Americans deserve to assess the legitimacy of the science underpinning EPA decisions that may impact their lives."

This proposed rule is in line with the scientific community's moves toward increased data sharing to address the "replication crisis"—a growing recognition that a significant proportion of published research may not be reproducible. The proposal is consistent with data access requirements for major scientific journals like *Science*, *Nature*, and *Proceedings of the National Academy of Sciences* as well as recommendations from the Bipartisan Policy Center's Science for Policy Project and the Administrative Conference of the United States' Science in the Administrative Process Project.

The proposed rule builds upon President Trump's executive orders on regulatory reform and energy independence:

- **Executive Order 13777**, issued in March 2017, provides that regulatory reform efforts shall attempt to identify "those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard of reproducibility."
- **Executive Order 13783**, also issued in March 2017, provides that "It is the policy of the United States that necessary and appropriate environmental regulations comply with the law, are of greater benefit than cost, when permissible, achieve environmental improvements for the American people, and are developed through transparent processes that employ the best available peer-reviewed science and economics."

Chairman Lamar Smith (R-TX): "Administrator Pruitt's announcement ensures that data will be secret no more. For too long, the EPA has issued rules and regulations based on data that has been withheld from the American people. It's likely that in the past, the data did not justify all regulations. Today, Administrator Pruitt rightfully is changing business as usual and putting a stop to hidden agendas."

Senator Mike Rounds (R-SD): "Sound, reliable science is vital to helping us make important policy decisions that impact the health of American families and their livelihoods. Inserting new levels of transparency in the EPA rulemaking process will help make the agency more accountable to the American people and help everyone understand the impact of EPA's decisions. Today's directive is a significant step toward making sure these decisions are not made behind closed doors with information accessible only to those writing the regulations, but rather in the full view of those who will be affected."

Dr. Edward J. Calabrese, Professor, Environmental Health Sciences, University of Massachusetts: "The proposal represents a major scientific step forward by recognizing the widespread occurrence of non-linear dose responses in toxicology and epidemiology for chemicals and radiation and the need to incorporate such data in the risk assessment process."

Dr. Louis Anthony (Tony) Cox, President, Cox Associates; Member, National Academy of Engineering; and Editor-in-Chief of the Journal *Risk Analysis*: "I believe that transparency and independent reproducibility of analyses and conclusions are bedrock principles of sound science. Some commentators have expressed concerns that making the data behind policy conclusions and recommendations accessible and transparent might threaten the privacy of individuals. But this concern can be fully met by applying current privacy-protection techniques for data analysis. These techniques have been developed and used successfully for years at the Census Bureau and elsewhere. Thus, we can have the scientific benefits of accessible data while protecting individual privacy."

Dr. Jason Scott Johnston, Director, Olin Law and Economics Program, University of Virginia School of Law: "EPA's proposed rule, Strengthening Transparency in Regulatory

Science, is badly needed "Best practice among peer-edited scientific journals is to require that data and statistical routines used in published papers be posted online and/or made publicly available. To apply the same standards to research that EPA says justify regulations affecting billions of dollars in economic activity and millions of human lives is essential for those regulations to truly be scientifically based."

Bruno Pigott, Commissioner of the Indiana Department of Environmental Management (IDEM): "IDEM supports transparency in rulemaking. Good, sound science leads to better regulations."

Dr. George Wolff, Principal Scientist, Air Improvement Resource, Inc., and former Chairman of EPA's Clean Air Scientific Advisory Committee (1992 - 1996): "In the development of regulations based on environmental studies, numerous subjective assumptions and choices must be made regarding the selection of data and models that have a profound impact on the strength of any statistical associations and even whether the associations are positive or negative. The appropriateness of the assumptions and choices are not adequately evaluated in the standard peer review process. That is why it is essential that the data and models be placed in the public domain for a more rigorous evaluation by qualified experts. The proposed regulation, Strengthening Transparency in Regulatory Science, will provide an opportunity for such evaluations."

Subject: EPA's Weekly Report for 3/23/18

U.S. ENVIRONMENTAL PROTECTION AGENCY

NEWS RELEASE

WWW.EPA.GOV/NEWSROOM

EPA'S WEEKLY REPORT

This week Environmental Protection Agency (EPA) Administrator Scott Pruitt sat down with more than a dozen reporters across all mediums to discuss the important work the Agency is doing to ensure regulatory certainty for America's farmers, ranchers, and businesses during National Agriculture Week. Pruitt also advanced the Trump Administration's infrastructure agenda with a push to eradicate lead from drinking water and convene a national leadership summit on PFAS to update America's crumbling water infrastructure.

NATIONAL NEWS ...

In an exclusive interview with the Daily Caller, EPA Administrator Scott Pruitt laid out his plans to end the use of "secret science" to craft Agency regulations. "Pruitt will reverse long-standing EPA policy allowing regulators to rely on non-public scientific data in crafting rules. Such studies have been used to justify tens of billions of dollars worth of regulations. EPA regulators would only be allowed to consider scientific studies that make their data available for public scrutiny under Pruitt's new policy. Also, EPA-funded studies would need to make all their data public."

EPA Administrator Pruitt sat down with AgDay to talk about issues impacting farmers and ranchers including EPA's efforts to provide certainty by redefining "Waters of the U.S." According to Pruitt, a substitute or replacement definition will be issued sometime this year, a definition that will recognize private property ownership and the roles of states, and will answer the question of what exactly is a water of the United

States. 'We're going to get that right going forward, and the definition is going to provide clarity, objective measurements by which we know where federal jurisdiction begins and ends,' he said."

OP-ED ...

In the Washington Times, EPA Administrator Pruitt outlined the Agency's efforts to overhaul the permitting process to "rebuild and revitalize our nation's crumbling infrastructure." "The president's ambitious proposal calls for the U.S. Environmental Protection Agency to play a leading role in the administration's efforts ... America's infrastructure was once the envy of the world. The president's proposal will restore our roads, bridges and waterways to greatness and create a safer, stronger America. Through regulatory reforms and targeted investments, EPA will spearhead the much-needed repairs to infrastructure in a way that provides tangible environmental benefits to all Americans."

REGIONAL NEWS ...

The Detroit News reported that eradicating lead from drinking water is one of EPA Administrator Pruitt's top priorities. "'I do think that what happened in Flint is something that could happen elsewhere. We just simply need to take steps to do all that we can to address it prospectively and proactively,' Pruitt said. Pruitt said President Donald Trump's $1.5 trillion plan to bolster the nation's infrastructure over the next decade would include investments in aging water infrastructure."

While speaking with the New York Post, Pruitt called for a local, state, and federal response to the lead crisis in New York City and across the country. "EPA Administrator Scott Pruitt called for a 'coordinated' response between New York State and City officials to address the ongoing lead crisis."

In an interview with Newark Star-Ledger, Pruitt discussed efforts to make cleaning up Superfund sites a priority to advance the Agency's core mission. "The Environmental Protection Agency plans to step up efforts to get companies who dumped toxic waste at New Jersey's Superfund sites to pay to clean them up, Administrator Scott Pruitt said. Pruitt on Monday blamed a lack of urgency... New Jersey has 114 designated Superfund sites, the most in the nation, included three of Pruitt's 21 highest-priority locations."

Pruitt reiterated his commitment to prioritizing the Superfund program to clean up America's most contaminated sites, including Tar Creek, in an interview with the Tulsa World. "Administrator Scott Pruitt of the U.S. Environmental Protection Agency said his new push on the nation's Superfund program finally can provide clarity and accountability to the Tar Creek area, for decades one of the oldest, largest and most complex toxic sites in the nation. 'It is really unacceptable,' Pruitt said as he

recalled the history of the Tar Creek area in far northeastern Oklahoma, whose Superfund legacy dates back to 1983, as well as the amount of money and time deployed there."

At this week's regional roundtable, the Albuquerque Journal **reported on progress the Trump Administration is making on claim stemming from the 2015 Gold King Mine spill.** "Environmental Protection Agency Administrator Scott Pruitt said Monday that the federal government is close to finishing its assessment of roughly 400 claims for financial damages stemming from the 2015 Gold King Mine spill, which dumped toxic chemicals into waters in New Mexico, Colorado and Utah, and final recommendations could be ready by the end of the month."

RADIO ...

This week, Administrator Pruitt joined WZFG 1100 AM The Flag - North Dakota **to talk about his first year accomplishments, including repeal and replacement of both "Waters of the U.S." rule and Clean Power Plan.**

Administrator Pruitt also joined the Lars Larson Show**, based in Portland, Ore., and discussed how he's working to get the EPA back to basics and provide regulatory certainty for all Americans.**

On the St. Louis, Missouri's own Mark Reardon Show**, Administrator Pruitt talked a little about baseball and a lot about the good work the Agency is doing to improve environmental outcomes across the country.**

Scott Voorhees on 1110 KFAF-Omaha had Administrator Pruitt on his show Wednesday to talk about what's to come at the EPA this year, including a continued focused on Superfund clean-up and regulatory transparency.

Cut down on the way home

Megan Pierl holds a wedding photo of her and her husband, Joseph Pierl, on Monday. Joe Pierl, 42, died approximately a week after suffering injuries in a road rage assault in Deptford Township on March 9. Lou M. Nichols, for South Jersey Times

Victim of deadly road rage, a devoted father 'came face-to-face with evil' during storm

Matt Gray For South Jersey Times

Sitting on a couch in the living room of her Blackwood home, Megan Pierl carefully recalled the last conversation she had with her husband.

Joe Pierl was preparing to head home from work and wanted his wife to know he might be a little later than usual. It was March 7 and a nor'easter was dumping snow across the region, making for a slow commute.

"Just take your time and be careful," she told him. They ended their conversation with their traditional "I love you."

Joe Pierl never made it home that night.

Pierl, 42, was shoved to the face during a road rage assault in Deptford Township that afternoon. He died of his injuries a week later.

"He just wanted to come home and he didn't make it home," his wife said, her voice cracking with grief.

Pierl was able to speak to emergency responders and gave them his wife's phone number. By the time his family arrived at the hospital, they couldn't speak with him, explained Megan Pierl's mother, Betsy Jean Hampton.

"He was gasping," she said. "He never came to."

His family was covered by the time they saw him. "Pieces from one side of his nose to the other side of his face," Hampton said. "We don't know what happened. We just know a very good man was taken from all of us."

He remained on life support until Thursday.

Pierl was an organ donor and "he saved seven lives," she said, praising the doctors and nurses who cared for him at [SEE PIERL, A8]

4 who trafficked dogs for pit fights are sent to prison

Thomas Moriarty For South Jersey Times

Three South Jersey men were among four sentenced this month to years in federal prison for their roles in a criminal network prosecutors said trafficked dogs across state lines for bloody pit fights.

In the course of a sprawling multistate investigation, the U.S. attorney's office said in a statement, federal agents discovered the basement of a defendant's home called to mind, evidence it had been used as a fighting pit. One man admitted his dog died on the way home after losing a fight.

Of the four defendants, Maryland resident Anthony "Money" Gaines and Federal Harris received sentences of 42 months and 37 months, respectively, for charges that included conspiracy and possessing a dog with the intent to use it in a dog fight.

Frank Nichols, of Millville, was sentenced to 37 months on charges that included being a felon in possession of a firearm. The fourth defendant, Peden Chandler of Willow Springs, Illinois, received a year in prison after pleading guilty to a misdemeanor charge.

All four of the men previously had pleaded guilty before U.S. District Judge Mary L. Cooper in Trenton.

Prosecutors said their arrests stemmed from Operation Grand Champion, a coordinated effort targeting dog fighting across multiple federal districts.

Court records show agents seized six pit bulls when they served a search warrant at Gaines' home in November 2015, and federal authorities have said a total of 44 dogs were recovered in New Jersey as part of the investigation. Investigators said they also seized treadmills, heavy chains and breeding stands — meant to restrain female dogs — as they built their case against the men.

Prosecutors said a fifth defendant, 42-year-old Asbury Park resident Kevin Atkinson, has also pleaded guilty and is scheduled to be sentenced on April 18. Other defendants remain awaiting trial.

Thomas Moriarty, NJ Advance Media, tmoriarty@njadvancemedia.com

STATEHOUSE

AG orders random drug tests for police

N.F. Sullivan For South Jersey Times

All police officers in New Jersey are now subject to random drug testing under a directive from the state's new attorney general.

Police departments are also required to implement "early warning systems" triggered by problem behavior such as excessive force accusations, lawsuits, domestic abuse and drunken driving, under a separate directive announced by Attorney General Gurbir Grewal's office.

Grewal, who was appointed by Gov. Phil Murphy in January, said Tuesday that most police departments and county prosecutors already have such policies in place. The two new directives would mandate them statewide.

"We support our officers in their difficult jobs, and at times that means intervening with a troubled officer to protect the public, the individual officer, and his or her fellow officers," he said in a statement announcing the move.

How it works

Under the new rules, every state, county and local law enforcement agency is required to conduct one random drug screening in 2018 and perform such tests twice a year going forward.

Departments are required to report any failed tests — or officers who refuse a test — as well as any resulting discipline to the county prosecutor or other supervising agency.

The early warning system requirement spells out 10 "performance indicators" that are triggers. A5

WASHINGTON

EPA to make polluters clean Superfund sites in N.J.

Jonathan D. Salant For South Jersey Times

The Environmental Protection Agency plans to step up efforts to get the companies that dumped toxic waste at New Jersey's Superfund sites to pay to clean them up, administrator Scott Pruitt said.

Pruitt on Monday blamed a lack of urgency, not a lack of funding, for the slow progress in cleaning up the sites. New Jersey has 114 unregulated Superfund sites, the most in the nation, including three of Pruitt's 13 highest priority locations.

"I'm going to get accountability with whomever it is on these Superfund sites and we will use every means of enforcement to do so," Pruitt said. "I don't think we've done it as well as we should have historically and we're going to do better going forward."

While President Donald Trump has proposed cutting the EPA's budget, Pruitt said the agency will have the money it needs by ensuring that the companies responsible for the contamination clean it up.

"Most of our sites across the country have a responsible party," Pruitt said. "We have very few orphan sites." [SEE EPA, A8]

Jacqueline Arellano and her fiancé, Daniel Crespin, talk in the Manzano Mesa Multigenerational Center on Monday about their escape from a fire at their apartment building on Sunday. With them are their children, from left, Francisco Arellano Crespin, 5; Daniel Crespin Jr., 3 months; Alaniey Crespin, 4; and Vincente Crespin, 2.

Residents smelled gas before fire

30 stay in shelter after blaze destroys, damages SE Albuquerque apartments

BY RICK NATHANSON

Residents say a fire that destroyed or damaged a number of units at a Southeast Heights apartment complex Sunday was caused by the same leaky gas meter [illegible] claim to have repeatedly reported to the apartment manager for more than a year.

The property manager Tuesday denied receiving the reports.

About 30 people who lived in the apartment building in the 400 block of Georgia SE were temporarily relocated to the Manzano Mesa Multigenerational Center, where they were housed overnight, and given provisions by the city of Albuquerque and the Red Cross, said Anna Sanchez, director of the city's Office of Senior Affairs.

The center was closed to the public Monday. Sanchez thanked the public for being understanding, and said the building would reopen for normal activities and services today.

St. Martin's HopeWorks homeless provided vouchers so the displaced families, which include 16 people under age 18, could stay at a local motel, Sanchez said.

Union urges teachers to skip survey

ATF leader calls APS budget questionnaire problematic, divisive and inappropriate

BY SHELBY PEREA

Former Albuquerque Public Schools teacher Julia Barraza says she left APS after two years because she felt like she had no voice in the district.

She often tried to share her input on classroom and curriculum procedures with administration, saying she was shot down time and time again.

But Barraza, now a second- and third-grade math teacher at the state-chartered Mission Achievement and Success Charter School, was encouraged when she saw APS' new 2018-2019 budget survey on the district's website that invites members of the public, including parents, teachers and students, to weigh in on budget priorities for next year.

"I was excited to hear they were progressing," she said.

That excitement was tempered when she learned of an email blast by the Albuquerque Teachers Federation, the local union, urging APS employees to skip the survey about APS' $1.3 billion budget.

APS' online survey [illegible] included ranking school subjects and programs in order of importance and suggestions for reducing expenses, among other questions.

The district has conducted several online budget surveys [illegible]

EPA close to settling claims on mine spill

$1.2 billion in damages sought after toxic waste polluted rivers

Scott Pruitt

BY MICHAEL COLEMAN

WASHINGTON — Environmental Protection Agency Administrator Scott Pruitt said Monday that the federal government is close to finalizing the assessment of roughly 380 claims for financial damages stemming from the 2015 Gold King Mine spill, which dumped toxic chemicals into waters in New Mexico, Colorado and Utah, and final recommendations could be ready by the end of the month.

Former EPA Administrator Gina McCarthy, an Obama-era appointee, announced toward the end of her tenure in 2016 that the government would not pay any damages to farmers and others harmed by the toxic spill, arguing it was not allowed under the Federal Tort Claims Act. But after President Donald Trump

The Oklahoman: EPA Gains Clouded By Controversies Involving Pruitt

It looked for a time last week as though Scott Pruitt, embroiled in another controversy, might be shown the door as administrator of the Environmental Protection Agency. But Pruitt remains on the job and we hope that continues, because he's made a difference at the EPA. At the same time, however, it's hard to ignore the constant drumbeat of criticism, even if it largely stems from those on the left who were mortified when President Trump tapped Pruitt for the job and have worked unceasingly to derail his work since arriving in Washington. Yet pointing at the other guy and saying "He (or she) did plenty of things wrong, too," isn't a great defense. Pruitt has led major reform at EPA by, among other things, undoing the Waters of the U.S. rule, working to repeal the Clean Power Plan and revising burdensome fuel-economy standards, all products of the Obama administration. These moves and others have enraged the left and he'll continue to be their chief target, but he nonetheless should take pains not to give them more fodder for their assaults.

The Daily Caller: SCOOP: The White House Just Got Pruitt's Plan To Repeal WOTUS. Here Are The Details

White House officials are reviewing an updated Environmental Protection Agency (EPA) proposal to repeal the Obama administration's "waters of the United States" that expanded federal control over waters on private property. EPA officials submitted a supplemental proposal to the Office of Management and Budget (OMB) on Thursday. The proposal clarifies the agency is in fact repealing the Obama-era regulation and addressing some concerns brought up by stakeholders. The proposal also states EPA will be re-codifying the pre-Obama definition of WOTUS, The Daily Caller News Foundation has learned. The Obama administration finalized the Clean Water Rule in 2015 that expanded the definition of "waters of the United States" (WOTUS), arguing the rule was needed to clear up uncertainties in the wake of two U.S. Supreme Court decisions. More than half of U.S. states sued EPA to have the rule overturned. The courts quickly issued regulatory stays on the Clean Water Rule, meaning it never really went into effect. Manufacturers, energy companies, farmers, ranchers and land developers said the Obama-era rule would only make it harder to do business and manage land.

CBS News: Here Are Some Of The Threats Made Against EPA Administrator Scott Pruitt

CBS News has obtained an August 2017 report prepared by the Environmental Protection Agency's office of inspector general that contains a list of 13 threats made against EPA Administrator Scott Pruitt and his family. The threats range in severity, credibility and specificity. One tweet flagged by investigators said, "Pruitt, I'm gonna find you and put a bullet between your eyes. Don't think I'm joking. I'm planning this." Investigators believe the threat was made by someone living in India. Another person wished the administrator "a very painful and horrible death through poisoning. Please explain the scientific method to this freaking neanderthal." The inspector general also looked into a complaint that "unknown protesters attempted to disrupt the EPA Administrator's speech during a closed event." Another person emailed the EPA threatening to dump old paint outside Pruitt's door. The threats took various forms -- some arriving via social media and email, others by postcard. Pruitt's daughter received a menacing message on Facebook, the document reveals.

CNN: Vote Slated For Thursday For Former Inhofe Aide Wheeler To Be EPA's No. 2

The Senate is set to vote on Andrew Wheeler to be the number two official at the Environmental Protection Agency amid ethics concerns plaguing EPA chief Scott Pruitt and calls from Democrats for him to resign. If Pruitt left, it could fall

to Wheeler to run the agency until a new administrator is confirmed. Two GOP leadership aides told CNN they expected Wheeler to be approved, which would make him the latest appointee at the agency with close ties to the energy industry. While there is widespread opposition to Wheeler in the Democratic caucus, two Democrats running for reelection from energy producing states that strongly backed President Donald Trump in 2016 have said they will vote for him: Joe Manchin of West Virginia and Heidi Heitkamp of North Dakota.

Bloomberg: Here's Why Friends And Foes Of EPA Chief Pruitt Are So Adamant

Supporters and detractors of Environmental Protection Agency head Scott Pruitt agree on this much: He matters. Narrow that list to the new rules that have actually been issued, and Pruitt's impact is even harder to spot. Of the 24 economically significant regulations that have been approved by the White House under President Donald Trump, just one was issued by the EPA, according to data posted by the Office of Information and Regulatory Affairs. And that rule set the amount of renewable fuels that must be used in 2018 -- a regulation the EPA must issue every year, regardless of who's in charge. "Without a doubt, Scott Pruitt has been the single most effective appointment of the president of the United States," said Tim Huelskamp, president of the Heartland Institute, an industry-funded nonprofit that advocates for less regulation.

The Washington Times: Here Are The Legitimate Death Threats Against Scott Pruitt That Dems Claim Don't Exist

One of the more sickening episodes of the full-court press by members of The Swamp against EPA Administrator Scott Pruitt is the claim that he has spent too much money on extravagant security details. Democrats in the Senate have questioned the legitimacy of death threats against Pruitt and his family and have demanded hearings to investigate the matter: Two top Democrats on the committee, ranking member Thomas R. Carper of Delaware and Sheldon Whitehouse of Rhode Island, on Tuesday demanded such hearings, saying they have confidential documents that contradict public statements made by Pruitt, EPA spokespersons and President Donald Trump regarding the administrator's security spending. The lawmakers in their letter asserted that the documents in their hands fall far short of supporting claims by Pruitt's office that he needed elaborate security measure to protect him from death threats.

The Washington Free Beacon: Breaking: Liberals Suddenly Care About Wasting Taxpayer Money

I suddenly have a lot of competition covering my beat. Who knew the mainstream media cared how our taxpayer dollars are wasted? Security costs for cabinet secretaries are "steep." Spending is "lavish" again. When, God forbid, a secretary takes his wife with him on a business trip, CNN is there with the documents in hand, showing her "involvement." The New York Times is now giving tips on how to save taxpayers money, while lambasting Treasury Secretary Steven Mnuchin's use of military charter flights. (Mnuchin's travel ended up costing half of what Obama administration secretaries spent on average. Oddly, the Times never followed up.) The latest target is Scott Pruitt, arguably President Trump's most effective cabinet secretary. While there is questionable conduct for sure, like using an obscure law to give aides huge taxpayer-funded raises, it's curious the media suddenly care how much international junkets cost. The first scandal that caught the press's attention was Pruitt's trip to Italy last summer to attend the G-7 summit, which cost $84,000 in airfare and security, roughly the same that Lisa Jackson, Obama's first EPA administrator, spent on average on flights and security for four international trips. The headlines for Jackson's trip to the same summit in Syracuse, Italy, in early 2009 were slightly different. The Times has hit Pruitt for his "extravagant spending" on private flights and 24-hour security. But not too long ago it was the Times defending lavish trips on the taxpayer's dime. "There is nothing like a little Mediterranean beach vacation to unwind," the Times wrote back in August 2010. Do tell.

Reuters: Trump Administration Weighs High-Ethanol Fuel Waiver To Placate Farmers

The Trump administration is considering allowing the sale of a higher ethanol fuel blend in the summer, a source familiar with the issue said, a move that would placate corn growers worried about the future of U.S. biofuels policy. President Donald Trump recently met with the heads of the Environmental Protection Agency and the U.S. Department of Agriculture to discuss ways to make the Renewable Fuel Standard less expensive to the oil industry without undercutting demand for ethanol. The RFS requires refiners to add increasing volumes of biofuels like corn-based ethanol into the nation's fuel supply each year which is a boon to farmers but a headache for refining companies that must either blend the fuels themselves or purchase credits from those who do.

City Journal: Scott Pruitt, Warrior for Science

Imagine if the head of a federal agency announced a new policy for its scientific research: from now on, the agency would no longer allow its studies to be reviewed and challenged by independent scientists, and its researchers would not share the data on which their conclusions were based. The response from scientists and journalists would be outrage. By refusing peer review from outsiders, the agency would be rejecting a fundamental scientific tradition. By not sharing data with other researchers, it would be violating a standard transparency requirement at leading scientific journals. If a Republican official did such a thing, you'd expect to hear denunciations of this latest offensive in the "Republican war on science." That's the accusation being hurled at Scott Pruitt, the Republican who heads the Environmental Protection Agency. But Pruitt hasn't done anything to discourage peer review. In fact, he's done the opposite: he has called for the use of more independent experts to review the EPA's research and has just announced that the agency would rely only on studies for which data are available to be shared. Yet Democratic officials and liberal journalists have denounced these moves as an "attack on science," and Democrats have cited them (along with accusations of ethical violations) in their campaign to force Pruitt out of his job.

National News Highlights 4.12.18

The Wall Street Journal: U.S. Weekly Jobless Claims Hold Below 300,000 for Longest Streak on Record
The number of Americans claiming new unemployment benefits has never been so low for so long. Initial jobless claims, a proxy for layoffs across the U.S., decreased by 9,000 to a seasonally adjusted 233,000 in the week ended April 7, the Labor Department said Thursday. This means claims have now held below 300,000 for 162 consecutive weeks, cementing the longest streak for weekly records dating back to 1967. The current streak eclipsed the previous longest stretch that ended in April 1970. The consistently low claims levels point to labor market health because they mean relatively few Americans are losing their jobs and applying for benefits to tide them over until they can find new employment. After several years of consistent job growth, firms are reluctant to let employees go in a tightening labor market in which many available workers are quickly snapped up.

The Washington Post: As Fears Mount Over Open U.S.-Russia Conflict, Moscow Seeks To Lower The Temperature
Russian officials on Thursday sought to tamp down public fears of a looming conflict with the United States, even as Syrian government forces took control of the town where they are suspected of carrying out a chemical attack last weekend. Russian military police also entered Douma on Thursday to act as "guarantors of law and order in the town," the Russian Defense Ministry said, according to Russian news agencies. Russian troops had arrived earlier Monday under the terms of a surrender deal reached with the rebels after the suspected chemical attack — which Russia and Syria say did not happen. The recapture of Douma, in the region of Eastern Ghouta on the outskirts of Damascus, effectively represents the end of the war between Syrian President Bashar al-Assad and the rebel groups opposing his rule. Although chunks of the country remain under opposition control, none are as symbolic as Eastern Ghouta.

EPA Gains Clouded By Controversies Involving Pruitt
By The Oklahoman Editorial Board, 4/12/18

It looked for a time last week as though Scott Pruitt, embroiled in another controversy, might be shown the door as administrator of the Environmental Protection Agency. But Pruitt remains on the job and we hope that continues, because he's made a difference at the EPA.

At the same time, however, it's hard to ignore the constant drumbeat of criticism, even if it largely stems from those on the left who were mortified when President Trump tapped Pruitt for the job and have worked unceasingly to derail his work since arriving in Washington.

Late last week, the federal government's top ethics official wrote a letter to the person in charge of ethics at the EPA warning of possible ethics violations by Pruitt, who served six years as Oklahoma's attorney general before going to Washington.

"Reports of the administrator making frequent official trips to his home state at government expense to offset the expense of returning home for personal or political reasons do raise concerns about whether the administrator is using his public office for personal gain in violation of ethics rules," the letter said.

In recent weeks, some Republican members of Congress have called for Pruitt to resign or be fired. One member, Rep. Carlos Curbelo of Florida, said Pruitt's "corruption scandals are an embarrassment to the administration."

Among other things, Pruitt has been criticized for occasional first-class travel — the bill during his first year on the job totaled about $105,000, according to Politico — and for expensive security expenditures. Most recently, Pruitt has come under fire for spending several months last year in a lobbyist's D.C. condominium at $50 per night, and for giving two top aides large pay raises after the White House denied the request.

Pruitt has said the raises were enacted not by him but by someone else, and that they had been reversed. As for the condo deal, it was approved by an EPA ethics official who has been at the agency 18 years. Mollie Ziegler Hemmingway, writing at the conservative website The Federalist, noted: "The general rental space also was used by three members of Congress for fundraising on days Pruitt wasn't in town. He wasn't invited to the events, didn't attend them, and even if he had no ethics laws would have been violated …"

Conservative defenders of Pruitt note that the Obama EPA had numerous controversies when led by administrators Lisa Jackson and Gina McCarthy. It is indeed a hoot that Jackson, who used a fake name and private email address while conducting official EPA business, has criticized Pruitt for a lack of transparency.

Yet pointing at the other guy and saying "He (or she) did plenty of things wrong, too," isn't a great defense. Pruitt has led major reform at EPA by, among other things, undoing the Waters of the U.S. rule, working to repeal the Clean Power Plan and revising burdensome fuel-economy standards, all products of the Obama administration. These moves and others have enraged the left and he'll continue to be their chief target, but he nonetheless should take pains not to give them more fodder for their assaults.

The Daily Caller

SCOOP: The White House Just Got Pruitt's Plan To Repeal WOTUS. Here Are The Details

By Michael Bastasch, 4/12/18

White House officials are reviewing an updated Environmental Protection Agency (EPA) proposal to repeal the Obama administration's "waters of the United States" that expanded federal control over waters on private property.

EPA officials submitted a supplemental proposal to the Office of Management and Budget (OMB) on Thursday. The proposal clarifies the agency is in fact repealing the Obama-era regulation and addressing some concerns brought up by stakeholders. The proposal also states EPA will be re-codifying the pre-Obama definition of WOTUS, The Daily Caller News Foundation has learned.

The Obama administration finalized the Clean Water Rule in 2015 that expanded the definition of "waters of the United States" (WOTUS), arguing the rule was needed to clear up uncertainties in the wake of two U.S. Supreme Court decisions.

More than half of U.S. states sued EPA to have the rule overturned. The courts quickly issued regulatory stays on the Clean Water Rule, meaning it never really went into effect. Manufacturers, energy companies, farmers, ranchers and land developers said the Obama-era rule would only make it harder to do business and manage land.

President Donald Trump signed an executive order last year, asking EPA and the U.S. Army Corps of Engineers to replace the Obama-era WOTUS rule with one consistent with former U.S. Supreme Court Justice Antonin Scalia's plurality opinion in the 2006 Rapanos v. United States case.

EPA began the WOTUS repeal process in June and published a plan for WOTUS repeal in the Federal Register the following month. EPA's new submission clarifies some concerns stakeholders expressed last summer, but the details aren't clear because it's still under review.

"From day one, EPA and the Department of the Army have been committed to providing certainty and clarity to our state and tribal co-regulators and farmers, ranchers and other stakeholders across the country," an EPA spokeswoman told TheDCNF.

"After reviewing this input, EPA and the Army have decided to issue a supplemental proposal to provide the public with additional clarity on the scope of the agencies' efforts," the spokeswoman said.

The move comes after environmentalists published a memo related to Clean Water Act enforcement. The memo, obtained by Public Employees for Environmental Responsibility (PEER), detailed how Pruitt would reserve the final say on jurisdiction under the Clean Water Act that was formerly delegated to regional officers.

PEER lambasted Pruitt's "restore regulatory certainty" as a "crude Clean Water Act coup d'état."

"This action subjects safeguards for clean water across the U.S. to filtration through one politician's hands," PEER's New England Director Kyla Bennett said in a statement. "Every corporation that wants a pass on Clean Water Act compliance is invited to privately meet with the most user friendly EPA Administrator in history."

However, Pacific Legal Foundation attorney Jonathan Wood said the memo could "promote both consistency in application and more accountability." PLF has challenged WOTUS in federal court.

"As it stands now, it makes a huge difference which regional office reviews your case — and often which bureaucrat within the office you happen to draw," Wood told TheDCNF. "Centralizing final decision making should lead to more consistent decision-making."

"There's also an important accountability issue here," Wood said. "Clean Water Act decisions require a mix of science and policy judgment."

"As the person appointed by the President and confirmed by the Senate to make those judgments, Pruitt can be forced to answer for the exercise of that policy-making power," Wood said. "When these decisions are made by anonymous regional bureaucrats, it is exponentially harder to hold anyone accountable."

CBS News

https://www.cbsnews.com/news/here-are-some-of-the-threats-made-against-epa-administrator-scott-pruitt/

Here Are Some Of The Threats Made Against EPA Administrator Scott Pruitt

By Jacqueline Alemany, Arden Farhi, 4/11/18

CBS News has obtained an August 2017 report prepared by the Environmental Protection Agency's office of inspector general that contains a list of 13 threats made against EPA Administrator Scott Pruitt and his family.

The threats range in severity, credibility and specificity.

One tweet flagged by investigators said, "Pruitt, I'm gonna find you and put a bullet between your eyes. Don't think I'm joking. I'm planning this." Investigators believe the threat was made by someone living in India.

Another person wished the administrator "a very painful and horrible death through poisoning. Please explain the scientific method to this freaking neanderthal."

The inspector general also looked into a complaint that "unknown protesters attempted to disrupt the EPA Administrator's speech during a closed event." Another person emailed the EPA threatening to dump old paint outside Pruitt's door.

The threats took various forms -- some arriving via social media and email, others by postcard.

Pruitt's daughter received a menacing message on Facebook, the document reveals.

In certain cases, cases were referred to the Justice Department, but just one was deemed serious enough to prosecute. The report covers the period from Oct. 2016 to Aug. 2017.

EPA Spokesman Jahan Wilcox responded that Pruitt had faced "unprecedented" threats.

In an email to the EPA's "Threat Coordination Group," Patrick Sullivan, the assistant inspector general for investigations at the EPA outlined an incident that occurred on March 6, 2018, in which a trespasser gained entry to the EPA headquarters and identified himself as a student attending a "Microsoft event."

"The personal asked about Scott Pruitt and wanted to know where Pruitt's office was and if Pruitt ever walked in the hallway outside the room," wrote Sullivan.

The intruder was soon escorted out of the EPA but called the desk phone of an employee and left voicemails following the intrusion claiming "he can gain entry into EPA space anytime he wants."

The security vulnerability was soon thereafter investigated.

Wilcox told CBS News, "We do not comment on matters pertaining to EPA's IG." A spokesperson for the EPA inspector general had no comment.

In early March, Pruitt told CBS News, "The quantity and the type of threats I've faced are unprecedented."

The inspector general report also details threats made against EPA employees and facilities and two threats against Gina McCarthy, the EPA administrator under President Obama.

McCarthy's office received a series of hostile phone calls from a person who is currently being prosecuted for making "Felony Threats." The caller said, "I will kill ya'll (sic) and f*** up Gina McCarthy," according to the report.

Democratic Sens. Tom Carper, of Delaware, and Sheldon Whitehouse, of Rhode Island, released a letter on Tuesday to Wyoming Sen. John Barrasso, chairman of the Senate committee that oversees the EPA, that said the assertions of "ongoing threats associated with the administrator's air travel" were inconsistent with an internal memo they obtained from a whistleblower at the EPA.

The memo, dated Feb. 14, 2018, according to the letter sent by Carper and Whitehouse, claimed that "EPA Intelligence has not identified any specific direct threat to the EPA administrator."

In a statement provided to the New York Times, Barrasso said that he Democrats had selectively released parts of the internal memo.

On Wednesday, Democratic senators held a press conference demanding answers from Pruitt about why he had ordered costly security measures and full time protection -- even on personal trips.

Sen. Tom Udall, D-New Mexico, said Pruitt had committed some of the worst "ethical transgressions of the entire Trump administration."

"The list of abuses just keeps getting longer," Udall told reporters at the press conference. "Lavish first class flights around the world, swanky hotel stays, taxpayers footing the bill for personal trips to Oklahoma, a $43,000 soundproof phone booth in his office, taking 30 EPA enforcement officers away from investigating polluters to serve as his round the clock personal security detail, speeding down the streets of Washington with sirens and lights blaring to get to fancy restaurants, huge unauthorized salary raises for his friends, allowing a close aide not to come to work for three months while still getting paid, and finally detailing EPA staff to find him a place to live. These are just a few of the things he is doing."

As Udall sees it, "Scott Pruitt has misused taxpayer dollars while enhancing his own personal perks."

The AP first reported that Pruitt's 20-member full time security detail "approached $3 million when pay is added in travel expenses." But EPA spokesman Jahan Wilcox defended the EPA administrator and said he has faced "unprecedented" threats.

The EPA administrator has been embroiled in scandal during his term, facing persistent rumors about the future of his job in the Trump administration. But he has also been called the president's most effective Cabinet secretary by Republican allies around Washington – including the president himself.

Last Thursday, the president praised Pruitt aboard Air Force One en route to Washington, calling him "a good man."

"I think he's done a fantastic job at EPA," Trump told reporters. "I think he's done an incredible job. He's been very courageous. Hasn't been easy, but I think he's done an absolutely fantastic job. I think he'll be fine."

The president added that the White House was looking into reports about Pruitt's ethical entanglements: he has not only come under fire for habitually traveling first class or by military jet at considerable taxpayer expense but he is now also is under investigation by House Oversight Committee Chairman Trey Gowdy for a housing arrangement in Washington, D.C., in 2017. ABC News first reported that Pruitt had lived in a Capitol Hill apartment owned by the wife of a fossil fuels lobbyist and rented the space for $50 a night – only paying for nights that he slept there.

Here are some of the documents obtained by CBS News:

CNN

https://www.cnn.com/2018/04/12/politics/andrew-wheeler-environmental-protection-agency-scott-pruitt-congress/index.html

Vote Slated For Thursday For Former Inhofe Aide Wheeler To Be EPA's No. 2

By Daniella Diaz and Ted Barrett, 4/12/18

The Senate is set to vote on Andrew Wheeler to be the number two official at the Environmental Protection Agency amid ethics concerns plaguing EPA chief Scott Pruitt and calls from Democrats for him to resign.

If Pruitt left, it could fall to Wheeler to run the agency until a new administrator is confirmed.

Two GOP leadership aides told CNN they expected Wheeler to be approved, which would make him the latest appointee at the agency with close ties to the energy industry.

His firm's clients include Murray Energy, which bills itself as "the largest coal mining company in America."

Senate Minority Leader Chuck Schumer, D-New York, blasted Wheeler as "a former industry lobbyist who has worked on behalf of big polluters and climate change deniers. He has spent years working to undermine or lobby against the environmental protections he may soon oversee."

Prior to his lobbying work, Wheeler served on Capitol Hill as a Republican staff member for the Senate Environment and Public Works Committee and as a top aide to Sen. Jim Inhofe, an Oklahoma Republican and an outspoken climate change skeptic who told CNN last month the EPA is "brainwashing our kids."

New Mexico Democratic Sen. Tom Udall said Wednesday that Wheeler should be carefully vetted, as if he were taking over for Pruitt now. Udall told reporters that he believes Wheeler wouldn't be a much better option to run the agency.

"The problem with the Wheeler nomination is if Trump (fires Pruitt) tomorrow, Wheeler is in fact the administrator, and that is a very, very serious problem," Udall said. "I know that there are many Republicans who haven't spoken out yet, but privately they are very disturbed by what Scott Pruitt is doing at the EPA."

While there is widespread opposition to Wheeler in the Democratic caucus, two Democrats running for reelection from energy producing states that strongly backed President Donald Trump in 2016 have said they will vote for him: Joe Manchin of West Virginia and Heidi Heitkamp of North Dakota.

"After meeting with Mr. Wheeler and reviewing his record, I've decided to support his nomination," Heitkamp said in a statement provided to CNN. "I believe he'll be open to working on issues important to North Dakota in a pragmatic and fair way, and I'll hold him accountable to make sure he implements the mission of the EPA in a way that works for my state."

One key centrist Republican has also signaled support for Wheeler.

"Mr. Wheeler has demonstrated that he understands the mission of the EPA and the role of Congress when it comes to oversight and accountability," said Maine Sen. Susan Collins in a statement.

Wheeler's nomination comes amid a steady stream of negative headlines involving Pruitt in recent weeks and months that has official Washington wondering whether the embattled agency chief can hold onto his job.

Most recently, Pruitt has been fighting stories revealing he paid about $6,100 over the course of a six-month lease last year to rent a room in a condo owned by Vicki Hart, a health care lobbyist whose husband, Steven Hart, has lobbied the EPA. His daughter also reportedly lived there while she was interning in Washington.

He paid $50 per night, according to the reports, and paid only for the nights he used the condo.

The federal government's top voice on ethics David Apol sent a letter to the agency outlining areas of concern regarding Pruitt. Apol, the acting director and general counsel of the Office of Government Ethics, summarized reports of Pruitt's conduct, including the rental agreement, as well as EPA spending on Pruitt's travel and security.

The letter also expresses concern with reports of Pruitt bypassing the White House to give raises to favored aides and other employees who faced job changes after raising concerns over his conduct.

Here's Why Friends And Foes Of EPA Chief Pruitt Are So Adamant

By Christopher Flavelle, Ari Natter, and Jennifer Dlouhy, 4/12/18

Supporters and detractors of Environmental Protection Agency head Scott Pruitt agree on this much: He matters.

Pruitt, whose continued tenure has been put in doubt by a series of ethics controversies, has attracted an extraordinary outpouring of support among conservative boosters who say he's the most effective member of President Donald

Trump's cabinet. Likewise, the organizers of a "Boot Pruitt" movement see him as a serious risk to the environment he's supposed to be protecting.

Yet it is hard to assess Pruitt's tenure by traditional standards. Many of his high-profile initiatives, such as overturning the Obama administration's plan to curb carbon emissions from power plants, face years of legal challenges.

Nor can Pruitt's significance be tied to a roster of regulatory actions -- including those designed to jettison old rules. Federal data show that since Trump's inauguration, the agency has submitted nine "economically significant" rules, defined as those with likely economic impact of at least $100 million, to the White House for review. By comparison, the Department of Health and Human Services has produced 31 such rules, the Department of Labor six and the Department of the Interior five.

Narrow that list to the new rules that have actually been issued, and Pruitt's impact is even harder to spot. Of the 24 economically significant regulations that have been approved by the White House under President Donald Trump, just one was issued by the EPA, according to data posted by the Office of Information and Regulatory Affairs. And that rule set the amount of renewable fuels that must be used in 2018 -- a regulation the EPA must issue every year, regardless of who's in charge.

Those figures don't include regulations that were in the works when Pruitt arrived in Washington and that he has blocked.

EPA spokesman Jahan Wilcox cited the agency's work to repeal Obama-era rules governing carbon dioxide emissions and water pollution as evidence Pruitt is advancing Trump's agenda.

"From advocating to leave the Paris Accord, working to repeal Obama's Clean Power Plan and Waters of the United States, declaring a war on lead and cleaning up toxic Superfund sites, Administrator Pruitt is focused on advancing President Trump's agenda of regulatory certainty and environmental stewardship," Wilcox said in an emailed statement.

A fuller assessment of Pruitt's 14 months in office shows that he's laid the groundwork for a wholesale revision of environmental policy, one that delights anti-regulatory groups and frightens environmentalists.

"Without a doubt, Scott Pruitt has been the single most effective appointment of the president of the United States," said Tim Huelskamp, president of the Heartland Institute, an industry-funded nonprofit that advocates for less regulation.

Vera Pardee, senior counsel for the Center for Biological Diversity, shared that view, albeit from the opposite direction. "The deregulatory agenda of Trump finds its most destructive expression in Mr. Pruitt," she said.

That shared view of Pruitt's importance helps explain the effort that advocates have poured into keeping him in his job -- or getting him removed. The outpouring is far greater than was expended on behalf of other embattled cabinet members, such as Secretary of State Rex Tillerson or Veterans Affairs Secretary David Shulkin who both ended up losing their jobs.

Pruitt has been dogged by a series of controversies, including expensive first-class tickets and 24-hour security details, hefty raises for aides and renting a Capitol Hill bedroom from a lobbyist for $50 a night. In response, environmentalists have mounted a campaign to seek Pruitt's ouster; advocates of smaller government, meanwhile, have set up a coordinated effort of their own to retain him at the EPA.

Both sides put Pruitt's effort to reduce the influence of academic scientists within the EPA near the top of their list of reasons why he matters. Pruitt has removed many of those scientists from advisory boards, replacing them with people who reflect the concerns of industries the EPA regulates.

Those boards are important. The Clean Air Scientific Advisory Committee, for example, helps establish ozone standards that the agency is required to implement.

JunkScience.com
Steven Milloy, publisher of the website JunkScience.com and a senior fellow at the Energy and Legal Institute, praised Pruitt for installing as chairmen of the Science Advisory Board and the Clean Air Scientific Advisory Committee "people I consider to be very strongly grounded in science."

Michael Halpern, deputy director of the Center for Science and Democracy at the Union of Concerned Scientists, echoed Milloy's point about the importance of those boards -- although he characterized Pruitt's appointments as "stacking" them.

Another point of agreement is Pruitt's changing the rules on so-called "secret science." He has directed the EPA to use only research whose underlying data is publicly available. Environmental advocates say that prevents the EPA from issuing air and water regulations supported by health research, since the identities of patients studied in those papers is kept private.

Huelskamp, of the Heartland Institute, praised that change. Halpern criticized it.

Pruitt also has made major policy pivots outside the formal rulemaking process. That includes the EPA's decision not to ban the commercial use of the pesticide chlorpyrifos and methylene chloride used in paint strippers. The EPA also has relaxed air pollution requirements via memos and internal opinions -- navigating around the federal rulemaking process in a way that has already drawn at least one legal challenge.

Environmental advocates also argue that Pruitt has restrained the EPA's willingness to fine polluters for violating the law.

"If you look at his enforcement record, it is disastrous and terrifying," said Lukas Ross, climate and energy advocate for Friends of the Earth. "It's not just the number of cases lodged, but it's also the amount of money that's been captured through lodging those cases."

Equally consequential, Ross added, are Pruitt's efforts to change the mission of the agency, in a way that will drive away staff who care about protecting the environment.

"There is a very real threat of brain drain because of the morale crisis being created by Scott Pruitt," Ross said. "If I worked at the EPA, I would be thinking about quitting too."

On that point as well, Milloy, the Junk Science publisher, agreed.

"Are these people sad?" Milloy asked. "The rest of America is happy."

The Washington Times
https://www.washingtontimes.com/news/2018/apr/12/here-are-legitimate-death-threats-against-scott-pr/
Here Are The Legitimate Death Threats Against Scott Pruitt That Dems Claim Don't Exist
By Larry O'Connor, 4/12/18

One of the more sickening episodes of the full-court press by members of The Swamp against EPA Administrator Scott Pruitt is the claim that he has spent too much money on extravagant security details.

Democrats in the Senate have questioned the legitimacy of death threats against Pruitt and his family and have demanded hearings to investigate the matter:

Two top Democrats on the committee, ranking member Thomas R. Carper of Delaware and Sheldon Whitehouse of Rhode Island, on Tuesday demanded such hearings, saying they have confidential documents that contradict public statements made by Pruitt, EPA spokespersons and President Donald Trump regarding the administrator's security spending.

The lawmakers in their letter asserted that the documents in their hands fall far short of supporting claims by Pruitt's office that he needed elaborate security measure to protect him from death threats.

"Documents provided to us by EPA official(s) suggest the agency has relied on questionable threats to the Administrator, including reports of non-violent protests, negative feedback about the administrators actions or other First Amendment protected activity to justify millions of dollars in additional security spending, inducing first-class air travel, as compared to his predecessors at the agency," Carper and Whitehouse wrote.

This is how vicious the opposition to Pruitt has become. As if a person would go out of their way to have an obtrusive and heavy-handed security detail for no good reason.

CBS News has obtained (probably from staffers at the EPA hoping to push back on the despicable narrative from Senate Democrats) documentation on just some of the death threats against Pruitt that had been detailed in August 2017 and, no, the threats are not isolated to anonymous tweets:

In an email to the EPA's "Threat Coordination Group," Patrick Sullivan, the assistant inspector general for investigations at the EPA outlined an incident that occurred on March 6, 2018, in which a trespasser gained entry to the EPA headquarters and identified himself as a student attending a "Microsoft event."

"The person asked about Scott Pruitt and wanted to know where Pruitt's office was and if Pruitt ever walked in the hallway outside the room," wrote Sullivan.
The intruder was soon escorted out of the EPA but called the desk phone of an employee and left voicemails following the intrusion claiming "he can gain entry into EPA space anytime he wants."

The security vulnerability was soon thereafter investigated.

McCarthy's office received a series of hostile phone calls from a person who is currently being prosecuted for making "Felony Threats." The caller said, "I will kill ya'll (sic) and f*** up Gina McCarthy," according to the report.

The Daily Caller also has a summary of some of the threats Pruitt has had to deal with presumably from global warming enthusiasts who care more about carbon emission hysteria than they do human life:

Investigators flagged one tweet that stated: "Pruitt, I'm gonna find you and put a bullet between your eyes. Don't think I'm joking. I'm planning this." Investigators determined the threat came from someone living in India. The investigation is ongoing.

These types of threats were a common occurrence, the report notes.

For instance, another person mailed a postcard to Pruitt telling him to "get out while you still can, Scott, you are evil incarnate you ignorant fuck." An investigation was unable to determine who sent the message. The case was not presented to the United States Attorney's Office for prosecution.

Pruitt's opponents hate how effective he has been (as we detailed last week) and they hate that President Trump has stood by him in the face of unfair and duplicitous attacks against his ethics and credibility. But to question the cost of his security detail for partisan purposes is beyond the pale.

It's time for Senate Republicans to unequivocally stand behind Pruitt and publicly shame these Democrats for their unprecedented attacks. They are even going out of their way to minimize real and credible threats against a man's wife and against innocent government workers.

It's time for a Joseph Welch moment. "Have you no decency? At long last, have you no shame?"

The Washington Free Beacon

Breaking: Liberals Suddenly Care About Wasting Taxpayer Money

By Elizabeth Harrington, 4/11/18

I suddenly have a lot of competition covering my beat. Who knew the mainstream media cared how our taxpayer dollars are wasted?

Security costs for cabinet secretaries are "steep." Spending is "lavish" again. When, God forbid, a secretary takes his wife with him on a business trip, CNN is there with the documents in hand, showing her "involvement."

The New York Times is now giving tips on how to save taxpayers money, while lambasting Treasury Secretary Steven Mnuchin's use of military charter flights. (Mnuchin's travel ended up costing half of what Obama administration secretaries spent on average. Oddly, the Times never followed up.)

The latest target is Scott Pruitt, arguably President Trump's most effective cabinet secretary. While there is questionable conduct for sure, like using an obscure law to give aides huge taxpayer-funded raises, it's curious the media suddenly care how much international junkets cost.

The first scandal that caught the press's attention was Pruitt's trip to Italy last summer to attend the G-7 summit, which cost $84,000 in airfare and security, roughly the same that Lisa Jackson, Obama's first EPA administrator, spent on average on flights and security for four international trips.

The headlines for Jackson's trip to the same summit in Syracuse, Italy, in early 2009 were slightly different.

The Times has hit Pruitt for his "extravagant spending" on private flights and 24-hour security. But not too long ago it was the Times defending lavish trips on the taxpayer's dime.

"There is nothing like a little Mediterranean beach vacation to unwind," the Times wrote back in August 2010. Do tell.

"Unless you happen to travel with dozens of Secret Service agents, trailed by photographers and dogged by controversy."

Ah, poor Michelle Obama. She just wanted to get away, but those mean Republicans had to spoil her vacation.

"Michelle Obama hoped to enjoy a quiet summer break in southern Spain with her younger daughter and a few friends," the Times wrote. "But the Andalusian getaway has gotten away from her as the European media document her every flamenco dance step and critics back home question the wisdom of such a lavish vacation, which involves at least some taxpayer money, in a time of austerity."

"At least some" turned into a measly $467,585, including $26,670.61 for a "chauffeur tour of Costa del Sol."

The Times wrote approvingly of Mrs. Obama and "her entourage" touring the "picturesque southern city of Ronda," and hobnobbing with Eva Longoria Parker and Antonio Banderas.

Besides, reports on the trips "had been exaggerated," the Times said.

"Mrs. Obama is not traveling with 40 friends," the Times assured us. It was only "two friends and four of their daughters, as well as a couple of aides and a couple of advance staff members."

It was no big deal for Mrs. Obama and friends to stay at the five-star Hotel Villa Padierna, where "at least 30 rooms were reserved for the entourage."

"The hotel is one of Spain's more luxurious establishments, with rooms ranging from $500-a-night to a $6,600 suite with 24-hour butler service," the Times wrote.

"While some Americans frown," the Times concluded, "the Spanish eagerly welcomed the Obama group, seeing it as a boost for a tourism sector severely hit by the country's economic downturn."

It might not have been great for the taxpayers, but it was good for Spain!

It wasn't just the first lady's taxpayer-funded trips the media were either uninterested in covering or eager to defend. It was the entire Obama cabinet.

In fact, then-congressman Barney Frank had to apologize for scrutinizing Timothy Geitner's use of military charter flights, which cost at least $150,000 for international trips and totaled "several million dollars a year."

The only Obama official who came close to scrutiny from the mainstream media was Attorney General Eric Holder, who along with his predecessor Michael Mukasey and former FBI director Robert Mueller, now the special counsel, spent over $11 million on taxpayer-funded private jets for personal travel.

Holder used the FBI's private Gulfstream V to go to the Super Bowl in New Orleans in 2013, costing $15,000 each way.

Holder alone spent $4.3 million on travel in three years, including 31 personal trips and "two jaunts to Martha's Vineyard that totaled $95,184 in flight expenses."

Tom Price was ousted from the Department of Health and Human Services for far less.

The media didn't report on Energy Secretary Ernest Moniz's travel costs either, which lasted up until 11 days before Trump's inauguration. Who knows how much it cost us for Moniz to travel to Mexico City on January 9, 2017, to sign a "non-binding" document on electricity grids.

Republicans shouldn't be hypocrites, careless, or both, when it comes to how they spend our money. But let's not kid ourselves by pretending the media actually cares.

Reuters

Trump administration weighs high-ethanol fuel waiver to placate farmers

By Jarrett Renshaw and Chris Prentice, 4/11/18, 7:20 PM

NEW YORK (Reuters) - The Trump administration is considering allowing the sale of a higher ethanol fuel blend in the summer, a source familiar with the issue said, a move that would placate corn growers worried about the future of U.S. biofuels policy.

President Donald Trump recently met with the heads of the Environmental Protection Agency and the U.S. Department of Agriculture to discuss ways to make the Renewable Fuel Standard less expensive to the oil industry without undercutting demand for ethanol.

The RFS requires refiners to add increasing volumes of biofuels like corn-based ethanol into the nation's fuel supply each year which is a boon to farmers but a headache for refining companies that must either blend the fuels themselves or purchase credits from those who do.

Trump has tried in vain over the past several months to broker a deal between "Big Oil" and "Big Corn" over the issue, and has faced mounting pressure from lawmakers in the Midwest who are concerned that he will weaken domestic demand for ethanol at a time farmers are already facing a potential trade war with China that could hurt export demand for corn and soybeans.

Sources had told Reuters this week that Trump was temporarily suspending his consideration of a refining industry-backed proposal to cap prices for blending credits, an idea that the biofuels industry has opposed as damaging to farmers.

But in the meantime, the administration is considering moving forward with plans to allow for the ethanol industry's long sought waiver to sell gasoline containing 15 percent ethanol in the summer, instead of the usual 10 percent blend, the source familiar with the issue told Reuters on Wednesday.

The higher ethanol blend, called E15, is currently banned by the Environmental Protection Agency due to concerns it contributes to smog on hot days, a worry that biofuels advocates say is baseless. If done soon, the waiver could be in effect in time for the 2018 summer driving season.

EPA spokeswoman Liz Bowman did not immediately respond to a request for comment. White House spokeswoman Kelly Love did not comment on the E15 waiver but said that during Trump's meeting Monday he "instructed his Cabinet to continue to explore options that protect American farmers and America's refinery workers."

Biofuels proponents have heaped pressure on the White House after reports that the EPA was granting dozens of small refineries exemptions from the RFS to help them avoid the costs of compliance, something the ethanol industry says will weaken demand for their product.

On Monday, Trump acknowledged farmers may bear the brunt of the economic harm if China retaliates against Washington's threat of tariffs, noting that "we'll make it up to them". Many U.S. farmers are battling debt after years of excess global supplies and depressed prices.

"We need some good news out here," said Monte Shaw, the Executive Director of the Iowa Renewable Fuels Association.

"The best news (Trump) could give us right now is year-round sales of E15," he said.

City Journal

Scott Pruitt, Warrior for Science

By John Tierney, 4/11/18

Imagine if the head of a federal agency announced a new policy for its scientific research: from now on, the agency would no longer allow its studies to be reviewed and challenged by independent scientists, and its researchers would not share the data on which their conclusions were based. The response from scientists and journalists would be outrage. By refusing peer review from outsiders, the agency would be rejecting a fundamental scientific tradition. By not sharing data with other researchers, it would be violating a standard transparency requirement at leading scientific journals. If a Republican official did such a thing, you'd expect to hear denunciations of this latest offensive in the "Republican war on science."

That's the accusation being hurled at Scott Pruitt, the Republican who heads the Environmental Protection Agency. But Pruitt hasn't done anything to discourage peer review. In fact, he's done the opposite: he has called for the use of more

independent experts to review the EPA's research and has just announced that the agency would rely only on studies for which data are available to be shared. Yet Democratic officials and liberal journalists have denounced these moves as an "attack on science," and Democrats have cited them (along with accusations of ethical violations) in their campaign to force Pruitt out of his job.

How could "the party of science," as Democrats like to call themselves, be opposed to transparency and peer review? Because better scientific oversight would make it tougher for the EPA to justify its costly regulations. To environmentalists, rigorous scientific protocols are fine in theory, but not in practice if they interfere with the green political agenda. As usual, the real war on science is the one waged from the left.

The EPA has been plagued by politicized science since its inception in 1970. One of its first tasks was to evaluate the claim, popularized in Rachel Carson's Silent Spring, that the use of DDT pesticide was causing an epidemic of cancer. The agency held extensive hearings that led to the conclusion that DDT was not a carcinogen, a finding that subsequent research would confirm. Yet the EPA administrator, William Ruckelshaus, reportedly never even bothered to read the scientific testimony. Ignoring the thousands of pages of evidence, he declared DDT a potential carcinogen and banned most uses of it.

Since then, the agency has repeatedly been criticized for relying on weak or cherry-picked evidence to promote needless alarms justifying the expansion of its authority (and budget). Its warnings about BPA, a chemical used in plastics, were called unscientific by leading researchers in the field. Its conclusion that secondhand smoke was killing thousands of people annually was ruled by a judge to be in violation of "scientific procedure and norms"—and was firmly debunked by later research.

To justify the costs of the Obama administration's Clean Power Plan restricting coal-burning power plants, the EPA relied on a controversial claim that a particular form of air pollution (from small particulates) was responsible for large numbers of premature deaths. To reach that conclusion, the agency ignored contradictory evidence and chose to rely on 1990s research whose methodology and conclusions were open to question. The EPA's advisory committee on air pollution, a group of outside scientists, was sufficiently concerned at the time to ask to see the supporting data. But the researchers and the EPA refused to share the data, citing the confidentiality of the medical records involved, and they have continued refusing demands from Congress and other researchers to share it, as Steve Milloy recounts in his book, Scare Pollution: Why and How to Fix the EPA.

Pruitt's new policy will force the EPA to rely on studies for which data is available to other researchers, ensuring the transparency that enables findings to be tested and confirmed. So why is he being attacked? His critics argue that some worthwhile research will be ignored because it is based on confidential records that are impractical to share. They say that it would cost the EPA several hundred million dollars to redact personal medical information in the air-pollution studies used to justify the Obama administration's Clean Power Plan. But even if that estimate is correct—it seems awfully high—it's a pittance compared with the costs of the EPA's regulations. The Obama EPA estimated the annual cost of its Clean Power Plan at $8 billion; others estimated it at more than $30 billion. Before saddling utility customers with those higher bills year after year, the EPA could at least pay for reliable research.

Pruitt's critics have also excoriated him for insisting that the EPA's advisory boards consist of independent scientists, ending the practice of including researchers who receive grants from the agency—exactly the sort of conflict of interest that progressives object to when researchers receive money from private industry. He has also proposed an analysis of climate change using a "red-team/blue-team" exercise, an innovative technique that has been used to draw up plans at the Defense Department and the CIA and by private industry for industrial operations and projects such as designing spacecraft. A group of outside experts, the red team, is brought in to critique the work of the in-house blue team, which then responds, and the teams keep going back and forth, under the supervision of a moderator. It's an enhanced form of peer review, forcing researchers and bureaucrats to defend or reconsider their ideas, and ideally leading to sounder conclusions and better plans. A version of this exercise has already been used to bolster the case for man-made global warming, as noted by Joseph Majkut of the Niskanen Institute.

Given the high stakes and the many uncertainties related to climate change—the dozens of computer climate models, the widely varying estimates of costs and benefits of mitigation strategies—who could object to studying the problem carefully? Yet Pruitt's proposal has been denounced by Democrats as well as liberal Republicans like Christine Whitman, the former New Jersey governor, who argued that the facts are so well-established that further examination is unnecessary. As a former head of the EPA, Whitman no doubt appreciates how much easier it is to make regulations without the nuisance of debate. But what's good for bureaucrats is not good for science.

The Wall Street Journal

https://www.wsj.com/articles/u-s-weekly-jobless-claims-hold-below-300-000-for-longest-streak-on-record-1523536549

U.S. Weekly Jobless Claims Hold Below 300,000 For Longest Streak On Record

By Sarah Chaney, 4/12/18

WASHINGTON—The number of Americans claiming new unemployment benefits has never been so low for so long.

Initial jobless claims, a proxy for layoffs across the U.S., decreased by 9,000 to a seasonally adjusted 233,000 in the week ended April 7, the Labor Department said Thursday. This means claims have now held below 300,000 for 162 consecutive weeks, cementing the longest streak for weekly records dating back to 1967.

The current streak eclipsed the previous longest stretch that ended in April 1970.

The consistently low claims levels point to labor market health because they mean relatively few Americans are losing their jobs and applying for benefits to tide them over until they can find new employment.

After several years of consistent job growth, firms are reluctant to let employees go in a tightening labor market in which many available workers are quickly snapped up.

"Even if you aren't aggressively hiring, if you know the labor market is tight and it's going to be difficult to hire someone…you're only going to lay someone off if you had to," said Stephen Stanley, chief economist at Amherst Pierpont Securities.

Data on jobless claims can be volatile from week to week, especially around holidays when seasonal adjustments can be tricky.

"The changing date of the Easter holiday from year to year makes the seasonal adjustment process tricky from late March through late April, so further volatility in headline claims over the next few weeks can't be ruled out," wrote Ian Shepherdson, chief economist at Pantheon Macroeconomics, in a note to clients.

The four-week moving average of initial claims, a more-stable measure, increased last week to 230,000.

The low level of claims is among multiple signs of health in the U.S. labor market. The unemployment rate has held at 4.1% since October, its lowest level since late 2000. Employers have added to nonfarm payrolls for 90 straight months in the longest continuous jobs expansion on record.

Thursday's report showed the number of claims workers made for longer than a week increased by 53,000 to 1,871,000 in the week ended March 31. That figure, known as continuing claims, is reported with a one-week lag.

The Washington Post

https://www.washingtonpost.com/world/middle_east/russia-seeks-to-allay-fears-of-open-conflict-with-the-us-over-syria/2018/04/12/2d2407c4-3e38-11e8-8d53-eba0ed2371cc_story.html?utm_term=.587c5a0bc9a8

As Fears Mount Over Open U.S.-Russia Conflict, Moscow Seeks To Lower The Temperature

By Anton Troianovski, Louisa Loveluck, 4/12/18

MOSCOW — Russian officials on Thursday sought to tamp down public fears of a looming conflict with the United States, even as Syrian government forces took control of the town where they are suspected of carrying out a chemical attack last weekend.

Russian military police also entered Douma on Thursday to act as "guarantors of law and order in the town," the Russian Defense Ministry said, according to Russian news agencies. Russian troops had arrived earlier Monday under the terms of a surrender deal reached with the rebels after the suspected chemical attack — which Russia and Syria say did not happen.

The recapture of Douma, in the region of Eastern Ghouta on the outskirts of Damascus, effectively represents the end of the war between Syrian President Bashar al-Assad and the rebel groups opposing his rule. Although chunks of the country remain under opposition control, none are as symbolic as Eastern Ghouta.

But the situation in Syria remained in flux ahead of an anticipated airstrike by the United States, which President Trump has signaled he plans to carry out in response to the suspected use of chemical weapons by Assad's forces.

Trump appeared to moderate his tone with a tweet early Thursday, saying he did not mean to suggest that missile strikes are imminent.

"Never said when an attack on Syria would take place," he tweeted. "Could be very soon or not so soon at all!"

A spokesman for the Kremlin told reporters Thursday that Russia is watching the American declarations closely.

"We continue to believe that it is extremely important to avoid any steps that may lead to an increase of tensions in Syria," Dmitry Peskov said.

Russian officials in recent days had warned of the possibility of a direct military confrontation with the United States as a result of a U.S. strike. Any missile attack that puts Russian lives at risk, Moscow has said, would result in Russia striking back at the missiles and at the planes or ships that launched them.

Russia has deployed air defense systems in Syria, including its sophisticated S-400 long-range surface-to-air missile system. The fact that thousands of Russian troops and military advisers are stationed across the country means there's a chance that a large-scale U.S. strike on Syrian government forces would — deliberately or not — also kill Russians, military analysts in Moscow say.

In the wake of Trump's Wednesday tweet warning Russia of a planned U.S. missile strike, however, Moscow appears to be trying to make clear that it does not want a war and that a limited attack that doesn't risk Russian lives would not precipitate a military response.

Moscow bureau chief Anton Troianovski describes Russia's tensions with the U.S. and how state media are covering the alleged chemical weapons attack in Syria. (Sarah Parnass, Anton Troianovski/The Washington Post)

"I rule out a scenario in which the United States will intentionally strike a facility in Syria where Russian servicemen are located," Military Sciences Academy Vice President Sergei Modestov said in Thursday's edition of the government newspaper Rossiyskaya Gazeta.

The Kommersant newspaper quoted anonymous Defense Ministry sources as saying that Russia's General Staff was in touch with the U.S. Joint Chiefs of Staff and expected to receive coordinates on airstrike targets from the Pentagon to avoid Russian casualties.

"Right now, the talk is about the necessity of de-escalation," said Alexander Golts, an independent military analyst in Moscow. "We've practically come to the brink of war."

On the ground, fighters from the hard-line Jaish al-Islam group have trickled out of Douma in recent days under the terms of a deal that followed Saturday's suspected chemical attack. Local residents said Wednesday that the militants had insisted on emptying their magazines into the air instead of handing them to the Syrian military, and that they wounded civilians in the process.

But by Thursday morning, a monitoring group reported that they had surrendered their weapons altogether. Russia says that more than 13,000 militants and their families have left Douma since April 1.

Negotiations for the group's withdrawal had taken months, stalling and resuming as the fighting ebbed and flowed. But Jaish al-Islam's political chief said Thursday that the suspected chemical attacks had been the final straw.

"Of course, the chemical attack is what pushed us to agree," Yasser Dalwan told the Agence France-Presse news agency.

The World Health Organization has said that during the shelling of Douma on Saturday, about 500 patients exhibited "signs and symptoms consistent with exposure to toxic chemicals."

A network of local flight monitors said they had tracked several helicopters heading southwest from a government air base on Saturday evening. The same models of aircraft were then seen circling over Douma at 7:26 p.m. and 7:38 p.m.

Reports of a suspected gas attack began circulating minutes later. In one apartment block, rescuers would later find rooms filled with tangled bodies and the stench of chlorine. Some people had died foaming at the mouth, according to video footage.

Russia, however, says that its specialists who have visited Douma have found no evidence of a chemical attack. Instead, Saturday's incident represented the latest example of rebel trying to stage such an attack to undermine the Assad regime, Lt. Gen. Viktor Poznikhir, deputy chief of operations of the Russian General Staff, said Wednesday.

Rebel supporters on Saturday "once again tried to imitate in front of video cameras a staged chemical attack on civilians in the town of Douma," he said.

The Oklahoman: EPA Gains Clouded By Controversies Involving Pruitt

It looked for a time last week as though Scott Pruitt, embroiled in another controversy, might be shown the door as administrator of the Environmental Protection Agency. But Pruitt remains on the job and we hope that continues, because he's made a difference at the EPA. At the same time, however, it's hard to ignore the constant drumbeat of criticism, even if it largely stems from those on the left who were mortified when President Trump tapped Pruitt for the job and have worked unceasingly to derail his work since arriving in Washington. Yet pointing at the other guy and saying "He (or she) did plenty of things wrong, too," isn't a great defense. Pruitt has led major reform at EPA by, among other things, undoing the Waters of the U.S. rule, working to repeal the Clean Power Plan and revising burdensome fuel-economy standards, all products of the Obama administration. These moves and others have enraged the left and he'll continue to be their chief target, but he nonetheless should take pains not to give them more fodder for their assaults.

The Daily Caller: SCOOP: The White House Just Got Pruitt's Plan To Repeal WOTUS. Here Are The Details

White House officials are reviewing an updated Environmental Protection Agency (EPA) proposal to repeal the Obama administration's "waters of the United States" that expanded federal control over waters on private property. EPA officials submitted a supplemental proposal to the Office of Management and Budget (OMB) on Thursday. The proposal clarifies the agency is in fact repealing the Obama-era regulation and addressing some concerns brought up by stakeholders. The proposal also states EPA will be re-codifying the pre-Obama definition of WOTUS, The Daily Caller News Foundation has learned. The Obama administration finalized the Clean Water Rule in 2015 that expanded the definition of "waters of the United States" (WOTUS), arguing the rule was needed to clear up uncertainties in the wake of two U.S. Supreme Court decisions. More than half of U.S. states sued EPA to have the rule overturned. The courts quickly issued regulatory stays on the Clean Water Rule, meaning it never really went into effect. Manufacturers, energy companies, farmers, ranchers and land developers said the Obama-era rule would only make it harder to do business and manage land.

CBS News: Here Are Some Of The Threats Made Against EPA Administrator Scott Pruitt

CBS News has obtained an August 2017 report prepared by the Environmental Protection Agency's office of inspector general that contains a list of 13 threats made against EPA Administrator Scott Pruitt and his family. The threats range in severity, credibility and specificity. One tweet flagged by investigators said, "Pruitt, I'm gonna find you and put a bullet between your eyes. Don't think I'm joking. I'm planning this." Investigators believe the threat was made by someone living in India. Another person wished the administrator "a very painful and horrible death through poisoning. Please explain the scientific method to this freaking neanderthal." The inspector general also looked into a complaint that "unknown protesters attempted to disrupt the EPA Administrator's speech during a closed event." Another person emailed the EPA threatening to dump old paint outside Pruitt's door. The threats took various forms -- some arriving via social media and email, others by postcard. Pruitt's daughter received a menacing message on Facebook, the document reveals.

CNN: Vote Slated For Thursday For Former Inhofe Aide Wheeler To Be EPA's No. 2

The Senate is set to vote on Andrew Wheeler to be the number two official at the Environmental Protection Agency amid ethics concerns plaguing EPA chief Scott Pruitt and calls from Democrats for him to resign. If Pruitt left, it could fall to Wheeler to run the agency until a new administrator is confirmed. Two GOP leadership aides told CNN they expected Wheeler to be approved, which would make him the latest appointee at the agency with close ties to the energy industry. While there is widespread opposition to Wheeler in the Democratic caucus, two Democrats running for reelection from energy producing states that strongly backed President Donald Trump in 2016 have said they will vote for him: Joe Manchin of West Virginia and Heidi Heitkamp of North Dakota.

Bloomberg: Here's Why Friends And Foes Of EPA Chief Pruitt Are So Adamant

Supporters and detractors of Environmental Protection Agency head Scott Pruitt agree on this much: He matters. Narrow that list to the new rules that have actually been issued, and Pruitt's impact is even harder to spot. Of the 24 economically significant regulations that have been approved by the White House under President Donald Trump, just

one was issued by the EPA, according to data posted by the Office of Information and Regulatory Affairs. And that rule set the amount of renewable fuels that must be used in 2018 -- a regulation the EPA must issue every year, regardless of who's in charge. "Without a doubt, Scott Pruitt has been the single most effective appointment of the president of the United States," said Tim Huelskamp, president of the Heartland Institute, an industry-funded nonprofit that advocates for less regulation.

The Washington Times: Here Are The Legitimate Death Threats Against Scott Pruitt That Dems Claim Don't Exist

One of the more sickening episodes of the full-court press by members of The Swamp against EPA Administrator Scott Pruitt is the claim that he has spent too much money on extravagant security details. Democrats in the Senate have questioned the legitimacy of death threats against Pruitt and his family and have demanded hearings to investigate the matter: Two top Democrats on the committee, ranking member Thomas R. Carper of Delaware and Sheldon Whitehouse of Rhode Island, on Tuesday demanded such hearings, saying they have confidential documents that contradict public statements made by Pruitt, EPA spokespersons and President Donald Trump regarding the administrator's security spending. The lawmakers in their letter asserted that the documents in their hands fall far short of supporting claims by Pruitt's office that he needed elaborate security measure to protect him from death threats.

The Washington Free Beacon: Breaking: Liberals Suddenly Care About Wasting Taxpayer Money

I suddenly have a lot of competition covering my beat. Who knew the mainstream media cared how our taxpayer dollars are wasted? Security costs for cabinet secretaries are "steep." Spending is "lavish" again. When, God forbid, a secretary takes his wife with him on a business trip, CNN is there with the documents in hand, showing her "involvement." The New York Times is now giving tips on how to save taxpayers money, while lambasting Treasury Secretary Steven Mnuchin's use of military charter flights. (Mnuchin's travel ended up costing half of what Obama administration secretaries spent on average. Oddly, the Times never followed up.) The latest target is Scott Pruitt, arguably President Trump's most effective cabinet secretary. While there is questionable conduct for sure, like using an obscure law to give aides huge taxpayer-funded raises, it's curious the media suddenly care how much international junkets cost. The first scandal that caught the press's attention was Pruitt's trip to Italy last summer to attend the G-7 summit, which cost $84,000 in airfare and security, roughly the same that Lisa Jackson, Obama's first EPA administrator, spent on average on flights and security for four international trips. The headlines for Jackson's trip to the same summit in Syracuse, Italy, in early 2009 were slightly different. The Times has hit Pruitt for his "extravagant spending" on private flights and 24-hour security. But not too long ago it was the Times defending lavish trips on the taxpayer's dime. "There is nothing like a little Mediterranean beach vacation to unwind," the Times wrote back in August 2010. Do tell.

Reuters: Trump Administration Weighs High-Ethanol Fuel Waiver To Placate Farmers

The Trump administration is considering allowing the sale of a higher ethanol fuel blend in the summer, a source familiar with the issue said, a move that would placate corn growers worried about the future of U.S. biofuels policy. President Donald Trump recently met with the heads of the Environmental Protection Agency and the U.S. Department of Agriculture to discuss ways to make the Renewable Fuel Standard less expensive to the oil industry without undercutting demand for ethanol. The RFS requires refiners to add increasing volumes of biofuels like corn-based ethanol into the nation's fuel supply each year which is a boon to farmers but a headache for refining companies that must either blend the fuels themselves or purchase credits from those who do.

City Journal: Scott Pruitt, Warrior for Science

Imagine if the head of a federal agency announced a new policy for its scientific research: from now on, the agency would no longer allow its studies to be reviewed and challenged by independent scientists, and its researchers would not share the data on which their conclusions were based. The response from scientists and journalists would be outrage. By refusing peer review from outsiders, the agency would be rejecting a fundamental scientific tradition. By not sharing data with other researchers, it would be violating a standard transparency requirement at leading scientific journals. If a Republican official did such a thing, you'd expect to hear denunciations of this latest offensive in the "Republican war on science." That's the accusation being hurled at Scott Pruitt, the Republican who heads the Environmental Protection Agency. But Pruitt hasn't done anything to discourage peer review. In fact, he's done the opposite: he has called for the use of more independent experts to review the EPA's research and has just announced

that the agency would rely only on studies for which data are available to be shared. Yet Democratic officials and liberal journalists have denounced these moves as an "attack on science," and Democrats have cited them (along with accusations of ethical violations) in their campaign to force Pruitt out of his job.

National News Highlights 4.12.18

The Wall Street Journal: U.S. Weekly Jobless Claims Hold Below 300,000 for Longest Streak on Record
The number of Americans claiming new unemployment benefits has never been so low for so long. Initial jobless claims, a proxy for layoffs across the U.S., decreased by 9,000 to a seasonally adjusted 233,000 in the week ended April 7, the Labor Department said Thursday. This means claims have now held below 300,000 for 162 consecutive weeks, cementing the longest streak for weekly records dating back to 1967. The current streak eclipsed the previous longest stretch that ended in April 1970. The consistently low claims levels point to labor market health because they mean relatively few Americans are losing their jobs and applying for benefits to tide them over until they can find new employment. After several years of consistent job growth, firms are reluctant to let employees go in a tightening labor market in which many available workers are quickly snapped up.

The Washington Post: As Fears Mount Over Open U.S.-Russia Conflict, Moscow Seeks To Lower The Temperature
Russian officials on Thursday sought to tamp down public fears of a looming conflict with the United States, even as Syrian government forces took control of the town where they are suspected of carrying out a chemical attack last weekend. Russian military police also entered Douma on Thursday to act as "guarantors of law and order in the town," the Russian Defense Ministry said, according to Russian news agencies. Russian troops had arrived earlier Monday under the terms of a surrender deal reached with the rebels after the suspected chemical attack — which Russia and Syria say did not happen. The recapture of Douma, in the region of Eastern Ghouta on the outskirts of Damascus, effectively represents the end of the war between Syrian President Bashar al-Assad and the rebel groups opposing his rule. Although chunks of the country remain under opposition control, none are as symbolic as Eastern Ghouta.

EPA Gains Clouded By Controversies Involving Pruitt
By The Oklahoman Editorial Board, 4/12/18

It looked for a time last week as though Scott Pruitt, embroiled in another controversy, might be shown the door as administrator of the Environmental Protection Agency. But Pruitt remains on the job and we hope that continues, because he's made a difference at the EPA.

At the same time, however, it's hard to ignore the constant drumbeat of criticism, even if it largely stems from those on the left who were mortified when President Trump tapped Pruitt for the job and have worked unceasingly to derail his work since arriving in Washington.

Late last week, the federal government's top ethics official wrote a letter to the person in charge of ethics at the EPA warning of possible ethics violations by Pruitt, who served six years as Oklahoma's attorney general before going to Washington.

"Reports of the administrator making frequent official trips to his home state at government expense to offset the expense of returning home for personal or political reasons do raise concerns about whether the administrator is using his public office for personal gain in violation of ethics rules," the letter said.

In recent weeks, some Republican members of Congress have called for Pruitt to resign or be fired. One member, Rep. Carlos Curbelo of Florida, said Pruitt's "corruption scandals are an embarrassment to the administration."

Among other things, Pruitt has been criticized for occasional first-class travel — the bill during his first year on the job totaled about $105,000, according to Politico — and for expensive security expenditures. Most recently, Pruitt has come under fire for spending several months last year in a lobbyist's D.C. condominium at $50 per night, and for giving two top aides large pay raises after the White House denied the request.

Pruitt has said the raises were enacted not by him but by someone else, and that they had been reversed. As for the condo deal, it was approved by an EPA ethics official who has been at the agency 18 years. Mollie Ziegler Hemmingway, writing at the conservative website The Federalist, noted: "The general rental space also was used by three members of Congress for fundraising on days Pruitt wasn't in town. He wasn't invited to the events, didn't attend them, and even if he had no ethics laws would have been violated …"

Conservative defenders of Pruitt note that the Obama EPA had numerous controversies when led by administrators Lisa Jackson and Gina McCarthy. It is indeed a hoot that Jackson, who used a fake name and private email address while conducting official EPA business, has criticized Pruitt for a lack of transparency.

Yet pointing at the other guy and saying "He (or she) did plenty of things wrong, too," isn't a great defense. Pruitt has led major reform at EPA by, among other things, undoing the Waters of the U.S. rule, working to repeal the Clean Power Plan and revising burdensome fuel-economy standards, all products of the Obama administration. These moves and others have enraged the left and he'll continue to be their chief target, but he nonetheless should take pains not to give them more fodder for their assaults.

The Daily Caller

SCOOP: The White House Just Got Pruitt's Plan To Repeal WOTUS. Here Are The Details

By Michael Bastasch, 4/12/18

White House officials are reviewing an updated Environmental Protection Agency (EPA) proposal to repeal the Obama administration's "waters of the United States" that expanded federal control over waters on private property.

EPA officials submitted a supplemental proposal to the Office of Management and Budget (OMB) on Thursday. The proposal clarifies the agency is in fact repealing the Obama-era regulation and addressing some concerns brought up by stakeholders. The proposal also states EPA will be re-codifying the pre-Obama definition of WOTUS, The Daily Caller News Foundation has learned.

The Obama administration finalized the Clean Water Rule in 2015 that expanded the definition of "waters of the United States" (WOTUS), arguing the rule was needed to clear up uncertainties in the wake of two U.S. Supreme Court decisions.

More than half of U.S. states sued EPA to have the rule overturned. The courts quickly issued regulatory stays on the Clean Water Rule, meaning it never really went into effect. Manufacturers, energy companies, farmers, ranchers and land developers said the Obama-era rule would only make it harder to do business and manage land.

President Donald Trump signed an executive order last year, asking EPA and the U.S. Army Corps of Engineers to replace the Obama-era WOTUS rule with one consistent with former U.S. Supreme Court Justice Antonin Scalia's plurality opinion in the 2006 Rapanos v. United States case.

EPA began the WOTUS repeal process in June and published a plan for WOTUS repeal in the Federal Register the following month. EPA's new submission clarifies some concerns stakeholders expressed last summer, but the details aren't clear because it's still under review.

"From day one, EPA and the Department of the Army have been committed to providing certainty and clarity to our state and tribal co-regulators and farmers, ranchers and other stakeholders across the country," an EPA spokeswoman told TheDCNF.

"After reviewing this input, EPA and the Army have decided to issue a supplemental proposal to provide the public with additional clarity on the scope of the agencies' efforts," the spokeswoman said.

The move comes after environmentalists published a memo related to Clean Water Act enforcement. The memo, obtained by Public Employees for Environmental Responsibility (PEER), detailed how Pruitt would reserve the final say on jurisdiction under the Clean Water Act that was formerly delegated to regional officers.

PEER lambasted Pruitt's "restore regulatory certainty" as a "crude Clean Water Act coup d'état."

"This action subjects safeguards for clean water across the U.S. to filtration through one politician's hands," PEER's New England Director Kyla Bennett said in a statement. "Every corporation that wants a pass on Clean Water Act compliance is invited to privately meet with the most user friendly EPA Administrator in history."

However, Pacific Legal Foundation attorney Jonathan Wood said the memo could "promote both consistency in application and more accountability." PLF has challenged WOTUS in federal court.

"As it stands now, it makes a huge difference which regional office reviews your case — and often which bureaucrat within the office you happen to draw," Wood told TheDCNF. "Centralizing final decision making should lead to more consistent decision-making."

"There's also an important accountability issue here," Wood said. "Clean Water Act decisions require a mix of science and policy judgment."

"As the person appointed by the President and confirmed by the Senate to make those judgments, Pruitt can be forced to answer for the exercise of that policy-making power," Wood said. "When these decisions are made by anonymous regional bureaucrats, it is exponentially harder to hold anyone accountable."

CBS News

https://www.cbsnews.com/news/here-are-some-of-the-threats-made-against-epa-administrator-scott-pruitt/

Here Are Some Of The Threats Made Against EPA Administrator Scott Pruitt

By Jacqueline Alemany, Arden Farhi, 4/11/18

CBS News has obtained an August 2017 report prepared by the Environmental Protection Agency's office of inspector general that contains a list of 13 threats made against EPA Administrator Scott Pruitt and his family.

The threats range in severity, credibility and specificity.

One tweet flagged by investigators said, "Pruitt, I'm gonna find you and put a bullet between your eyes. Don't think I'm joking. I'm planning this." Investigators believe the threat was made by someone living in India.

Another person wished the administrator "a very painful and horrible death through poisoning. Please explain the scientific method to this freaking neanderthal."

The inspector general also looked into a complaint that "unknown protesters attempted to disrupt the EPA Administrator's speech during a closed event." Another person emailed the EPA threatening to dump old paint outside Pruitt's door.

The threats took various forms -- some arriving via social media and email, others by postcard.

Pruitt's daughter received a menacing message on Facebook, the document reveals.

In certain cases, cases were referred to the Justice Department, but just one was deemed serious enough to prosecute. The report covers the period from Oct. 2016 to Aug. 2017.

EPA Spokesman Jahan Wilcox responded that Pruitt had faced "unprecedented" threats.

In an email to the EPA's "Threat Coordination Group," Patrick Sullivan, the assistant inspector general for investigations at the EPA outlined an incident that occurred on March 6, 2018, in which a trespasser gained entry to the EPA headquarters and identified himself as a student attending a "Microsoft event."

"The personal asked about Scott Pruitt and wanted to know where Pruitt's office was and if Pruitt ever walked in the hallway outside the room," wrote Sullivan.

The intruder was soon escorted out of the EPA but called the desk phone of an employee and left voicemails following the intrusion claiming "he can gain entry into EPA space anytime he wants."

The security vulnerability was soon thereafter investigated.

Wilcox told CBS News, "We do not comment on matters pertaining to EPA's IG." A spokesperson for the EPA inspector general had no comment.

In early March, Pruitt told CBS News, "The quantity and the type of threats I've faced are unprecedented."

The inspector general report also details threats made against EPA employees and facilities and two threats against Gina McCarthy, the EPA administrator under President Obama.

McCarthy's office received a series of hostile phone calls from a person who is currently being prosecuted for making "Felony Threats." The caller said, "I will kill ya'll (sic) and f*** up Gina McCarthy," according to the report.

Democratic Sens. Tom Carper, of Delaware, and Sheldon Whitehouse, of Rhode Island, released a letter on Tuesday to Wyoming Sen. John Barrasso, chairman of the Senate committee that oversees the EPA, that said the assertions of "ongoing threats associated with the administrator's air travel" were inconsistent with an internal memo they obtained from a whistleblower at the EPA.

The memo, dated Feb. 14, 2018, according to the letter sent by Carper and Whitehouse, claimed that "EPA Intelligence has not identified any specific direct threat to the EPA administrator."

In a statement provided to the New York Times, Barrasso said that he Democrats had selectively released parts of the internal memo.

On Wednesday, Democratic senators held a press conference demanding answers from Pruitt about why he had ordered costly security measures and full time protection -- even on personal trips.

Sen. Tom Udall, D-New Mexico, said Pruitt had committed some of the worst "ethical transgressions of the entire Trump administration."

"The list of abuses just keeps getting longer," Udall told reporters at the press conference. "Lavish first class flights around the world, swanky hotel stays, taxpayers footing the bill for personal trips to Oklahoma, a $43,000 soundproof phone booth in his office, taking 30 EPA enforcement officers away from investigating polluters to serve as his round the clock personal security detail, speeding down the streets of Washington with sirens and lights blaring to get to fancy restaurants, huge unauthorized salary raises for his friends, allowing a close aide not to come to work for three months while still getting paid, and finally detailing EPA staff to find him a place to live. These are just a few of the things he is doing."

As Udall sees it, "Scott Pruitt has misused taxpayer dollars while enhancing his own personal perks."

The AP first reported that Pruitt's 20-member full time security detail "approached $3 million when pay is added in travel expenses." But EPA spokesman Jahan Wilcox defended the EPA administrator and said he has faced "unprecedented" threats.

The EPA administrator has been embroiled in scandal during his term, facing persistent rumors about the future of his job in the Trump administration. But he has also been called the president's most effective Cabinet secretary by Republican allies around Washington – including the president himself.

Last Thursday, the president praised Pruitt aboard Air Force One en route to Washington, calling him "a good man."

"I think he's done a fantastic job at EPA," Trump told reporters. "I think he's done an incredible job. He's been very courageous. Hasn't been easy, but I think he's done an absolutely fantastic job. I think he'll be fine."

The president added that the White House was looking into reports about Pruitt's ethical entanglements: he has not only come under fire for habitually traveling first class or by military jet at considerable taxpayer expense but he is now also is under investigation by House Oversight Committee Chairman Trey Gowdy for a housing arrangement in Washington, D.C., in 2017. ABC News first reported that Pruitt had lived in a Capitol Hill apartment owned by the wife of a fossil fuels lobbyist and rented the space for $50 a night – only paying for nights that he slept there.

Here are some of the documents obtained by CBS News:

CNN

https://www.cnn.com/2018/04/12/politics/andrew-wheeler-environmental-protection-agency-scott-pruitt-congress/index.html

Vote Slated For Thursday For Former Inhofe Aide Wheeler To Be EPA's No. 2

By Daniella Diaz and Ted Barrett, 4/12/18

The Senate is set to vote on Andrew Wheeler to be the number two official at the Environmental Protection Agency amid ethics concerns plaguing EPA chief Scott Pruitt and calls from Democrats for him to resign.

If Pruitt left, it could fall to Wheeler to run the agency until a new administrator is confirmed.

Two GOP leadership aides told CNN they expected Wheeler to be approved, which would make him the latest appointee at the agency with close ties to the energy industry.

His firm's clients include Murray Energy, which bills itself as "the largest coal mining company in America."

Senate Minority Leader Chuck Schumer, D-New York, blasted Wheeler as "a former industry lobbyist who has worked on behalf of big polluters and climate change deniers. He has spent years working to undermine or lobby against the environmental protections he may soon oversee."

Prior to his lobbying work, Wheeler served on Capitol Hill as a Republican staff member for the Senate Environment and Public Works Committee and as a top aide to Sen. Jim Inhofe, an Oklahoma Republican and an outspoken climate change skeptic who told CNN last month the EPA is "brainwashing our kids."

New Mexico Democratic Sen. Tom Udall said Wednesday that Wheeler should be carefully vetted, as if he were taking over for Pruitt now. Udall told reporters that he believes Wheeler wouldn't be a much better option to run the agency.

"The problem with the Wheeler nomination is if Trump (fires Pruitt) tomorrow, Wheeler is in fact the administrator, and that is a very, very serious problem," Udall said. "I know that there are many Republicans who haven't spoken out yet, but privately they are very disturbed by what Scott Pruitt is doing at the EPA."

While there is widespread opposition to Wheeler in the Democratic caucus, two Democrats running for reelection from energy producing states that strongly backed President Donald Trump in 2016 have said they will vote for him: Joe Manchin of West Virginia and Heidi Heitkamp of North Dakota.

"After meeting with Mr. Wheeler and reviewing his record, I've decided to support his nomination," Heitkamp said in a statement provided to CNN. "I believe he'll be open to working on issues important to North Dakota in a pragmatic and fair way, and I'll hold him accountable to make sure he implements the mission of the EPA in a way that works for my state."

One key centrist Republican has also signaled support for Wheeler.

"Mr. Wheeler has demonstrated that he understands the mission of the EPA and the role of Congress when it comes to oversight and accountability," said Maine Sen. Susan Collins in a statement.

Wheeler's nomination comes amid a steady stream of negative headlines involving Pruitt in recent weeks and months that has official Washington wondering whether the embattled agency chief can hold onto his job.

Most recently, Pruitt has been fighting stories revealing he paid about $6,100 over the course of a six-month lease last year to rent a room in a condo owned by Vicki Hart, a health care lobbyist whose husband, Steven Hart, has lobbied the EPA. His daughter also reportedly lived there while she was interning in Washington.

He paid $50 per night, according to the reports, and paid only for the nights he used the condo.

The federal government's top voice on ethics David Apol sent a letter to the agency outlining areas of concern regarding Pruitt. Apol, the acting director and general counsel of the Office of Government Ethics, summarized reports of Pruitt's conduct, including the rental agreement, as well as EPA spending on Pruitt's travel and security.

The letter also expresses concern with reports of Pruitt bypassing the White House to give raises to favored aides and other employees who faced job changes after raising concerns over his conduct.

Here's Why Friends And Foes Of EPA Chief Pruitt Are So Adamant

By Christopher Flavelle, Ari Natter, and Jennifer Dlouhy, 4/12/18

Supporters and detractors of Environmental Protection Agency head Scott Pruitt agree on this much: He matters.

Pruitt, whose continued tenure has been put in doubt by a series of ethics controversies, has attracted an extraordinary outpouring of support among conservative boosters who say he's the most effective member of President Donald Trump's cabinet. Likewise, the organizers of a "Boot Pruitt" movement see him as a serious risk to the environment he's supposed to be protecting.

Yet it is hard to assess Pruitt's tenure by traditional standards. Many of his high-profile initiatives, such as overturning the Obama administration's plan to curb carbon emissions from power plants, face years of legal challenges.

Nor can Pruitt's significance be tied to a roster of regulatory actions -- including those designed to jettison old rules. Federal data show that since Trump's inauguration, the agency has submitted nine "economically significant" rules, defined as those with likely economic impact of at least $100 million, to the White House for review. By comparison, the Department of Health and Human Services has produced 31 such rules, the Department of Labor six and the Department of the Interior five.

Narrow that list to the new rules that have actually been issued, and Pruitt's impact is even harder to spot. Of the 24 economically significant regulations that have been approved by the White House under President Donald Trump, just one was issued by the EPA, according to data posted by the Office of Information and Regulatory Affairs. And that rule set the amount of renewable fuels that must be used in 2018 -- a regulation the EPA must issue every year, regardless of who's in charge.

Those figures don't include regulations that were in the works when Pruitt arrived in Washington and that he has blocked.

EPA spokesman Jahan Wilcox cited the agency's work to repeal Obama-era rules governing carbon dioxide emissions and water pollution as evidence Pruitt is advancing Trump's agenda.

"From advocating to leave the Paris Accord, working to repeal Obama's Clean Power Plan and Waters of the United States, declaring a war on lead and cleaning up toxic Superfund sites, Administrator Pruitt is focused on advancing President Trump's agenda of regulatory certainty and environmental stewardship," Wilcox said in an emailed statement.

A fuller assessment of Pruitt's 14 months in office shows that he's laid the groundwork for a wholesale revision of environmental policy, one that delights anti-regulatory groups and frightens environmentalists.

"Without a doubt, Scott Pruitt has been the single most effective appointment of the president of the United States," said Tim Huelskamp, president of the Heartland Institute, an industry-funded nonprofit that advocates for less regulation.

Vera Pardee, senior counsel for the Center for Biological Diversity, shared that view, albeit from the opposite direction. "The deregulatory agenda of Trump finds its most destructive expression in Mr. Pruitt," she said.

That shared view of Pruitt's importance helps explain the effort that advocates have poured into keeping him in his job -- or getting him removed. The outpouring is far greater than was expended on behalf of other embattled cabinet members, such as Secretary of State Rex Tillerson or Veterans Affairs Secretary David Shulkin who both ended up losing their jobs.

Pruitt has been dogged by a series of controversies, including expensive first-class tickets and 24-hour security details, hefty raises for aides and renting a Capitol Hill bedroom from a lobbyist for $50 a night. In response, environmentalists have mounted a campaign to seek Pruitt's ouster; advocates of smaller government, meanwhile, have set up a coordinated effort of their own to retain him at the EPA.

Both sides put Pruitt's effort to reduce the influence of academic scientists within the EPA near the top of their list of reasons why he matters. Pruitt has removed many of those scientists from advisory boards, replacing them with people who reflect the concerns of industries the EPA regulates.

Those boards are important. The Clean Air Scientific Advisory Committee, for example, helps establish ozone standards that the agency is required to implement.

JunkScience.com
Steven Milloy, publisher of the website JunkScience.com and a senior fellow at the Energy and Legal Institute, praised Pruitt for installing as chairmen of the Science Advisory Board and the Clean Air Scientific Advisory Committee "people I consider to be very strongly grounded in science."

Michael Halpern, deputy director of the Center for Science and Democracy at the Union of Concerned Scientists, echoed Milloy's point about the importance of those boards -- although he characterized Pruitt's appointments as "stacking" them.

Another point of agreement is Pruitt's changing the rules on so-called "secret science." He has directed the EPA to use only research whose underlying data is publicly available. Environmental advocates say that prevents the EPA from issuing air and water regulations supported by health research, since the identities of patients studied in those papers is kept private.

Huelskamp, of the Heartland Institute, praised that change. Halpern criticized it.

Pruitt also has made major policy pivots outside the formal rulemaking process. That includes the EPA's decision not to ban the commercial use of the pesticide chlorpyrifos and methylene chloride used in paint strippers. The EPA also has relaxed air pollution requirements via memos and internal opinions -- navigating around the federal rulemaking process in a way that has already drawn at least one legal challenge.

Environmental advocates also argue that Pruitt has restrained the EPA's willingness to fine polluters for violating the law.

"If you look at his enforcement record, it is disastrous and terrifying," said Lukas Ross, climate and energy advocate for Friends of the Earth. "It's not just the number of cases lodged, but it's also the amount of money that's been captured through lodging those cases."

Equally consequential, Ross added, are Pruitt's efforts to change the mission of the agency, in a way that will drive away staff who care about protecting the environment.

"There is a very real threat of brain drain because of the morale crisis being created by Scott Pruitt," Ross said. "If I worked at the EPA, I would be thinking about quitting too."

On that point as well, Milloy, the Junk Science publisher, agreed.

"Are these people sad?" Milloy asked. "The rest of America is happy."

The Washington Times
https://www.washingtontimes.com/news/2018/apr/12/here-are-legitimate-death-threats-against-scott-pr/
Here Are The Legitimate Death Threats Against Scott Pruitt That Dems Claim Don't Exist
By Larry O'Connor, 4/12/18

One of the more sickening episodes of the full-court press by members of The Swamp against EPA Administrator Scott Pruitt is the claim that he has spent too much money on extravagant security details.

Democrats in the Senate have questioned the legitimacy of death threats against Pruitt and his family and have demanded hearings to investigate the matter:

Two top Democrats on the committee, ranking member Thomas R. Carper of Delaware and Sheldon Whitehouse of Rhode Island, on Tuesday demanded such hearings, saying they have confidential documents that contradict public statements made by Pruitt, EPA spokespersons and President Donald Trump regarding the administrator's security spending.

The lawmakers in their letter asserted that the documents in their hands fall far short of supporting claims by Pruitt's office that he needed elaborate security measure to protect him from death threats.

"Documents provided to us by EPA official(s) suggest the agency has relied on questionable threats to the Administrator, including reports of non-violent protests, negative feedback about the administrators actions or other First Amendment protected activity to justify millions of dollars in additional security spending, inducing first-class air travel, as compared to his predecessors at the agency," Carper and Whitehouse wrote.

This is how vicious the opposition to Pruitt has become. As if a person would go out of their way to have an obtrusive and heavy-handed security detail for no good reason.

CBS News has obtained (probably from staffers at the EPA hoping to push back on the despicable narrative from Senate Democrats) documentation on just some of the death threats against Pruitt that had been detailed in August 2017 and, no, the threats are not isolated to anonymous tweets:

In an email to the EPA's "Threat Coordination Group," Patrick Sullivan, the assistant inspector general for investigations at the EPA outlined an incident that occurred on March 6, 2018, in which a trespasser gained entry to the EPA headquarters and identified himself as a student attending a "Microsoft event."

"The person asked about Scott Pruitt and wanted to know where Pruitt's office was and if Pruitt ever walked in the hallway outside the room," wrote Sullivan.
The intruder was soon escorted out of the EPA but called the desk phone of an employee and left voicemails following the intrusion claiming "he can gain entry into EPA space anytime he wants."

The security vulnerability was soon thereafter investigated.

McCarthy's office received a series of hostile phone calls from a person who is currently being prosecuted for making "Felony Threats." The caller said, "I will kill ya'll (sic) and f*** up Gina McCarthy," according to the report.

The Daily Caller also has a summary of some of the threats Pruitt has had to deal with presumably from global warming enthusiasts who care more about carbon emission hysteria than they do human life:

Investigators flagged one tweet that stated: "Pruitt, I'm gonna find you and put a bullet between your eyes. Don't think I'm joking. I'm planning this." Investigators determined the threat came from someone living in India. The investigation is ongoing.

These types of threats were a common occurrence, the report notes.

For instance, another person mailed a postcard to Pruitt telling him to "get out while you still can, Scott, you are evil incarnate you ignorant fuck." An investigation was unable to determine who sent the message. The case was not presented to the United States Attorney's Office for prosecution.

Pruitt's opponents hate how effective he has been (as we detailed last week) and they hate that President Trump has stood by him in the face of unfair and duplicitous attacks against his ethics and credibility. But to question the cost of his security detail for partisan purposes is beyond the pale.

It's time for Senate Republicans to unequivocally stand behind Pruitt and publicly shame these Democrats for their unprecedented attacks. They are even going out of their way to minimize real and credible threats against a man's wife and against innocent government workers.

It's time for a Joseph Welch moment. "Have you no decency? At long last, have you no shame?"

The Washington Free Beacon

Breaking: Liberals Suddenly Care About Wasting Taxpayer Money

By Elizabeth Harrington, 4/11/18

I suddenly have a lot of competition covering my beat. Who knew the mainstream media cared how our taxpayer dollars are wasted?

Security costs for cabinet secretaries are "steep." Spending is "lavish" again. When, God forbid, a secretary takes his wife with him on a business trip, CNN is there with the documents in hand, showing her "involvement."

The New York Times is now giving tips on how to save taxpayers money, while lambasting Treasury Secretary Steven Mnuchin's use of military charter flights. (Mnuchin's travel ended up costing half of what Obama administration secretaries spent on average. Oddly, the Times never followed up.)

The latest target is Scott Pruitt, arguably President Trump's most effective cabinet secretary. While there is questionable conduct for sure, like using an obscure law to give aides huge taxpayer-funded raises, it's curious the media suddenly care how much international junkets cost.

The first scandal that caught the press's attention was Pruitt's trip to Italy last summer to attend the G-7 summit, which cost $84,000 in airfare and security, roughly the same that Lisa Jackson, Obama's first EPA administrator, spent on average on flights and security for four international trips.

The headlines for Jackson's trip to the same summit in Syracuse, Italy, in early 2009 were slightly different.

The Times has hit Pruitt for his "extravagant spending" on private flights and 24-hour security. But not too long ago it was the Times defending lavish trips on the taxpayer's dime.

"There is nothing like a little Mediterranean beach vacation to unwind," the Times wrote back in August 2010. Do tell.

"Unless you happen to travel with dozens of Secret Service agents, trailed by photographers and dogged by controversy."

Ah, poor Michelle Obama. She just wanted to get away, but those mean Republicans had to spoil her vacation.

"Michelle Obama hoped to enjoy a quiet summer break in southern Spain with her younger daughter and a few friends," the Times wrote. "But the Andalusian getaway has gotten away from her as the European media document her every flamenco dance step and critics back home question the wisdom of such a lavish vacation, which involves at least some taxpayer money, in a time of austerity."

"At least some" turned into a measly $467,585, including $26,670.61 for a "chauffeur tour of Costa del Sol."

The Times wrote approvingly of Mrs. Obama and "her entourage" touring the "picturesque southern city of Ronda," and hobnobbing with Eva Longoria Parker and Antonio Banderas.

Besides, reports on the trips "had been exaggerated," the Times said.

"Mrs. Obama is not traveling with 40 friends," the Times assured us. It was only "two friends and four of their daughters, as well as a couple of aides and a couple of advance staff members."

It was no big deal for Mrs. Obama and friends to stay at the five-star Hotel Villa Padierna, where "at least 30 rooms were reserved for the entourage."

"The hotel is one of Spain's more luxurious establishments, with rooms ranging from $500-a-night to a $6,600 suite with 24-hour butler service," the Times wrote.

"While some Americans frown," the Times concluded, "the Spanish eagerly welcomed the Obama group, seeing it as a boost for a tourism sector severely hit by the country's economic downturn."

It might not have been great for the taxpayers, but it was good for Spain!

It wasn't just the first lady's taxpayer-funded trips the media were either uninterested in covering or eager to defend. It was the entire Obama cabinet.

In fact, then-congressman Barney Frank had to apologize for scrutinizing Timothy Geitner's use of military charter flights, which cost at least $150,000 for international trips and totaled "several million dollars a year."

The only Obama official who came close to scrutiny from the mainstream media was Attorney General Eric Holder, who along with his predecessor Michael Mukasey and former FBI director Robert Mueller, now the special counsel, spent over $11 million on taxpayer-funded private jets for personal travel.

Holder used the FBI's private Gulfstream V to go to the Super Bowl in New Orleans in 2013, costing $15,000 each way.

Holder alone spent $4.3 million on travel in three years, including 31 personal trips and "two jaunts to Martha's Vineyard that totaled $95,184 in flight expenses."

Tom Price was ousted from the Department of Health and Human Services for far less.

The media didn't report on Energy Secretary Ernest Moniz's travel costs either, which lasted up until 11 days before Trump's inauguration. Who knows how much it cost us for Moniz to travel to Mexico City on January 9, 2017, to sign a "non-binding" document on electricity grids.

Republicans shouldn't be hypocrites, careless, or both, when it comes to how they spend our money. But let's not kid ourselves by pretending the media actually cares.

Trump administration weighs high-ethanol fuel waiver to placate farmers

By Jarrett Renshaw and Chris Prentice, 4/11/18, 7:20 PM

NEW YORK (Reuters) - The Trump administration is considering allowing the sale of a higher ethanol fuel blend in the summer, a source familiar with the issue said, a move that would placate corn growers worried about the future of U.S. biofuels policy.

President Donald Trump recently met with the heads of the Environmental Protection Agency and the U.S. Department of Agriculture to discuss ways to make the Renewable Fuel Standard less expensive to the oil industry without undercutting demand for ethanol.

The RFS requires refiners to add increasing volumes of biofuels like corn-based ethanol into the nation's fuel supply each year which is a boon to farmers but a headache for refining companies that must either blend the fuels themselves or purchase credits from those who do.

Trump has tried in vain over the past several months to broker a deal between "Big Oil" and "Big Corn" over the issue, and has faced mounting pressure from lawmakers in the Midwest who are concerned that he will weaken domestic demand for ethanol at a time farmers are already facing a potential trade war with China that could hurt export demand for corn and soybeans.

Sources had told Reuters this week that Trump was temporarily suspending his consideration of a refining industry-backed proposal to cap prices for blending credits, an idea that the biofuels industry has opposed as damaging to farmers.

But in the meantime, the administration is considering moving forward with plans to allow for the ethanol industry's long sought waiver to sell gasoline containing 15 percent ethanol in the summer, instead of the usual 10 percent blend, the source familiar with the issue told Reuters on Wednesday.

The higher ethanol blend, called E15, is currently banned by the Environmental Protection Agency due to concerns it contributes to smog on hot days, a worry that biofuels advocates say is baseless. If done soon, the waiver could be in effect in time for the 2018 summer driving season.

EPA spokeswoman Liz Bowman did not immediately respond to a request for comment. White House spokeswoman Kelly Love did not comment on the E15 waiver but said that during Trump's meeting Monday he "instructed his Cabinet to continue to explore options that protect American farmers and America's refinery workers."

Biofuels proponents have heaped pressure on the White House after reports that the EPA was granting dozens of small refineries exemptions from the RFS to help them avoid the costs of compliance, something the ethanol industry says will weaken demand for their product.

On Monday, Trump acknowledged farmers may bear the brunt of the economic harm if China retaliates against Washington's threat of tariffs, noting that "we'll make it up to them". Many U.S. farmers are battling debt after years of excess global supplies and depressed prices.

"We need some good news out here," said Monte Shaw, the Executive Director of the Iowa Renewable Fuels Association.

"The best news (Trump) could give us right now is year-round sales of E15," he said.

Scott Pruitt, Warrior for Science

By John Tierney, 4/11/18

Imagine if the head of a federal agency announced a new policy for its scientific research: from now on, the agency would no longer allow its studies to be reviewed and challenged by independent scientists, and its researchers would not share the data on which their conclusions were based. The response from scientists and journalists would be outrage. By refusing peer review from outsiders, the agency would be rejecting a fundamental scientific tradition. By not sharing data with other researchers, it would be violating a standard transparency requirement at leading scientific journals. If a Republican official did such a thing, you'd expect to hear denunciations of this latest offensive in the "Republican war on science."

That's the accusation being hurled at Scott Pruitt, the Republican who heads the Environmental Protection Agency. But Pruitt hasn't done anything to discourage peer review. In fact, he's done the opposite: he has called for the use of more independent experts to review the EPA's research and has just announced that the agency would rely only on studies for which data are available to be shared. Yet Democratic officials and liberal journalists have denounced these moves as an "attack on science," and Democrats have cited them (along with accusations of ethical violations) in their campaign to force Pruitt out of his job.

How could "the party of science," as Democrats like to call themselves, be opposed to transparency and peer review? Because better scientific oversight would make it tougher for the EPA to justify its costly regulations. To environmentalists, rigorous scientific protocols are fine in theory, but not in practice if they interfere with the green political agenda. As usual, the real war on science is the one waged from the left.

The EPA has been plagued by politicized science since its inception in 1970. One of its first tasks was to evaluate the claim, popularized in Rachel Carson's Silent Spring, that the use of DDT pesticide was causing an epidemic of cancer. The agency held extensive hearings that led to the conclusion that DDT was not a carcinogen, a finding that subsequent research would confirm. Yet the EPA administrator, William Ruckelshaus, reportedly never even bothered to read the scientific testimony. Ignoring the thousands of pages of evidence, he declared DDT a potential carcinogen and banned most uses of it.

Since then, the agency has repeatedly been criticized for relying on weak or cherry-picked evidence to promote needless alarms justifying the expansion of its authority (and budget). Its warnings about BPA, a chemical used in plastics, were called unscientific by leading researchers in the field. Its conclusion that secondhand smoke was killing thousands of people annually was ruled by a judge to be in violation of "scientific procedure and norms"—and was firmly debunked by later research.

To justify the costs of the Obama administration's Clean Power Plan restricting coal-burning power plants, the EPA relied on a controversial claim that a particular form of air pollution (from small particulates) was responsible for large numbers of premature deaths. To reach that conclusion, the agency ignored contradictory evidence and chose to rely on 1990s research whose methodology and conclusions were open to question. The EPA's advisory committee on air pollution, a group of outside scientists, was sufficiently concerned at the time to ask to see the supporting data. But the researchers and the EPA refused to share the data, citing the confidentiality of the medical records involved, and they have continued refusing demands from Congress and other researchers to share it, as Steve Milloy recounts in his book, Scare Pollution: Why and How to Fix the EPA.

Pruitt's new policy will force the EPA to rely on studies for which data is available to other researchers, ensuring the transparency that enables findings to be tested and confirmed. So why is he being attacked? His critics argue that some worthwhile research will be ignored because it is based on confidential records that are impractical to share. They say that it would cost the EPA several hundred million dollars to redact personal medical information in the air-pollution studies used to justify the Obama administration's Clean Power Plan. But even if that estimate is correct—it seems awfully high—it's a pittance compared with the costs of the EPA's regulations. The Obama EPA estimated the annual cost of its Clean Power Plan at $8 billion; others estimated it at more than $30 billion. Before saddling utility customers with those higher bills year after year, the EPA could at least pay for reliable research.

Pruitt's critics have also excoriated him for insisting that the EPA's advisory boards consist of independent scientists, ending the practice of including researchers who receive grants from the agency—exactly the sort of conflict of interest that progressives object to when researchers receive money from private industry. He has also proposed an analysis of climate change using a "red-team/blue-team" exercise, an innovative technique that has been used to draw up plans at the Defense Department and the CIA and by private industry for industrial operations and projects such as designing spacecraft. A group of outside experts, the red team, is brought in to critique the work of the in-house blue team, which then responds, and the teams keep going back and forth, under the supervision of a moderator. It's an enhanced form of peer review, forcing researchers and bureaucrats to defend or reconsider their ideas, and ideally leading to sounder conclusions and better plans. A version of this exercise has already been used to bolster the case for man-made global warming, as noted by Joseph Majkut of the Niskanen Institute.

Given the high stakes and the many uncertainties related to climate change—the dozens of computer climate models, the widely varying estimates of costs and benefits of mitigation strategies—who could object to studying the problem carefully? Yet Pruitt's proposal has been denounced by Democrats as well as liberal Republicans like Christine Whitman, the former New Jersey governor, who argued that the facts are so well-established that further examination is unnecessary. As a former head of the EPA, Whitman no doubt appreciates how much easier it is to make regulations without the nuisance of debate. But what's good for bureaucrats is not good for science.

The Wall Street Journal

https://www.wsj.com/articles/u-s-weekly-jobless-claims-hold-below-300-000-for-longest-streak-on-record-1523536549

U.S. Weekly Jobless Claims Hold Below 300,000 For Longest Streak On Record

By Sarah Chaney, 4/12/18

WASHINGTON—The number of Americans claiming new unemployment benefits has never been so low for so long.

Initial jobless claims, a proxy for layoffs across the U.S., decreased by 9,000 to a seasonally adjusted 233,000 in the week ended April 7, the Labor Department said Thursday. This means claims have now held below 300,000 for 162 consecutive weeks, cementing the longest streak for weekly records dating back to 1967.

The current streak eclipsed the previous longest stretch that ended in April 1970.

The consistently low claims levels point to labor market health because they mean relatively few Americans are losing their jobs and applying for benefits to tide them over until they can find new employment.

After several years of consistent job growth, firms are reluctant to let employees go in a tightening labor market in which many available workers are quickly snapped up.

"Even if you aren't aggressively hiring, if you know the labor market is tight and it's going to be difficult to hire someone…you're only going to lay someone off if you had to," said Stephen Stanley, chief economist at Amherst Pierpont Securities.

Data on jobless claims can be volatile from week to week, especially around holidays when seasonal adjustments can be tricky.

"The changing date of the Easter holiday from year to year makes the seasonal adjustment process tricky from late March through late April, so further volatility in headline claims over the next few weeks can't be ruled out," wrote Ian Shepherdson, chief economist at Pantheon Macroeconomics, in a note to clients.

The four-week moving average of initial claims, a more-stable measure, increased last week to 230,000.

The low level of claims is among multiple signs of health in the U.S. labor market. The unemployment rate has held at 4.1% since October, its lowest level since late 2000. Employers have added to nonfarm payrolls for 90 straight months in the longest continuous jobs expansion on record.

Thursday's report showed the number of claims workers made for longer than a week increased by 53,000 to 1,871,000 in the week ended March 31. That figure, known as continuing claims, is reported with a one-week lag.

The Washington Post

https://www.washingtonpost.com/world/middle_east/russia-seeks-to-allay-fears-of-open-conflict-with-the-us-over-syria/2018/04/12/2d2407c4-3e38-11e8-8d53-eba0ed2371cc_story.html?utm_term=.587c5a0bc9a8

As Fears Mount Over Open U.S.-Russia Conflict, Moscow Seeks To Lower The Temperature

By Anton Troianovski, Louisa Loveluck, 4/12/18

MOSCOW — Russian officials on Thursday sought to tamp down public fears of a looming conflict with the United States, even as Syrian government forces took control of the town where they are suspected of carrying out a chemical attack last weekend.

Russian military police also entered Douma on Thursday to act as "guarantors of law and order in the town," the Russian Defense Ministry said, according to Russian news agencies. Russian troops had arrived earlier Monday under the terms of a surrender deal reached with the rebels after the suspected chemical attack — which Russia and Syria say did not happen.

The recapture of Douma, in the region of Eastern Ghouta on the outskirts of Damascus, effectively represents the end of the war between Syrian President Bashar al-Assad and the rebel groups opposing his rule. Although chunks of the country remain under opposition control, none are as symbolic as Eastern Ghouta.

But the situation in Syria remained in flux ahead of an anticipated airstrike by the United States, which President Trump has signaled he plans to carry out in response to the suspected use of chemical weapons by Assad's forces.

Trump appeared to moderate his tone with a tweet early Thursday, saying he did not mean to suggest that missile strikes are imminent.

"Never said when an attack on Syria would take place," he tweeted. "Could be very soon or not so soon at all!"

A spokesman for the Kremlin told reporters Thursday that Russia is watching the American declarations closely.

"We continue to believe that it is extremely important to avoid any steps that may lead to an increase of tensions in Syria," Dmitry Peskov said.

Russian officials in recent days had warned of the possibility of a direct military confrontation with the United States as a result of a U.S. strike. Any missile attack that puts Russian lives at risk, Moscow has said, would result in Russia striking back at the missiles and at the planes or ships that launched them.

Russia has deployed air defense systems in Syria, including its sophisticated S-400 long-range surface-to-air missile system. The fact that thousands of Russian troops and military advisers are stationed across the country means there's a chance that a large-scale U.S. strike on Syrian government forces would — deliberately or not — also kill Russians, military analysts in Moscow say.

In the wake of Trump's Wednesday tweet warning Russia of a planned U.S. missile strike, however, Moscow appears to be trying to make clear that it does not want a war and that a limited attack that doesn't risk Russian lives would not precipitate a military response.

Moscow bureau chief Anton Troianovski describes Russia's tensions with the U.S. and how state media are covering the alleged chemical weapons attack in Syria. (Sarah Parnass, Anton Troianovski/The Washington Post)

"I rule out a scenario in which the United States will intentionally strike a facility in Syria where Russian servicemen are located," Military Sciences Academy Vice President Sergei Modestov said in Thursday's edition of the government newspaper Rossiyskaya Gazeta.

The Kommersant newspaper quoted anonymous Defense Ministry sources as saying that Russia's General Staff was in touch with the U.S. Joint Chiefs of Staff and expected to receive coordinates on airstrike targets from the Pentagon to avoid Russian casualties.

"Right now, the talk is about the necessity of de-escalation," said Alexander Golts, an independent military analyst in Moscow. "We've practically come to the brink of war."

On the ground, fighters from the hard-line Jaish al-Islam group have trickled out of Douma in recent days under the terms of a deal that followed Saturday's suspected chemical attack. Local residents said Wednesday that the militants had insisted on emptying their magazines into the air instead of handing them to the Syrian military, and that they wounded civilians in the process.

But by Thursday morning, a monitoring group reported that they had surrendered their weapons altogether. Russia says that more than 13,000 militants and their families have left Douma since April 1.

Negotiations for the group's withdrawal had taken months, stalling and resuming as the fighting ebbed and flowed. But Jaish al-Islam's political chief said Thursday that the suspected chemical attacks had been the final straw.

"Of course, the chemical attack is what pushed us to agree," Yasser Dalwan told the Agence France-Presse news agency.

The World Health Organization has said that during the shelling of Douma on Saturday, about 500 patients exhibited "signs and symptoms consistent with exposure to toxic chemicals."

A network of local flight monitors said they had tracked several helicopters heading southwest from a government air base on Saturday evening. The same models of aircraft were then seen circling over Douma at 7:26 p.m. and 7:38 p.m.

Reports of a suspected gas attack began circulating minutes later. In one apartment block, rescuers would later find rooms filled with tangled bodies and the stench of chlorine. Some people had died foaming at the mouth, according to video footage.

Russia, however, says that its specialists who have visited Douma have found no evidence of a chemical attack. Instead, Saturday's incident represented the latest example of rebel trying to stage such an attack to undermine the Assad regime, Lt. Gen. Viktor Poznikhir, deputy chief of operations of the Russian General Staff, said Wednesday.

Rebel supporters on Saturday “once again tried to imitate in front of video cameras a staged chemical attack on civilians in the town of Douma,” he said.

Unilever Admits to Struggle With Plastic Wrapping

By Stephen Gardner

Posted June 21, 2018, 3:01 AM

Dealing with plastic packaging is proving tough for the world's largest consumer goods company.

Pruitt's Ethics Allegations Dog Nominees for EPA Posts at Hearing

By Sylvia Carignan

Posted June 20, 2018, 12:54 PM

Members of a Senate panel pressed two nominees for EPA posts, including Superfund program chief, for assurances they wouldn't fall prey to unethical behavior.

Senate GOP Ally of Pruitt's Says Concerns Allayed After Meeting (1)

By Ari Natter

Posted June 20, 2018, 10:46 AMUpdated June 20, 2018, 12:27 PM

EPA Administrator Scott Pruitt's longtime friend and political ally on Capitol Hill is walking back his criticism of the embattled agency leader after the two met June 19 evening.

INSIDEEPA.COM ARTICLES

Pruitt's Scandals Complicate Path For EPA Waste, International Nominees

Ongoing concerns about EPA Administrator Scott Pruitt's ethics scandals, the agency's limited responses to oversight requests and other issues will make it difficult for President Donald Trump's nominees to head the agency's waste and international affairs offices to gain Senate approval, Democratic senators told a June 20 environment committee hearing.

Reversing Course, Inhofe Defends Pruitt, Calling Accusations 'Lies'

Sen. James Inhofe (R-OK) is strongly defending EPA Administrator Scott Pruitt against numerous allegations of unethical conduct, calling them "outrageous lies," an apparent reversal from a week ago when the senator said he was upset by Pruitt's missteps and suggested the administrator might need to step down.

ATSDR Seeks To Downplay Effect Of PFAS Risk Levels Stricter Than EPA's

A federal health agency has released its much-anticipated draft toxicological profile for perfluorinated chemicals that recommends risk values more conservative than EPA's, but the agency is downplaying potential health concerns from exposures above its limits, cautioning the public not to read its levels as cleanup or health effects standards.

Inhofe defends Pruitt, despite 'questionable judgment'

Geof Koss and Kevin Bogardus, E&E News reporters

Published: Wednesday, June 20, 2018

EPA Administrator Scott Pruitt (left) and Sen. Jim Inhofe (R-Okla.) are shown here in 2010 during Pruitt's campaign for Oklahoma attorney general. Pruitt/Facebook

Following a lengthy meeting with EPA Administrator Scott Pruitt yesterday evening, Sen. Jim Inhofe (R-Okla.) is dismissing the host of ethics questions surrounding his onetime political protégé as "misrepresentations."

In an interview with E&E News and other media outlets in his office this morning, Inhofe pinned blame for Pruitt's ethics scandals on California billionaire Tom Steyer, "disgruntled" former employees, the media and what he described as unprecedented security threats against the former Oklahoma attorney general.

Sean Hannity declined jet ride with Pruitt

Fox News talk show host Sean Hannity was invited to ride on a jet with EPA Administrator Scott Pruitt last summer. Gage Skidmore/Flickr

EPA officials asked Sean Hannity to hop into a jet with agency chief Scott Pruitt when he barnstormed farming communities to promote changes to a water pollution rule.

The Fox News host ultimately didn't join Pruitt for a jaunt across Oklahoma to talk about the Waters of the United States rule, emails shared with E&E News by the Natural Resources Defense Council showed. But the communications, obtained via Freedom of Information Act request, shed more light on EPA's media strategy.

Federal study sounds alarm on nonstick materials

Ariel Wittenberg, E&E News reporter

Published: Wednesday, June 20, 2018

Health and Human Services headquarters in Washington. Matthew G. Bisanz/Wikipedia

The Trump administration has released a politically charged toxicology report about nonstick chemicals showing they can endanger human health at significantly lower levels than EPA has previously called safe.

The draft report from the Department of Health and Human Services' Agency for Toxic Substances and Disease Registry is a toxicological profile of four types of stain- and water-resistant chemicals.

It finds that so-called "minimum risk levels" for the toxins should be seven to 10 times lower than standards set by EPA in 2016.

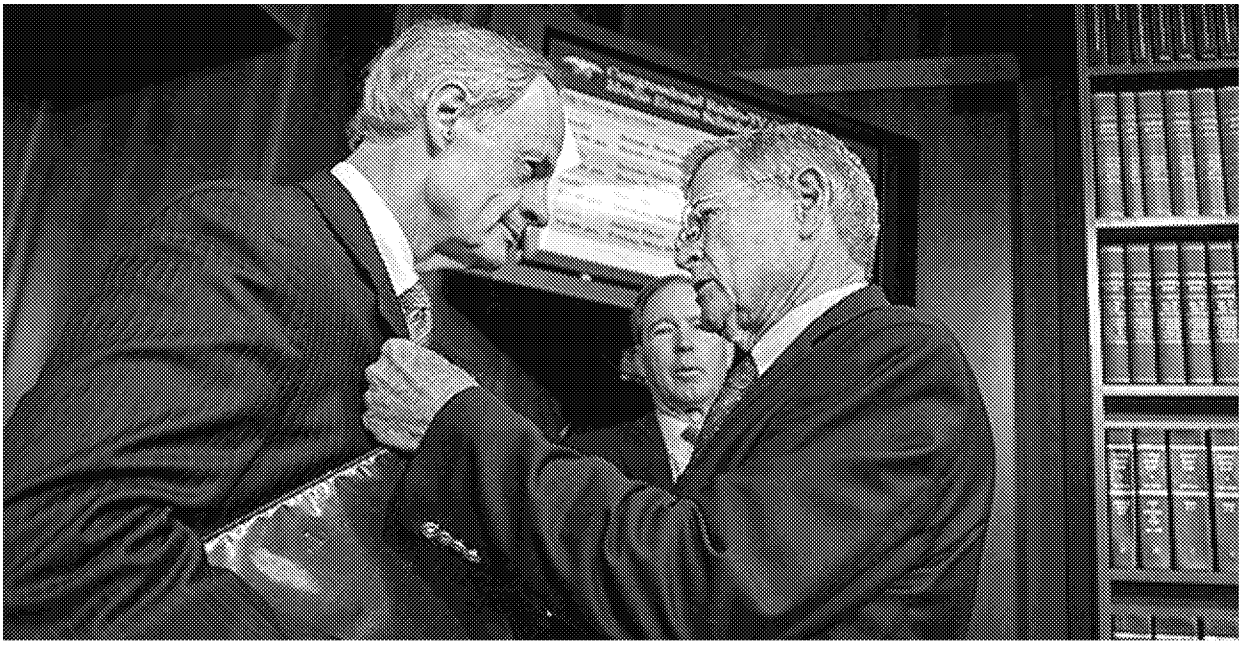
Carper, Inhofe spar over Pruitt at confirmation hearing

Corbin Hiar, E&E News reporter

Published: Wednesday, June 20, 2018



Sens. Tom Carper (D-Del.) and Jim Inhofe (R-Okla.) are shown here in a 2015 file photo. The two lawmakers this morning squared off during a hearing over EPA Administrator Scott Pruitt's alleged actions. Tom Williams/CQ Roll Call/Associated Press

Arguments over EPA Administrator Scott Pruitt's scandals, and the media's coverage of them, overshadowed a Senate confirmation hearing this morning for two nominees who hope to help him lead the agency.

Delaware Sen. Tom Carper, the top Democrat on the Environment and Public Works Committee, used his opening statement to criticize Chairman John Barrasso (R-Wyo.) for failing to promptly call Pruitt to testify as news reports raised questions about work that staffers have allegedly done for his family, his spending on travel and a secure phone booth, and his use of sports tickets secured by executives with business before the agency, among other issues.

Career staff warned cuts would cripple research office

Corbin Hiar, E&E News reporter

Published: Wednesday, June 20, 2018

EPA headquarters in Washington. Tim Evanson/Flickr

EPA career officials warned the Trump administration last year that its proposed staffing changes and budget shortfalls could undermine the agency's scientific research, documents show.

As political appointees began assembling a strategic plan to guide the agency through 2022, staffers in the Office of Research and Development alerted them to risks facing their programs.

The most serious risk — in terms of both its likelihood of happening and the extent of its potential impact — was that ORD would be unable to maintain a "sustainable workforce," says the undated draft assessment staffers had to provide to EPA's Office of Program Accountability and Resource Management by Aug. 2, 2017.

Union chief heads for the exit

John O'Grady is president of the American Federation of Government Employees Council 238, EPA's largest union. O'Grady/Flickr

John O'Grady, head of EPA's largest employee union, is retiring.

As president of American Federation of Government Employees Council 238, he represents about 8,000 EPA employees through 14 local unions nationwide. O'Grady said he will retire from EPA and resign from his position as head of the council at the end of this month.

In an interview with E&E News, O'Grady, 66, said the time was right to depart, noting his wife was also retiring as a teaching assistant job in the Naperville, Ill., school district.

"I looked at all the financial numbers, and it just made sense," O'Grady said. "I wanted to enjoy some things."

Denise Morrison, executive vice president for the council, will be its acting president after O'Grady's departure. A special election will be held later on to fill the job permanently.

US senators demand release of controversial PFAS report

Bill would continue current EPA funding, differing little from House plan

20 June 2018 / PFCs, United States

A US Senate committee has ordered the release of controversial toxicological profiles for four per- and polyfluoroalkyl substances (PFASs).

The demand comes in a report accompanying a fiscal 2019 spending bill, approved by the Senate Appropriations Committee on 14 June. It directs the Agency for Toxic Substances and Disease Registry (ATSDR) to release its analyses within 15 days of the final approval of the EPA's 2019 spending plan.

Adoption of the plan is unlikely to occur before the autumn, so the instruction may end up having little practical effect. Nevertheless it does amount to a public statement.

A row erupted after the public release of internal EPA documents showed that the ATSDR assessments propose safe exposure levels for PFASs significantly below the EPA's non-enforceable drinking water guidelines. In internal agency emails, officials called this a "public relations nightmare" and NGOs have claimed the Trump administration is blocking release of the assessments.

The Senate committee not only demands release of the study, but also asks for a report "identifying any changes made" to the toxicology profiles after 30 January.

Spending bill

The Senate spending bill would continue current funding for the US EPA and its programmes in chemical research and management, differing only slightly from legislation approved earlier by the House Appropriations Committee.

Both bills reject Trump administration proposals for huge spending cuts. They provide the same $92.5m for the "toxics risk review and prevention" funding category as in fiscal 2017 and 2018.

The senators instruct the EPA to follow lawmakers' 2018 order to continue operating the Integrated Risk Information System (IRIS) programme under the Office of Research and Development. The House bill does not mention IRIS, and so the programme appears to be safe.

National Academies forms flame retardant committee

20 June 2018 / Built environment, Children's products, Electrical & electronics, Halocarbons, United States

The National Academies has appointed a new committee to assess potential chronic health hazards, posed by organohalogen flame retardants.

Its findings will ultimately inform a Consumer Product Safety Commission (CPSC) assessment of the risk that additive, nonpolymeric organohalogen flame retardants (OFRs) pose to human health from four consumer products categories.

These are: children's products, upholstered residential furniture, mattresses and the external casings of electronics devices.

The CPSC's work on the products comes after its September decision to grant an NGO petition to begin a rulemaking that could see OFRs banned from these applications.

The National Academies of Sciences, Engineering, and Medicine (NASEM) is tasked with producing a hazard assessment plan that the CPSC-convened Chronic Advisory Panel (CHAP) will use when completing its risk assessment.

The committee's provisional slate – pending a public comment period and final approval by the National Academies – comprises:

- David Dorman (chair) – professor of toxicology, North Carolina State University;
- Hugh Barton – associate research fellow, Pfizer, Inc;
- Karen Blackburn – Victor Mills Society research fellow, The Procter and Gamble Co;
- John Bucher – senior scientist, National Toxicology Program (NTP);
- Julie Daniels – professor, University of North Carolina at Chapel Hill;
- Jennifer Freeman – associate professor, School of Health Sciences at Purdue University;
- Kamel Mansouri – lead computational chemist, Integrated Laboratory Systems;
- Carmen Messerlian – research scientist, Harvard TH Chan School of Public Health;
- David Reif – associate professor, North Carolina State University;
- Gina Solomon – principal investigator, Public Health Institute; and
- Chihae Yang – chief scientific officer, Altamira LLC.

Comments on the committee appointments are being accepted for 20 days, following the original posting of membership.

Campaigners secure third paint stripper victory with Home Depot

Retailer to phase out NMP, methylene chloride products by year's end

20 June 2018 / Built environment, Retail, Solvents, United States

NGO campaigners are celebrating the latest "nail in the coffin" for paint strippers containing methylene chloride and N-methylpyrrolidone (NMP), following news that the world's largest home improvement retailer, Home Depot, will no longer sell them.

In recent weeks, retail giants Lowe's and Sherwin-Williams have pledged to phase out the sale of the products by the year's end. This week, Home Depot announced plans to do the same.

"To build upon our strategy to maintain continual improvement in health and environmental safety for products, we have added many alternative chemical paint removers, and will phase out paint removal products that contain methylene chloride and N-Methylpyrrolidone (NMP) by the end of 2018," says the store's website.

Mike Schade, Mind the Store campaign director at Safer Chemicals, Healthy Families, said that the action means "the time for hazardous paint strippers is over".

He urged the retailers which continue to stock these products – including Menards, Walmart and Ace Hardware – to phase out the products' sales by the end of the year.

Canadian NGO Environmental Defence similarly called for Canadian Tire and Home Hardware to follow suit.

Mike Belliveau, executive director of NGO, the Environmental Health Strategy Center, also urged the US EPA to take action on the two solvents in order to "sweep up the laggards".

The agency announced last month that it will finalise a rule on methylene chloride, after its proposal to ban or restrict methylene chloride and NMP in paint strippers appeared to be shelved last year.

But thus far, it has not indicated a timeline for this final rule, nor whether it will address NMP.

Andy Igrejas: 1970-2018

Campaigner and powerful voice in TSCA negotiations dies aged 47

21 June 2018 / North America, TSCA

Chemical Watch has learned of the recent passing of US public health advocate Andy Igrejas at the age of 47.

Founder of the NGO Safer Chemicals, Healthy Families, Mr Igrejas built a coalition of more than 450 organisations to advocate for stronger chemical safety laws and better protection of consumer health.

He was a powerful voice in the negotiations to reform the US's outdated federal TSCA law. And despite not endorsing the final bill, SCHF says Mr Igrejas "directly wrung more health-protective concessions even up through the final hours of negotiations."

Mr Igrejas also conceived the Mind the Store Campaign which has helped drive retailers to act on chemicals issues where the government has failed to do so. Just this week, the campaign played an instrumental part in convincing Home Depot to halt the sale of paint strippers containing methylene chloride, where the EPA has stalled on its own rule.

Beyond his legislative and grassroots efforts, Mr Igrejas will be remembered for his effective communication and sense of humour.

"His humour was infectious, and no one escaped his wit," an SCHF statement says. "Andy could have had a second career in stand-up comedy. But in those moments, he wasn't simply entertaining. For Andy, it was also a subversive organising technique that endeared him to allies and disarmed our opponents."

"He was a passionate, talented and committed advocate who dedicated his life to protecting children and families from toxic chemicals," said Sarah Vogel, vice president for health at the Environmental Defense Fund (EDF). "He will be greatly missed."

And Cal Dooley, president and CEO of the American Chemistry Council (ACC) said: "Over the years and through many hours of dialogue and negotiation, I and other members of the ACC team developed great respect for the commitment and passion Andy brought to his work to promote the safe use of chemicals.

"With Andy's passing, the environmental community has lost a tireless voice and dedicated advocate."

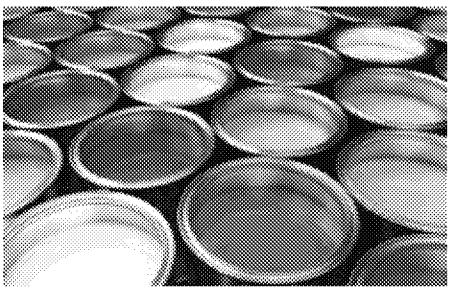
Paint industry frustrated by Rac limit for paint preservative MBIT

Use will require skin sensitiser classification

21 June 2018 / Built environment, Classification, Classification, labelling and packaging Regulation, Europe, Risk assessment, Sensitisers



The European paint industry is "surprised" and disappointed that Echa's Risk Assessment Committee has agreed that the preservative MBIT should have a specific concentration limit (SCL) of 15 parts per million (ppm) for classification as a category 1A skin sensitiser.

The preservative is commonly used in cans of water-based products, such as paints, and the aim is to prevent skin sensitisation induction in exposed people.

Industry had hoped for a higher concentration limit for MBIT (2-methyl-1,2-benzisothiazol3(2H)-one), said Didier Leroy, technical director at the European Council of the Paint, Printing and Artists' Colours Industry (Cepe). "It is a concerning development that all isothiazolinones that go through Rac get lower [than expected] thresholds," he added.

In 2016, the committee also decided on a 15ppm specific concentration limit for MIT and a mixture of CMIT and MIT. During its meeting on 4-8 June, Rac decided that MBIT is in the same "bracket of potency" as MIT and CMIT. "We came to the conclusion that it was very similar," said Rac chair Tim Bowmer.

MBIT prevents bacteria, yeast and moulds from growing in products but is not effective at 15ppm, said Mr Leroy. "Should our members want to use it, they would have to classify their paint or printing inks."

"That does not send a good signal to those adventurous biocide suppliers who would still try to get a new biocide substance on the market. Innovation is quasi non-existent and we observe the continuous reduction of availability of efficient preservatives," he said.

MBIT, CMIT and MIT are described as "product-type 6" biocides under the biocidal products Regulation (BPR); MBIT was approved as a new active substance last year.

Industry has long voiced concerns about the "uncertain" availability of active substances. Only a handful of substances can preserve products without affecting performance, it says.

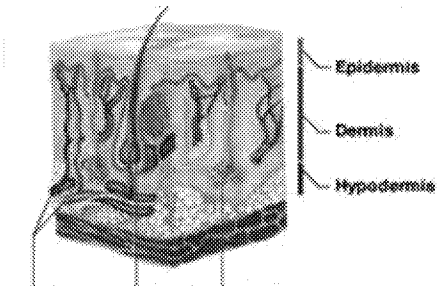
Tattoo ink restriction 'complicated', says Echa's risk assessment committee

Some 3,000 chemicals must be addressed

21 June 2018 / Europe, REACH, Risk assessment



Echa's risk assessment committee (Rac) is continuing to review information on around 3000 chemicals used in tattoo inks and permanent make-up (PMU), for a proposed REACH restriction. "It's complicated – there are a lot of groups of substances that need to be addressed," said chair Tim Bowmer, following the Rac's meeting on 4-8 June 2018.

Chemicals requiring review include carcinogens, mutagens, reprotoxic substances, sensitisers and irritating or corrosive substances. The Rac is currently considering concentration limits, in the context of current analytical methods' detection limits, said Dr Bowmer. Levels that protect consumers are required but analytical restraints mean that setting levels too low may make harmonised enforcement across the EU difficult.

"In most cases, we are rather looking for a concentration limit that will reasonably regulate a substance in tattoo inks and will relatively easily allow enforcement to check."

Some of the substances come under the cosmetics products Regulation or are subject to harmonised classification under CLP. Most are covered by a Council of Europe recommendation on tattoo inks, on which seven member states have based national legislation.

Unique exposure route

The intra-dermal exposure route for both tattoo inks and PMU is unique among REACH risk assessments, according to the restriction proposal. It contains one exposure scenario, based on a "realistic worst case situation". This consists of single, full-colour, tattoo sessions on 300cm^2 skin, repeated until most of the body is covered.

Rac has access to quantitative risk assessments for some of the compounds but for others has to rely on semi-quantitative or qualitative evaluations. The restriction dossier proposes that a qualitative risk assessment will often suffice, given the exposure route, and makes the "important assumption" that injecting substances will give more severe adverse effects than applying them to the skin's surface. The dossier also describes the "major challenge" of a lack of harmonised analytical methods for analysing some of the components of tattoo and PMU inks, such as azo dyes. "There is a need for such methods to be developed," it states.

The restriction proposal was under public consultation until 20 June 2018. In their comments, NGOs the Health and Environmental Alliance (HEAL) and the European Environmental Bureau (EEB) point out that intra-dermal exposure is

"very poorly understood" and that ingestion "isn't necessarily or obviously predictive" of adverse outcomes. They support including tattoo workers in the restriction. Estimating workers' exposure would be "dramatically" simpler than estimating recipients' exposure because it requires a simple risk assessment involving inhalation and dermal exposures, they add.

In its comments, Sweden advocates listing all ingredients on ink labels. In particular, it suggests that products containing chromium VI should come with a warning such as: "Contains chromium. Can cause allergic reactions".

The Rac and the committee for socio-economic analysis (Seac) have until the end of 2018 to give their opinions on the restriction proposal for tattoo inks and PMU, put together by Echa, Denmark, Italy and Norway.

"I think this is a serious restriction. We are not trying to ban tattoo inks or drive it underground. We just want whatever is there to be safe," Dr Bowmer said.

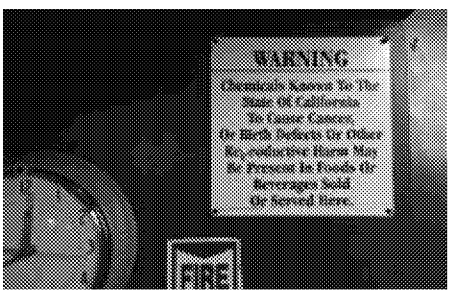
California court upholds Proposition 65 lead limit

Federal judge affirms injunction against glyphosate warning mandate

21 June 2018 / California Prop 65, Labelling, Metals, United States



A court in California has found that the state "did not abuse its authority" in setting a permissible exposure level for lead, leaving in place the "safe harbour" level used to decide when warnings are required under Proposition 65.

In 2015, the NGO Mateel Environmental Justice Foundation sued the state's Office of Environmental Health Hazard Assessment (Oehha), seeking to invalidate the maximum allowable dose level (MADL) the agency had set for lead in 1989.

The NGO argued that the MADL does not set a standard at which there would be "no observable effect" from lead exposure. This is a requirement under Proposition 65.

However, on 5 June, the California Court of Appeal for the First District agreed with a lower court's decision in favour of Oehha. It said that data presented by the NGO does not prove that the existing MADL is invalid.

If the courts had ordered its repeal, there would have been no "safe harbour" in place. Employees and consumers would have had to be warned about any potential exposure to lead, until Oehha could set a new standard.

Lead and related chemicals are listed under Prop 65 for cancer and reproductive toxicity (male reproductive, female reproductive and developmental toxicity endpoints).

Mateel was one of three NGOs that separately petitioned Oehha to expand the basis for listing lead as a female reproductive toxicant. The agency rejected that petition in 2016.

Glyphosate injunction

In a separate 12 June proceeding, a federal judge has refused to change his ruling that temporarily blocks California from requiring labelling of products containing the herbicide glyphosate. This is while a trial continues on the constitutionality of Proposition 65 warning requirements.

District Judge William Shubb issued a preliminary injunction in March. He said Monsanto is likely to win on its claim that requiring a statement on labels that the herbicide is a carcinogen is a violation of the company's free speech rights, if the required warning is not an "undisputed fact".

The injunction does not bar California from listing glyphosate as a carcinogen, but does block it from enforcing warning requirements. If Judge Shubb's interpretation sticks, the state could be forced to defend the scientific basis underlying the listing of chemicals under Prop 65, in lieu of accepting the findings of any one "authoritative body" referenced in the law.

Monsanto is backed by a coalition of industry groups in that case and a separate lawsuit brought under state law. In the latter, two courts have ruled against it on the issue of whether Prop 65 can rely on outside standards.

The state courts have held it is not an "unconstitutional delegation of authority" to list chemicals under Prop 65 based on determinations by the World Health Organization's International Agency for Research on Cancer (Iarc).

Inclusion on the Proposition 65 list triggers requirements that consumers and employees exposed to the substance are warned, primarily through labelling.

EU Commissioners urge greater action on SVHCs in imported articles

Level playing field needed, REACH Review conference hears

21 June 2018 / Alternatives assessment & substitution, Europe, REACH, SVHCs

The EU Commissioner for environment, maritime affairs and fisheries has urged Echa to assess the need for a restriction of SVHCs in imported articles earlier in the regulatory process.

Action 11(1) of the REACH Review calls upon Echa to consider developing systematically a restriction dossier before the sunset date for substances listed on Annex XIV – the authorisation list.

Speaking to delegates at last week's conference on the second Review of the Regulation, Karmenu Vella said that when companies point out that articles imported into the EU can still contain substances for which they have had to obtain authorisation "they do have a point".

It is an "understandable concern" for domestic companies which want a level playing field for EU and non-EU companies, he added. It is also "a very obvious concern" to citizens because of the potential impact on the environment and human health.

He said he would be following the outcome of Echa's assessment "very, very closely".

Mr Vella's calls are related to the requirement in REACH Article 69(2), which states that Echa must assess the need for a restriction on substances included in Annex XIV for their use in articles (EU produced and imported) and propose such a measure – if the risks are not adequately controlled – once the sunset date for the substance has passed.

The agency told Chemical Watch it has already assessed five substances and concluded that no restriction is required. For another four substances – the phthalates DEHP, DBP, DIBP and BBP – Echa proposed a restriction, which was supported by the Committees for Risk Assessment and Socio-economic Analysis (Rac and Seac) and is currently being discussed in the REACH Committee.

Meanwhile, restriction dossiers are being prepared for TCEP and lead chromates. For the remaining substances, Echa said it will carry out screening reports to assess if a restriction is required over the next six to 12 months.

The agency added that it is also assessing what can be done to speed up the process in the future, "such as gathering information on use of Annex IV substances in articles whilst the application for authorisation process is ongoing".

However, it said, the outcome of the application for authorisation process and whether an authorisation is granted "is an important issue to be clarified before any restriction is proposed".

Market protection

At the REACH Review conference, Elżbieta Bieńkowska, commissioner for internal market, industry, entrepreneurship and SMEs, said authorities needs to ensure that substances subject to authorisation in the EU will not bring risks when they are used in articles that are imported into the single market.

"On the other hand," she added "whenever we restrict the use of substances or their presence in articles, we have to make sure that this applies to imports as well."

The Review, she added, identifies the need to enhance enforcement, in particular at the border. Establishing closer cooperation of authorities responsible for REACH and customs authorities will be "vital", she said.

And Ms Bieńkowska also reiterated her previous calls for the simplification of the authorisation process. The Review found companies are investing in substitution of SVHCs and improving risk management measures when substitution is not possible, she said. However, authorisation is a "resource- and time-intensive process that should be simplified" and must be made more predictable for companies, she said.

Echa's Enforcement Forum will conduct a third pilot project on authorisation in 2019. This will check whether companies that are using Annex XIV substances, or marketing them, have the required authorisation.

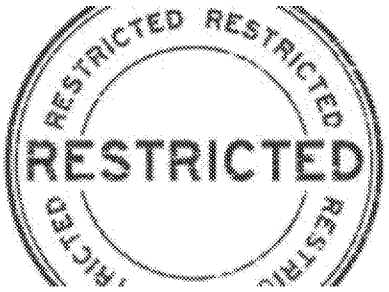
ChemSec disputes Echa has 'addressed' all relevant SVHCs

Agency head urged to 'clean up' candidate list process

21 June 2018 / Alternatives assessment & substitution, Europe, REACH, SVHCs



NGO ChemSec is challenging Echa's claim that it has "addressed all relevant currently known" SVHCs.

The agency most recently stated this in its fourth progress report on the implementation of the SVHC roadmap.

The NGO is questioning Echa's use of the words 'addressed' and 'relevant' and will be raising the issue in a letter to agency head Bjorn Hansen next week.

"We don't agree they are addressed because they are not [all] on the candidate list. They are somewhere in the system," ChemSec senior toxicologist Anna Lennquist tells Chemical Watch.

She says she sees the need to put high priority substances in the system "because we know they are used and in that sense relevant". But, she adds: "You cannot just sit back and say that's it, that's done."

In Echa's automated SVHC roadmap process, Ms Lennquist says, unregistered substances are "usually filtered out". It does not mean that the agency can say the non-registered are not relevant, she adds, because they may well be.

There are "very many substances" Echa needs to look at that are not yet regulated. "They are just somewhere in some expert group."

And when the agency uses the words 'relevant substances', she says, it's really whatever they think is so. "It's time to move beyond that now for Echa and member states."

In November last year, Echa analysis identified seven substances on ChemSec's Substitute It Now (SIN List) that are not yet under regulatory scrutiny but that may be potentially harmful to humans or the environment.

The SIN List contains publicly available information on substances from existing databases and scientific studies, as well as new research. At the end of last year, the NGO produced a report which said the list shows the REACH process is too slow. It cited the wide disparity between it and the candidate list of substances.

'Political' process

The second REACH Review acknowledges that the process of adding SVHCs to the candidate list is "extremely slow", Ms Lennquist says, and that the precautionary principle is "not yet used".

The process is 'politicised' and there is "so much manufacturing of doubt from industry, so much insecurity from member states", which she says are too cautious. "They want to nominate something they know is certain to get through because it is costly."

Many of the last year's nominated substances, she adds, were degradation products of a substance already on the candidate list, or a mixture with something closely related to a substance on the list.

"All the time they are trying to take the very secure ones people can agree on rather than perhaps the most important ones that we can protect human health and the environment from."

There is a need to work on many different levels, she says, to "take back the candidate list and its role".

Overall, she adds, there is a "common understanding" that this is an important list. The actors need to "work harder to get it populated and this letter to Bjorn is one way of doing that. We hope he can have an overview and clean that up because it is difficult on a member state level to have this."

Ms Lennquist talks more on the issue in this month's Global Business Briefing.

US ATSDR releases 'suppressed' PFAS tox profile

Study confirms EPA guidelines 'woefully underestimate risk', says NGO

21 June 2018 / PFCs, Toxicology, United States

ATSDR
AGENCY FOR TOXIC SUBSTANCES AND DISEASE REGISTRY

The US Agency for Toxic Substances and Disease Registry has released a controversial draft toxicological profile on four per- and polyfluoroalkyl substances (PFASs). The move comes amid uproar over allegations that other federal agencies were suppressing its release.

Last month, internal EPA emails released under a public records request showed concern that the ATSDR was planning to publish a study with minimal risk levels (MRLs) for the PFASs far below those set by the EPA. One White House staffer feared this would result in a "public relations nightmare".

Congress and the consumer advocacy community responded with outrage over the delay, and called for the ATSDR – which is housed under the US Department of Health and Human Services (HHS) – to release the draft toxicological profile.

Now the "very, very low" MRLs values referenced in the January email exchange have been confirmed in the toxicological profile for four of the 14 assessed substances: PFOS, PFOA, PFHxS, and PFNA.

The limits are set out on a body-weight basis (mg/kg/day), intended to serve as estimates of daily human exposure unlikely to cause an appreciable risk of adverse non-cancer health effects.

Environmental Working Group researchers tell Chemical Watch that using the EPA's methodology for translating these figures into drinking water advisory values results in the following levels:

- PFOS: approximately 7 parts per trillion (ppt);
- PFOA and PFNA: approximately 11ppt; and
- PFHxS: approximately 74ppt.

This contrasts with the EPA's non-enforceable lifetime health advisory level for PFOA and PFOS of 70ppt in drinking water. This makes its level seven to ten times higher than that recommended by the ATSDR, says the EWG.

And it "confirms that the EPA's guidelines for PFAS levels in drinking water woefully underestimate risks to human health," said Olga Naidenko, senior science adviser at the group.

NGOs push for further action

Michael Halpern of the NGO Union of Concerned Scientists praised the ATSDR for "finally doing the right thing" by releasing the "suppressed" assessment.

He requested that Congress "step up oversight into political interference in science that causes direct harm to public health and the environment."

And the EWG used the document's release to reiterate a call made by 40 NGOs for US states to continue taking the lead on eliminating the use of PFASs.

"It will largely fall to state and local governments to step in and take the necessary action to deliver results for the public," said EWG president Ken Cook.

The American Chemistry Council (ACC) told Chemical Watch it looked forward to reviewing the draft and providing feedback.

The ATSDR will accept comments on the document for 30 days. It is particularly seeking "additional information, reports and studies about the health effects of these substances" for possible inclusion in the final profile.

Greenpeace finds PFAS and microplastics in the Antarctic

Polyester fabric is likely source of microfibres, says report

21 June 2018 / Global, Microplastics, PFCs, Textiles & apparel

A Greenpeace study, has revealed the presence of microplastics and per- and polyfluorinated alkylated substances (PFASs) in seawater and snow samples from the Antarctic.

The samples were gathered during a three-month expedition from January to March this year.

In its recently published report, *Microplastics and persistent fluorinated chemicals in the Antarctic,* Greenpeace says the study shows "even the most remote and pristine habitats of the Antarctic are contaminated with microplastic waste and persistent hazardous chemicals".

The study found:

- seven out of eight seawater samples contained microplastics;
- microplastics were detected in two samples of seawater taken using a manta trawl (a net system for sampling the surface of the ocean);
- seven out of nine snow samples tested contained detectable concentrations of PFASs.

'Fast fashion' risk

Microplastics are defined by Greenpeace, as pieces of plastic "with a diameter of 5mm or less" which are likely to come from microbeads in personal care products, fragments from land-based sources such as tyres, or fibres from synthetic clothes, which are released into wastewater systems when consumers wash them.

The most likely sources of microplastic fibres in the Antarctic ocean, the report says, are fishing nets and polyester from textiles.

"Synthetic fibres, especially polyester, are widely used in textile products. For example, 60% of the material currently used in clothing is polyester, much of it in short life 'fast fashion' items of clothing," the report says.

Last year, Greenpeace warned about the industry's use of large quantities of polyester and its contribution to pollution of the oceans with microplastic fibres. Its Fashion at the crossroads report called for industry to slow down its plans for expansion - which include plans to nearly double its annual use of polyester by up to 76 million tonnes annual by 2030.

According to the report the "synthetic nature and their propensity to absorb or attract chemicals from seawater on to their surfaces" of microplastics means they can also carry "substantial concentrations of a range of chemical additives and contaminants, contributing to the exposure of marine species to hazardous chemicals".

The European apparel and textile confederation, Euratex declined to comment.

'Global spread'

The most commonly detected chemical was PFOA, which was found in "significant concentrations" in five out of nine snow samples.

Greenpeace says the findings confirm its conclusion from previous expeditions, that once PFAS are released they "are spread globally by long distance transport through the atmosphere and are deposited as snow in all remote regions."

PFASs are widely used in many industrial processes and consumer products, such as in waterproof and dirt-repellent finishes by the outdoor apparel industry.

Jon Corley, spokesperson for the chemical industry trade association, FlouroCouncil, said it was difficult to comment on the report without knowing more about the underlying data and methodologies used.

"It is important to note they provide no risk context for the extremely low levels of PFAS detected in their report," he said.

In response, Kirsten Brodde, project lead for Greenpeace's Detox my Fashion campaign said: "The FluoroCouncil should be aware that persistent chemicals such as the PFAS found in Greenpeace's study can be hazardous at extremely low levels – they should be concerned by the fact that they've been found in habitats as remote as the Antarctic."

Walmart considers blockchain technology for tracing chemicals

Potential to create 'a new era of transparency'

21 June 2018 / Confidentiality & right-to-know, Data, United States, Voluntary action

US retail giant Walmart is assessing whether the digital technology 'blockchain' can be used to trace chemicals across some of its products and packaging.

Blockchain is a digital record keeping system that enables the creation and maintenance of a growing number of records, allowing fast tracking of information. It was originally created to manage transactions through the crypto-currency Bitcoin, but has since shown potential for sharing and retrieving many other forms of data.

In its 2018 global responsibility report, the company says the technology holds a lot of promise for "enabling a new era of transparency and enhanced trust".

A Walmart spokesperson told Chemical Watch that,"the beauty of blockchain is that it lets us shine a light on a range of data attributes".

"We have certainly thought about how we could trace chemicals in foods and food packaging among these," she added.

Blockchain, she said, lets companies confidently and precisely pinpoint ingredients and suppliers, with dates, times, locations, temperatures, certificates and more.

"It can provide an extraordinary level of detail that we would definitely like to see include chemical ingredients, direct and indirect additives and colours," she added.

Pilot projects

Last year, Walmart collaborated with Chinese online retailer JD.com, IBM, and the Tsinghua University National Engineering Laboratory for E-Commerce Technologies to create a 'Blockchain Food Safety Alliance'. This aims to enhance food tracking, traceability and achieve greater transparency across the food supply chain.

In a trial of the technology, the company first asked a team to trace a package of sliced mangoes back to their source using current methods. Because of paper-based record keeping commonly used in the industry and multiple layers in produce supply chains, it took six days, 18 hours and 26 minutes.

However, using blockchain it was able to trace a mango in a US store back to its origin on a farm in Mexico in 2.2 seconds.

"Such capability would help enable rapid processing of recalls and help limit potential exposure to affected products," it said.

It also ran a blockchain pilot in China on pork, significantly reducing the time needed to trace products back to the farm.

Its potential has sparked the formation of a coalition comprised of the suppliers and retailers Danone, Dole, Driscolls, Golden State Foods, Kroger, McCormick, Nestlé, Tyson, Unilever and Walmart. The aim is to identify new areas where the global supply chain can benefit from blockchain.

The technology is a hot topic and has been linked with its potential use for a number of materials and products, including the tracking of conflict minerals and nanomaterials.

In a 2017 report on the mining industry, service provider PwC says through its use, materials could be tracked and traced from the "moment of extraction to the point of sale". This, it says, would satisfy increasing consumer demand for both improved supply chain transparency and more environmentally sound products.

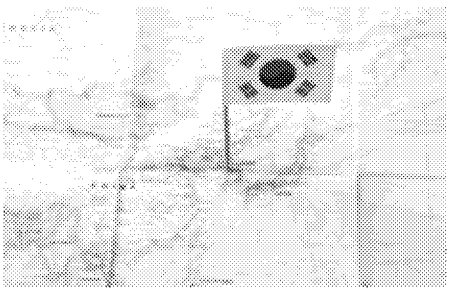
As deadline approaches, details emerge on K-REACH enforcement rules

Animal testing and polymer requirements are revealed

21 June 2018 / K-REACH, South Korea



With less than two weeks to go until the first K-REACH registration deadline of 30 June, 286 of the 370 substances expected have been submitted, with 109 of them completed, according to sources close to South Korea's Ministry of Environment.

And the MOE has provided extensive draft K-REACH enforcement rules. They include:

Animal testing

Duplicate vertebrate animal testing must be avoided. However, by presidential order, it can be carried out if:

- new findings suggest hazardousness and risk concerns;

- where existing data has low credibility; and
- when considering existing data costs and whether it can be shared.

When the owner of vertebrate animal testing data does not agree to share this, a company can apply to the MOE for an exemption from submitting the data. However, this only applies where the data owner is either registered or intends to register under K-REACH.

Polymers with hazardous monomers

A polymer can be not hazardous, but still subject to registration. This is if it contains a monomer that is subject to registration and the unreacted monomer persists at 0.1% or more of weight.

Abolition of risk concern products Regulation

The ministry guidelines also note that the "products of risk concern" Regulations under Article 34 of the initial K-REACH have been abolished; as have enforcement decrees and rules, including reporting on manufacturing. Regulation of these products has moved to K-BPR, where required.

Other sections of the enforcement rules include:

- registration outcomes;
- joint registration exceptions;
- research exemptions; and
- domestic representatives' obligations.

The public consultation on the draft rules runs until 9 July.

More details available on CW+AsiaHub

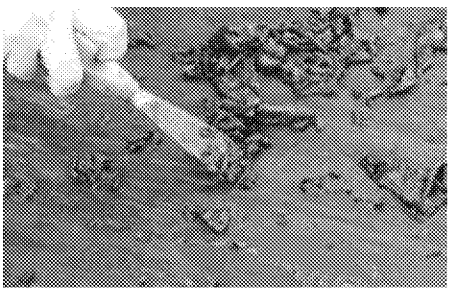
US industry defends methylene chloride despite retailer bans

Consumers will buy paint removers in smaller hardware stores, says HSIA

21 June 2018 / Built environment, Retail, Solvents, United States



US industry groups have continued to defend the need for methylene chloride paint removers, despite three major retailers announcing plans to phase them out.

In recent weeks, retail giants Home Depot, Lowe's and Sherwin-Williams have pledged to stop selling products containing the solvent by the end of this year. The actions follow campaigning from consumer advocacy groups for a ban, after a number of deaths over the last few years.

But a spokesperson for the Halogenated Solvents Industry Alliance (HSIA) insisted that methylene chloride products still had an important place in the marketplace, and "are the best products for efficient and effective paint removal".

Alternative formulations have not been widely accepted in the market, the spokesperson told Chemical Watch. "They do not work as well and many of them are flammable, unlike methylene chloride."

They are frequently returned to the store and exchanged for the methylene chloride-based products, the spokesperson added. "To the extent the big stores stop carrying these, I would guess contractors [and] knowledgeable consumers will go to smaller local hardware stores."

The US paint and coatings trade group, American Coatings Association, also defended the use of methylene chloride and alternative solvent N-methylpyrrolidone (NMP) in paint removal products.

A spokesperson said the association "opposed outright bans of these compounds in the absence of environmentally safer alternatives."

ACA "strongly endorses following the precautionary labelling guidelines of using proper personal protective equipment (PPE) and ensuring proper ventilation," they said.

The US Consumer Product Safety Commission (CPSC) recently expanded its labelling guidance for paint strippers containing methylene chloride to address acute inhalation hazards.

Decoupling NMP from methylene chloride

Meanwhile, the NMP Producers Group told Chemical Watch it believes the US EPA should decouple its approach to NMP and methylene chloride in regulating the products.

In 2017, the EPA proposed a single rule under section 6 of TSCA to ban methylene chloride paint strippers, and either to ban or impose restrictions on products containing NMP.

But Kathleen M Roberts, manager of the NMP Producers Group, said that assessing them as a single category had "led to confusion in the marketplace, by giving the impression these products present a comparable risk profile."

Methylene chloride is "very volatile and most of the exposures occur via inhalation", she said. NMP is "mildly volatile and most of the exposures would occur through dermal exposure".

The fact that the agency put forward a proposal for NMP that considers labelling and other restrictions in place of a ban "demonstrates that EPA does not intend for the two chemicals to be treated the same", Ms Roberts added.

Apparently shelved, the EPA announced last month that it will finalise a rule on methylene chloride. But the EPA's recent problem formulations suggest the agency might not be moving forward with its rulemaking on NMP.

US EPA updates TSCA new chemical submission guidance

21 June 2018 / Substance notification & inventories, TSCA, United States

The US EPA has published an updated copy of its guidance for submitting new chemicals for agency review under TSCA.

The newest version of the document – *Points to consider when preparing TSCA new chemical notifications* – incorporates comments received on a November draft, including those made at a December public meeting.

Formation of the document came amid ongoing industry frustration at the slow pace of review of pre-manufacture notices (PMNs) since TSCA was amended in 2016. It provides non-binding information to assist submitters in preparing PMNs, significant new use notices (Snuns) or exemption notices under section 5 of TSCA.

The agency says the guidance "promotes early engagement and communication, and enhances overall understanding of EPA's technical review and analysis to better move chemicals through the evaluation process."

EPA Administrator Scott Pruitt said this will "increase manufacturers' certainty, improve submissions, and get new, safer chemicals on the market faster and more efficiently".

Alongside the guidance, the agency has published responses to more than 100 comments raised by stakeholders.

Echa round-up

21 June 2018 / Classification, labelling and packaging Regulation, Europe, REACH, Safety data sheets

Testing proposals

Echa has invited third parties to submit scientifically valid information and studies on 13 testing proposals for nine substances. The deadline for providing information is 2 August.

CLH intentions

The agency has received new intentions to harmonise the classification and labelling of:

- multi-walled carbon nanotubes (fibres fulfilling the WHO definition: diameter <3µm, fibre length >5µm and aspect ratio ≥3:1, with a diameter >xx nm), [MWCNT]. Additional lower cut-off value for the diameter of the MWCNT will be clarified in the final CLH proposal. Germany proposes a harmonised classification of carcinogen 1B, specific target organ toxicity-repeated exposure (Stot Re) with submission expected by 31 December;
- 2,4,6-tri-tert-butylphenol; and
- 6-[(C10-C13)-alkyl (branched, unsaturated)-2,5-dioxopyrrolidin-1-yl] hexanoic acid.

Echa closure

Echa will be closed on 22 June.

Video on updating REACH-IT contact details

The agency has reminded registrants of the importance of keeping contact details up to date in its REACH-IT tool. There is a video with practical advice on how to do this, which is through the REACH-IT menu (Menu/Manage company/Contacts).

It is also important, Echa says, to make sure the email address in the 'Email notifcation settings' is up to date (Menu/Manage company/Contacts). An email is sent to this account every time an action is required in REACH-IT by the registrant, for example, updating a dossier, it says.

Update to interactive guide on SDSs

Echa has updated its interactive guide on safety data sheets and exposure scenarios. The guide is to help suppliers and SDS recipients to compile and understand substance and use information.

The agency has fixed some minor bugs and updated links. Translated versions will be corrected in coming weeks.

Consultation on new guidance on Annex VIII to CLP

The agency has sent its new draft guidance on harmonised information related to emergency health response for Forum consultation (Annex VIII to CLP).

Echa opens consultation on derogation request for PFOA restriction

21 June 2018 / Alternatives assessment & substitution, Europe, PFCs, REACH

Echa is inviting comments on a proposal for an additional derogation to the restriction of perfluorooctanoic acid (PFOA), its salts and PFOA-related substances (entry 68 of Annex XVII to REACH).

The agency's Committees for Risk Assessment and for Socio-economic Analysis (Rac and Seac) have been requested to prepare an opinion.

Echa says this assessment is not being carried out under the normal restriction procedure as it is a specific request from the European Commission for a derogation on an existing restriction. The opinions will be sent to the Commission by 1 December 2018.

The restriction entered into force in June 2017 and includes several derogations for different industrial sectors and uses.

The derogation review request came from pharmaceutical company AstraZeneca, which uses perfluorooctane bromide (PFOB) for the manufacturing of pharmaceutical products for the treatment of pulmonary diseases.

PFOB is excluded from the scope of the PFOA restriction, but it contains perfluorooctane iodide (PFOI) as an impurity in concentrations above the threshold in the PFOA restriction. PFOI is a PFOA-related substance that is covered by the restriction.

The public consultation ends on 20 August.

US legislators seek changes in Iarc procedures

Threat to bar funding continues a long campaign

21 June 2018 / Toxicology, United States

Members of the House Appropriations Committee have demanded assurances that the International Agency for Research on Cancer (Iarc) will make specified changes in the way it conducts research reviews as a condition of receiving US funding.

Fiscal 2019 spending legislation contains a provision barring funding for Iarc's monograph programme unless the US National Institutes of Health (NIH) submits to Congress a report which describes "that grants, contracts or cooperative agreement awards to Iarc will require":

- a "transparent review process" in which drafts and revisions are publicly available online;
- a process to "address conflicts of interest in the selection of individuals involved with monograph programme assessments;"
- use of "the best available science" in developing assessment conclusions; and
- summaries of "relevant and significant" studies and reports that do not support assessment conclusions.

The legislation, approved on 15 June by a House appropriations subcommittee, covers the fiscal year beginning on 1 October. But spending bills are not likely to be finalised for several months, and Senate appropriators would have to agree for the provision to be included in the final version.

Long-simmering row

The appropriations rider is the latest salvo in a long-running feud between the international agency and Republicans in the US Congress.

Members of the House Committee on Science, Space and Technology recently wrote to Elisabete Weiderpass, the incoming Iarc director, asking her to testify at a July hearing. The letter described the monograph programme as "an affront to scientific integrity" and accused Dr Weiderpass of having aligned herself with "shoddy and politics-driven science".

Iarc's decisions have regulatory implication in the US because they lead to substances being listed as carcinogens under California's Proposition 65.

Critics have taken aim at Iarc's procedures generally, but their primary focus has been its 2015 review of glyphosate – the primary ingredient of Monsanto's Roundup herbicide – which Iarc classified as "probably" carcinogenic to humans. Litigation over the substance's listing under Prop 65 is currently underway.

The NIH has given nearly $48m to Iarc since 1985. More than $22m of this went to the monographs programme.

EU presidency to 'finalise' POPs recast

21 June 2018 / Europe, Persistent organic pollutants

Austria said it aims to finalise the recast of the persistent organic pollutants (POPs) Regulation during its presidency of the Council of the EU, which starts on 1 July.

The recast provides for adjustments to the Treaty of Lisbon and to the definitions of EU chemicals and waste legislation, as well as an adaptation of the monitoring system.

In May, NGO the Health and Environment Alliance (HEAL) sent a letter to Austrian chancellor Sebastian Kurz urging the country to seize "significant opportunities" to improve chemicals regulations and push for better controls of hazardous substances during its presidency.

NGO launches Brexit and chemicals blog

21 June 2018 / Europe, REACH, United Kingdom

UK NGO CHEM Trust has set up a blog containing perspectives and news on chemicals regulations as Britain prepares to leave the EU.

In it, the NGO say it agrees with Cefic's calls for a post-Brexit bilateral chemicals regulations agreement, advocating continued membership of Echa and the retention of REACH in the UK.

Speaking at Chemical Watch's second Brexit conference in April, CHEM Trust executive director Michael Warhurst said the remaining 27 countries might come to recognise the benefits to the EU of allowing the UK to stay in REACH.

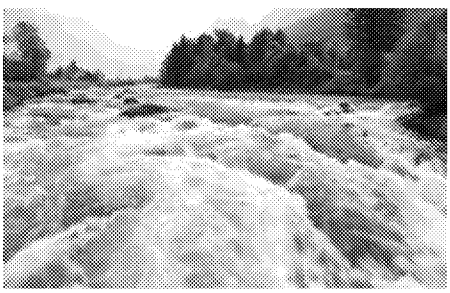
Echa's MSC agrees that D4, D5 and D6 are SVHCs

Strong reaction from industry

21 June 2018 / Built environment, Ecotoxicology, Europe, Persistent, bioaccumulative & toxic, REACH



Echa's Member State Committee has agreed that the siloxanes D4, D5 and D6 are all REACH substances of very high concern (SVHCs), based on persistent, bioaccumulative and toxic (PBT) properties. Industry has voiced strong criticism of the decision.

Based on intrinsic properties, D4 is both PBT and "very persistent, very bioaccumulative" (vPvB), while D5 and D6 are only considered vPvB. The use of D4 and D5 is already restricted in wash off personal care products - at a concentration equal to or greater than 0.1% by weight - to reduce emissions to the aquatic environment.

The MSC agreed that D5 and D6 can be considered PBT and vPvB because of D4 impurities, when present at "relevant concentrations" above or equal to 0.1% by weight.

"If D5 and D6 get into the environment, the impurity D4 will have its own fate and behaviour," said Watze de Wolf, MSC chair. D5 and D6 products without D4 impurities would not be considered PBT, he added.

Germany compiled the SVHC reports for D4 and D5, while Echa prepared D6's Annex XV report, at the European Commission's request. In its reports, Germany recommends not immediately including the substances on the authorisation list (Annex XIV). Once included, they would no longer be subject to targeted restrictions, it says.

However, Pierre Germain, secretary general of trade organisation CES-Silicones Europe, said: "The silicones industry strongly believes that the Member State Committee has not taken full account of the whole body of scientific evidence."

"It should have recognised that measured levels in the real environment are extremely low; taken into account already applicable or ongoing regulatory activities; and that it will cause considerable uncertainty for customers on a global level," he added.

A recent US industry-funded study suggested that D4 poses a "negligible risk to the environment", based on data collected under an Environmental Protection Agency enforceable consent order.

On 2 April, the Global Silicones Council, US, together with European silicones producers, launched legal action against the European Commission. They argue that criteria in Annex XIII of REACH should not have been used to decide on the persistence and bioaccumulation of D4 and D5. The applicants describe concerns over hazard assessment, risk assessment and the use of weight of evidence.

U.S. Companies Split Over Global Chemical Classifications

Posted: Nov 24, 2017, 9:01 AM EST

By Sylvia Carignan

A United Nations proposal for a single, global classification list for chemicals used in trade is getting support—and some skeptical looks—from U.S. companies navigating the conflicting standards.

Companies in favor of a single, harmonized, global list of chemicals that would classify things like flammability and carcinogenicity, say it would reduce compliance costs and trade barriers by resolving conflicts between countries' chemical classifications. But, skeptics say there is an overwhelming amount of work to be done to create such a list.

Hach Co., which manufactures and distributes water quality testing technology, is in favor of the proposal.

"For a multi-national company like Hach, it is very difficult to keep up with national classification lists," James Lee, senior compliance analyst for chemicals at Hach Co., said.

In U.S. workplaces regulated by the Occupational Safety and Health Administration, hazard communication citations are among the most common violations, according to the agency. In fiscal 2015, hazard communication, which governs the evaluation of chemicals in the workplace, was the second most frequently cited standard.

The United Nations committee considering the chemical list proposal is scheduled to meet Dec. 6 through Dec. 8 in Geneva. But the committee needs to reach an agreement to take action on the list.

"There are concerns about how it should be developed, politics involved, how much work and time, and whether major players like [the European Union], China, and Japan will pay much attention to this list, or even oppose it," Lee said.

Lagging Behind

The "Globally Harmonized System of Classification and Labelling of Chemicals" is a framework a U.N. committee built to help countries classify the hazards of individual chemicals used in trade.

OSHA was involved with the system at its inception, and has been taking public input on the U.N. proposal for a global list based on the system's framework. The U.N. committee first started studying the possibility of a global list in 2008.

The classifications range from a chemical's carcinogenicity to flammability to environmental contamination risk. But, since countries have based their classifications on differing studies, or interpreted them differently, a single chemical's classification can vary from country to country.

One country may designate a chemical as a known carcinogen, while another may designate it as a suspected carcinogen.

Companies know that communicating chemical hazards is a clear priority, but the classifications are not well understood, Glenn Trout, president and chief executive officer of VelocityEHS, told Bloomberg Environment. "There's really a lot of confusion around how to label chemicals in the work environment," Trout said.

A global list proposed by the U.N. committee would align those classifications.

"Theoretically, it sounds like a great idea, but when you think about how it would be implemented, practically speaking, it is very complicated," Melissa McCaffrey, marketing communications director for VelocityEHS, told Bloomberg Environment.

A pilot program involving three chemicals, facilitated by the Organization for Economic Co-operation and Development, found that international bodies could reach a consensus on nonbinding classifications, but "substantial" effort was required. It would take potentially 18 to 20 months from selecting a chemical to finalizing its classifications, according to Edmund Baird, counsel for standards at the U.S. Department of Labor.

"It just seems like—not an insurmountable task, but there has to be a serious commitment," McCaffrey said.

OSHA has its own separate hazard communication rule, and doesn't plan to make changes to the rule as a result of global list feedback, according to an agency spokeswoman.

Weighing In

The American Petroleum Institute supports developing a list, as long as its classifications are not binding or mandatory. The institute's members include Alcoa Oil and Gas, Belle Fourche Pipeline, and Hess Corp.

A global list would help countries that don't have the resources to develop their own classifications, the institute said in a statement. But, the U.N. committee would need to determine how it chooses chemicals for the list and how it justifies each classification.

"These two key considerations become particularly salient when the available data are apparently conflicting," the institute said in a statement.

The U.N. committee has already agreed that the list be developed transparently and that the classifications be non-binding.

The American Cleaning Institute, which represents companies such as Cargill, Inc., Unilever, and Colgate-Palmolive, isn't supporting the list.

The list isn't a priority for the institute's members, and the effort necessary to build a list is a significant roadblock, Richard Sedlak, executive vice president for technical and international affairs at the American Cleaning Institute, said.

It's unclear whether the U.N. committee will set a timeline if it decides to build a list.

Buyout stories: 'We are kind of being hollowed out'

Three hundred seventy-two U.S. EPA employees took buyouts this year, with the enforcement and research offices among the hardest hit, according to agency data obtained by E&E News. "We are going to be able to hang a shingle on the outside of the building and still call it EPA," a union official said, "but we're not going to be able to still do what EPA used to do."

Federalist Society project hunts for burdensome rules

Maxine Joselow, E&E News reporter

Published: Wednesday, November 22, 2017

The Federalist Society has launched a project to identify regulations whose costs exceed the benefits.

The Regulatory Transparency Project, which kicked off this month, seeks to find rules and guidance that place an undue burden on the American economy.

Despite the best of intentions, government regulations can cause harm," said Devon Westhill, director of the project. "What we're trying to do is examine rules and guidance and the regulatory process itself to find areas where regulation seems to be doing more harm than good."

It's a frequent conservative talking point that red tape should be cut and the sprawling regulatory state should be trimmed. But Westhill said the project is nonpartisan, noting that the Federalist Society doesn't take a stance on specific law or policy initiatives.

The project comes as President Trump has made deregulation a top priority for his administration. Trump signed a January executive order requiring that two rules be revoked for every new one issued, followed by a February executive order requiring that agencies set up regulatory reform task forces.

But Westhill said the Regulatory Transparency Project has been in the works since spring 2016.

"While we're just announcing this, this is something that's been in the hopper since before the election of President Trump," Westhill said. "There's no idea that there would be a sympathetic ear at the federal level."

The project will consist of 12 working groups that each focus on an area of rulemaking, including antitrust and consumer protection, energy and environment, intellectual property, and labor and employment.

The energy and environment working group has eight members. All have academic credentials, and some have conservative pedigrees, with two previously serving in the George W. Bush administration and one having served in the Reagan administration.

Jeff Holmstead, chairman of the energy and environment working group and former assistant administrator of U.S. EPA's Office of Air and Radiation under President George W. Bush, said he hopes to foster meaningful conversations about regulatory reform.

"When this opportunity came along, I really viewed it as a way to help create the intellectual framework for regulatory reform," Holmstead said. "Regulations are basically a bad deal for society if the costs outweigh the benefits. And even when the benefits outweigh the costs of a particular regulation, that doesn't make it a good thing if there are less costly ways to achieve the same result."

So far, the group has produced two papers. The first criticized EPA's "expansive regulatory approach" to the Waters of the U.S. rule and called for "restoring meaningful limits" to the statute. The second called for repealing the Jones Act to unfetter American oil and gas production.

Richard Belzer, a member of the energy and environment working group and former staff economist in the Office of Management and Budget under President Reagan, said he hopes the group turns its attention next to the Safe Drinking Water Act.

"The last time it was reauthorized was 1996," he said. "What's going on, I think, is that the 1996 amendments to the law finally told EPA that they had to do benefit-cost analysis. And I think what they're discovering is that the costs outweigh the benefits."

Swiss chemical giant, Lonza, rolls out global preservatives strategy

Aims to defend ingredients for personal care and household products

22 November 2017 / Active substances, Biocides, Cleaning products, Global, Personal care

Swiss multinational Lonza has rolled out a global strategy, dedicated to ensuring a broad palette of preservatives remains available to the household and personal care products industries in the years ahead.

The chemical giant's consumer care division is investing in short-, medium- and long-term preservation programmes. The move comes partly in response to increasing regulatory scrutiny of traditional preservatives, which has thrown the cosmetics industry in particular into a crisis.

An ongoing goal is to defend existing ingredients, which are "supported by robust data packages and underpinned by regulatory compliance", Lonza says.

The company is working with relevant trade bodies and regulators to argue for keeping these on the market. Often this means addressing negative media attention, says Lonza's head of global marketing for preservation, Phil Hindley.

"It is inevitable that some companies in the market will be more sensitive towards such controversy than others, with a continuing dilemma being the battle between negative PR and actual regulatory restrictions," he says.

"We recognise there is a move away from certain 'controversial' chemistries, but equally that many formulators and personal care companies are continuing to use these, given their familiarity and longstanding adoption."

Bans and restrictions on widely used substances have come into force over the last two years in Europe and in the US, including for several parabens and the mixture of methylchloroisothiazolinone and methylisothiazolinone (MCI/MI). Other compounds are facing scrutiny from authorities and NGOs.

Innovation

Meanwhile, Lonza is future-proofing its portfolio by formulating new preservative systems, based on options including organic acids and multifunctional additives.

A growing trend in the personal and home care sectors - blending recognised actives with inert ingredients or other co-formulants - can improve a preservative system's efficacy and reduce the content of single ingredients in the final formulation. This can help in complying with restrictions, or reducing the potential for allergies.

Multifunctional additives are not regulated as preservatives, but can contribute towards the effectiveness of the final product. They can be used as either standalone systems that offer a preservation effect in addition to other benefits, or as potentiators that boost the activity of existing active substances.

Although multifunctionals can add a level of complexity to a product, they have a "solid place" in the preservation market, says Mr Hindley. Nevertheless, they are also beginning to give concern to authorities and NGOs. Sweden's EPA has flagged up that with a lack of research on their use, these additives could come with unknown human health risks.

Organic acids, meanwhile, are growing in popularity and adoption, particularly in personal care markets, he says.

Lonza's long-term goal is to develop two new preservative active substances for a number of applications. A "significant investment" for the company, it is expecting to progress these within the next few years.

Joint efforts

Mr Hindley adds that Lonza's strategy fits into a joint effort by industry to defend preservatives. "There are trade bodies working to [do this] on behalf of their members; some of our competitors are making efforts too. And outside of that we are also communicating with the regulators about this issue."

The European Commission acknowledged earlier this year that reducing the palette of preservatives available to formulators "creates real public health problems" because it means that consumers are exposed to higher levels of those remaining.

And Cosmetics Europe has been vocal in its defence of preservatives, calling the shrinking pool of substances available "a crisis".

Meanwhile, US business group the Green Chemistry and Commerce Council (GC3) has run a competition with the aim of identifying promising safe preservation systems for personal care and household products, and help bring them to market. It closed in the summer with 48 submissions for potential new systems.

Judges from 11 companies, including Lonza, are currently evaluating them.

Niceatm invites scientists to build oral toxicity models

22 November 2017 / Alternative approaches to testing, United States

The US National Toxicology Program Interagency Center for the Evaluation of Alternative Toxicological Methods (Niceatm) has invited researchers to take part in a global project to develop *in silico* models to predict acute oral systemic toxicity, using available rodent data.

Acute oral toxicity is one of the US EPA "six-pack" tests, which result in high animal use worldwide. Tests are for acute oral, dermal and inhalation systemic toxicity, as well as eye and skin irritation and skin sensitisation.

The Interagency Coordinating Committee on the Validation of Alternative Methods (Iccvam) is organising the international modelling project through its acute toxicity workgroup. One of Iccvam's "high-priority efforts" is to develop alternative test methods for the six-pack.

Niceatm and the EPA National Center for Computational Toxicology have collected a large body of rat acute oral lethality data. Researchers interested in joining the project should build and test models, using this. A 'training' data set is already available on the Niceatm website and prediction data will be released in December.

Models that meet certain criteria will be used to generate consensus predictions for acute oral toxicity endpoints of particular interest to regulatory agencies, according to Niceatm.

Toxicity predictions generated by the models will also be made publicly available on the EPA's chemistry dashboard.

Prediction results should be submitted by 9 February 2018. The results will be presented at a workshop in April.

Thailand's draft chemical inventory expected by year end

Limited searches possible, based on Cas numbers

22 November 2017 / Safety data sheets, Substance notification & inventories, Thailand

The first draft of Thailand's existing chemical inventory is expected before the end of the year, delegates at Chemical Watch's Regulatory Summit Asia have heard.

Dr Piyatida Pukclai, regulatory policy director at consultancy Dr Knoell Thailand, said that it will include data collected up until December 2016. However, she noted, there is currently no date for the official first full version.

Dr Pukclai also covered recent announcements on confidential business information (CBI) by the Department of Industrial Works (DIW). These include a minimum period for CBI requests of eight-12 months and the rules for rejecting a CBI submission, which are currently published in Thai.

She also discussed changes to Thailand's Hazardous Substance Act. The updated law is "expected soon" and will include 22 new substances.

Dr Pukclai told delegates that from October, the ministry has allowed a Thai subsidiary company of a manufacturer – or an authorised agent – to consult with them on behalf of importers.

She also reported on a new online tool, called the hazardous substance single submission (HSSS), that can be used for the registration of type two and three hazardous substances and for the licensing of type three substances.

Vietnam sets limits on formaldehyde and azo colourants in textiles

23 November 2017 / Textiles & apparel, Vietnam

Vietnam's Ministry of Industry and Trade has published limits on the amount of formaldehyde and azo colourants in textiles. The new regulation takes effect on 1 May 2018.

Under the new rules, the limits of formaldehyde are:

- 30mg/kg in textile products for children under three;
- 75mg/kg in textile products in direct contact with the skin; and
- 300mg/kg in textile products with no direct skin contact.

It also specifies the limit of 30mg/kg for 22 aromatic amines converted from azo colourants.

The ministry published a draft on the limits earlier this year. The new rules will be introduced under Circular No 21/2017/TT-BCT: "the national technical regulation on the content of formaldehyde and certain aromatic amines derived from azo colourants in textile products."

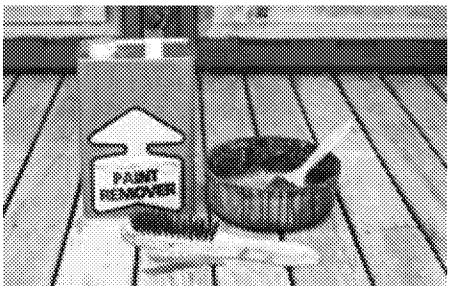
California moves on methylene chloride paint strippers under SCP programme

'Priority product' designation will require 'alternatives analysis'

23 November 2017 / Alternatives assessment & substitution, Built environment, TSCA, United States



California's Department of Toxic Substances Control (DTSC) has proposed regulations to name paint strippers containing methylene chloride a "priority product". The move comes under the state's Safer Consumer Products (SCP) programme and is the next step in a process that could lead to the products being restricted or banned in California.

The agency said it will accept written comments until 18 January, and will hold a public hearing on 8 January.

Once the regulation is finalised, manufacturers of such products sold in the state will have 60 days to register with the department and begin an analysis to determine if a safer alternative is possible.

The DTSC named the first three chemicals to be scrutinised under the programme in 2014. And children's sleeping items containing the flame retardants TDCPP or TCEP officially became the first "priority product" on 1 July. Alternatives analyses for this should be underway. The public comment period on the second priority product – spray polyurethane foam (SPF) containing MDI – ended on 6 June.

It took more than eight months to move from consultation to finalised regulations on the flame retardants, so it is likely alternatives analyses for methylene chloride paint strippers will not begin until the end of 2018.

Methylene chloride paint strippers are not only carcinogenic and neurotoxic, the DTSC says, but "high-level acute exposures can be fatal and there are numerous worker and consumer deaths" associated with their use.

The requirements will apply to any methylene chloride product sold in California "as a chemical substance designed to break down paint, varnish, or any other surface coating to facilitate its removal from any surface."

Separate California regulations already ban the use of methylene chloride in a variety of consumer cleaning products.

Listing as a priority product "sets in motion a strategy to reduce human exposure," the DTSC said in its current proposal, but it is unknown what regulatory action might be taken in response to alternatives analyses.

"Because each manufacturer's proposal will address its specific business situation, DTSC cannot predetermine the actions that paint or varnish manufacturers would need to take, either individually or collectively, to meet the goals of protecting people and the environment and advance green chemistry or green engineering principles," the agency said.

EPA considering federal ban

In the last days of the Obama administration, the US EPA issued a proposed rule to ban all consumer, and most commercial, use of methylene chloride as a paint stripper. And the agency solicited feedback on whether to additionally ban n-methylpyrrolidone (NMP), or impose rules on concentration, workplace protections and labelling.

The January proposal specifically excluded furniture refinishing, indicating that the EPA would "propose such a regulation at a later date."

At a September EPA stakeholder workshop, manufacturers and industrial users argued for requiring protective measures and possibly restricting the use of methylene chloride to commercial products, arguing that an outright ban would make furniture stripping unprofitable.

The workshop could be a clue that the Trump administration might follow through on some methylene chloride regulation. In addition, the semiannual regulatory agenda the EPA published on 24 August indicated that the agency plans to publish a supplemental notice of proposed rulemaking, amending its original proposal.

There is no requirement that the EPA act on that rule. However, methylene chloride is also being reviewed separately as one of the first ten priority substances subject to mandatory risk evaluation under the new TSCA. Furniture refinishing is included in the scope of that evaluation.

Sale of paint strippers containing methylene chloride is restricted in the EU under REACH.

EU enforcement pilot to target phthalates, flame retardants

Substances in articles project to include electrical products, building materials

23 November 2017 / Built environment, Electrical & electronics, Enforcement, Europe, Halocarbons, Phthalates, REACH

Echa's Enforcement Forum has started work on a pilot project to verify compliance with the notification and communication obligations of substances in articles in REACH. It will specifically target seven substances, or groups of substances, including flame retardants and phthalates.

National enforcement actions, reports from authorities and NGOs, and the low number of notifications being made to Echa indicate that industry is failing to meet its obligations.

The pilot was first announced in November 2015, two months after the European Court of Justice (ECJ) ruling that the 0.1% threshold for notifying SVHCs in articles applies to each component of a complex product rather than the entire product.

The project aims to:

- check compliance of producers, importers and suppliers of articles with their obligations (REACH Articles 7 and 33);
- raise awareness and understanding of legal obligations and the level of compliance among duty holders;
- build a better picture of the actual level of compliance by suppliers of articles;
- identify reasons for non-compliance and decide whether Echa, the Commission and/or member states competent authorities need to do more, such as providing support to duty holders; and
- gather experience and establish enforcement methods for a potential future large-scale check of these obligations.

Echa says electrical products, building materials and interior articles are examples of consumer goods that may be inspected. The substances, or groups of, that it will focus on are:

- brominated flame retardants;
- phosphorous flame retardants;
- short-chain chloroparaffins;
- phthalates;

- aprotic polar solvents;
- perfluorinated substances; and
- phenolic benzotriazoles.

The project runs from from October 2017 to June 2018. A report of the results is expected by the end of next November.

At the end of June, Echa published the long awaited revision of its guidance on substances in articles. The agency said the "comprehensive update", which was expected in 2016, gives more clarity on communication and notification obligations when articles contain SVHCs. It includes new examples, which it says are in line with the judgement of the ECJ ruling.

Forum meeting

Textile articles will also be addressed in the pilot, Forum chair Katja vom Hofe told Chemical Watch. This subject was raised at the November Forum meeting by Mauro Scalia, manager of sustainable business at European textiles industry association Euratex. He said the association has faced challenges with some non-compliant companies and asked if there was any enforcement activity around textiles.

"We said we have a number of enforcement projects, which – among other types of articles – are looking into textiles," Ms vom Hofe said. This includes the recently concluded fourth REACH-En-Force (Ref-4) project, which had "quite a high number" of checks for textiles.

Cefic REACH director Erwin Annys also spoke at the meeting about the enforcement of imported substances and how to protect competition for European manufacturers, which face strict controls inside the EU. Robust checks of imported substances are needed because, he said, Cefic believes some non-EU manufacturers are potentially not following the rules of REACH.

The Forum has "a very high percentage" of checks that address imports, Ms vom Hofe said, and added that "at least half" of the substances or products that it inspects are imported because it knows there is "a fairly high chance" they might not be compliant.

The third authorisation pilot project to be carried out by EU national enforcement authorities (NEAs) in 2019 will cover chromates with sunset dates that have passed.

In June, the Forum announced that NEA inspectors will focus on registration obligations – including substances registered as intermediates – under Ref-7. It also launched its first joint action agreement with its accredited stakeholder organisations (ASOs) – trade bodies and NGOs – to improve the quality of safety data sheets.

The working group is now set up and there is "lots of willingness" among its members, who will report at the end of next year on their findings, Ms vom Hofe says.

The next Forum meeting will take place in March 2018.

EPA lists chemicals reported under TSCA inventory notification rule

23 November 2017 / Substance notification & inventories, TSCA, United States

The US EPA has published an updated list of more than 10,000 chemical substances that have been reported under the TSCA inventory notification rule.

The rule requires manufacturers and importers to report by 7 February 2018 all nonexempt substances that they used in the ten-year 'lookback period' ending 21 June 2016.

Processors (downstream users) have until 5 October 2018. They are not required to report but must do so to avoid having a chemical labelled "inactive".

Agency officials said last month that a final inventory would be published within two months of the October deadline.

The list will be the starting point for identifying high and low priority substances for assessment under TSCA.

The list of 10,370 chemicals published on 22 November includes reports received by 10 November, and the agency plans to update it regularly.

"This list is for informational purposes only" and the listed substances "are not exempt from retrospective reporting by other manufacturers" unless they have obtained a Central Data Exchange (CDX) receipt from the manufacturer who has reported it, the EPA's notice says.

It will probably be most useful to processors, who are not required to report but may want to ensure that chemicals they deal with are on the active inventory.

The EPA has developed a separate list of 13,209 active chemical substances that are exempt from reporting. They are substances reported under the 2012 and 2016 Chemical Data Reporting (CDR) rule, and in Notices of Commencement received during the ten-year lookback period.

Canada will not regulate 2-MBS

23 November 2017 / Canada, Environmental Protection Act, Personal care

The Canadian government has decided that 2-MBS (benzenesulfonamide, 2-methyl) does not pose health or environmental risks, sufficient to warrant regulation under the country's environmental protection act (Cepa).

The substance is used primarily as an intermediate for fluorescent pigments and plasticiser resins, and as a plasticiser for hot-melt adhesives. It is also used as an ingredient in nail polish, and may be formed in small amounts during the manufacture of the food additive saccharin.

The risk assessment of these substances, and the proposal to take no action on them, was published for public consultation in February.

The final determination was published in the 18 November *Gazette*.

US Senate spending bill would eliminate IRIS programme

Appropriations measure would restore more than half of Trump's proposed cuts

23 November 2017 / TSCA, United States

The Senate Appropriations Committee has released a proposal that would eliminate the US EPA's Integrated Risk Information System (IRIS) programme. Such a move would potentially give control of chemical research directly to political appointees who run the agency's regulatory agenda.

The Senate committee's version of the fiscal 2018 appropriations bill covering the EPA was published on its website on 20 November. It would cut the agency's overall funding by $149m. But it provides $3.8bn more than the counterpart legislation approved by the House in September and $22.5bn above the 30% cut called for in the Trump administration's requested budget.

The Senate bill includes $111.6m for the "chemical safety and sustainability" line item that funds chemical research. This would be a $15.3m cut, but is more generous than the House and restores more than half of the $27m cut proposed by the administration.

Eliminating IRIS

However, the report accompanying the bill's text says the committee has not provided funding for IRIS. "In order to ensure that important chemical assessment work is completed, the Committee has transferred resources within the agency from IRIS to help implement the Lautenberg Chemical Safety Act," it said.

Chemical safety and sustainability is one of six thematic research programmes managed by the Office of Research and Development (ORD). Actual research is carried out by seven laboratory organisations. IRIS is part of one such laboratory, the National Center for Environmental Assessment (NCEA), which has facilities in Ohio and North Carolina.

"The bill imposes the IRIS workload onto the recently-reformed Toxic Substances Control Act (TSCA) programme, which was not designed to accommodate the breadth of the IRIS programme's responsibilities," minority Democrats on the Senate Appropriations Committee said in a statement.

It is not clear exactly how the committee's majority envisions redistributing funding and responsibilities, but the office in charge of "implementing" the Lautenberg Act's TSCA reforms is the Office of Chemical Safety and Pollution Prevention (OCSPP). That is the regulatory division that would be headed by Michael Dourson if his nomination is not defeated in the Senate.

"At best a small fraction of its responsibilities — and only one-third of its funding — would be re-allocated" to the OCSPP, Jennifer McPartland, a senior scientist at the Environmental Defense Fund (EDF), wrote in criticising the Senate bill's treatment of IRIS.

Moving IRIS staff from the non-regulatory ORD into the OCSPP would cost the EPA "scientific expertise that serves the entire agency, severely undermining the legal responsibilities Congress has given it," and would "sever the independence between scientific review and regulatory decisions informed by such reviews," Dr McPartland wrote.

She noted that the EPA's website says placing the IRIS programme within ORD "ensures that IRIS can develop impartial toxicity information independent of its use by EPA's program and regional offices."

Alternative test methods

The Senate panel's report also included unusually specific language regarding development of a strategic plan to promote alternative test methods that is required under TSCA. EPA officials discussed the emerging plan at a recent public meeting. The process of developing the plan should involve public meetings, consultation with "the scientific community and the public" and a final version "documenting response to, and disposition of, public comments". The committee asked for a progress report by 30 September 2018.

Finally, the report addresses a TSCA provision allowing the EPA to collect fees from manufacturers. The bill would earmark $10m in federal funds that would be replaced by the fees that are anticipated to come in during fiscal 2018.

Russia sends implementation plan to Stockholm Convention

23 November 2017 / Persistent organic pollutants, Russia

The Russian Federation has submitted its national plan on implementing the Stockholm Convention on persistent organic pollutants (POPs).

Each party to the convention is required to develop such a plan, which the Secretariat then presents to the next Conference of the Parties.

The national implementation plan (NIP) was approved by the country's Ministry of Natural Resources on 3 October.

The NIP consists of two sections. The first deals with activities to be implemented by 2020, and includes seven objectives:

- improved legal regulation of POPs;
- an improved management system for POPs;
- the destruction/disposal of accumulated pesticides, industrial wastes and equipment containing POPs;
- cleaning of contaminated territories;
- monitoring of the pollutants in the environment and population health in relation to their effects;
- improved information and education; and
- exchange of information with the Secretariat and Parties to the Stockholm Convention.

The second section deals with long-term versions of these activities for the years 2021-2028.

- NIPs

US children's products trade group refutes NGO chemical ranking

Mind the Store defends retailer report card

23 November 2017 / United States

US trade group the Juvenile Products Manufacturers Association criticised an NGO report — which grades retailers' on their efforts to tackle chemicals of concern — for implying children's products could be toxic.

Kelly Mariotti, executive director of the JPMA, told Chemical Watch that children's products "cannot present either acute or chronic hazards to children" because they are "heavily regulated" under the Federal Hazardous Substance Act and Consumer Product Safety Act, and most products were tested by government-accredited laboratories before sale.

She said: "We are extremely confident these products are safe and would be verified as safe by any board-certified toxicologist. The claims here are false and misleading, which is why we urge all responsible parties to either verify them or retract them from publication."

The 'report card' by the Mind the Store coalition of NGOs ranked 30 retailers across 11 sectors on their chemicals policies.

The eight baby and children's products retailers assessed received an average D+ grade, matching the average retailer performance on safer chemicals.

Co-author of the report and executive director of the Environmental Health Strategy Center, Mike Belliveau, told Chemical Watch: "We did find that the baby product sector is a laggard in ensuring the chemical safety of the products they sell. That should be a wake-up call to action for most consumers and the retailers."

In a Mind the Store press release, Bobbi Wilding, coordinator of the Getting Ready for Baby campaign, called on Toys R Us subsidiary Babies R Us, and Buybuy Baby to make "vast improvements" in 2018.

However, Frederick Locker, attorney at Locker Greenberg & Brainin LLP, the independent general counsel for JPMA, told Chemical Watch: "The premise of the reports and supporting campaigns is a claim the mere presence of a substance or material renders products toxic; rather than a toxicological assessment of hazardous exposure. There is a significant distinction."

'Drop in the bucket'

In response to the JPMA's comments, Mr Belliveau said: "This report is not an assessment of the safety of an individual product, it is a comparison of leaders and laggards in the retail sector regarding policies and practices that are designed to ensure that chemical safety in the products they buy and sell."

He added: "There are thousands of dangerous chemicals and untested chemicals in commerce. The US government has only outright banned two classes of chemicals in toys in recent times, which is lead compounds and phthalates. That's a drop in the bucket."

Ms Wilding said in response to the JPMA: "Baby products retailers were evaluated with the same criteria looking at their corporate practices. You don't need to look any further than the Washington State database on chemicals of concerns in children's products to realise that there are chemicals of concern being reported by manufacturers in products made for children."

She added: "We stand by our concern in making sure that products made for children are made without chemicals of concern, because we are concerned about eliminating the hazards."

Toys R Us

Toys R Us and its subsidiary Babies R Us, received an F grade, scoring five out of a possible 135 points and ranking 22nd out of 30 retailers.

The report says the store is "failing to publicly address toxic chemicals in the products they sell". Toys R Us missed out on points because it does not publish a corporate responsibility report or other public facing documents that summarise their efforts to address chemicals of concern.

A spokesperson for Toys R Us said that, because the report based its grades on publicly available information, it did not reflect its actual policies or programmes.

Buybuy Baby did not respond to Chemical Watch's request for comment by the time of publishing.

Head of UN Environment calls for 'targeted intervention' on hazardous chemicals

Executive director sets out framework ahead of global environment meeting

23 November 2017 / Global

In his vision to combat the rise in global pollution, UN Environment executive director, Erik Solheim (pictured), has set out measures to address hazardous chemicals.

Mr Solheim's report, *Towards a Pollution-Free Planet*, outlines actions to tackle the issue around the world and highlights chemicals of concern as a "hard-hitting" target. The report has been prepared for the third United Nations Environment Assembly (Unea-3) in Nairobi, Kenya between 4 and 6 December which has the overarching theme of pollution.

The framework targets substances already addressed through multilateral agreements — such as those covered by the UN's Basel, Rotterdam, Stockholm and Minamata Conventions. The aim will be to identify — and take action on — areas where implementation and enforcement of these substances needs to be strengthened and scaled up. Examples of where action can be taken include:

- identifying alternatives;
- providing additional finances to curb risks;
- capacity building; and
- encouraging industry support.

A second target category will be pollutants where scientific evidence already exists to justify new interventions to reduce the risk that they pose, for example for heavy metals. Actions, it says, could include enforcing new emissions standards and improving chemical labelling schemes.

A third category focuses on substances where the emerging scientific evidence of the "nature and magnitude of their risk to human health and the environment points to the need for further investigation and better understanding of those risks", such as endocrine-disrupting chemicals.

"There is a need to step up research into, and build understanding of, the potential risks of these substances, especially in developing countries," the report says.

Chemicals and waste

The report sets out 50 broad policy options to address air, water, land/soil, marine and coastal, and chemicals and waste pollution. Of these, 19 come under chemicals and waste.

These include:

- adopt sound chemicals management and advance sustainable chemistry within business approaches, policies and practices;

- increase efforts to deploy locally safe, effective, affordable and environmentally sound alternatives to chemicals of concern, including DDT (dichlorodiphenyltrichloroethane), PCBs (polychlorinated biphenyls), asbestos, lead and mercury;
- accelerate the implementation of the Basel, Rotterdam and Stockholm conventions, the Minamata Convention and the Strategic Approach to International Chemicals Management in a coordinated manner at the national level;
- improve knowledge relating to chemicals in products throughout their life cycle (production, use, consumption and disposal); and
- increase publicly available information and monitor data on the presence of chemicals in the environment, in humans and in pollution hotspots.

Last month, the EU Council of Ministers called on UN member states to help increase knowledge of hazardous substances, encourage the exchange of information on chemicals in products and replace hazardous chemicals with safer alternatives.

It called upon the assembly meeting to decide upon concrete measures to deal with specific issues such as endocrine disruptors and heavy metals.

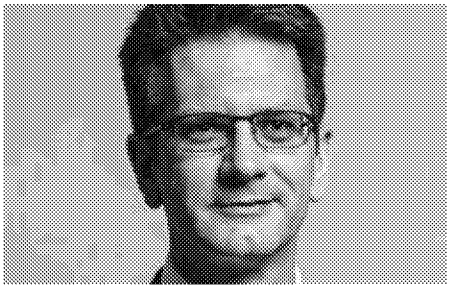
UK government wants Brexit deal validity for REACH registrations

Chemicals regulations 'key topic in opening phase of negotiations', minister says

23 November 2017 / REACH, Substance registration, United Kingdom



The UK government has reaffirmed its position that it wants existing REACH registrations and authorisations to remain valid in both the EU and UK markets after Brexit.

And, according to a government spokeperson, the matter has been a key topic of the opening phase of Brexit negotiations.

The comments were due to be made in a speech by Steve Baker, a junior minister in the Department for Exiting the European Union at last week's Brexit conference, which was hosted by the Chemical Industries Association (CIA). Mr Baker was forced to pull out at the last minute but supplied his speaker's notes to the organisation.

"The UK's position is clear," the notes say. "We want existing registrations, authorisations and approvals to remain valid in both the EU and UK markets. Clearly, this is in the interests of businesses in the UK and the EU. [The government] recognises the complex compliance activity that takes place through supply chains.

"We understand the concerns of businesses regarding the validity of their REACH registrations, as well as the costs that industry have already invested to comply with REACH," he says. "We have been listening to what businesses and others have been telling us about their concerns for the future and the potential impacts and opportunities of EU Exit. We will continue do this.

"I can assure you that this matter has been a key topic of the opening phase of negotiations. Our position paper on this in August sets out the UK's principles for ensuring goods continue to be available on UK and EU markets."

The CBA, CIA and Cefic have all called for regulatory consistency and for the country to remain in REACH. Failure to do so, they say, might result in British registrations and authorisation applications becoming invalid.

Continuity

In the short-term, Mr Baker's notes say, the EU Withdrawal Bill will provide "continuity" for the chemicals sector, because it is "designed to ensure" that the UK exits the Union with "certainty, continuity and control".

According to the notes, the UK wants:

- high standards of protection of human health and the environment;
- to make sure it can respond to emerging risks; and
- to make sure it can minimise barriers to trade.

Britain and the EU start from "the unique position" of regulatory alignment, Mr Baker says. "So the question for us now, in building a new economic partnership, is not how we bring our rules and regulations closer together, but how we manage our interdependence in a way that maintains the balance of rights and obligations that flow from this regulatory relationship."

It is in the "mutual interests" of the UK and EU chemicals industries to agree a deal that allows the greatest possible tariff-free and barrier-free trade in chemicals.

In the "unlikely scenario" that no mutually satisfactory agreement can be reached, the government will "make sure we continue to have a functioning chemicals regulatory and enforcement system".

Earlier this month, CIA and Cefic said failure to secure a transition period and a new UK/EU trade agreement after Brexit could cost the chemicals industry an extra €1.5bn a year.

Collaboration

The chemicals sector, Mr Baker's notes say, is "the industry of industries", and one of the UK's "core objectives" is to continue to collaborate with European partners on major science, research and technology initiatives.

"The UK will look to build on its unique relationship with the EU and establish an agreement on science and innovation that ensures the valuable research links between us continue to grow."

And the notes say "stakeholder engagement is a central element" of the government's plan to build its negotiating positions.

Industry and NGOs have both called for business to "speak up" for a better Brexit, through cooperation and more visibly communicating their concerns.

Echa round-up

23 November 2017 / Classification, labelling and packaging Regulation, Europe, SVHCs

Extension of public consultation on CLH

Echa will extend the public consultation comment period on harmonised classification and labelling (CLH) proposals from 45 to 60 days from 1 January 2018. The reason for this is to allow more time for the parties concerned to prepare and submit their comments, the agency says.

Testing proposals

The agency has received twelve testing proposals for eight substances. The deadline for submitting information is 8 January 2018.

Translations:

- **Guidance on labelling and packaging**

Translations of the updated Guidance on labelling and packaging (version 3.0) published in July, are now available in 23 EU languages on Echa's website.

- **Information on manual verification**

The agency's advice for manual verification at the completeness check was updated in October. Translations in 22 EU languages are now available.

Survey of SVHC Roadmap tools

Echa is reviewing, with member states and the European Commission, implementation of the roadmap for SVHC identification and REACH risk management measures from now to 2020 (the SVHC Roadmap).

In particular, the agency is looking for ideas on how to improve current tools that have been developed to enhance and support the transparency and predictability of the work of authorities.

Survey of poison centres website

Echa is planning an update of the poison centres website and would like users' opinion on the current content. Its online survey will take about five to ten minutes to complete, it says.

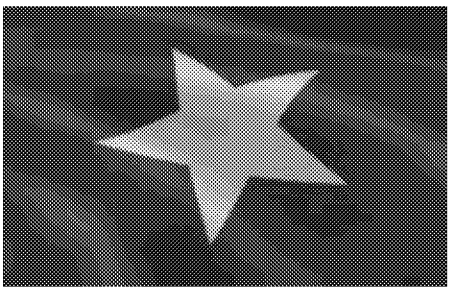
Vietnam to introduce national database by 2019 at earliest

23 November 2017 / Vietnam



Vietnam aims to complete its first comprehensive national chemical inventory and database by 2019, an official at its chemicals agency Vinachemia said.

Speaking at the International Chemical Management Conference earlier this month, Nguyen Thi Ha, head of the organisation's Conventions and International Cooperation Division, said that one of its priorities is the development of a national chemical database and inventory.

The government is funding the project with support from Japan's Ministry of Economy, Trade and Industry (Meti). The agency published a draft inventory in March 2017.

The new database and inventory aim to reach an effective list of between 300 and 400 chemical substances.

"We expect that we can complete this task at the earliest by 2019," she said.

Details of Decree 113/2017/ND-CP unveiled

During the conference, Ms Ha also introduced the key points of Decree 113/2017/ND-CP which regulates the declaration of manufacturing/import of chemicals. The rules take effect on 25 November and include:

- adding requirement for the bottling and packaging of chemicals;
- adding clear criteria for each list of chemicals based on the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) classification;
- removing the current list of toxic chemicals;
- removing the requirement for the registration for the use of chemicals; and
- mandating that reporting requirements to be integrated in general reports on all chemical activities.

The aim is to ease numerous onerous or unnecessary restrictions and make some tasks for self-management.

Spanish initiative targets child poisoning from 'everyday' products

23 November 2017 / Accidents, emergency response & poison centres, Cleaning products, Labelling, Spain

The Spanish consumers federation, CECU, has launched a new initiative to raise awareness of chemicals contained in glues and paints, used daily by children. It will also target household products, such as detergents, to prevent incidents of poisoning.

The project – Ojo a la Etiqueta (Watch the label) – will promote knowledge about the labelling and safe use of stationery items, including markers and correctors, as well as cleaning products and insecticides used at home.

"Every year thousands of accidents related to poisoning occur, of which more than 93% happen in the home and more than 45% affect children under ten years," CECU said in a statement.

The project, to be carried out in collaboration with the Spanish chemicals industry association (Feique), will be presented in Madrid today. Mercedes Vinas, Echa's head of unit for dossier submission, will be at the launch.

The CECU says it has prepared ten training sheets for parents, tutors and teachers with advice on what to do if a child swallows paint, glue or medication, and how to act in case of poisoning. The material will also be available on the CECU website.

It has also created a mobile app with:

- access to the sheets;
- rapid advice in case of poisoning; and
- a direct dial button to the Toxicological Information Service.

The initiative, subsidised by the Spanish agency for consumer affairs, food safety and nutrition (AECOSAN), will be disseminated in social networks and has the hashtag #OjoALaEtiqueta.

Earlier this year, soap and detergents trade body Aise said some of its members plan to undertake voluntary measures, to help reduce child exposure to liquid laundry detergent capsules (LLDCs). These will include superior child-impeding closures and an advertising code of conduct.

It followed European Commission's LiquiCaps study, which highlighted an increase in the numbers of accidental exposure or poisoning in children under five, when compared with traditional detergents.

Echa: non-animal tests for complex endpoints remain distant

Regulatory applicability 'not foreseen' in near or medium term

23 November 2017 / Biocidal products Regulation, Classification, Classification, labelling and packaging Regulation, Europe, GHS, REACH, Test methods

Non-animal approaches for the prediction of higher-tier hazard endpoints that would be applicable under EU chemical legislation are "not foreseen" in the near or medium term, according to analysis by Echa.

Non-animal approaches in general are the subject of "very active ongoing research", the agency said in a report on the current status of regulatory applicability of such approaches under the REACH, CLP and biocidal products Regulations. Furthermore, those for the prediction of certain lower-tier endpoints, such as skin irritation, corrosion and sensitisation, have become standards, as defined by the legislation.

But non-animal approaches for the prediction of more complex endpoints, such as repeated dose or reproductive toxicity, remain far off, the report said.

Challenges

The report outlines several challenges to the development of such approaches and their uptake in regulatory contexts.

First, they do not always provide the same levels of information as their animal equivalents in terms of the dose- or concentration-response relationship and adverse effects, it says. Some still under development could provide higher levels of information than current ones. These include approaches based on *in vitro* microsystems and high-throughput or high-content approaches. But these will still require standardisation and validation before they can be used in regulatory contexts.

Second, standardisation and validation is complicated by the plurality of approaches required, compared with animal equivalents. Regulators must work out how data generated by non-animal approaches that do not have a direct relationship with an endpoints specified in CLP, can be used for classification and for the derivation of safe use levels.

The agency suggests that an inventory of non-animal approaches that shows stage of development and regulatory applicability would help to identify gaps and determine future steps to enhance use.

The report, requested by Echa's management board, is the first of its kind. In previous reports, requested by the European Commission and published in 2011, 2014 and 2017, Echa provided data on companies' use of non-animal approaches under REACH.

In contrast, for each relevant information requirement, the new report provides:

- the potential non-animal approaches;
- the challenges to achieving their use in regulatory contexts; and
- future perspectives, including of those approaches that could be close to regulatory applicability.

In a foreword, outgoing Echa executive director Geert Dancet says he hopes the report will act as a guide for the scientific community.

Animal rights NGO Humane Society International (HSI) questioned "the continued emphasis on animal methods as the basis for comparison of the viability of new methods". Such emphasis presumes that toxicology studies on animals are the only valid approach, it said.

"These words must now be backed-up by more positive practical action and financial support for the promotion of non-animal approaches."

Furthermore, future reviews should be led by "mandated bodies", such as the European Commission Reference Laboratory for Alternatives (EURL-Ecvam), HSI said.

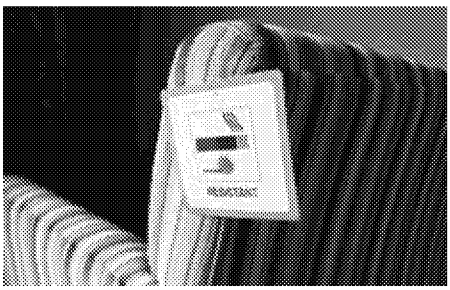
Furniture trade body welcomes EU warning on flame retardants

Member states urged to evaluate testing methods for upholstered items

23 November 2017 / Built environment, Europe, Substances of concern



The European Furniture Industries Confederation (Efic) has welcomed a warning, included in the revised EU Green Public Procurement criteria, on the negative effects of flame retardant use.

GPP criteria for furniture are voluntary guidelines, which aim to help public authorities purchase products and services with reduced environmental impacts.

In the staff working document on the EU GPP, the European Commission notes that the open flame test for upholstered furniture (EN 1021-2) requires a lower level of flammability than the European 'smoulder ignition test' (EN 1021-1).

It says the open flame test can lead to use of flame retardant chemicals which "may have negative effects for the environment, health, durability and quality of products, and may lead to cost increases".

The guidelines urge public authorities to "therefore consider, according to the intended use and location of the furniture items, what levels of flammability it needs to require."

'A first step'

Efic general secretary, Roberta Dessi, told Chemical Watch that the association was glad the Commission had adopted this recommendation.

She said: "It is a first step. We believe that this can help raise awareness among member states about the consequences of choosing certain flammability tests for furniture."

But she added that the "sustainability part" of public tenders is often accompanied by demands for very stringent flammability standards. This leads to widespread use of flame retardants "in contradiction with the aim of having truly green procurements".

She urged member states to "use this feedback to re-evaluate the need for such stringent standards for furniture in their national requirements, in the light of the overwhelming scientific evidence on risks connected to flame retardant use."

The UK and Ireland are the only EU countries to have national regulations requiring an open flame test for domestic furniture, which effectively necessitates the use of flame retardants. Last year, Efic lodged a complaint with the Commission on the basis that these standards pose a barrier to trade in the single market.

For furniture for the public market there are different national regulations in force, some of which also impose open flame tests.

Furniture design

The GPP criteria technical report acknowledges that the need for flame retardants can potentially be avoided by "careful choice of materials and product design". But it says that this type of upholstered furniture "can be considered to only represent a niche market at this stage and, unlike California, current fire safety standards in Europe for public furniture are currently not well set up to embrace this approach."

California removed its open flame test in 2013. Prior to that, California's Technical Bulletin (TB) 117 had served as the de facto national standard, which effectively required the use of flame retardants.

The report adds that the lack of a harmonised approach to fire safety standards, at the European level, means that "any potential restrictions on flame retardants, recommended in EU GPP criteria, may conflict with specific member state legislation."

Ms Dessi responded: "Our campaign is aimed at having a more proactive approach from European institutions, in making the case for flame retardant free furniture possible."

She also noted: "In addition to the environmental and health impact, there is a growing concern that flame retardants may increase fire toxicity. This would also seriously question any concrete fire safety benefit from their use."

Efic is a member of the Alliance for Flame Retardant Free Furniture in Europe, a coalition of stakeholders including industry associations and environmental NGOs.

Last year, the coalition published a paper, *The Case for Flame Retardant free Furniture,* calling for the EU to harmonise fire safety regulations so that the chemicals were not required for them to be met.

Efic have argued that the use of flame retardants and other chemicals may prevent the furniture sector from fully entering the circular economy.

Earlier this year, San Francisco banned the sale of upholstered furniture and children's products, "made with or containing an added flame retardant chemical". More than a dozen US states have banned some categories of the chemicals.

ToxCast and Tox21 high-throughput data identify potential EDCs

Fifra SAP set to discuss androgen receptor model

23 November 2017 / Alternative approaches to testing, EDCs, United States

ToxCast and Tox21 high-throughput screening data provide a "rapid and effective resource" for identifying substances with the potential to activate human oestrogen (estrogen) receptors (ERs), according to a top US Environmental Protection Agency (EPA) official.

Stan Barone, acting director of the EPA's Office of Chemical Safety and Pollution Prevention, was describing progress in using ER high-throughput assays for tier 1 of the Endocrine Disruptor Screening Program (EDSP) at a workshop on toxicity testing and decision making.

The EDSP uses an oestrogen receptor model that integrates data from 18 high-throughput assays. The agency has recently been looking into whether it actually needs all of the tests to get the same predictive validity from the model, and has a publication in press. "The short answer is we don't need 18 assays," said Dr Barone.

The EDSP is making good progress on an androgen receptor model, which integrates 11 *in vitro assays*, he added.

The Federal Insecticide, Fungicide, and Rodenticide Act Scientific Advisory Panel (Fifra SAP) is set to discuss the tests between 28 and 29 November.

Limitations

Like most alternative approaches, the high-throughput assays have limitations, Dr Barone explained. These include metabolism and solubility issues. False negatives can result from low solubility, which limits test chemical concentrations. Furthermore, reactive compounds, metals and particulates tend not to work well in the low volume, high-throughput assays, he added. The EPA is conducting research to address these issues.

The agency is also looking into "critical performance criteria" to include in a performance-based guideline to help stakeholders understand data and documentation requirements.

One of the lessons learned is that annotating assays is "critically important for acceptance", said Dr Barone.

Understanding pathways to a paradigm shift in toxicity testing and decision making was held by the National Academies of Sciences, Engineering and Medicine in Washington DC between 20 and 21 November.

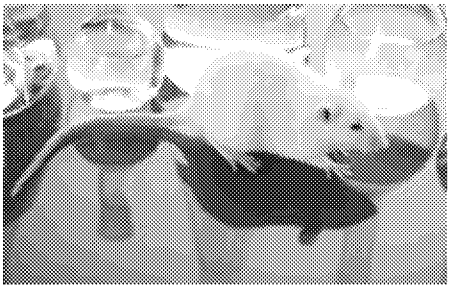
US NAS workshop raises issue of animal tests as 'gold standard'

Greatest progress where human data available

23 November 2017 / Test methods, United States



The issue of whether animal test methods should be used as as a "gold standard" against which to judge the alternatives was raised by multiple attendees at a recent US workshop on toxicity testing and decision making.

"It is one of the big challenges that we face," said Anna Lowit, co-chair of the Interagency Coordinating Committee on the Validation of Alternative Methods (Iccvam) and senior science adviser at the US EPA's Office of Pesticide Programs.

"One of the things that we are finding is that we are having the most success in areas where human data exists to make those comparisons," she added. As an example, she pointed to recent research suggesting that OECD test guidelines for skin sensitisation may give better predictions of human toxicity than the local lymph node assay (LLNA) in rodents.

Maurice Whelan, head of the EU Reference Laboratory for Alternatives to Animal Testing (EURL Ecvam), described the relevance and variability of animal test results as the "elephant in the room". In the case of alternative skin sensitisation test methods, discussing it with regulatory committees resulted in an important step forwards. "What's the variability of the LLNA data? ... From the human data that we have, we know it's not perfect."

Rodent retreat

Meanwhile, Dr Lowit spoke of progress in moving away from rodent tests for skin irritants, and effects in the nasal cavity and lung tissue.

"Industry partners are working towards actually eliminating the 28-day and 90-day rate inhalation study, just because it's not really relevant to humans," she said. "We can do better with animal 3D tissues combined with sophisticated pharmacokinetic modelling and just avoid the animal completely."

She predicted that: "When we start to tackle complicated things, like cancer and developmental reprotoxicity, we will have enough experience under our belt, in a way that we won't have to hold up the rat and the mouse models as a gold standard."

The importance of uncertainty

Finally, workshop participants agreed on the need to understand the uncertainties associated with alternative test methods.

The skin sensitisation case "highlights the importance of something that we have neglected for many years: appreciating that, in fact, understanding uncertainty, describing it, talking about it, is extremely important for moving towards people using new approaches," said Professor Whelan.

"The good news is that we won't have to start from scratch. There is an awful lot of rigorous scientific-based work being done on how to go about describing uncertainties."

Understanding pathways to a paradigm shift in toxicity testing and decision making was organised by the US National Academies of Sciences, Engineering and Medicine and held in Washington, DC on 20-21 November.

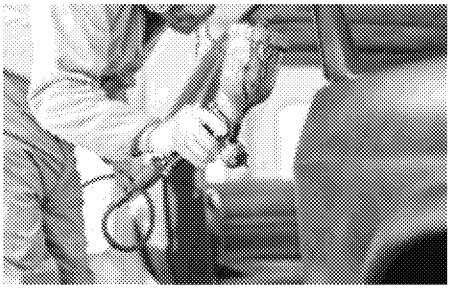
- Understanding pathways to a paradigm shift in toxicity testing and decision making

REACH exposure scenario group looks for improvements

New batch of updated use maps to be published soon

24 November 2017 / Europe, Exposure scenarios



Stakeholders of the REACH Exchange Network on Exposure Scenarios (Enes) have been discussing a draft programme that will take its work through until 2020, at its eleventh meeting in Helsinki this week.

The network aims to improve the content and use of exposure scenarios generated under REACH. They are a key element of safe use communication through the supply chain through the extended safety data sheet.

Erwin Annys, REACH director at Cefic, told stakeholders – including representatives from Echa, up and downstream industry and member state authorities – the programme aims to tackle six issues:

- promotion of the Enes tools to various stakeholders;
- support for downstream sectors developing use maps;
- support for registrants in applying new use information in their chemical safety reports, and communicating safe use information through the supply chain. Proposed activities include adapting the software tool Chesar and building a common practical framework for various estimation tools relating to worker exposure;
- improving tools for formulators;
- further market research especially to help downstream users; and
- improving the interface between REACH and occupational safety and health controls.

The programme will be finalised early next year, and presented to the Competent Authorities for REACH and CLP (Caracal) in March.

Updated sector use maps

Meanwhile, a raft of updated REACH sector specific use maps are expected to be published shortly on Echa's website. The agency's Laure-Anne Carton de Tournai, said that 13 sectors are currently active in the programme.

So far six groups have published the standardised information. This aims to provide realistic descriptions of chemical uses and, depending on their relevance, inputs for worker, consumer and environmental exposure, in their industries.

Another five sector groups – paints and coatings, plastics additives, petroleum products, solvents and fertilisers – will be published soon.

Ms Carton de Tournai also gave figures for how many files had been downloaded from the Echa use map library.

The detergents sector, represented by Aise, which had its documents published in October 2016, has had nearly 5,800 downloaded; and the adhesives and sealants industry (Feica) has had more than 3,500 documents downloaded since November 2016.

Ambition

Echa is unclear on exact use of the documents. Originally the ambition was for the updated use maps to be implemented in 2018 dossiers. However, this has not occurred, and the hope now is they will be used to update dossiers after the deadline.

Speaking for the European Solvents Industry Group (Esig), Cornelia Tietz said assessment of generic exposure scenarios developed for solvent uses for the 2010 REACH deadline showed good alignment with the new batch of use maps and specific worker exposure determinants.

Dook Noij of Dow outlined a pilot project trying to quantify the benefits of the harmonised communication package ESCom XML, and standard ESCom phrases. The project indicated that manual exposure scenario data input takes between 2-4 hours, compared to five minutes to quality check electronic submissions – if all phrases exist in ESCom. If there are phrases missing, the estimated time is up to an hour.

Mr Noij noted that the initial effort needed to implement ESCom XML can be significant, but he said the benefits included improved use of resources and expertise, and faster processing.

Subject: STPC September Meeting
When: Wednesday, September 12, 2018 2:00 PM-4:00 PM (UTC-05:00) Eastern Time (US & Canada).
Where: DC Location - Ronald Reagan Building Room 41213

AGENDA

SCIENCE & TECHNOLOGY POLICY COUNCIL MEETING

Wednesday, September 12, 2018
2:00 – 4:00 PM ET

Conference Room (DC): Ronald Reagan Building 4th Floor Room 41213
Audio Conference Call-in Number: 1-202-991-0477
Conference Code: 312-3584

Adobe Connect Information: http://epawebconferencing.acms.com/amudambi/

1. **Introductory Remarks and Roll Call** (10 minutes, to 2:10)
   Lead: Jennifer Orme-Zavaleta (Science Advisor)
   Roll Call: Anand Mudambi, STPC Coordinator (OSA)

2. **Updates:** (40 minutes, to 2:50)
   a. Strengthening Transparency Rule (Response to comment and rulemaking): Maria Doa (ORD)
   b. PFAS Coordination : OW
   c. Pb Coordination : Hayley Hughes and Valerie Zartarian (ORD)
   d. Contaminants of Emerging Concern Project : Jeff Frithsen (ORD)
   e. Standing Groups Status : Anand Mudambi (OSA)

3. **Voluntary Consensus Standard (VCS) Development - Draft EPA Guidance** (20 minutes to 3:10)
   Lead: Elise Owen (EPA Standards Executive, housed in OCSPP)
   Purpose: Brief the STPC on the development of Agency guidance regarding EPA personnel participation in private sector Voluntary Consensus Standards (VCS) development
   Outcome: Inform STPC input on the draft guidance

4. **Citizen Science** (25 minutes, to 3:35)
   Lead: Jay Benforado (OSA)
   Purpose: Discussion of Draft Charge to Implement NACEPT and OIG Recommendations
   Outcome: Get STPC input on the charge activities

5. **RAF Cumulative Risk Assessment (CRA) Technical Panel Products** (20 minutes, to 3:55)
   Lead: Lawrence Martin (OSA)
   Purpose: Inform STPC about the CRA Guidelines on Planning and Problem Formulation, and the Document updating Chemical Mixtures Additivity
   Outcome: Preparation for STPC concurrence on the RAF's CRA products for external peer review

6. **Summary of Action Items** (5 minutes, to 4:00)
   Report: Anand Mudambi (OSA)

Next STPC Meeting: Wednesday, December 5, 2018

Next STPC Meeting: Wednesday, December 5, 2018

STRENGTHENING TRANSPARENCY IN REGULATORY SCIENCE RULEMAKING

OVERVIEW

- Proposed on April 30, 2018
- The proposed rule would require that for significant regulatory actions, the underlying data for pivotal regulatory science be made publicly available to support independent validation of the studies
- OPD is leading the Agency workgroup for this Tier 1 action
- Representatives from OAR, OGC, OLEM, OP, OW, OCSPP, R4, R5 and R7
  - Have started assessing some issues
- ORD team representatives from OSP, OCA, NHEERL, NERL, OSIM, NCEA

PUBLIC COMMENT

- Public Hearing was held on July 17, 2018
  - 150 attendees and 91 speakers
- Public comment period closed August 16, 2018
  - Comments are still being processed but as of August 21, 2018 there were almost 600,000 public comments of which more than 9,500 are unique comments
- In the process of organizing and reviewing the comments

- Comments submitted by
  - Professional organizations and journal editors
    - E.g. SOT, ACS, AAAS
  - States, Tribes and Localities
  - State associations
  - Industry
  - Environmental groups
  - Health groups
  - Labor Unions
  - Universities
  - Public
    - Federalregister.gov/documents/public_submissions

PUBLIC COMMENT

PUBLIC COMMENT

- Major categories of comments
  - Comparison of the proposed rule requirements with statutory findings and procedures in environmental statutes
  - What problem is the proposed rule intended to fix?
  - Consistency with the Administrative Procedures Act
  - Degree of consistency with scientific norms
  - Types and extent of data that would be excluded
  - EIS
  - Quality of regulatory text
  - Costs
  - Peer review
  - Does the process work?

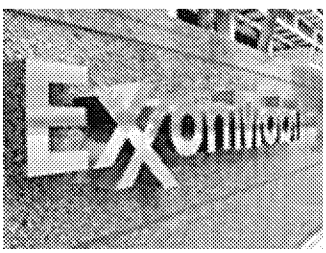
Security Detail Added $30K More to EPA Chief's Italy Trip

Travel costs for security personnel accompanying EPA Administrator Scott Pruitt to Italy tallied $30,554, bringing the grand total for the trip to $120,249, according to documents obtained by the Environmental Integrity Project.

Trump EPA Plans New Restrictions on Science Used in Rulemaking

The Environmental Protection Agency is preparing to restrict the scientific studies it uses to develop and justify regulations, making it harder to rely on research when its underlying data are shielded from view.

Exxon Says U.S. Gulf Coast Plastics Project Could Begin by 2021



Snapshot

• Final investment decision due to be taken later this year

• U.S. shale boom has spurred hundreds of chemical investments

By Kevin Crowley

Exxon Mobil Corp. said a project to expand plastics manufacturing along the U.S. Gulf Coast could start up by 2021 as the oil explorer boosts investment in a business that accounted for almost one-fourth of last year's profit.

Engineering work has begun on a facility that would increase Exxon's ability to produce polypropylene, a resin used to make lightweight and durable plastics, by as much as 450,000 tons a year, the Irving, Texas-based company said in a statement March 20.

The project will cost "several hundred million dollars" with a final investment decision due later this year.

Hundreds of U.S. chemical projects valued at $188 billion have been announced since 2010, according to the American Chemistry Council, as the U.S. shale boom slashed the cost of oil, natural gas, and byproducts used as feedstocks.

"Most of our planned investment in the Gulf Coast region is focused on supplying emerging markets like Asia with high-demand products," John Verity, who heads Exxon's chemical business, said in the statement.

Exxon's polypropylene project is one of the company's 13 new facilities planned to expand chemical output in North America and Asia.

Negotiators aim to settle policy fights, post omnibus tonight

George Cahlink and Geof Koss, E&E News reporters

Published: Tuesday, March 20, 2018

Congressional leaders hope to have massive omnibus spending legislation on the House floor by Thursday. Wikipedia (money); Ed Uthman/Flickr (Capitol)

Congressional leaders hope to have massive omnibus spending legislation on the House floor by Thursday, assuming they can resolve a few dozen outstanding policy fights.

House Speaker Paul Ryan (R-Wis.) said this morning he's "hoping" to file the $1.3 trillion spending bill late tonight, paving the way for the House Rules Committee to consider the bill tomorrow and then floor action Thursday

Pruitt aide didn't have to sign Trump ethics pledge

Kevin Bogardus and Amanda Reilly, E&E News reporters

Published: Tuesday, March 20, 2018

U.S. EPA headquarters in Washington. EPA/Flickr

One of U.S. EPA Administrator Scott Pruitt's top aides wasn't required to sign President Trump's ethics pledge.

Byron Brown, deputy chief of staff for policy, was hired in an "administratively determined" position — a unique hiring authority held by the agency under the Safe Drinking Water Act. Consequently, Brown was not designated as a political appointee and didn't have to abide by the pledge.

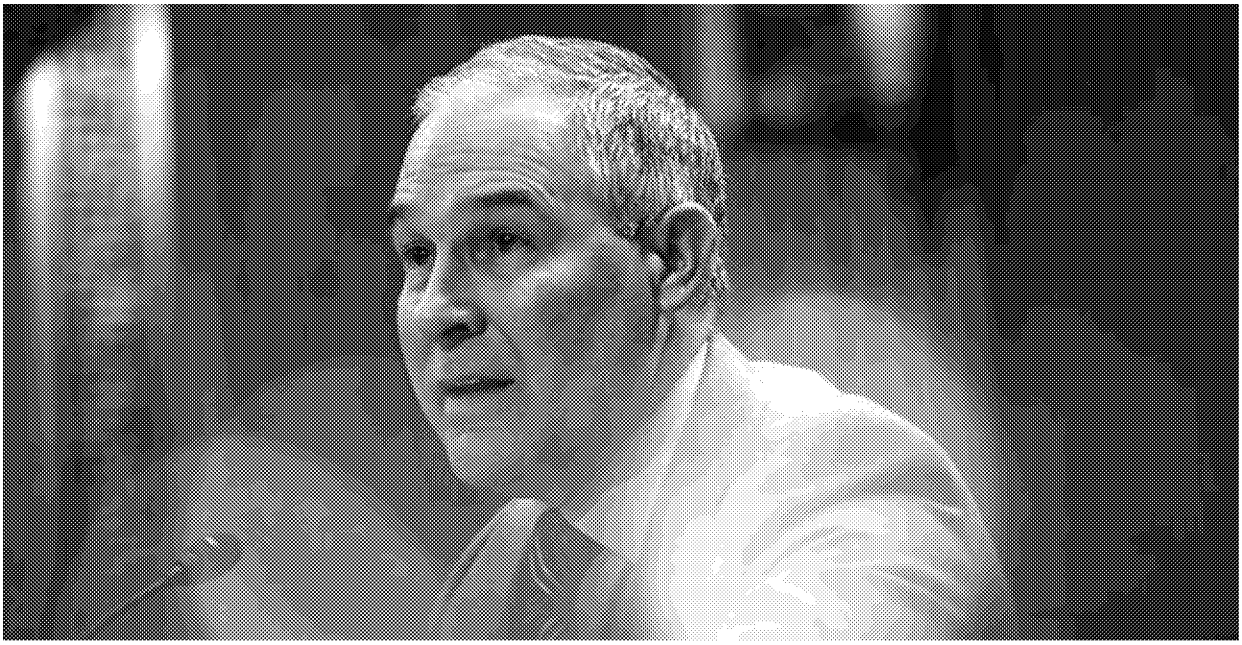
Details lacking as Pruitt attacks 'secret science'

Scott Waldman, E&E News reporter

Published: Tuesday, March 20, 2018



U.S. EPA Administrator Scott Pruitt is sharing few details about his plan to make agency science more transparent. Pablo Martinez Monsivais/Associated Press

U.S. EPA is not releasing details of its plan to make science at the agency more transparent.

EPA will require that data and methodology from studies used to craft regulations be made public. In addition, studies that receive EPA funding must make data public.

EPA spokesman Jahan Wilcox would not release additional information about the plan and referenced Administrator Scott Pruitt's comments to the conservative news organization *The Daily Caller*. The agency sent that publication the article as a press release but did not otherwise lay out any details.

EPA plans summit on politically toxic nonstick chemicals

Corbin Hiar, E&E News reporter

Published: Tuesday, March 20, 2018

U.S. EPA Administrator Scott Pruitt has invited governors from every state and territory to a two-day meeting on a class of stain- and water-resistant chemicals after concerns about their health effects sank the nomination of his chemical safety adviser.

The National Leadership Summit, as EPA is referring to it, will take place in Washington on May 22 and 23. Governors or their representatives will share information on ongoing efforts to evaluate and respond to contamination from per- and polyfluoroalkyl substances, or PFAS.

Consensus forming around TSCA unique identifier provision

Industry and NGO lend tepid support to 'third option'

20 March 2018 / Confidentiality & right-to-know, TSCA, United States

Stakeholders from industry and public advocacy groups have backed a single proposed approach to applying a 'unique identifier' to confidential information submitted under TSCA.

The US EPA has been grappling for more than a year with a requirement under the new TSCA that it develop a system for applying a unique identifier (UID) to a substance, whose identity is protected as confidential business information (CBI).

It made two proposals aimed at addressing the challenge of consistently identifying information, while maintaining confidentiality.

Industry had initially rallied around the second option – a company-specific approach – until it became apparent that once the agency published the UIDs and their corresponding chemical accession numbers, it would inadvertently create linkages that could divulge CBI.

Last month, the EPA consulted on a third approach. This called for giving a single UID to each confidential chemical substance, and applying it to pertinent information, both confidential and non-confidential. In cases, however, where the application of the identifier would allow the public to work out the identity of the CBI substance, the agency would omit the UID and simply identify the substance by its name.

In comments to the agency, a majority of industry groups – including the American Chemistry Council, Socma, the American Fuel & Petrochemical Manufacturers (AFPM) and the International Fragrance Association North America (Ifrana) – endorsed this latest option.

Meanwhile, NGO the Environmental Defense Fund has also agreed this is the "preferable" of the three options. "If implemented narrowly, as promised in the *Federal Register*," the EDF said in its comments, the third approach would "result in substantially fewer violations of the statute as compared with the earlier alternatives proposed by EPA."

The is a significant development. Previously the NGO had vehemently opposed the industry-backed second option.

Concerns persist

Nonetheless, the EDF continues to argue that even the third option is "flawed". It has called on the agency to "follow the plain text of the statute" and to require UIDs to be applied "consistently to all information relevant" to the chemical substance.

And industry has also raised concerns. The ACC was among groups that highlighted a risk of the EPA erring in its assessment of whether application of a UID would result in CBI disclosure, and applying it where it should not. It called on the agency to use caution and "implement a robust system of quality control and quality assurance to mitigate any risk of error".

And the American Petroleum Institute said it does not support the third option, because it "does not offer enough protection against CBI disclosure".

The approach, said the API, requires the EPA to screen non-confidential information for possible disclosure of CBI before determining whether to omit the UID – a "resource-intensive" process that carries a risk that the agency "would not be thorough" in its determinations.

The Lautenberg Act requires the EPA to annually publish a list of substances for which it has approved claims of protected chemical identity, together with those substances' unique identifiers.

The EDF pointed out in its comments that the agency's failure to do so – together with its apparent failure to begin applying any unique identifiers to date – has "already resulted in innumerable statutory violations". It has called on the agency to "act expeditiously" to address this.

Unique identifier

TSCA allows companies to request to keep a substance's identity confidential. If the EPA grants this, the substance is listed in the public portion of the TSCA inventory by an accession number and a generic chemical name that masks the specific substance identity.

Under section 14 of the new TSCA, the EPA must:

- develop a system to assign a UID to each specific chemical identity, for which it has approved a confidentiality request;
- apply that identifier consistently to all information relevant to the applicable substance;
- annually publish a list of confidential substances with their UIDs, including the expiration date for the claim;
- ensure that any non-confidential information received uses them to identify the substance; and
- for any expired confidentiality claim, link the chemical identity back to its unique identifier.

But in a May *Federal Register* notice, the agency said that two requirements – to apply the unique identifier to all non-confidential information related to the substance, while ensuring the identity is protected from disclosure – "do not appear to be completely reconciled in the statute". And it cited several examples where universally applying them to every information submission could result in CBI, including the chemical identity, being revealed.

US EPA to convene PFAS summit

20 March 2018 / United States

The US EPA is convening a summit to identify risks associated with, and ways to take action on, per- and polyfluoroalkyl substances (PFAS). The agency says it plans to develop and release a PFAS management plan later this year, using information from the meeting.

In letters to state and US territory governors, EPA Administrator Scott Pruitt said that the substances have "emerged as a concern in communities across the nation, and it is time to come together to identify near-term actions to protect the health of all Americans."

The National Leadership Summit will take place on 22-23 May in Washington, DC. The EPA says it will include:

- discussion on characterising risks, monitoring and cleanup techniques of PFAS;
- identifying "specific near-term actions" that can be taken; and
- developing communications approaches to "address public concerns" with the chemical class.

The latest action follows the announcement late last year of a "cross-agency effort" to address PFAS substances, even as states continue to ramp up efforts to address the highly persistent substances.

Ongoing work by the agency includes the development of additional toxicity values, analytical methods, and treatment options for PFAS in drinking water.

The EPA has published drinking water health advisories for perfluorooctanoic acid (PFOA) and perfluorooctane sulfonate (PFOS), but has not formally regulated them.

Instead, the agency took the approach of working with industry to phase out their use, under a stewardship programme slated for completion by 2015. It proposed a significant new use rule (Snur) to codify the voluntary phase-out and apply it to manufacturers which were not party to that agreement, but the Snur has not been finalised.

Maryland considers NMP, methylene chloride ban

21 March 2018 / Built environment, Solvents, United States

Maryland is considering legislation to ban the sale of paint strippers containing N-methylpyrrolidone (NMP) or methylene chloride.

Introduced last month, the bill (HB 1138) calls for a prohibition on the sale or distribution of "any paint or coating removal product" containing either solvent. If passed into law, the ban would take effect from 1 January 2020.

A similar ban is being considered at the federal level. The US EPA proposed a rule under section 6 of TSCA in the final days of the Obama administration to ban paint strippers containing methylene chloride and prohibit or restrict such products containing NMP. However, the current administration appears to be delaying action on finalising it.

The NGO Center for Environmental Health has praised Maryland for taking up the issue "where the EPA has failed to act". It is calling on other states to follow suit.

In addition to the paint stripper legislation, Maryland lawmakers are also contemplating a cleaning product ingredient disclosure bill, similar to one passed last year in California.

The state is also one of more than half a dozen contemplating legislation to ban certain flame retardants from children's products.

Amazon's e-commerce model a 'hurdle' for chemicals policy compliance

Company plans to make announcement this year

21 March 2018 / North America, Retail, United States, Voluntary action

Retail giant Amazon's promise of a chemicals management policy this year will have a big influence on the market, but its e-commerce business model will prove a challenge when it comes to getting third-party product sellers to adhere to it, say US NGOs and business groups.

The company announced in 2017 that it would launch its chemical policy – the first by a solely e-commerce business – this year, but it has not said exactly when it will do this.

Boma Brown-West, senior manager of the business programme at US NGO the Environmental Defense Fund (EDF), told Chemical Watch: "One of Amazon's biggest hurdles could be demonstrating that it can influence its large third-party seller population to adhere to its chemicals policy, when it doesn't have the traditional buyer-seller relationship that brick and mortar retailers have."

If, she added, Amazon is able to address this and establish a chemicals policy that commits to clear time-bound goals, then "I could see the retailer having a real impact on the marketplace."

Similarly, Joel Tickner, director of the Green Chemistry and Commerce Council (GC3), a cross-sectoral, business-to-business network of companies and other organisations, said: "The Amazon model of e-commerce, particularly of third-party sellers – that is becoming the norm with other retailers selling online – will create significant challenges in terms of extending chemicals policies beyond own brands to a dispersed network of smaller and larger resellers."

'Online retailers, like their brick and mortar peers, need to hold suppliers accountable for reducing the use of chemicals of high concern in the products they sell on their virtual shelves,' Mark Rossi, Clean Production Action

And Mark Rossi, executive director of US NGO Clean Production Action, the team behind the Chemical Footprint Project, said retailers that are successful in reducing their chemical footprints are setting clear goals for suppliers, both brands and private labels, to meet and then holding those companies accountable to the goals.

"Online retailers, like their brick and mortar peers, need to hold suppliers accountable for reducing the use of chemicals of high concern in the products they sell on their virtual shelves," he said.

Size and reach

The company's size and global reach in terms of product sales makes its development and implementation of a chemicals policy hugely significant. Amazon last year recorded net sales of almost $180bn.

However, it has been criticised for its lack of chemicals management and came bottom of a 2016 'report card', ranking US retailers on their actions to eliminate chemicals in consumer products. The report card has been produced for the past two years by Mind the Store, a campaign run by the coalition Safer Chemicals, Healthy Families.

In last year's report card, the company ranked 14th out of 30 companies and scored 30.5 points out of a possible 135.

Mike Schade, Mind the Store director, said: "We are confident that Amazon will develop a chemicals policy that ensures the products they sell don't contain harmful chemicals. Given the company's innovation, resources and market power, the company can have a big impact on the health of its consumers."

David Levine, co-founder and CEO of the American Sustainable Business Council (ASBC), a policy group representing a network of more than 250,000 businesses, told Chemical Watch Amazon's plan to launch a policy is part of a trend of more businesses creating products that meet safer chemical criteria – and the growing demand of consumers.

Retailer policies

Amazon will follow several major retailers which have recently launched chemicals policies – such as Home Depot and Costco. Walgreens and Staples also plan to launch policies this year.

Professor Tickner said that those being developed by major retailers to date have played a significant role in signalling demand for safer chemistry. "This has in turn driven the growth of green chemistry initiatives within brands and chemical manufacturers."

"Amazon's chemicals policy – the first of a solely e-commerce retailer – will only augment these demand signals and hopefully investments in green chemistry," said Professor Tickner.

Ms Brown-West said an effective policy sets clear time-bound goals on ingredient transparency within the supply chain and to consumers, and on safer products via removal of chemicals of concern and prevention of regrettable substitutes. Equally important, she said, is a plan to measure and demonstrate progress to consumers and the business.

Amazon declined to respond to Chemical Watch's questions asking for details about its policy and how it plans to address the challenge of ensuring its third-party sellers adhere.

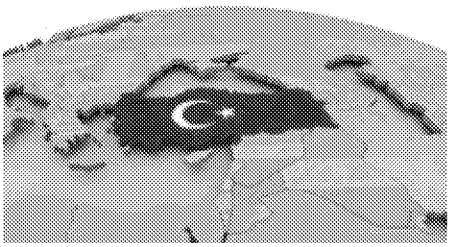
Industry moots 'Turcha' Turkish chemicals agency

But proposal for Echa-style agency may face political hurdles

21 March 2018 / KKDIK, Turkey



A Turkish consultancy has called on the country's environment ministry to establish a chemicals agency, modelled on Europe's Echa. Its purpose would be to support the implementation of KKDIK, the country's new REACH-like regulation.

The 'Turcha' proposal, led by DorukSistem consultancy, has been endorsed by a leading Turkish scientific research organisation, academic institutions, free trade zones and civil society organisations, according to managing partner Selçuk Bilgin.

Mr Bilgin says that due to the size of the industry and potentially large number of registrations, "we need an organisation that can work closely with Cefic, Echa and the OECD."

Stakeholders have expressed concerns over the Ministry of Environment and Urbanisation's (MoEU) ability to process a high volume of KKDIK registrations with its current team of five to six people.

The law came into effect in December last year and sets a registration deadline of 2023. Pre-registrations are due by the end of 2020 and already some 4,000 substances are in the system, most of them carried over from the previous chemicals legislation.

Around 10,000 companies are expected to submit pre-registrations, industry observers say.

Mr Bilgin plans to take the proposal to the MoEU and other ministries to secure formal approval. He told Chemical Watch that during informal conversations MoEU officials have been "keen" on the idea.

However, he added, the proposal is still in the "early stages" and it may be a while before it can get off the ground – mostly because of political hurdles.

Some industry representatives doubt an Echa-style agency can be established in Turkey. Mustafa Bagan, KKDIK training executive at industry association TKSD and formerly its general secretary, called the Turcha proposal "politically difficult".

And another industry consultant with close links to the ministry said such a proposal would need to originate from them to have any chance of success. An independently conceived Turcha "does not fit" the definition of Echa, the consultant said.

Taking shape

Turcha would mirror Echa's management structure, with similar risk assessment and socio-economic analysis committees and composition of the management board, Mr Bilgin said.

He has asked Cefic – the European chemicals industry council – to help set up a meeting with the agency to discuss the proposal.

Cooperation with Echa, he said, would "speed things up" and could attract more financial support for the idea.

It could also lead to possible mutual recognition of registrations between the two agencies, he added. This might allay the fears of the many Turkish and European companies, concerned about the duplicate cost of data-sharing arrangements under REACH and KKDIK.

Cefic said discussions about the topic are "still in the very early stages", while an Echa spokesperson said it has not had "any "formal cooperation" with Turkey on the subject.

The spokesperson added: "Any potential mutual recognition system cannot be initiated by Echa, but should first be based on formal agreement at political level."

MoEU officials did not respond to Chemical Watch requests for comment.

Meanwhile, another initiative in Turkey seeks to set up an only representative organisation, similar to the European ORO, to advise on reputable service providers for KKDIK.

Mr Bilgin said foreign companies were having difficulties appointing ORs in Turkey and an ORO platform would provide a secure environment for European companies trading in the country.

Mexico consults on household cleaning product labels

21 March 2018 / Biocides, GHS, Mexico

Mexico's health ministry has released a proposed standard on the labelling and packaging of household cleaning products.

The proposal, which aims to promote customer choice and reduce health risks, lays down the labelling requirements for hygiene products and substances intended for the "washing or cleaning of objects, surfaces or buildings, and that release specific fragrances into the air".

Products affected include:

- soaps;
- detergents;
- cleaners;
- whiteners;
- starches for external use;
- stain removers;
- disinfectants;
- deodorisers and air fresheners; and
- other similar products, determined by the ministry.

The draft standard, published on 7 March, also mentions cleaning products for textiles, substances used to unblock sanitary conduits, and products such as waxes, used to apply glossy finishes.

In a non-exclusive list, it singles out the following substances for particular attention:

- phosphates;
- phosphonates;
- anionic surfactants;
- cationic surfactants;
- amphoteric surfactants;
- nonionic surfactants;
- oxygen-based bleaches;
- chlorine-based bleaches;
- EDTA;
- nitrilotriacetic acid;
- halogenated phenols and phenols;
- aromatic hydrocarbons;
- aliphatic hydrocarbons;
- halogenated hydrocarbons;
- waxes;
- silicones;

- sulphates;
- carbonates;
- silicate;
- zeolites; and
- polycarboxylates.

Consultation on the proposal will finish on 7 May. The final standard will then become law, three months after its publication in the country's official journal.

In a study last November, Mexico was identified as one of a number of countries to have only partially implemented the Globally Harmonized System (GHS) of classification and labelling of chemicals.

Tulsa World: EPA Administrator Scott Pruitt says lack of clean up of Tar Creek Superfund site is 'unacceptable'
Administrator Scott Pruitt of the U.S. Environmental Protection Agency said his new push on the nation's Superfund program finally can provide clarity and accountability to the Tar Creek area, for decades one of the oldest, largest and most complex toxic sites in the nation. "It is really unacceptable," Pruitt said as he recalled the history of the Tar Creek area in far northeastern Oklahoma, whose Superfund legacy dates back to 1983, as well as the amount of money and time deployed there. "You don't list a site in the mid-1980s and you don't take the kind of steps we have taken historically and still have issues today in 2018."The area in Ottawa County is contaminated by lead and other heavy metals from long-closed mining operations and is undermined with caverns that are prone to cave-ins. The Picher and Cardin communities were bought out by a federal program and are now ghost towns, but the mine wastes remain.

Hot Air: EPA Ends The Use Of "Secret Science" In Crafting Regulations
Just in case liberals didn't already have enough reasons to pin EPA Administrator Scott Pruitt's picture to their dart boards, he's just rolled out another policy change which will force the "party of science" to rely on actual science when pushing for regulatory changes. Promising to eliminate "secret science" in EPA deliberations, Pruitt is ordering all scientific studies used when considering new regulations to include publicly available data and methodologies. This was announced in an exclusive interview with The Daily Caller News Foundation.

Detroit News: EPA chief wants to eradicate lead from drinking water
The head of the Environmental Protection Agency says eradicating lead from drinking water is one of his top priorities three years after the Flint water crisis, and he's worried Americans aren't "sufficiently aware" of the threat. "I really believe that we ought to set a goal as a country that, over the next 10 years, that we ought to work with respect to investments in our infrastructure to eradicate lead in our drinking water," EPA Administrator Scott Pruitt told reporters this week at the agency's headquarters. "It can be achieved. Some of the mental-acuity levels of our children are being impacted adversely as a result of this." Pruitt is concerned that parents and citizens don't understand the threat of lead in drinking water or toys, and "we're looking at ways we can contribute to that dialogue," he said, according to an audio recording provided by the New York Post.

New York Post: EPA head calls for 'coordinated' response to NYC lead crisis
EPA Administrator Scott Pruitt called for a "coordinated" response between New York State and City officials to address the ongoing lead crisis. Asked whether federal intervention is needed to protect New York children and tenants from lead poisoning, the Environmental Protection Agency chief urged action on all fronts. "I think a local, state and federal response that is very coordinated and collaborative is terribly important," Pruitt said in an interview. "We each play a role. I'd love to see steps taken at the local level to invest." Gov. Cuomo already announced an emergency declaration for New York Housing Authority buildings and pledged an additional $250 million for upgrades. But heated public squabbles over resources and responsibility with rival Mayor de Blasio have complicated progress.

The Philadelphia Inquirer: Philly has a smog problem. Will Scott Pruitt's EPA say so?
Whether Philadelphia is violating the federal Clean Air Act remains in bureaucratic limbo. Despite deadlines, the EPA has refused to say whether Philadelphia and some other cities, including Pittsburgh, have met a 2015 benchmark of 70 parts per billion or less of ground-level ozone in the ambient atmosphere. Being out of compliance, or in "nonattainment," has a real-world impact on the state, city, businesses and industry, and even motorists through increased regulation and funding. The EPA was supposed to state whether Philadelphia was in compliance by last Oct. 1. Last week, a federal court ruled that the EPA, under its administrator, Scott Pruitt, broke the law by missing the deadline, and gave the EPA until April. On Monday, Pruitt's office said it would meet the deadline.

Politico: Congress struggles to clinch spending deal

Congressional leaders are racing to finalize a spending bill by the end of Tuesday but find themselves still at odds over a host of controversial issues — delaying plans to unveil the proposal and raising the prospect of weekend votes to avoid a shutdown. Democrats, Republicans and the White House battled late into the night Monday and into Tuesday afternoon over whether to include provisions on President Donald Trump's border wall, a massive New York infrastructure project and the special counsel's Russia investigation, according to lawmakers and aides in both parties. There were still a number of unresolved issues as of Tuesday evening, and multiple sources were pessimistic that negotiators would reach a deal in time to release the bill before Wednesday.

Wall Street Journal: Trump to Ramp Up Trade Restraints on China

The White House is preparing to crack down on what it says are improper Chinese trade practices by making it significantly more difficult for Chinese firms to acquire advanced U.S. technology or invest in American companies, individuals involved in the planning said. The administration plans to release on Thursday a package of proposed punitive measures aimed at China that include tariffs on imports worth at least $30 billion. But the tariffs won't be imposed immediately. Rather, U.S. industry will be given an opportunity to comment on which products should be subject to the duties. As part of the package, the White House will announce possible investment restrictions by Chinese firms in the U.S. and will direct the Treasury Department to outline rules governing investment from China.

EPA Administrator Scott Pruitt says lack of clean up of Tar Creek Superfund site is 'unacceptable'

By: Jim Myers, 3/21/18

Administrator Scott Pruitt of the U.S. Environmental Protection Agency said his new push on the nation's Superfund program finally can provide clarity and accountability to the Tar Creek area, for decades one of the oldest, largest and most complex toxic sites in the nation.

"It is really unacceptable," Pruitt said as he recalled the history of the Tar Creek area in far northeastern Oklahoma, whose Superfund legacy dates back to 1983, as well as the amount of money and time deployed there.

"You don't list a site in the mid-1980s and you don't take the kind of steps we have taken historically and still have issues today in 2018."

The area in Ottawa County is contaminated by lead and other heavy metals from long-closed mining operations and is undermined with caverns that are prone to cave-ins. The Picher and Cardin communities were bought out by a federal program and are now ghost towns, but the mine wastes remain.

Pruitt blamed inconsistency, even within the EPA's 10 regions, as well as a lack of attention and focus, for slowing remediation outcomes.

"It is one of the things that seemed to be languishing as we arrived," Pruitt said, making it clear that the lack of urgency was something he found "palpable" at Superfund sites across the country.

"When it takes you 27, 28 years to make a decision — make a decision, not clean it up, not remediate, but make a decision on how you are going to remediate — that is unacceptable."

His comments came during one of several reporter roundtables he has been holding at the EPA's headquarters to mark his first year as administrator, during which he also became a leading voice in the Trump administration's major push on regulation reform.

Those efforts have prompted applause from his supporters and alarm from his critics.

Recently Pruitt is rarely out of the headlines, with stories ranging from travel expenses to speculation over whether his political future might include bids for a U.S. Senate seat or even the White House.

When given the chance to comment on yet another story this week about his political options, he took a pass.

Pruitt also declined to comment when asked about a recent decision by an Oklahoma judge to allow a lawsuit filed by Campaign for Accountability to continue. The lawsuit seeks to force the release of a 2014 audit of the Lead-Impacted Communities Relocation Trust, which was created in an effort to help move residents out of communities affected by the Tar Creek contamination.

"That is during my time as attorney general," he said. "I think it is better that I just keep it focused on the EPA matters."

Pruitt, who was Oklahoma's attorney general before being tapped by President Donald Trump to lead the EPA, had declined to file charges based on the audit by state Auditor Gary Jones and also had taken steps to bar its release to the public.

According to reporting by The Oklahoman, legal action in the case continues and eventually could include an appeal to the Oklahoma Supreme Court.

Pruitt's emphasis on Tar Creek and the other Superfund sites across the country grew out of a task force he created in 2017, just months after being sworn in as administrator.

Members of the Superfund Task Force came back with a list of specific recommendations under major goals ranging from expediting cleanup and remediation to promoting redevelopment and community revitalization.

As part of that process, Tar Creek landed on a list Pruitt says he will use to keep the emphasis on the program.

EPA Ends The Use Of "Secret Science" In Crafting Regulations

By: Jazz Shaw 3/20/18

Just in case liberals didn't already have enough reasons to pin EPA Administrator Scott Pruitt's picture to their dart boards, he's just rolled out another policy change which will force the "party of science" to rely on actual science when pushing for regulatory changes. Promising to eliminate "secret science" in EPA deliberations, Pruitt is ordering all scientific studies used when considering new regulations to include publicly available data and methodologies. This was announced in an exclusive interview with The Daily Caller News Foundation.

> "We need to make sure their data and methodology are published as part of the record," Pruitt said in an exclusive interview with The Daily Caller News Foundation. "Otherwise, it's not transparent. It's not objectively measured, and that's important."
>
> Pruitt will reverse long-standing EPA policy allowing regulators to rely on non-public scientific data in crafting rules. Such studies have been used to justify tens of billions of dollars worth of regulations.

> EPA regulators would only be allowed to consider scientific studies that make their data available for public scrutiny under Pruitt's new policy. Also, EPA-funded studies would need to make all their data public.
>
> "When we do contract that science out, sometimes the findings are published; we make that part of our rule-making processes, but then we don't publish the methodology and data that went into those findings because the third party who did the study won't give it to us," Pruitt added.

In other words, science is not being excluded from any EPA studies. The agency is simply ensuring that groups conducting studies publish the data used to reach the conclusions they forward to the EPA so it can be examined and potentially challenged if it's found to be faulty. Surely nobody who's really interested in following the science could object to that, right?

Wrong. Democrats were immediately arguing against such a move, saying that forcing research organizations to publish their figures "would reveal confidential patient data." That's a rather odd argument in a couple of different ways. First of all, there's a lot of data collected for various studies used by the EPA which have nothing to do with medical records. Examples include all of the groundwater studies done when the Obama administration was considering banning fracking.

But even in cases where medical information is required, the groups conducting the study were able to obtain the patient data. As Steve Milloy, the publisher of JunkScience.com was quoted as saying, California regularly makes such data available under the name, 'Public Use Death Files.' Other medical information can be compiled and have the patients' names and other identifying personal information scrubbed. This is already done on a regular basis.

In fact, barring some subject which might compromise national security – such as the handling of tactical weapons materials – it's difficult to imagine many true, scientific studies which couldn't publish their underlying data, making it available for peer review. So if you're still opposed to federal agencies wanting to see such data, the next logical question to ask is precisely what it is that you're hiding.

The Detroit News

https://www.detroitnews.com/story/news/politics/2018/03/20/epa-pruitt-lead-water-flint/33125283/

EPA chief wants to eradicate lead from drinking water

By: Melissa Nann Burke, 3/20/18

The head of the Environmental Protection Agency says eradicating lead from drinking water is one of his top priorities three years after the Flint water crisis, and he's worried Americans aren't "sufficiently aware" of the threat.

"I really believe that we ought to set a goal as a country that, over the next 10 years, that we ought to work with respect to investments in our infrastructure to eradicate lead in our drinking water," EPA Administrator Scott Pruitt told reporters this week at the agency's headquarters.

"It can be achieved. Some of the mental-acuity levels of our children are being impacted adversely as a result of this."

Pruitt is concerned that parents and citizens don't understand the threat of lead in drinking water or toys, and "we're looking at ways we can contribute to that dialogue," he said, according to an audio recording provided by the New York Post.

"I do think that what happened in Flint is something that could happen elsewhere. We just simply need to take steps to do all that we can to address it prospectively and proactively," Pruitt said.

Pruitt said President Donald Trump's $1.5 trillion plan to bolster the nation's infrastructure over the next decade would include investments in aging water infrastructure.

Pruitt didn't describe a plan for replacing the thousands of lead service lines throughout the country – a cost estimated around $40 billion to $45 billion – but stressed the need for state and local governments to invest in such upgrades, perhaps with federal grant aid.

Pruitt added he would "love" to see local governments investing more in water infrastructure.

"These water treatment facilities – they have authority to bond out, to raise fees, to invest in corrosion control, the replacement of service lines and the rest," Pruitt said. "And some of them just aren't doing it."

Gov. Rick Snyder has proposed having water customers across Michigan pay a $5 annual fee to help upgrade aging infrastructure and replace lead pipes in their local communities, but the plan hasn't gained steam in the Republican-controlled Legislature.

U.S. Rep. Dan Kildee, D-Flint Township, said what Pruitt has described isn't really a plan.

"When it comes to Mr. Pruitt, nice words don't replace pipes. It takes money. What they have proposed is really nothing when it comes to infrastructure," Kildee said of the Trump administration.

Kildee said what would help is Pruitt putting his support behind Kildee's legislation that would reduce the acceptable amount of lead in drinking water to 5 parts per billion. The current federal action limit is 15 parts per billion.

"Force federal and state governments to stare this in the face by adopting a level that is science-based that says there is no acceptable level of lead," he said.

EPA has spent a decade trying to update the rule.

Snyder called the rule "dumb and dangerous" after the Flint disaster. The state has proposed draft rules to drop the acceptable amount of lead in drinking water to 10 parts per billion by 2024.

The New York Post

https://nypost.com/2018/03/21/epa-head-calls-for-coordinated-response-to-nyc-lead-crisis/

EPA head calls for 'coordinated' response to NYC lead crisis

By: Marisa Schultz, 3/21/18

EPA Administrator Scott Pruitt called for a "coordinated" response between New York State and City officials to address the ongoing lead crisis.

Asked whether federal intervention is needed to protect New York children and tenants from lead poisoning, the Environmental Protection Agency chief urged action on all fronts.

"I think a local, state and federal response that is very coordinated and collaborative is terribly important," Pruitt said in an interview. "We each play a role. I'd love to see steps taken at the local level to invest."

Gov. Cuomo already announced an emergency declaration for New York Housing Authority buildings and pledged an additional $250 million for upgrades. But heated public squabbles over resources and responsibility with rival Mayor de Blasio have complicated progress.

Pruitt declined to weigh in on the Cuomo/de Blasio feud but encouraged broad infrastructure investment from all levels to prevent children from getting sick.

"I think the governor's call for that is important and it's something we think is important as well and we need to contribute to it along with the states, local cities and towns," Pruitt said.

While the problems in NYCHA are centered on lead paint, Pruitt has primarily tackled the issue of eliminating lead poisoning from water. He raised concerns over high lead levels found at certain New York City school water fountains.

"I do think that what happened in Flint is something that could happen elsewhere," Pruitt said. "We just simply need to take steps to do all that we can to address it prospectively and proactively."

Pruitt estimated it would take $40 billion – $45 billion to replace lead service lines nationwide and suggested President Trump's $1.5 trillion infrastructure plan can assist states and cities with the costs.

"I really believe that we ought to set a goal as a country that, over the next 10 years, that we ought to work with respect to investments in our infrastructure to eradicate lead in our drinking water," Pruitt said.

He added: "It can be achieved. Some of the mental-acuity levels of our children are being impacted adversely as a result of this."

The Philadelphia Inquirer

http://www.philly.com/philly/health/pruitt-epa-smog-philadelphia-ozone-20180320.html

Philly has a smog problem. Will Scott Pruitt's EPA say so?

By: Frank Kummer, 3/20/18

Mollie Michel of South Philadelphia keeps her children inside some days because of air pollution, so she's particularly irked by a long delay by the U.S. Environmental Protection Agency to say officially whether Philadelphia has a smog problem. That designation could mean more regulation to help clean up the dirty air, she said.

"You have a city with a childhood asthma rate twice as high as the national average," Michel said to bolster her argument. A member of Moms Clean Air Force, she gathered Tuesday with a few dozen other activists and local officials at City Hall to mark the first day of spring by protesting Trump administration policies.

Whether Philadelphia is violating the federal Clean Air Act remains in bureaucratic limbo. Despite deadlines, the EPA has refused to say whether Philadelphia and some other cities, including Pittsburgh, have met a 2015 benchmark of 70 parts per billion or less of ground-level ozone in the ambient atmosphere. Being out of compliance, or in "nonattainment," has a real-world impact on the state, city, businesses and industry, and even motorists through increased regulation and funding.

The EPA was supposed to state whether Philadelphia was in compliance by last Oct. 1. Last week, a federal court ruled that the EPA, under its administrator, Scott Pruitt, broke the law by missing the deadline, and gave the EPA until April.

On Monday, Pruitt's office said it would meet the deadline.

Pruitt said during a meeting with reporters at EPA headquarters in Washington that the scope of monitoring required to answer the smog question had caused the delay.

"The agency has been running behind for a number of years," said Pruitt, who took office a year ago.

Pruitt, who said he didn't have data specific to Philadelphia in front of him, also took issue with how the monitoring program has been carried out in the past, saving money by "modeling" — using data from one area and applying it to another.

"Real data is terribly important," Pruitt said. "When we go forward, we need to focus more on monitoring as opposed to modeling … You shouldn't get data from one monitor and extrapolate it over a whole area because you're not dealing with real data at that point."

He said his office is "exploring ways" to pay for monitoring.

If Philadelphia is declared to have a smog problem, the Pennsylvania Department of Environmental Protection would be responsible for crafting a plan to reduce ground-level ozone. Ozone is formed when volatile organic compounds and nitrogen oxides — created by burning fossil fuels, and power plants and other industries — combine in sunlight. Long, hot, humid days act as smog factories, so smog is expected to increase as the climate warms up.

James Garrow, a spokesman for the city's Department of Public Health, said, "Philadelphia is indeed out of compliance" as of March 1. He said the trend for ground-level ozone has been going down for years and Philadelphia expects to meet requirements within a few years.

At the protest, Flora Cardoni, an organizer with PennEnvironment, joined Democratic State Reps. James R. Roebuck Jr. and Brian K. Sims, as well as members of Deep Green Philly and the Clean Air Council, in speaking out. Cardoni said it's already been too long a wait for action.

"Philadelphians want to walk along the Schuylkill, play in Fairmount Park, and wander the historic city without worrying about choking on smog and soot," she said.

Congress struggles to clinch spending deal

By: Burgess Everett, Rachel Bade, Sarah Ferris and Heather Caygle, 3/20/18

Congressional leaders are racing to finalize a spending bill by the end of Tuesday but find themselves still at odds over a host of controversial issues — delaying plans to unveil the proposal and raising the prospect of weekend votes to avoid a shutdown.

Democrats, Republicans and the White House battled late into the night Monday and into Tuesday afternoon over whether to include provisions on President Donald Trump's border wall, a massive New York infrastructure project and the special counsel's Russia investigation, according to lawmakers and aides in both parties.

There were still a number of unresolved issues as of Tuesday evening, and multiple sources were pessimistic that negotiators would reach a deal in time to release the bill before Wednesday.

Asked how confident he was that the Senate would avoid weekend work, Sen. John Thune (R-S.D.) replied: "I'm not real confident at this point."

Dragging the talks into Wednesday would increase the chance that lawmakers pass a short-term spending bill to prevent a temporary shutdown when funding lapses Friday evening.

Several issues remain open after administration officials participated in a lengthy meeting Tuesday afternoon with top leadership and appropriations staffers that did little to break the logjam.

“Everything that remains is going to be pulling teeth to resolve,” said a senior congressional aide with knowledge of the meeting, which included representatives from the White House and the Office of Management and Budget.

The New York-area Gateway project is a primary issue for the White House, according to the aide, but several other provisions are also still up in the air.

Trump is likely to support the bill if the Gateway project is excluded, the military receives a major budget boost and there is a significant infusion of border security funding, White House legislative affairs director Marc Short said at the Capitol Tuesday.

House Speaker Paul Ryan (R-Wis.) told his conference that he is planning to pass the massive, $1.3 trillion omnibus on Thursday, according to House Republicans.

"I'm hoping today," Ryan told reporters when asked Tuesday morning when leaders would wrap up negotiations. He said lawmakers were not yet considering a short-term funding patch to buy more negotiating time. "There are some unresolved issues. We're working through them as we speak."

Senate Majority Leader Mitch McConnell (R-Ky.) said he would keep the Senate in until the bill is passed.

"We anticipate the House filing later today, which will give the Senate plenty of time to take a look at it and see what’s in it," McConnell said on Tuesday afternoon.

Still, on the House's current schedule, the Senate would have just a day to pass the bill before government funding runs out on Friday evening — allowing for any one senator to shut the government down briefly. Sen. Rand Paul (R-Ky.) caused such a shutdown last month in protest over a budget deal.

Paul would not rule out doing everything he can to stop the spending bill if he views it as poorly as he did a budget bill in February.

“I will oppose the bill. I have to make a decision about whether or I will accept a time agreement,” Paul told reporters on Tuesday.

Senate leaders are already entertaining a short-term spending bill in preparation for any antics by Paul.

"We're going to be here into the weekend, perhaps. But I think there could be some measures taken to keep the lights on. But we'll get it done," said Senate Majority Whip John Cornyn (R-Texas). "Anything can happen around here."

Congressional leaders had hoped to file the bill, which would fund the government through the end of September, on Monday night with a House vote on Wednesday. But Congress is bogged down over policy provisions that various congressional factions are trying to attach to the must-pass bill. Many lawmakers view the legislation as their last chance to get their priorities signed into law before the midterm elections.

“Negotiations continue between the four leaders. A few sticking points remain, but we are very close," said Senate Minority Leader Chuck Schumer (D-N.Y.). "I think it will be a fair compromise."

Lawmakers and aides estimated there were as many as 20 provisions still being debated. One of the most controversial is $900 million in funding for the Gateway tunnel project in New York, a key priority of Schumer and New York-area Republicans and Democrats.

Gateway supporters are trying to include language that would allow the project to apply for competitive grant money and prevent the Trump administration from squashing the project. Trump has told Republicans he will veto a bill that funds the project specifically. Schumer and GOP leaders were still battling over the provision as of Tuesday afternoon, and the New Yorker said the tunnel is of national significance despite Trump's complaints.

The White House remains unmoved, however.

"The secretary of transportation has explained if you put that much money in one project it's going to crimp projects across the country she needs to fund. It's also a project that a majority of House Republicans... voted against," Short said. "The president has made his wishes well known so I think we're going to be fine."

Another sticking point: immigration. Talks to protect young immigrants facing deportation fell apart over the weekend, but congressional Democrats spent Monday and Tuesday pushing to freeze hiring of immigration enforcement officials in return for providing Trump more than $1 billion in funding on his border wall.

Democrats and Republicans are likely to agree on about $1.6 billion in border funding that would help finance some fencing and security and avoid directly funding the large concrete wall that Trump wants, according to a Democratic aide.

Republicans are seeking to fix an error in the new tax law that lowers tax bills for farmers that sell grain to cooperatives at the expense of other companies. Though Senate Democrats and some Senate Republicans are willing to rewrite the provision in exchange for a boost in Low-Income Housing Tax Credits in the spending bill, Ryan has resisted, according to people in both parties. Ryan allies say that just because he rejected an offer from Schumer to fix the so-called "grain glitch," it doesn't mean the issue is dead altogether.

Congressional Democrats also pushed provisions to protect special counsel Robert Mueller but have been rebuffed by GOP leaders. An attempt to shore up Obamacare's insurance markets is also stalled in a battle over abortion.

Lawmakers believe neither of those provisions will be in the omnibus.

A Tuesday morning school shooting in Maryland, however, may have thrown another wild card into the mix: GOP leaders are pressing to include popular legislation that would improve the National Instant Criminal Background Check System for firearms purchases.

"We remain hopeful that Fix NICS is in the omni," Short said of the proposal to improve the FBI's background check system.

But Democrats want a broader gun debate and note that the provision is a modest way to simply bolster existing gun laws. Meanwhile, conservatives believe it would make it more difficult for some veterans to buy a gun, which could keep that provision out as well.

"There are still some key questions. There's a NICS question, there's an Internet sales tax question, there's [an Obamacare] question. There's a Gateway project financing question," said Rep. Jim Jordan (R-Ohio), a conservative leader. "It looks like a lot of those things aren't gonna be in it, which is a good step, but it still spends way too much money."

The Wall Street Journal

https://www.wsj.com/articles/trump-to-ramp-up-trade-restraints-on-china-1521593091

Trump to Ramp Up Trade Restraints on China

By: Bob Davis, 3/20/18

The White House is preparing to crack down on what it says are improper Chinese trade practices by making it significantly more difficult for Chinese firms to acquire advanced U.S. technology or invest in American companies, individuals involved in the planning said.

The administration plans to release on Thursday a package of proposed punitive measures aimed at China that include tariffs on imports worth at least $30 billion.

But the tariffs won't be imposed immediately. Rather, U.S. industry will be given an opportunity to comment on which products should be subject to the duties. As part of the package, the White House will announce possible investment restrictions by Chinese firms in the U.S. and will direct the Treasury Department to outline rules governing investment from China.

Final details of the plan, including the amount of imports to be hit by tariffs, remain in flux, those involved with the discussions said. While the rough amount and rationale for the tariffs are expected to be disclosed on Thursday, the final decisions will come once U.S. industry has had its say, they said.

A White House spokeswoman declined to comment.

The effort stems from a monthslong investigation by the administration into Chinese intellectual property practices that found the damage to U.S. companies from forced technology transfer is $30 billion annually.

The administration has warned Beijing that it risked tariffs if it didn't significantly liberalize its market and eliminate practices that disadvantage foreign firms.

While the administration's plans to put tariffs on China have received most of the attention, it is considering other significant penalties, especially those aimed at state-owned Chinese firms. It plans to argue that Chinese state-owned firms buy U.S. technology not for commercial purposes, but to apply for military use and otherwise gain an edge in the race for global technological dominance.

The administration believes that Beijing, in requiring U.S. companies to form joint ventures to do business in China, then pressures them to transfer important technology to their Chinese partners. The U.S. also contends Beijing improperly subsidizes Chinese companies looking to overtake U.S. rivals in such advanced technologies as semiconductors, artificial intelligence and robotics.

Chinese officials have said that they are improving their protection of intellectual property and liberalizing their economy. They also complain that the U.S. hasn't given them a specific list of demands that they need to meet to head off tariffs.

The country's responses to challenges from President Donald Trump loomed large as China's leaders closed out an annual political gathering on Tuesday.

Premier Li Keqiang, the titular No. 2 leader, struck a conciliatory tone on trade with the U.S. At a news briefing in Beijing's Great Hall of the People, Mr. Li said "there are no winners" in a trade war between the world's two largest economies, and appealed for calm.

People involved in the planning say the Trump administration is looking at making reciprocity the core of U.S. investment relations with China, meaning that the U.S. would impose restrictions on Chinese investment similar to those that U.S. firms face in China. That could mean that the U.S. would insist that Chinese firms form joint ventures before doing business in the U.S., unless China dropped those restrictions.

The U.S. has already made it more difficult for Chinese companies to invest in the U.S. by blocking Chinese bids to purchase U.S. semiconductor firms. That is done by an interagency review of foreign acquisitions by the Committee on Foreign Investment in the U.S. Congress is looking to broaden CFIUS reviews of acquisitions so they include joint ventures too.

The expansion would include reviews of technology transfers to foreigners and could apply to joint ventures both outside and within the U.S. But CFIUS looks solely at national security concerns. The administration wants to address economic harm as well, according to these people.

Any imposition of tariffs, without going first to the World Trade Organization, is sure to prompt a chorus of criticism not just from Beijing but from U.S. industry, which has opposed tariffs as counterproductive. The WTO adjudicates trade cases and has the power to authorize tariffs in cases where a losing party doesn't change its practices. The administration is also considering bringing a case against Chinese trade practices that are covered by the WTO.

Oregon Sen. Ron Wyden, the senior Democrat on the Senate Finance Committee, said he opposes the broad imposition of tariffs. "American producers who haven't gotten a fair shake in the past aren't going to get that back by just have tariffs slapped on imports indiscriminately," he said.

Tariffs are bound to cause China to retaliate, said Clement Leung, Hong Kong's representative in the U.S. Chinese officials "cannot show any weakness" at a time when the country's leader, Xi Jinping, has just been confirmed for his second term, Mr. Leung said. Hong Kong, a trading center that operates somewhat independently from the rest of China, would be hurt by limits on trade.

Whatever the political blowback, Harvard law professor Mark Wu, a trade expert, says that the White House has authority to impose tariffs under section 301 of the Trade Act of 1974.

"In situations where the U.S. Trade Representative deems unfair trade practices to fall outside the scope of a WTO-covered agreement, then the statute permits the executive branch to take action directly without first seeking recourse through WTO dispute settlement" procedures, he said.

Frustration with Chinese trade practices has been building among both the governments and private sectors of the U.S., Japan and Europe. One reason the U.S. is considering a separate WTO case is to try to recruit allies to pressure China. But any move to impose tariffs could allow Beijing to portray itself as a victim. Coalition-building has become more complicated in the wake of a separate U.S. action to levy tariffs on steel and aluminum imports from allied nations.

For instance, finance ministers and central bankers from the Group of 20 countries, meeting in Buenos Aires on Tuesday, failed to reach any new agreement on shared principles when it comes to trade policies, as the split between the U.S. and other major economies deepened over the U.S.'s tariff policies.

The administration is considering recommendations from two other reports that would impose draconian investment restrictions on China. The U.S.-China Economic and Security Review Commission, a Congressional panel that takes a hard line on China, last year urged the administration to prohibit "the acquisition of U.S. assets by Chinese state-owned or state-controlled entities, including sovereign wealth funds."

A report for the Pentagon by its Defense Innovation Unit Experimental, which examines technology issues, has recommended that the Pentagon pursue a policy of "deterring Chinese technology transfer" by broadening CFIUS's mandate and strengthening export controls on technology to China.

China Investment Corp., Chinese sovereign-wealth fund which could get hit by sanctions, is putting together a fund targeting as much as $5 billion with Goldman Sachs Group Inc., aimed at investing in U.S. manufacturing and other sectors. CIC hopes the fund would pass muster with U.S. regulators, say those people familiar with the plans.

It is unclear how far the administration will go in pursuing these ideas. Blocking the acquisition of all purchases by Chinese state firms, for instance, would mean that Chinese state-owned airlines couldn't buy Boeing jets. Toughening export controls on, say, semiconductor production machinery could cede the market to Japanese vendors.

The administration's actions on China come on the heels of plans to levy tariffs on steel and aluminum imports. Japan, Korea and the European Union are scrambling to get exemptions from those levies, which are set to go into effect on Friday.

EPA Meeting about New Lead Cleanup Around Federated Metals Site Draws Large Crowd Seeking Answers

By: LuAnn Franklin, 05/24/18

Dozens of Hammond and Whiting residents gathered Wednesday to hear what action the U.S. Environmental Protection Agency plans to take to identify and remove possible lead contamination in the soil on their properties near the long-shuttered Federated Metals site.

The public meeting at the Whiting Family YMCA was the first to provide information about the soil sampling study area, which includes a mix of industrial, commercial and residential properties as well as vacant lots, community centers, playgrounds, parks, churches and schools.

Andrew Maguire, EPA on-scene coordinator, went through the history of the Hammond plant at 2230 Indianapolis Blvd. from 1937 to its closing in 1987, and how EPA teams, acting under the EPA's Resource Conservation & Recovery Act, consolidated waste there from 2003 to 2006. In September 2016, that program referred the surrounding area to the Superfund program, because soil sampling indicated pollution from smokestacks had spread beyond the Federated Metals site.

The study area is bounded by the alley between 119th Street and Fischrupp Avenue to the north, extending to Acthison on the west and White Oak Avenue to the east. The southern border is located between George Lake Trail and East Lakeview Street.

Soil sampling on some properties found lead above the EPA's designed level, Maguire said. Of the 51 properties sampled, 31 were found to have levels at the surface exceeding 400 parts per million, or ppm. Of those, 10 properties showed lead levels equal to or exceeding 1,200 ppm.

Removing contaminated soil, replacing it with clean soil and restoring the yard begins next week on properties where "sensitive populations" reside, he said. "For this project, sensitive population is defined as pregnant women and children under (age) 7."

The EPA also will evaluate removing soil in properties where children in the household have an elevated blood lead level, Maguire said.

All the work will be done at no cost to the property owners. Repairs of any damage done to a home's foundation during the project will be the EPA's responsibility, he said.

"The EPA is actively seeking properties to sample," he said. "We've sampled extensively outside the zone. That line is not set in stone. It is a work in progress."

Residents signed agreements to allow EPA officials and contractors to enter their property, including a tour of basements in homes.

Asked why all the soil in the area isn't being replaced, Maguire said it costs $50,000 to remediate each property.

"There is no responsible party," he said. "Unfortunately Federated Metals went bankrupt."

Pruitt Pledges EPA Action on Legacy PFASs

05/24/18

US EPA Administrator Scott Pruitt has pledged to address possible health hazards posed by perfluoroalkyl and polyfluoroalkyl substances (PFASs). But the agency's approach will apparently focus on contamination by the legacy chemicals PFOA and PFOS.

Meanwhile, thousands of PFASs could remain in active commerce, attendees heard at a recent agency summit. Speaking before state representatives, federal agencies, trade groups and NGOs at the 22 May meeting in Washington, DC, Mr Pruitt announced plans to take such actions on legacy PFASs as developing a maximum contaminant level (MCL) for drinking water and enabling cleanup efforts.

Absent from the proposed plan, however, was an approach for assessing the thousands of PFASs used in such consumer products as food packaging, firefighting foams, building materials and textiles.

Industry groups hold that there is no evidence newer "short-chain" PFASs carry the same risks as their "long-chain" predecessors. Perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS), which are not regulated, have been phased out under a stewardship programme and are no longer manufactured in the US.

Speaking at the summit, Jessica Bowman, executive director of American Chemistry Council subsidiary the FluoroCouncil, said regulators "should recognise the differences between various PFAS chemistries".

"Not all PFAS require risk-based regulation," Ms Bowman said.

Disagreement

But some NGOs and state officials are unconvinced on the safety of short-chain PFASs and would like to see them regulated as a class.

"There is a direct disagreement that short-chain products are known to be any safer," Erik Olson, senior director for health and food at the National Resources Defense Council, told Chemical Watch. He was the only NGO representative invited to speak at the summit.

"I have yet to see any information that says these chemicals are safer to drink in your water," said Brandon Kernen of the New Hampshire Department of Environmental Services. "There [are] a lot more questions than answers."

Mr Olson recommends that the EPA halt approval of new PFASs and issue significant new use rules (Snurs) limiting uses of those now in commerce. And he said the Food and Drug Administration (FDA) should revoke approval of the 19 PFASs allowed as food contact substances.

Jeff Morris, director of the EPA's Office of Pollution Prevention and Toxics (OPPT), said PFASs will be considered as a possible class of substances to be targeted as the agency prioritises chemicals for risk evaluation under TSCA.

Manufacturers have sought approval for 900 PFASs in the past 12 years, almost all before TSCA was amended in 2016, said Mr Morris. He did not say how many were approved, but he said the EPA has data from some 900 studies on approximately 200 PFASs.

EPA approach

The EPA laid out the following "concrete steps" to address PFASs:

- evaluate the need for a nationwide maximum contaminant level (MCL) in drinking water for PFOA and PFOS;
- publish groundwater cleanup recommendations for PFOA and PFOS by autumn;
- consider naming some PFASs hazardous substances under the Superfund program, establishing liability for cleaning them up;
- develop toxicity values by this summer for PFBS (perfluorobutane sulfonate) and GenX, a PFOA alternative used in producing Teflon; and
- produce a national PFAS management plan by this autumn.

The ACC said it supports "consideration of MCLs for PFOS, PFOA and other legacy PFAS", as well as regulation barring their import.

The Hill

EPA Grapples with Potential Health Threat in Drinking Water

By: Timothy Cama, 05/28/18

Environmental Protection Agency (EPA) chief Scott Pruitt is starting to grapple with a class of chemicals used in manufacturing that has been found in drinking water in recent years.

Pruitt convened a summit this week with state officials, industry representatives, environmental advocates and others to discuss the presence of per- and polyfluoroalkyl substances (PFAS) in the water supply. He labeled the issue a "national priority" and promised certain steps toward potentially regulating the chemicals' presence in water.

Among other steps, Pruitt said EPA would formally consider whether to set national limits on the drinking water concentration of two of the thousands of chemicals in the family: perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS).

The chemical industry even endorsed the actions, though cautioned that the EPA has to use "sound science" as it moves forward.

But some in Congress, along with environmental and public health advocates, are skeptical that Pruitt will take strong action on PFAS. They point to the Trump administration's deregulatory bent and an email uncovered last week in which a White House aide said an as-yet-unreleased federal study on the chemicals could be a "public relations nightmare."

"At this point, it really just seems like a public show, with no action to really to back it up," said David Andrews, a senior scientist at the Environmental Working Group.

Pruitt's actions on PFAS were also overshadowed by an uproar over EPA barring journalists from much of the summit and allegations that a security guard shoved a reporter out of the building when she tried to cover it.

The man-made chemicals have been used to make products like Teflon, Scotchgard and firefighting products. Companies have been using them for decades.

But only recently have the health risks from PFAS garnered attention. The risks are under scrutiny in part due to the Flint, Mich., water crisis, which spurred a nationwide focus on water contamination that has uncovered water issues at military bases and manufacturing facilities in New York, New Hampshire, Michigan, North Carolina, among other places.

Consumption of at least some of the compounds has been linked to cancer, thyroid disease, immune system problems and other ailments.

Pruitt organized the PFAS summit earlier this year in response to growing calls from lawmakers and states for EPA to take actions like increasing research and exploring regulation.

"This is a national priority that we need to focus on as a country," Pruitt said at the event. "There are concerns across the country about these chemicals because of their persistence, their durability, getting into the environment and impacting communities in an adverse way."

Pruitt made four pledges on behalf of EPA. He said the agency would evaluate whether to set maximum PFOS levels for drinking water, develop recommendations for cleaning the chemicals out of groundwater, consider whether to designate some of them as "hazardous substances" for environmental cleanup purposes and do research on toxicity levels for some of the compounds.

The American Chemistry Council, which represents chemical companies, endorsed Pruitt's approach.

"I think we were overall pretty encouraged. It's fairly consistent with the sort of things that we're looking for in terms of next steps we want EPA to take in this area," said Jessica Bowman, the group's director for fluor-chemistry.

The industry wants to ensure, however, that newer PFAS compounds are not swept up in EPA's action. It argues that legacy chemicals like PFAS and PFAO — neither of which is produced domestically anymore — are the main issue, and newer chemicals are more advanced and less harmful.

"We want to make sure that EPA does take into consideration that there is a significant variation in the substances that all fall within this class of chemistry, and they don't all require risk-based regulation," Bowman said, adding that she believes Pruitt will endorse that view.

But environmental advocates and many lawmakers distrust Pruitt to handle the issue. They say he is unlikely to order the right scientific studies or go far enough to limit acceptable chemical levels in water.

"I'm very concerned about Pruitt's leadership on this issue," said Rep. Brendan Boyle (D-Pa.).

Boyle said he's particularly worried about the revelation last week that an unknown White House aide predicted a "public relations disaster" from a federal health study about the substances. The email was uncovered by a Freedom of Information Act request filed by the Union of Concerned Scientists and first reported by Politico.

Numerous lawmakers are demanding that the Health and Human Services Department's Agency for Toxic Substances and Disease Registry release the research referenced in the email.

Patrick Breysse, that agency's head, said at the EPA summit that he and his staff were "working aggressively" to get the study out.

Sen. Shelley Moore Capito (R-W.Va.) has also put pressure on the EPA over PFAS.

Asked if she's pleased with how EPA is handling the issue, she said, "I'm not totally pleased, no, but I want to find out what kind of levels are acceptable and remediate the problems."

As for whether she has confidence in Pruitt's handling, she said, "I think time will tell, honestly."

It has proven difficult for the EPA to designate a new chemical for filtering under the Safe Drinking Water Act. Since the act was updated in 1996, only one new chemical has been designated for potential regulation, and the EPA still hasn't moved to regulate it.

But the bigger issue, in environmentalists view, is Pruitt's desire to avoid regulation and cater to industry.

"Reading the tea leaves, it's pretty clear that they are following the chemical industry's lead on this," said Erik Olson, director of the health program at the Natural Resources Defense Council.

"We feel that we certainly can't trust EPA to set a health-protective standard for these chemicals."

Pruitt controversial science "transparency" proposal would also make it difficult for the EPA to publish a strong regulation, green advocates say.

The proposal, among other changes, would require that any scientific findings the EPA uses for regulating be based on data that is available to the public and reproducible.

Epidemiological studies, like those examining the effects of contaminants, often rely on personal data that researchers agree to keep private, and they can't be reproduced since they only happen once.

That would make it difficult for the EPA to use some of the most consequential studies on PFAS, advocates say.

"You throw out all evidence that these chemicals are already impacting human health," Andrews said, pointing to research from the major PFOA spill in West Virginia in 2014 as an example.

"The implications could be enormous in terms of ignoring the significant amounts of scientific data that these chemic

Hoosick Falls Mayor Rob Allen Meets EPA Administrator Scott Pruitt, Talks PFOA

By: Keith Whitcomb, 05/25/18

Mayor Rob Allen met face-to-face with Environmental Protection Agency Administrator Scott Pruitt earlier this week to discuss the village's tainted water supply.

Allen met with Pruitt in Washington D.C. when he attended the National Leadership Summit on PFAS.

PFAS (Per- and Polyfluoroalkyl Substances) is the name for the group of chemicals that includes PFOA (perfluorooctanoic acid), which a few years ago was discovered in the village's water supply. It was also found in certain residential wells in nearby North Bennington, Vt., and other places. It's a byproduct of making teflon, which factories in the area at one time manufactured. Studies have suggested long-term exposure can lead to health problems. Similar chemicals are involved in foam used by fire departments on especially heavy fires.

Hoosick Falls has since acquired a filtration system, but is seeking a new water supply.

Allen said he asked Pruitt several questions and made a number of comments. Among them, he and others would like to see the EPA set safe, enforceable maximum contaminant levels (MCL) for PFOA and related chemicals.

He also brought up with Pruitt an article published by Politico about emails allegedly showing that a study set to be released by the federal Health and Human Services' Agency for Toxic Substances and Disease Registry was blocked by White House aids and people within the EPA. The study would have said that safe levels for PFAS are quite lower than what the EPA currently recommends.

Allen said that Pruitt told him he didn't know about the study until the Politico report, and that as EPA administrator he wouldn't have the authority to hold or release the study.

The Politico report is especially frustrating to hear for anyone in a community dealing with a PFAS chemical, said Allen. It was nice to see the EPA is talking about these issues, Allen said, but the reality is that any action the EPA would be likely to move forward with can take years. Setting a MCL, for example, can take as long as a decade. Allen said someone at the summit brought up the fact that the EPA has not set an enforceable MCL for a man-made chemical since 1995.

"Our community is used to hearing words," Allen said. "We want action."

Right now, the village is still negotiating with the companies the state has deemed responsible for the PFOA, St. Gobain and Honeywell. It's also researching new water sources. Candidates include the aquifer under the current polluted one, and the Tomhannock Reservoir which is used by the City of Troy. Allen said there are challenges and concerns with each option.

Ag Net West

USDA-EPA Discuss Year-Round E15

05/25/18

U.S. Department of Agriculture (USDA) and Environmental Protection Agency (EPA) officials met to discuss ways to increase ethanol usage and to address refiner concerns about volatility in the market for biofuel credits.

An Agri-Pulse report says the meeting followed months of discussions at the White House on the issue. It also follows months of concerns over the way EPA Administrator Scott Pruitt is overseeing the program.

The ethanol industry is pressing the EPA to finally move forward with issuing a vapor pressure waiver that will allow E15 to be sold all year.

Growth Energy CEO Emily Skor says President Trump promised to protect the statutory targets under the RFS. "We support Secretary Perdue's efforts to ensure the EPA upholds the commitment to rural families," Skor says, "and there's no reason to delay or attach unrelated gimmicks to benefit a few refinery owners."

The meeting comes as Marathon, the nation's second-largest refining company, is seeking a waiver from the RFS blending requirements. Iowa Senator Chuck Grassley says the Marathon request shows that the "embarrassing loophole," as he calls the RFS waiver authority, needs to be fixed.

Trump Welcomes 'Productive' Statement from North Korea, Says Dems 'Rooting Against' Talks

By: Brooke Singman, 05/25/18

President Trump kept the diplomacy door open with North Korea on Friday, welcoming the regime's latest "productive" statement following the administration's decision to cancel the highly anticipated summit with Kim Jong Un.

Trump nixed the summit, which was slated for June 12 in Singapore, following threats from North Korea. But hours after the U.S. pulled out of the meeting, North Korea issued a statement suggesting the regime was open to talks.

"Very good news to receive the warm and productive statement from North Korea. We will soon see where it will lead, hopefully to long and enduring prosperity and peace. Only time (and talent) will tell!" Trump tweeted on Friday morning.

A top North Korean official had issued a statement Thursday evening expressing the regime's "willingness" to sit down for a summit with the U.S.

"We express our willingness to sit down face-to-face with the U.S. and resolve issues anytime and in any format," North Korean Vice Foreign Minister Kim Kye-gwan said, according to Yonhap News outlet, which cited the Korean Central News Agency (KCNA.)

The official also said that Trump's move to call off the summit highlighted the tensions between the two countries, further emphasizing the need for a meeting. The official added that Kim had been preparing for the summit.

"Despite all of this, the U.S.' unilateral decision to scrap the talks causes us to reconsider whether all of the efforts and the path we have taken is really the right one or not," the official said according to Yonhap. "Our commitment to doing our best for the sake of peace and stability for the world and the Korean Peninsula remains unchanged, and we are open-minded in giving time and opportunity to the U.S."

But on Friday, with the door left open for potential U.S.-North Korea talks, Trump suggested it was the Democrats who were against "negotiations" with the rogue regime.

"Democrats are so obviously rooting against us in our negotiations with North Korea. Just like they are coming to the defense of MS 13 thugs, saying that they are individuals & must be nurtured, or asking to end your big Tax Cuts & raise your taxes instead. Dems have lost touch!" Trump tweeted Friday.

Following Trump's letter to Kim on Thursday suggesting to hold the meeting would have been "inappropriate," House Democratic Leader Nancy Pelosi, D-Calif., blasted the president, suggesting Kim had "won."

Pelosi described the letter from Trump to Kim as a "Valentine."

"He's the big winner and when he got this letter from the president saying 'okay nevermind,' he must be having a giggle fit, right now, in North Korea," Pelosi said on Capitol Hill Thursday.

Also on Friday, the president tweeted about the reported FBI informant who had communicated with members of his campaign in 2016.

"The Democrats are now alluding to the concept that having an informant placed in an opposing party's campaign is different than having a Spy, as illegal as that may be. But what about an 'informant' who is paid a fortune and who 'sets up' way earlier than the Russia Hoax?" Trump tweeted.

Moments later he added: "Can anyone even imagine having Spies placed in a competing campaign, by the people and party in absolute power, for the sole purpose of political advantage and gain? And to think that the party in question, even with the expenditure of far more money, LOST!"

After a high-level Justice Department briefing held Thursday on the Russia case, Democratic lawmakers maintained there was no evidence to support claims of a spy in the Trump campaign.

Politico

Trump's Next Economic Threat: Surging Gas Prices

By: Ben White, 05/25/18

President Donald Trump is hoping a wave of tax-cut-fueled economic euphoria will boost his approval ratings and his party's political fortunes this fall. A sharp spike in gas prices could slam the brakes on all of that.

As Americans head out for traditional Memorial Day weekend road trips, they'll confront gas prices of nearly $3 a gallon, the highest since 2014 and a 25 percent spike since last year.

The increased cost of fuel is already wiping out a big chunk of the benefit Americans received from the GOP tax cuts. And things could get worse as summer approaches following the administration's standoff with Iran and a move by oil-producing nations to tighten supplies.

The result: The economic and political benefits Trump and the GOP hoped to reap from cutting tax rates could be swamped by higher pump prices that Americans face every time they hit the road.

"If you look at the benefits of what households are getting from lower rates, roughly one-third of that is wiped out if these higher gas prices are sustained," said Ellen Zentner, chief U.S. economist at Morgan Stanley. "And when we drive down the street, every block we see glaring signs about how much gas costs that day and it's all over the media. The tax cuts were a one-off. It's a one-time level shift in your paycheck that you are not reminded of every day."

The economic impact of higher gas prices is already stark.

Morgan Stanley estimated that if prices remain at current levels, they would cost U.S. households an additional $38 billion this year. Using Joint Committee on Taxation data, it estimated the tax-cut bill would reduce individual taxes by about $128 billion in 2018. And it gets even worse for Trump.

The increase in gas prices is felt most heavily by lower-income Americans — especially in the South where people drive the most — who received the smallest share of the tax-cut benefits. So the increase could hit Trump's blue-collar Southern base the hardest while potentially eroding confidence in the economy and tamping down consumer spending, which accounts for 70 percent of economic output.

So far, consumer spending remains fairly strong as higher wages and lower taxes encourage people to open their wallets. But the first clear impact of higher gas prices emerged in the latest retail sales figures, which showed a 0.3 percent decline in spending at restaurants and bars. Typically, the first area households cut back when feeling pinched is going out to eat. Spending on travel, tourism and apparel, among other categories, could also wind up declining if fuel prices keep rising.

"Gas prices will reduce the benefits of the tax cut by at least one-third, but I think the impact may actually be much larger than that because the bulk of the tax cuts go to high-income households who aren't going to spend much of it," said Mark Zandi, chief economist at Moody's Analytics. "Gas prices mean less today than they did 20 years ago, but they still mean a lot, especially to those folks living on the margins in lower and lower-middle income groups."

When prices fell in 2014 and 2015, they hit the profits of oil giants but left everyone else with more money to spend, helping lift everything from dining out to home sales — and contributing to a boost in overall gross domestic product.

The reverse may now also be true. Higher gas prices will lead to stronger profits for oil and gas companies, but less spending on everything else and potentially higher inflation.

If prices continue to rise, consumers will feel the pinch not just at the pump but in what they pay to heat their homes and for virtually any product that is delivered to their home or the store in cars and trucks.

"The price of oil and inflation are positively — and highly — correlated," wrote Scott Anderson, chief economist at Bank of the West, in a recent note to clients. "In other words, as oil prices increase or decrease, inflation moves in the same direction."

A spike in inflation could push the Federal Reserve to add another interest rate hike this year, further pushing up the cost of borrowing on everything from credit cards to home purchases. Mortgage rates are already rising, and a further increase could reduce home purchases and all the household formation spending that goes along with them.

None of the negative impacts from higher gas prices are guaranteed.

Many analysts view the price spikes as temporary, noting that a decline in political uncertainty in the Middle East could push prices lower. The U.S. is also far less dependent on imported oil than it was during the oil shock of the late 1970s. And Americans spend less now on gas given alternative energy sources and more efficient cars.

But such a sharp spike in prices still has real economic and psychological impacts that could easily blow away any benefits from a tax-cut bill Americans already have mixed feelings about.

A study released this week by the Federal Reserve Bank of New York showed that only 37 percent of households believe they will be better off a year from now because of the tax cuts, while 47 percent expect no change and 16 percent think they will be worse off.

Higher gas prices, meanwhile, act as an immediate tax on consumers and make people feel poorer.

“There’s still a positive impact from the tax cut, but it tells a little different story when the tax cuts are seen against the backdrop of higher gas prices,” Zentner said. “It changes the narrative a little bit.”

EPA Meeting about New Lead Cleanup Around Federated Metals Site Draws Large Crowd Seeking Answers

By: LuAnn Franklin, 05/24/18

Dozens of Hammond and Whiting residents gathered Wednesday to hear what action the U.S. Environmental Protection Agency plans to take to identify and remove possible lead contamination in the soil on their properties near the long-shuttered Federated Metals site.

The public meeting at the Whiting Family YMCA was the first to provide information about the soil sampling study area, which includes a mix of industrial, commercial and residential properties as well as vacant lots, community centers, playgrounds, parks, churches and schools.

Andrew Maguire, EPA on-scene coordinator, went through the history of the Hammond plant at 2230 Indianapolis Blvd. from 1937 to its closing in 1987, and how EPA teams, acting under the EPA's Resource Conservation & Recovery Act, consolidated waste there from 2003 to 2006. In September 2016, that program referred the surrounding area to the Superfund program, because soil sampling indicated pollution from smokestacks had spread beyond the Federated Metals site.

The study area is bounded by the alley between 119th Street and Fischrupp Avenue to the north, extending to Acthison on the west and White Oak Avenue to the east. The southern border is located between George Lake Trail and East Lakeview Street.

Soil sampling on some properties found lead above the EPA's designed level, Maguire said. Of the 51 properties sampled, 31 were found to have levels at the surface exceeding 400 parts per million, or ppm. Of those, 10 properties showed lead levels equal to or exceeding 1,200 ppm.

Removing contaminated soil, replacing it with clean soil and restoring the yard begins next week on properties where "sensitive populations" reside, he said. "For this project, sensitive population is defined as pregnant women and children under (age) 7."

The EPA also will evaluate removing soil in properties where children in the household have an elevated blood lead level, Maguire said.

All the work will be done at no cost to the property owners. Repairs of any damage done to a home's foundation during the project will be the EPA's responsibility, he said.

"The EPA is actively seeking properties to sample," he said. "We've sampled extensively outside the zone. That line is not set in stone. It is a work in progress."

Residents signed agreements to allow EPA officials and contractors to enter their property, including a tour of basements in homes.

Asked why all the soil in the area isn't being replaced, Maguire said it costs $50,000 to remediate each property.

"There is no responsible party," he said. "Unfortunately Federated Metals went bankrupt."

Pruitt Pledges EPA Action on Legacy PFASs

05/24/18

US EPA Administrator Scott Pruitt has pledged to address possible health hazards posed by perfluoroalkyl and polyfluoroalkyl substances (PFASs). But the agency's approach will apparently focus on contamination by the legacy chemicals PFOA and PFOS.

Meanwhile, thousands of PFASs could remain in active commerce, attendees heard at a recent agency summit. Speaking before state representatives, federal agencies, trade groups and NGOs at the 22 May meeting in Washington, DC, Mr Pruitt announced plans to take such actions on legacy PFASs as developing a maximum contaminant level (MCL) for drinking water and enabling cleanup efforts.

Absent from the proposed plan, however, was an approach for assessing the thousands of PFASs used in such consumer products as food packaging, firefighting foams, building materials and textiles.

Industry groups hold that there is no evidence newer "short-chain" PFASs carry the same risks as their "long-chain" predecessors. Perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS), which are not regulated, have been phased out under a stewardship programme and are no longer manufactured in the US.

Speaking at the summit, Jessica Bowman, executive director of American Chemistry Council subsidiary the FluoroCouncil, said regulators "should recognise the differences between various PFAS chemistries".

"Not all PFAS require risk-based regulation," Ms Bowman said.

Disagreement

But some NGOs and state officials are unconvinced on the safety of short-chain PFASs and would like to see them regulated as a class.

"There is a direct disagreement that short-chain products are known to be any safer," Erik Olson, senior director for health and food at the National Resources Defense Council, told Chemical Watch. He was the only NGO representative invited to speak at the summit.

"I have yet to see any information that says these chemicals are safer to drink in your water," said Brandon Kernen of the New Hampshire Department of Environmental Services. "There [are] a lot more questions than answers."

Mr Olson recommends that the EPA halt approval of new PFASs and issue significant new use rules (Snurs) limiting uses of those now in commerce. And he said the Food and Drug Administration (FDA) should revoke approval of the 19 PFASs allowed as food contact substances.

Jeff Morris, director of the EPA's Office of Pollution Prevention and Toxics (OPPT), said PFASs will be considered as a possible class of substances to be targeted as the agency prioritises chemicals for risk evaluation under TSCA. Manufacturers have sought approval for 900 PFASs in the past 12 years, almost all before TSCA was amended in 2016, said Mr Morris. He did not say how many were approved, but he said the EPA has data from some 900 studies on approximately 200 PFASs.

EPA approach

The EPA laid out the following "concrete steps" to address PFASs:

- evaluate the need for a nationwide maximum contaminant level (MCL) in drinking water for PFOA and PFOS;
- publish groundwater cleanup recommendations for PFOA and PFOS by autumn;
- consider naming some PFASs hazardous substances under the Superfund program, establishing liability for cleaning them up;
- develop toxicity values by this summer for PFBS (perfluorobutane sulfonate) and GenX, a PFOA alternative used in producing Teflon; and
- produce a national PFAS management plan by this autumn.

The ACC said it supports "consideration of MCLs for PFOS, PFOA and other legacy PFAS", as well as regulation barring their import.

EPA Grapples with Potential Health Threat in Drinking Water

By: Timothy Cama, 05/28/18

Environmental Protection Agency (EPA) chief Scott Pruitt is starting to grapple with a class of chemicals used in manufacturing that has been found in drinking water in recent years.

Pruitt convened a summit this week with state officials, industry representatives, environmental advocates and others to discuss the presence of per- and polyfluoroalkyl substances (PFAS) in the water supply. He labeled the issue a "national priority" and promised certain steps toward potentially regulating the chemicals' presence in water.

Among other steps, Pruitt said EPA would formally consider whether to set national limits on the drinking water concentration of two of the thousands of chemicals in the family: perfluorooctanoic acid (PFOA) and perfluorooctanesulfonic acid (PFOS).

The chemical industry even endorsed the actions, though cautioned that the EPA has to use "sound science" as it moves forward.

But some in Congress, along with environmental and public health advocates, are skeptical that Pruitt will take strong action on PFAS. They point to the Trump administration's deregulatory bent and an email uncovered last week in which a White House aide said an as-yet-unreleased federal study on the chemicals could be a "public relations nightmare."

"At this point, it really just seems like a public show, with no action to really to back it up," said David Andrews, a senior scientist at the Environmental Working Group.

Pruitt's actions on PFAS were also overshadowed by an uproar over EPA barring journalists from much of the summit and allegations that a security guard shoved a reporter out of the building when she tried to cover it.

The man-made chemicals have been used to make products like Teflon, Scotchgard and firefighting products. Companies have been using them for decades.

But only recently have the health risks from PFAS garnered attention. The risks are under scrutiny in part due to the Flint, Mich., water crisis, which spurred a nationwide focus on water contamination that has uncovered water issues at military bases and manufacturing facilities in New York, New Hampshire, Michigan, North Carolina, among other places.

Consumption of at least some of the compounds has been linked to cancer, thyroid disease, immune system problems and other ailments.

Pruitt organized the PFAS summit earlier this year in response to growing calls from lawmakers and states for EPA to take actions like increasing research and exploring regulation.

"This is a national priority that we need to focus on as a country," Pruitt said at the event. "There are concerns across the country about these chemicals because of their persistence, their durability, getting into the environment and impacting communities in an adverse way."

Pruitt made four pledges on behalf of EPA. He said the agency would evaluate whether to set maximum PFOS levels for drinking water, develop recommendations for cleaning the chemicals out of groundwater, consider whether to designate some of them as "hazardous substances" for environmental cleanup purposes and do research on toxicity levels for some of the compounds.

The American Chemistry Council, which represents chemical companies, endorsed Pruitt's approach.

"I think we were overall pretty encouraged. It's fairly consistent with the sort of things that we're looking for in terms of next steps we want EPA to take in this area," said Jessica Bowman, the group's director for fluor-chemistry.

The industry wants to ensure, however, that newer PFAS compounds are not swept up in EPA's action. It argues that legacy chemicals like PFAS and PFAO — neither of which is produced domestically anymore — are the main issue, and newer chemicals are more advanced and less harmful.

"We want to make sure that EPA does take into consideration that there is a significant variation in the substances that all fall within this class of chemistry, and they don't all require risk-based regulation," Bowman said, adding that she believes Pruitt will endorse that view.

But environmental advocates and many lawmakers distrust Pruitt to handle the issue. They say he is unlikely to order the right scientific studies or go far enough to limit acceptable chemical levels in water.

"I'm very concerned about Pruitt's leadership on this issue," said Rep. Brendan Boyle (D-Pa.).

Boyle said he's particularly worried about the revelation last week that an unknown White House aide predicted a "public relations disaster" from a federal health study about the substances. The email was uncovered by a Freedom of Information Act request filed by the Union of Concerned Scientists and first reported by Politico.

Numerous lawmakers are demanding that the Health and Human Services Department's Agency for Toxic Substances and Disease Registry release the research referenced in the email.

Patrick Breysse, that agency's head, said at the EPA summit that he and his staff were "working aggressively" to get the study out.

Sen. Shelley Moore Capito (R-W.Va.) has also put pressure on the EPA over PFAS.

Asked if she's pleased with how EPA is handling the issue, she said, "I'm not totally pleased, no, but I want to find out what kind of levels are acceptable and remediate the problems."

As for whether she has confidence in Pruitt's handling, she said, "I think time will tell, honestly."

It has proven difficult for the EPA to designate a new chemical for filtering under the Safe Drinking Water Act. Since the act was updated in 1996, only one new chemical has been designated for potential regulation, and the EPA still hasn't moved to regulate it.

But the bigger issue, in environmentalists view, is Pruitt's desire to avoid regulation and cater to industry.

"Reading the tea leaves, it's pretty clear that they are following the chemical industry's lead on this," said Erik Olson, director of the health program at the Natural Resources Defense Council.

"We feel that we certainly can't trust EPA to set a health-protective standard for these chemicals."

Pruitt controversial science "transparency" proposal would also make it difficult for the EPA to publish a strong regulation, green advocates say.

The proposal, among other changes, would require that any scientific findings the EPA uses for regulating be based on data that is available to the public and reproducible.

Epidemiological studies, like those examining the effects of contaminants, often rely on personal data that researchers agree to keep private, and they can't be reproduced since they only happen once.

That would make it difficult for the EPA to use some of the most consequential studies on PFAS, advocates say.

"You throw out all evidence that these chemicals are already impacting human health," Andrews said, pointing to research from the major PFOA spill in West Virginia in 2014 as an example.

"The implications could be enormous in terms of ignoring the significant amounts of scientific data that these chemic

Hoosick Falls Mayor Rob Allen Meets EPA Administrator Scott Pruitt, Talks PFOA

By: Keith Whitcomb, 05/25/18

Mayor Rob Allen met face-to-face with Environmental Protection Agency Administrator Scott Pruitt earlier this week to discuss the village's tainted water supply.

Allen met with Pruitt in Washington D.C. when he attended the National Leadership Summit on PFAS.

PFAS (Per- and Polyfluoroalkyl Substances) is the name for the group of chemicals that includes PFOA (perfluorooctanoic acid), which a few years ago was discovered in the village's water supply. It was also found in certain residential wells in nearby North Bennington, Vt., and other places. It's a byproduct of making teflon, which factories in the area at one time manufactured. Studies have suggested long-term exposure can lead to health problems. Similar chemicals are involved in foam used by fire departments on especially heavy fires.

Hoosick Falls has since acquired a filtration system, but is seeking a new water supply.

Allen said he asked Pruitt several questions and made a number of comments. Among them, he and others would like to see the EPA set safe, enforceable maximum contaminant levels (MCL) for PFOA and related chemicals.

He also brought up with Pruitt an article published by Politico about emails allegedly showing that a study set to be released by the federal Health and Human Services' Agency for Toxic Substances and Disease Registry was blocked by White House aids and people within the EPA. The study would have said that safe levels for PFAS are quite lower than what the EPA currently recommends.

Allen said that Pruitt told him he didn't know about the study until the Politico report, and that as EPA administrator he wouldn't have the authority to hold or release the study.

The Politico report is especially frustrating to hear for anyone in a community dealing with a PFAS chemical, said Allen. It was nice to see the EPA is talking about these issues, Allen said, but the reality is that any action the EPA would be likely to move forward with can take years. Setting a MCL, for example, can take as long as a decade. Allen said someone at the summit brought up the fact that the EPA has not set an enforceable MCL for a man-made chemical since 1995.

"Our community is used to hearing words," Allen said. "We want action."

Right now, the village is still negotiating with the companies the state has deemed responsible for the PFOA, St. Gobain and Honeywell. It's also researching new water sources. Candidates include the aquifer under the current polluted one, and the Tomhannock Reservoir which is used by the City of Troy. Allen said there are challenges and concerns with each option.

Ag Net West

Trump Welcomes 'Productive' Statement from North Korea, Says Dems 'Rooting Against' Talks

By: Brooke Singman, 05/25/18

President Trump kept the diplomacy door open with North Korea on Friday, welcoming the regime's latest "productive" statement following the administration's decision to cancel the highly anticipated summit with Kim Jong Un.

Trump nixed the summit, which was slated for June 12 in Singapore, following threats from North Korea. But hours after the U.S. pulled out of the meeting, North Korea issued a statement suggesting the regime was open to talks.

"Very good news to receive the warm and productive statement from North Korea. We will soon see where it will lead, hopefully to long and enduring prosperity and peace. Only time (and talent) will tell!" Trump tweeted on Friday morning.

A top North Korean official had issued a statement Thursday evening expressing the regime's "willingness" to sit down for a summit with the U.S.

"We express our willingness to sit down face-to-face with the U.S. and resolve issues anytime and in any format," North Korean Vice Foreign Minister Kim Kye-gwan said, according to Yonhap News outlet, which cited the Korean Central News Agency (KCNA.)

The official also said that Trump's move to call off the summit highlighted the tensions between the two countries, further emphasizing the need for a meeting. The official added that Kim had been preparing for the summit.

"Despite all of this, the U.S.' unilateral decision to scrap the talks causes us to reconsider whether all of the efforts and the path we have taken is really the right one or not," the official said according to Yonhap. "Our commitment to doing our best for the sake of peace and stability for the world and the Korean Peninsula remains unchanged, and we are open-minded in giving time and opportunity to the U.S."

But on Friday, with the door left open for potential U.S.-North Korea talks, Trump suggested it was the Democrats who were against "negotiations" with the rogue regime.

"Democrats are so obviously rooting against us in our negotiations with North Korea. Just like they are coming to the defense of MS 13 thugs, saying that they are individuals & must be nurtured, or asking to end your big Tax Cuts & raise your taxes instead. Dems have lost touch!" Trump tweeted Friday.

Following Trump's letter to Kim on Thursday suggesting to hold the meeting would have been "inappropriate," House Democratic Leader Nancy Pelosi, D-Calif., blasted the president, suggesting Kim had "won."

Pelosi described the letter from Trump to Kim as a "Valentine."

"He's the big winner and when he got this letter from the president saying 'okay nevermind,' he must be having a giggle fit, right now, in North Korea," Pelosi said on Capitol Hill Thursday.

Also on Friday, the president tweeted about the reported FBI informant who had communicated with members of his campaign in 2016.

"The Democrats are now alluding to the concept that having an informant placed in an opposing party's campaign is different than having a Spy, as illegal as that may be. But what about an 'informant' who is paid a fortune and who 'sets up' way earlier than the Russia Hoax?" Trump tweeted.

Moments later he added: "Can anyone even imagine having Spies placed in a competing campaign, by the people and party in absolute power, for the sole purpose of political advantage and gain? And to think that the party in question, even with the expenditure of far more money, LOST!"

After a high-level Justice Department briefing held Thursday on the Russia case, Democratic lawmakers maintained there was no evidence to support claims of a spy in the Trump campaign.

Politico

Trump's Next Economic Threat: Surging Gas Prices

By: Ben White, 05/25/18

President Donald Trump is hoping a wave of tax-cut-fueled economic euphoria will boost his approval ratings and his party's political fortunes this fall. A sharp spike in gas prices could slam the brakes on all of that.

As Americans head out for traditional Memorial Day weekend road trips, they'll confront gas prices of nearly $3 a gallon, the highest since 2014 and a 25 percent spike since last year.

The increased cost of fuel is already wiping out a big chunk of the benefit Americans received from the GOP tax cuts. And things could get worse as summer approaches following the administration's standoff with Iran and a move by oil-producing nations to tighten supplies.

The result: The economic and political benefits Trump and the GOP hoped to reap from cutting tax rates could be swamped by higher pump prices that Americans face every time they hit the road.

"If you look at the benefits of what households are getting from lower rates, roughly one-third of that is wiped out if these higher gas prices are sustained," said Ellen Zentner, chief U.S. economist at Morgan Stanley. "And when we drive down the street, every block we see glaring signs about how much gas costs that day and it's all over the media. The tax cuts were a one-off. It's a one-time level shift in your paycheck that you are not reminded of every day."

The economic impact of higher gas prices is already stark.

Morgan Stanley estimated that if prices remain at current levels, they would cost U.S. households an additional $38 billion this year. Using Joint Committee on Taxation data, it estimated the tax-cut bill would reduce individual taxes by about $128 billion in 2018. And it gets even worse for Trump.

The increase in gas prices is felt most heavily by lower-income Americans — especially in the South where people drive the most — who received the smallest share of the tax-cut benefits. So the increase could hit Trump's blue-collar Southern base the hardest while potentially eroding confidence in the economy and tamping down consumer spending, which accounts for 70 percent of economic output.

So far, consumer spending remains fairly strong as higher wages and lower taxes encourage people to open their wallets. But the first clear impact of higher gas prices emerged in the latest retail sales figures, which showed a 0.3 percent decline in spending at restaurants and bars. Typically, the first area households cut back when feeling pinched is going out to eat. Spending on travel, tourism and apparel, among other categories, could also wind up declining if fuel prices keep rising.

"Gas prices will reduce the benefits of the tax cut by at least one-third, but I think the impact may actually be much larger than that because the bulk of the tax cuts go to high-income households who aren't going to spend much of it," said Mark Zandi, chief economist at Moody's Analytics. "Gas prices mean less today than they did 20 years ago, but they still mean a lot, especially to those folks living on the margins in lower and lower-middle income groups."

When prices fell in 2014 and 2015, they hit the profits of oil giants but left everyone else with more money to spend, helping lift everything from dining out to home sales — and contributing to a boost in overall gross domestic product.

The reverse may now also be true. Higher gas prices will lead to stronger profits for oil and gas companies, but less spending on everything else and potentially higher inflation.

If prices continue to rise, consumers will feel the pinch not just at the pump but in what they pay to heat their homes and for virtually any product that is delivered to their home or the store in cars and trucks.

"The price of oil and inflation are positively — and highly — correlated," wrote Scott Anderson, chief economist at Bank of the West, in a recent note to clients. "In other words, as oil prices increase or decrease, inflation moves in the same direction."

A spike in inflation could push the Federal Reserve to add another interest rate hike this year, further pushing up the cost of borrowing on everything from credit cards to home purchases. Mortgage rates are already rising, and a further increase could reduce home purchases and all the household formation spending that goes along with them.

None of the negative impacts from higher gas prices are guaranteed.

Many analysts view the price spikes as temporary, noting that a decline in political uncertainty in the Middle East could push prices lower. The U.S. is also far less dependent on imported oil than it was during the oil shock of the late 1970s. And Americans spend less now on gas given alternative energy sources and more efficient cars.

But such a sharp spike in prices still has real economic and psychological impacts that could easily blow away any benefits from a tax-cut bill Americans already have mixed feelings about.

A study released this week by the Federal Reserve Bank of New York showed that only 37 percent of households believe they will be better off a year from now because of the tax cuts, while 47 percent expect no change and 16 percent think they will be worse off.

Higher gas prices, meanwhile, act as an immediate tax on consumers and make people feel poorer.

"There's still a positive impact from the tax cut, but it tells a little different story when the tax cuts are seen against the backdrop of higher gas prices," Zentner said. "It changes the narrative a little bit."

Very good news to receive the warm and productive statement from North Korea. We will soon see where it will lead, hopefully to long and enduring prosperity and peace. Only time (and talent) will tell!

Democrats are so obviously rooting against us in our negotiations with North Korea. Just like they are coming to the defense of MS 13 thugs, saying that they are individuals & must be nurtured, or asking to end your big Tax Cuts & raise your taxes instead. Dems have lost touch!

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 30

[EPA-HQ-OA-2018-0259; FRL-XXXX-XX]

RIN 2080-AA14

Strengthening Transparency in Regulatory Science

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: This document proposes a regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation. In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

DATES: Comments must be received on or before **[insert date 30 days after date of publication in the Federal Register]**.

ADDRESSES: Submit your comments, identified by Docket ID No. EPA–HQ–OA-2018-0259, at *https:// www.regulations.gov.* Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a

written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.*, on the web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *https://www.epa.gov/dockets/ commenting-epa-dockets.*

FOR FURTHER INFORMATION, CONTACT: Tom Sinks, Office of the Science Advisor, Environmental Protection Agency, 1200 Pennsylvania Avenue NW, Washington, DC 20460; (202) 564-0221; email address: *staff_osa@epa.gov*.

SUPPLEMENTARY INFORMATION:

Submitting CBI. Do not submit information that you consider to be CBI electronically through *https://www.regulations.gov* or email. Send or deliver information identified as CBI to only the following address using U.S Postal Service: U.S. Environmental Protection Agency, EPA Docket Center, EPA–HQ–OA-2018-0259, Mail Code 28221T, 1200 Pennsylvania Avenue, NW, Washington, DC 20460. For other methods of delivery, see https://www.epa.gov/dockets/where-send-comments-epa-dockets.

Clearly mark the part or all of the information that you claim to be CBI. For CBI information in a disk or CD-ROM that you mail to EPA, mark the outside of the disk or CD-ROM as CBI and then identify electronically within the disk or CD-ROM the specific information that is claimed as CBI. In addition to one complete version of the comment that

includes information claimed as CBI, a copy of the comment that does not contain the information claimed as CBI must be submitted for inclusion in the public docket. If you submit a CD-ROM or disk that does not contain CBI, mark the outside of the disk or CD-ROM clearly that it does not contain CBI. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 Code of Federal Regulations (CFR) part 2.

Organization of This Document. The following outline is provided to aid in locating information in this preamble.

I. General Information

A. Does this action apply to me?

This proposed regulation does not directly regulate any entity outside the federal government. However, any entity interested in EPA's regulations may be interested in this proposal. This proposal may be of particular interest to entities that conduct research and other scientific activity that is likely to be relevant to EPA's regulatory activity.

B. What action is the agency taking?

This notice solicits information and comment from the public on a proposed regulation intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that, for the science pivotal to its significant regulatory actions, EPA will ensure that the data and models underlying the science is publicly available in a manner sufficient for validation and analysis. In this notice, EPA solicits comment on this proposal and how it can best be implemented in light of existing law and prior statements of policy that have called for increasing public access to data and influential scientific information used to inform federal regulation. EPA has not previously implemented these policies and guidance in a robust and consistent manner. This proposal will help ensure that EPA is pursuing its mission of protecting public health and the environment in a manner that the public can trust and understand.

C. What is the agency's authority for taking this action?

The Agency proposes to take this action under authority of the statutes it administers, including provisions providing general authority to promulgate regulations necessary to carry out the Agency's functions under these statutes and provisions specifically addressing the Agency's conducting of and reliance on scientific activity to inform those functions, including Clean Air Act sections 103, 301(a), 42 U.S.C. 7403, 7601(a); Clean Water Act sections 104, 501, 33 U.S.C. 1254, 1361; Safe Drinking Water Act sections 1442, 1450(a)(1), 42 U.S.C. 300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act sections 2002(a)(1), 7009, 42 U.S.C. 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) sections 115, 311, 42 U.S.C. 9616, 9660; Emergency Planning and Community Right-To-Know Act section 328, 42 U.S.C. 11048;

Federal Insecticide, Fungicide, and Rodenticide Act sections 25(a)(1), 136r(a), 7 U.S.C. 136r(a), 136w; and Toxic Substances Control Act, as amended, section 10, 15 U.S.C. 2609. This action is also consistent with requirements in the Administrative Procedure Act to ensure public participation in the rulemaking process. As noted in Section III below, EPA solicits comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.

II. Background

The best available science must serve as the foundation of EPA's regulatory actions.[1] Enhancing the transparency and validity of the scientific information relied upon by EPA strengthens the integrity of EPA's regulatory actions and its obligation to ensure the Agency is not arbitrary in its conclusions. By better informing the public, the Agency in enhancing the public's ability to understand and meaningfully participate in the regulatory process.[2] In applying the best available science to its regulatory decision-making, EPA must comply with federal transparency and data integrity laws, and must also ensure=that its decision-making is marked by independence, objectivity, transparency, clarity, and reproducibility. Although these standards are important in all scientific endeavors, they are of paramount importance when the government relies on science to inform its significant regulatory decisions that will affect the public. When EPA develops significant regulations using public resources, including regulations for which the public is likely to bear the cost of compliance, EPA should ensure that the data and models

[1] See Exec. Order No. 13563, 76 Fed. Reg. 3821 (Jan. 21, 2011). "Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation. It must be based on the best available science."

[2] See Memorandum for the Heads of Executive Department and Agencies on Scientific Integrity (Mar. 9, 2009). "If scientific and technological information is developed and used by the Federal Government, it should ordinarily be made available to the public. To the extent permitted by law, there should be transparency in the preparation, identification, and use of scientific and technological information in policymaking."

underlying scientific studies that are pivotal to the regulatory action are available to the public. This proposed rule is designed to increase transparency in the preparation, identification, and use of science in policymaking.

This proposed rule is consistent with the principles underlying the Administrative Procedure Act and programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions.[3] This proposed rule is also consistent with Executive Orders 13777[4] and 13783,[5] and the focus on transparency in OMB's *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies*[6] (the Guidelines) and OMB *Memorandum 13-13: Open Data Policy – Managing Information as an Asset.*[7] It builds upon prior EPA actions[8] in response to government-wide data access and sharing policies, as well as the experience of other

---

[3] EPA has the authority to establish policies governing its reliance on science in the administration of its regulatory functions. Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use non-public data in support of its regulatory actions. *See Coalition of Battery Recyclers Ass'n v. EPA*, 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass'ns v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002). EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.

[4] Exec. Order No. 13777, 82 Fed. Reg. 12285 (Mar. 1, 2017). Regulatory reform efforts shall attempt to identify "those regulations that rely in whole or in part on data, information, or methods that are not publicly available or that are insufficiently transparent to meet the standard for reproducibility."

[5] Exec. Order No. 13783, 82 Fed. Reg. 16093 (Mar. 31, 2017). "It is also the policy of the United States that necessary and appropriate environmental regulations comply with the law, are of greater benefit than cost, when permissible, achieve environmental improvements for the American people, and are developed through transparent processes that employ the best available peer-reviewed science and economics."

[6] February 22, 2002 (67 F.R 8453) *OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information* (2002) https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information.

[7] *Memorandum for the Heads of Executive Departments and Agencies on Open Data Policy—Managing Information as an Asset* (https://project-open-data.cio.gov/policy-memo/). "Specifically, this Memorandum requires agencies to collect or create information in a way that supports downstream information processing and dissemination activities. This includes using machine-readable and open formats, data standards, and common core and extensible metadata for all new information creation and collection efforts. It also includes agencies ensuring information stewardship through the use of open licenses and review of information for privacy, confidentiality, security, or other restrictions to release."

[8] Plan to Increase Access to Results of EPA-Funded Scientific Research; EPA Open Government Plan 4.0; Open Data Implementation Plan; EPA's Scientific Integrity Policy; Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency; ,

federal agencies in this space.[9] In particular, this proposal applies concepts and lessons learned from its ongoing implementation of the 2016 Plan to Increase Access to Results of EPA-Funded Scientific Research to significant regulatory decisions. The proposed rule takes into consideration the policies or recommendations of third party organizations who advocated for open science.[10] These policies are informed by the policies recently adopted by some major scientific journals,[11] spurred in some part by the "replication crisis." [12]

Today, EPA is proposing to establish a clear policy for the transparency of the scientific information used for significant regulations: specifically, the dose response data and models that underlie what we are calling "pivotal regulatory science." "Pivotal regulatory science" is the studies, models, and analyses that drive the magnitude of the benefit-cost calculation, the level of a standard, or point-of-departure from which a reference value is calculated. In other words, they are critical to the calculation of a final regulatory standard or level, or to the quantified costs, benefits, risks and other impacts on which a final regulation is based.

With this notice, EPA is soliciting public comment on a proposed regulation designed to provide a mechanism to increase access to dose response data and models underlying pivotal regulatory

---

[9] For example, see related policies from the National Science Foundation, National Institute of Science and Technology, the National Institutes of Health; and the US Census Bureau, which provides secure access to data from several agencies in an environment that protects against unauthorized disclosure (https://www.census.gov/fsrdc).

[10] These include policies and recommendations from: the Administrative Conference of the United States' Science in the Administrative Process Project; National Academies' reports on *Improving Access to and Confidentiality of Research Data*, *Expanding Access to Research Data*, and *Access to Research Data in the 21st Century*; the Health Effects Institute; Center for Open Science; members of the Risk Assessment Specialty Section of the Society of Toxicology, the Dose Response Section of the Society for Risk Analysis, and the International Society for Regulatory Toxicology and Pharmacology; and the Bipartisan Policy Center's Science for Policy Project.

[11] For example, see related policies from the *Proceedings of the National Academy of Sciences*, *PLOS ONE*, *Science*, and *Nature*.

[12] See: https://www.nature.com/articles/s41562-016-0021; http://journals.plos.org/plosmedicine/article?id=10.1371/journal.pmed.0020124; http://science.sciencemag.org/content/343/6168/229.long; https://www.economist.com/news/leaders/21588069-scientific-research-has-changed-world-now-it-needs-change-itself-how-science-goes-wrong.; http://stm.sciencemag.org/content/8/341/341ps12.full

science in a manner consistent with statutory requirements for protection of privacy and confidentiality of research participants, protection of proprietary data and confidential business information, and other compelling interests. The proposal takes comment on how to ensure that, over time, more of the data and models underlying the science that informs regulatory decisions (over and above the dose response data and models underlying "pivotal regulatory science") is available to the public for validation[13] in a manner that honors legal and ethical obligations to reduce the risks of unauthorized disclosure and re-identification. As such this proposed regulation is designed to change agency culture and practices regarding data access so that the scientific justification for regulatory actions is truly available for validation and analysis. Regulatory determinations based on science should describe and document any assumptions and methods used, and should address variability and uncertainty. Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments. EPA's regulatory science should be consistent with the Office of Management and Budget's *Final Information Quality Bulletin for Peer Review*.[14] Robust peer review plays a critical role in independently validating key findings and ensuring that the quality of published information meets the standards of the scientific and technical community.

In addition, this proposed regulation is designed to increase transparency of the assumptions underlying dose response models. As a case in point, there is growing empirical evidence of non-

[13] EPA has not consistently followed previous EPA policy (e.g, EPA's Scientific Integrity Guidance, referenced above) that encouraged the use of non-proprietary data and models.
[14] https://www.whitehouse.gov/wp-content/uploads/2017/11/2005-M-05-03-Issuance-of-OMBs-Final-Information-Quality-Bulletin-for-Peer-Review-December-16-2004.pdf

linearity in the concentration-response function for specific pollutants and health effects. The use of default models, without consideration of alternatives or model uncertainty, can obscure the scientific justification for EPA actions. To be even more transparent about these complex relationships, EPA should give appropriate consideration to high quality studies that explore: a broad class of parametric concentration-response models with a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the exposure range; and spatial heterogeneity. EPA should also incorporate the concept of model uncertainty when needed as a default to optimize low dose risk estimation based on major competing models, including linear, threshold, and U-shaped, J-shaped, and bell-shaped models.

Across EPA programs, much of the science that informs regulatory actions is developed outside the Agency. It is the charge of regulators to ensure that key findings are valid and credible, as required by OMB's Guidelines[15] (which apply to "third party" information - e.g., non-government scientific research – if the agency use of that information provides the appearance of representing agency views). Using scientific information that can be independently validated will lead to better outcomes, and strengthen public confidence in the health and environmental protections underpinning EPA's regulatory actions.

EPA believes that concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of

[15] February 22, 2002 (67 F.R 8453) *OMB's Guidelines Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information* (2002) https://www.federalregister.gov/documents/2002/02/22/R2-59/guidelines-for-ensuring-and-maximizing-the-quality-objectivity-utility-and-integrity-of-information

the Federal government.[16] Nothing in the proposed rule compels the disclosure of any confidential or private information in a manner that violates applicable legal and ethical protections. Other federal agencies have developed tools and methods to de-identify private information for a variety of disciplines.[17] The National Academies have noted that simple data masking, coding, and de-identification techniques have been developed over the last half century and that "Nothing in the past suggests that increasing access to research data without damage to privacy and confidentiality rights is beyond scientific reach."[18] More recently, both the National Academies and the Bipartisan Commission on Evidence Based Policy[19] have discussed the challenges and opportunities for facilitating to secure access to confidential data for non-government analysts.

Considering the breadth of dose response data and models used in the development of significant EPA regulations, the requirements for availability may differ. These mechanisms may range from deposition in public data repositories, consistent with requirements for many scientific journals,[20] to, for certain types of information, controlled access in federal research data centers that facilitate secondary research use by the public.[21] EPA should collaborate with other federal agencies to identify strategies to protect confidential and private information in any circumstance in which it is making information publicly available. These strategies should be cost-effective

[20] For example, see policies or recommendations of publishers Taylor & Francis, Elsevier, PLOS, and Springer Nature.

[21] For example: https://osp.od.nih.gov/scientific-sharing/requesting-access-to-controlled-access-data-maintained-in-nih-designated-data-repositories-e-g-dbgap/; https://www.census.gov/fsrdc.

and may also include: requiring applications for access; restricting access to data for the purposes of replication, validation, and sensitivity evaluation; establishing physical controls on data storage; online training for researchers; and nondisclosure agreements.[22]

Implementation of this proposed rule will be consistent with the definition of "research data" in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in P.L. 89-487, and other applicable federal laws.

This proposed regulation is intended to apply prospectively to final regulations that are determined to be "significant regulatory actions" pursuant to E.O. 12866. The Agency's offices should be guided by this policy to the maximum extent practicable during ongoing regulatory action, even where such research has already been generated, solicited, or obtained.

III. Request for Comment

EPA solicits comment on all aspects of the proposed regulation and the bases articulated for it above. Specifically, EPA believes that it has identified appropriate sources of statutory authority for this proposed regulation in Section I(c) above, and solicits public comment on whether additional or alternative sources of authority are appropriate bases for this proposed regulation.

EPA further believes that a generally applicable regulatory provision of the type proposed here is the appropriate vehicle to establish and implement the policies articulated in Section II above, in the interests of consistency, predictability, and transparency across the functions that EPA performs.

EPA solicits comment on whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other

---

[22]These recommendations are consistent with those of Lutter and Zorn (2016). https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf.we re

policy vehicles at the programmatic or statutory level would be appropriate as alternative or additional steps the agency may take to further the policies articulated in Section II above. EPA solicits comment on the effects of this proposed rule on individual EPA programs, including whether certain activities are appropriate to be excepted or if other requirements would affect implementation. EPA also seeks comments on which criteria the Agency should use to base any exceptions, including whether case-by-case exceptions may be appropriate. Although the proposed regulatory text would impose requirements specifically on final regulations determined to be "significant regulatory actions" under E.O. 12866, EPA solicits comment on whether and to what extent these requirements, or other provisions and policies, should apply to other stages of the rulemaking process, including proposed rules, as well as to other types of agency actions and promulgations, such as guidance. EPA also solicits comment on whether a narrower scope of coverage would be appropriate, such as only final regulations that are determined to be "major" under the Congressional Review Act, or "economically significant" under EO 12866. EPA also requests comment on whether certain categories of regulations should be excluded from coverage, such as those that merely reaffirm an existing standard, or some other category. For instance, we request comment on whether the provisions of the proposed rule should apply to individual party adjudications, enforcement activities, or permit proceedings when EPA determines that these provisions are practical and appropriate and that the actions are scientifically or technically novel or likely to have precedent-setting influence on future actions. EPA seeks comment on whether the Agency should apply the provisions of the proposed rule to these actions or to specific types of actions within these categories. The Agency also seeks comment on whether other agency actions, beyond significant

final regulatory actions under EO 12866, should be included, such as site-specific permitting actions or non-binding regulatory determinations.

EPA solicits comment on the definitions of "*pivotal regulatory science*," and "*dose response data and models*" and how to implement such definitions.

EPA also solicits comment on how to incorporate stronger data and model access requirements into the terms and conditions of cooperative agreements and grants. EPA solicits comments on how it can build upon other federal agencies' policies regarding grantee and cooperator requirements for data access and data sharing. EPA also solicits suggestions for a platform that would enable the Agency to implement the provisions of this proposal related to increasing public access to EPA-funded data. EPA also seeks comment on methodologies and technologies designed to provide protected access to identifiable and sensitive data, such as individual health data, and on commenters experience with the use of such methodologies and technologies and their strengths and limitations. Similarly, EPA seeks comment on how to balance appropriate protection for copyrighted or confidential business information, including where protected by law, with requirements for increased transparency of pivotal regulatory science. EPA also requests comment on whether there are other compelling interests besides privacy, confidentiality, national and homeland security that may require special consideration when data is being released.

EPA solicits comment on implementation of the proposed regulation, including which parts of the Agency should be responsible for carrying out these requirements. EPA seeks comment on the effective date of a rule as well as on whether the Agency should seek to phase-in the requirements for certain significant regulatory actions or seek to prioritize specific actions. For regulatory programs, like the National Ambient Air Quality Standards program, in which future

significant regulatory actions may be based on the administrative record from previous reviews - particularly where the governing statute requires repeated review on a fixed, date-certain cycle - EPA seeks comment on the manner in which this proposed rule should apply to that previous record. EPA also solicits comments on whether and how the proposed rule should apply to dose response data and models underlying pivotal regulatory science if those data and models were developed prior to the effective date. In addition, EPA seeks comment on how the prospective or retrospective application of the provisions for dose response data and models or pivotal regulatory science could inadvertently introduce bias regarding the timeliness and quality of the scientific information available. EPA seeks comment on how to address a circumstance in which EPA has a statutory requirement to make a determination for which scientific information publicly available in a manner sufficient for independent validation does not exist. EPA also seeks comment on any additional implementation challenges not discussed in this notice that commenters may be aware of as well as suggestions for addressing them.

The proposed rule includes a provision allowing the Administrator to exempt significant regulatory decisions on a case-by-case basis if he or she determines that compliance is impracticable because it is not feasible to ensure that all dose response data and models underlying pivotal regulatory science are publicly available in a fashion that is consistent with law, protects privacy and confidentiality, and is sensitive to national and homeland security, or in instances where OMB's Information Quality Bulletin for Peer Review provides for an exemption (Section IX). The agency requests comment on whether these exemptions are appropriate, and on whether there are other situations in which specific significant regulatory actions, or specific categories of significant regulatory actions should be exempted.

EPA also requests comment on whether the disclosure requirements applicable to dose response data and models in the proposed rule should be expanded to cover other types of data and information, such as for example economic and environmental impact data and models that are designed to predict the costs, benefits, market impacts and/or environmental effects of specific regulatory interventions on complex economic or environmental systems.

IV. Statutory and Executive Orders Reviews

A. *Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review*

This action is a significant regulatory action that was submitted to the Office of Management and Budget (OMB) for review. Any changes made in response to OMB recommendations have been documented in the docket.

EPA believes the benefits of this proposed rule justify the costs. The benefits of EPA ensuring that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation are that it will improve the data and scientific quality of the Agency's actions and facilitate expanded data sharing and exploration of key data sets; this is consistent with the conclusions of the National Academies[23] This action should be implemented in a cost-effective way and is consistent with recent activities of the scientific community and other federal agencies, which will help to lower costs of implementation. The proposed rule directs EPA to make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making dose response models and data underlying pivotal regulatory science used in significant regulatory decisions available to the public in a manner sufficient for independent validation, consistent with law and protection of privacy,

[23] https://www.nap.edu/catalog/11434/expanding-access-to-research-data-reconciling-risks-and-opportunities.

confidentiality, and national and homeland security. However, it does not compel the Agency to make that information available where it concludes after all such reasonable efforts that doing so in way that complies with the law and appropriate protections is not possible.

By limiting the proposed rule to pivotal regulatory science for final significant regulatory actions pursuant to EO 12866, the proposed rule ensures that this standard for transparency affects a smaller subset of regulations which are economically significant, create inconsistency for other federal agencies, alter budgetary impacts, or raise novel legal or policy issues. One recent analysis found that: "Improvements in reproducibility can be thought of as increasing the net benefits of regulation because they would avoid situations in which costs or benefits are wrongly estimated to occur or in which regulatory costs are imposed without corresponding benefits. …" They concluded that "an increase in existing net benefits from greater reproducibility, which, if it occurred, would cover the costs of obtaining the data and making the data available."[24]

B. Executive Order 13771: Reducing Regulations and Controlling Regulatory Costs

This action is not expected to be an Executive Order 13771 regulatory action because it relates to "agency organization, management or personnel."

C. Paperwork Reduction Act (PRA)

This action does not contain any information collection activities and therefore does not impose an information collection burden under the PRA.

D. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities.

[24] https://www.mercatus.org/system/files/Mercatus-Lutter-Public-Access-Data-v3.pdf.

E. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local or tribal governments or the private sector.

F. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

G. Executive Order 13175: Consultation and Coordination with Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. Thus, Executive Order 13175 does not apply to this action.

H. Executive Order 13045: Protection of Children from Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of "covered regulatory action" in section 2-202 of the Executive Order. This action is not subject to Executive Order 13045 because it does not concern an environmental health risk or safety risk.

I. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution or Use

This action is not a "significant energy action" because it is not likely to have a significant adverse effect on the supply, distribution or use of energy.

J. National Technology Transfer and Advancement Act (NTTAA)

This rulemaking does not involve technical standards.

K. Executive Order 12898: Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action is not subject to Executive Order 12898 (59 FR 7629, February 16, 1994) because it does not establish an environmental health or safety standard.

List of Subjects in 40 CFR Part 30

Environmental protection, Administrative practice and procedure, Reporting and recordkeeping requirements

Dated: _____.

_____

E. Scott Pruitt,

Administrator

For the reasons set forth in the preamble, EPA proposes to add 40 CFR part 30 as follows:

PART 30—Transparency in Regulatory Decisionmaking

1. Add part 30 to read as follows:

PART 30—Transparency in Regulatory Decisionmaking

Sec.

Authority: Clean Air Act §§ 103, 301(a), 42 U.S.C. §§ 7403, 7601(a); Clean Water Act §§ 104, 501, 33 U.S.C. §§ 1254, 1361; Safe Drinking Water Act §§ 1442, 1450(a)(1), 42 U.S.C. §§ 300j-1, 300j-9(a)(1); Resource Conservation and Recovery Act §§ 2002(a)(1), 7009, 42 U.S.C. §§ 6912(a)(1), 6979; Comprehensive Environmental Response, Compensation, and Liability Act (as delegated to the Administrator via Executive Order 12580) §§ 115, 311, 42 U.S.C. §§ 9616, 9660; Emergency Planning and Community Right-To-Know Act § 328, 42 U.S.C. § 11048; Federal Insecticide, Fungicide, and Rodenticide Act §§ 25(a)(1), 136r(a), 7 U.S.C. §§ 136r(a), 136w; and Toxic Substances Control Act, as amended, § 10, 15 U.S.C. § 2609.

§30.1 What is the purpose of this subpart?

This subpart directs EPA to ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation.

§30.2 What definitions apply to this subpart?

As used in this subpart, all terms not defined herein shall have the meaning given them in the Act or in subpart A; and the following terms shall have the specific meanings given them.

Dose response data and models means the data and models used to characterize the quantitative relationship between the amount of dose or exposure to a pollutant, contaminant, or substance and the magnitude of a predicted health or environmental impact. Such functions

typically underlie pivotal regulatory science that drives the size of benefit-cost calculations, the level of a standard, and/or the points of departure from which reference values (reference doses or reference concentrations) are calculated.

Pivotal regulatory science means the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions.

Regulatory decisions mean final regulations determined to be "significant regulatory actions" by the Office of Management and Budget pursuant to Executive Order 12866.

Regulatory science means scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions.

Research data means "research data" as that term is defined in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards.

§30.3 How do the provisions of this subpart apply?

The provisions of this subpart apply to *dose response data and models* underlying *pivotal regulatory science* that are used to justify significant *regulatory decisions* regardless of the source of funding or identity of the party conducting the regulatory science. The provisions of

this section do not apply to physical objects (like laboratory samples), drafts, and preliminary analyses. Except where explicitly stated otherwise, the provisions of this subpart do not apply to any other type of agency action, including individual party adjudications, enforcement activities, or permit proceedings.

§30.4 What requirements apply to EPA's use of studies in taking final action?

EPA shall clearly identify all studies (or other regulatory science) relied upon when it takes any final agency action. EPA should make all such studies available to the public to the extent practicable.

§30.5 What requirements apply to EPA's use of dose response data and models underlying pivotal regulatory science?

When promulgating significant regulatory actions, the Agency shall ensure that *dose response data and models* underlying *pivotal regulatory science* are publicly available in a manner sufficient for independent validation. Where the Agency is making data or models publicly available, it shall do so in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security. Information is considered "publicly available in a manner sufficient for independent validation" when it includes the information necessary for the public to understand, assess, and replicate findings. This may include, for example:

(a) Data (where necessary, data would be made available subject to access and use restrictions).

(b) Associated protocols necessary to understand, assess, and extend conclusions;

(c) Computer codes and models involved in the creation and analysis of such information;

(d) Recorded factual materials; and

(e) Detailed descriptions of how to access and use such information.

The provisions of this section apply to dose response data and models underlying pivotal regulatory science regardless of who funded or conducted the underlying data, models, or other regulatory science. The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national and homeland security is not possible. Where data is controlled by third parties, EPA shall work with those parties to endeavor to make the data available in a manner that complies with this section.

§30.6 What additional requirements pertain to the use of dose response data and models underlying pivotal regulatory science?

EPA shall describe and document any assumptions and methods used, and should describe variability and uncertainty. EPA shall evaluate the appropriateness of using default

assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis. EPA shall clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions. When available, EPA shall give explicit consideration to high quality studies that explore: a broad class of parametric dose-response or concentration-response models; a robust set of potential confounding variables; nonparametric models that incorporate fewer assumptions; various threshold models across the dose or exposure range; and models that investigate factors that might account for spatial heterogeneity.

§30.7 What role does independent peer review in this section?

EPA shall conduct independent peer review on all *pivotal regulatory science* used to justify *regulatory decisions,* consistent with the requirements of the OMB Final Information Quality Bulletin for Peer Review (70 FR 2664) and the exemptions described therein.

Because transparency in regulatory science includes addressing issues associated with assumptions used in models, EPA shall ask peer reviewers to articulate the strengths and weaknesses of EPA's justification for the assumptions applied and the implications of those assumptions for the results.

§30.8 How is EPA to account for cost under this subpart?

EPA shall implement the provisions of this subpart in a manner that minimizes costs.

§30.9 May the EPA Administrator grant exemptions to this subpart?

Yes. The Administrator may grant an exemption to this subpart on a case-by-case basis if he or she determines that compliance is impracticable because:

(a) It is not feasible to ensure that all dose response data and models underlying pivotal regulatory science is publicly available in a manner sufficient for independent validation, in a fashion that is consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security; or

(b) It is not feasible to conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions for reasons outlined in OMB Final Information Quality Bulletin for Peer Review (70 FR 2664), Section IX.

§30.10 What other requirements apply under this subpart?

EPA shall implement the provisions of this section consistent with the definition of "research data" in Uniform Administrative Requirements, Cost Principles, and Audit Requirements for Federal Awards, exemptions in P.L. 89-487, and other applicable federal laws.

Where appropriate, data sharing agreements and state-of-the-art data-masking techniques may be employed to facilitate access to information.

Pentagon's Use of Paint Stripper Unclear as EPA Moves to Curb Toxic

By Pat Rizzuto and Sam Pearson

Posted May 17, 2018, 6:37 PM

A White House office is working with the Defense Department and the EPA to decide how the military and its contractors could continue to use a paint stripper the agency now plans to restrict, EPA Administrator Scott Pruitt told Congress.

EPA Again Finds Formaldehyde Poses Leukemia Risks But Stalls Study

After years of additional study and scientific review, EPA has again found that formaldehyde poses leukemia and other cancer risks, though Democratic senators say the draft finding has prompted Trump EPA appointees to block release of the assessment and they are urging Administrator Scott Pruitt to quickly release it.

Democrats Take Rare Step Of Using CRA To Kill Trump Rule, Despite Critique

Democrats are taking the rare step of using the Congressional Review Act (CRA), the law that eases Congress' ability to repeal EPA and other agencies' rules, to block a Trump administration rule rolling back Obama-era 'net neutrality' mandates, despite criticism from environmentalists that it legitimizes use of a poorly-written law that Republicans and industry have long-used as a deregulatory tool and which they are seeking to repeal.

Who's donating to Pruitt's defense? Time will tell

Kevin Bogardus, E&E News reporter Published: Thursday, May 17, 2018

EPA Administrator Scott Pruitt yesterday arrived at the Dirksen Senate Office Building to testify before a Senate Appropriations subcommittee on his agency's fiscal 2019 budget proposal. Tom Williams/CQ Roll Call/Associated Press

You may wait a long time to see who is contributing to EPA Administrator Scott Pruitt's legal defense fund.

Like other federal officials, the EPA chief is required to report gifts, like travel and tickets to events, he has received on his public financial disclosure report. That also includes contributions to the legal defense fund established for his benefit, according to guidance on the Office of Government Ethics' website.

But those reports are filed just once a year. If Pruitt's legal defense fund was created this year, he will report contributions as gifts on his financial disclosure report covering the 2018 calendar year. That report isn't required to be filed until May 2019 at the earliest.

Emails: EPA all ears as industry pitched 'secret science'

Maxine Joselow, E&E News reporter

Published: Thursday, May 17, 2018

EPA headquarters in Washington. @EPAScottPruitt/Twitter

Industry groups pitched EPA a proposal last spring that closely resembled what became Administrator Scott Pruitt's "secret science" plan, according to emails released this week under Freedom of Information Act litigation.

The National Association of Manufacturers offered detailed suggestions on EPA's handling of scientific studies last May to the agency's regulatory reform task force, which was soliciting suggestions on rules and rulemaking.

"A common complaint among manufacturers in recent years has been a process at the EPA for evaluating science that is not transparent and minimizes third party stakeholder input," wrote Ross Eisenberg, NAM's vice president of energy and resources policy.

Chemicals could be making workers sick at coffee roasters

Published: Thursday, May 17, 2018

A Centers for Disease Control and Prevention investigation suggests chemicals in the air at coffee roasting operations could present a widespread health threat to employees.

A small group of CDC researchers spent the last two years investigating tiny coffee shops and large roasters around the country.

Their early results, based on 11 site reports, indicate that employees across the $74 billion industry could be experiencing health effects from the fumes given off in the roasting process.

US Osha seeks input on UN GHS conference

18 May 2018 / GHS, United States

The US Occupational Safety and Health Administration (Osha) will host a public meeting to discuss proposals in preparation for the 35th session of the UN Sub-Committee of Experts on the Globally Harmonized System of Classification and Labelling of Chemicals (UNSCEGHS).

At the 12 June meeting, Osha, along with the US Interagency GHS Coordinating Group, will provide updates on GHS-related interests. And it will consider comments submitted during the meeting when developing governmental positions for the UN session.

It will also give an update on the Regulatory Cooperation Council (RCC), the *Federal Register* notice says.

The meeting will take place at the Department of Transportation headquarters in Washington, DC. The UN meeting will be held between 4 and 6 July in Geneva.

US EPA eyes proposal on costs and benefits of rules

18 May 2018 / United States

The US EPA is working on a proposal to address how it weighs costs and benefits in its regulations.

According to its website, the White House's Office of Management and Budget (OMB) is conducting a standard interagency review of the proposal, "Increasing consistency and transparency in considering costs and benefits in the rulemaking process". Its status is listed as "prerule stage".

An EPA spokesperson told Chemical Watch the agency does not comment on the substance of actions under formal interagency review. But the spokesperson said the agency is "seeking to provide consistency and certainty in the way EPA calculates costs and benefits of its regulations."

The OMB website reflects three stakeholder meetings on the proposal. These were requested by

- the American Petroleum Institute (API);
- the National Association of Manufacturers (NAM); and
- the American Forest and Paper Association (AF&PA).

The American Chemistry Council (ACC) attended two of these.

Consideration of the proposal comes as the EPA takes comment on a controversial proposed rule aimed at increasing the transparency of the science it uses to underpin its regulatory decisions.

BNA DAILY ENVIRONMENT REPORT ARTICLES

Oil and Coal Executives Clamored for EPA Chief, Records Show

By Jennifer A. Dlouhy and Eric Roston

Posted May 8, 2018, 8:20 AM

The pleas began almost as soon as Scott Pruitt became Environmental Protection Agency administrator: requests from oil executives, coal miners, and energy lobbyists desperate to nab time with the newly confirmed regulator.

Walmart Backs States' Effort to Centralize Chemical Reporting

By Pat Rizzuto

Posted May 8, 2018, 7:48 AM

Walmart is working with a group to make it easier for companies to comply with state laws requiring businesses to report chemicals in children's products.

Eight States Urge EPA to Halt Draft Rule Limiting Science Use

By Katherine Tam

Posted May 7, 2018, 3:57 PM

A group of eight attorneys general are urging EPA Administrator Scott Pruitt to consult with the National Academy of Sciences before proceeding with a draft science "transparency" rule.

INSIDEEPA.COM ARTICLES

Pruitt's Science Plan Faces Host Of Legal Hurdles; Some Doubt Promulgation

Administrator Scott Pruitt's plan requiring EPA to use only publicly available information to justify its regulatory decisions faces a host of legal hurdles, industry officials and environmentalists say, including vague or undefined terminology, statutory mandates likely at odds with the rule and potential violations of administrative law.

EPA Appears Unlikely To Quickly Set PFAS Standard, Despite DOD Calls

EPA appears unlikely to quickly develop and adopt an enforceable drinking water standard for any perfluorinated chemicals as some lawmakers, states and others are seeking, despite calls from the Defense Department (DOD), which may be responsible for hundreds of contaminated water supplies, for a consistent national standard to preempt a patchwork of state limits.

Critics Doubt EPA Plan To Redact Confidential Data In Transparency Rule

Critics of EPA Administrator Scott Pruitt's proposal to require only publicly available research to justify regulatory decisions say agency plans to protect confidential information, such as personal data or trade secret studies, by redacting it are not adequate, will result in a host of adverse effects and will undermine agency decisionmaking.

EPA's Defense Of TSCA Rules Marks Key Legal Test After Early Court Losses

The Trump administration's upcoming defense of EPA rules implementing the recently revised toxics law will mark one of the first substantive tests for how well new regulations will withstand legal scrutiny after the agency suffered a series of early court losses as they sought to defend other regulatory delays and officials are scrambling to correct perceived flaws in several draft rules.

EPA Rule Deadline Tracking System May Help Avoid 'Sue-And-Settle' Rules

EPA is creating a system to track all its statutory rulemaking deadlines to support its goal of meeting every binding deadline by 2022, a goal that could help the agency avoid "sue and settle" agreements imposing new deadlines for agency action but one that EPA's Chief of Operations Henry Darwin acknowledges is a "heavy lift."

ACC Lauds Draft EPA Transparency Rule's Focus On Dose-Response

The American Chemistry Council (ACC) is lauding EPA's recently proposed rule on science transparency, arguing it "gets it right" with its bid to move away from the agency's long-time strict, default linear dose-response approach, even as the group suggests the proposal may not adequately protect trade secrets that its members submit for chemical approvals.

Tozzi Backs Bolstering Existing Data Laws Over EPA 'Secret Science' Rule

Former White House Office of Management & Budget (OMB) regulatory review chief Jim Tozzi is opposing EPA Administrator Scott Pruitt's proposed "secret science" rule to bar use of data in decisions if it is not publicly available, countering that a more effective way to improve transparency would be to bolster two existing data laws.

Expecting EPA Hurdles, NRDC Makes Case For Suit On 'New' Chemicals Plan

Anticipating procedural challenges from EPA, environmentalists are making the case that an appellate court should consider the merits of their litigation challenging the agency's framework for reviewing new chemicals, charging the policy has the effect of a legislative rule, was issued without following proper rulemaking procedure, and should be vacated.

Environmentalists Seek To Boost Ethics Claim In TSCA Rules Challenge

Environmentalists challenging EPA's rules for prioritizing and reviewing existing chemicals are seeking to include additional documents in the administrative record on Nancy Beck, the top political appointee in EPA's toxics office, in an effort to bolster their claim that the former chemical industry lobbyist has a conflict of interest and inappropriately revised the rules.

Environmentalists Seek More Time For EPA Science Rule Comments

Environmentalists are urging EPA to extend by 60 days its deadline for public comments on Administrator Scott Pruitt's controversial proposed rule requiring use of only public information in regulatory decisions, saying the 30 days EPA has offered is not adequate to address a rule of such magnitude.

California Adopts First Green Chemistry Priority Product, 2018-20 Work Plan

California toxics department officials have adopted the first regulatory listing of a priority product under its landmark Safer Consumer Products (SCP) green chemistry program, triggering the next phase in which manufacturers must determine whether they must conduct new chemical analyses to change their products' formulation to make them less hazardous.

Agency employees, Jeff Bezos up for government 'Oscars'

Nick Sobczyk, E&E News reporter

Published: Monday, May 7, 2018

Employees from EPA and the departments of Energy and the Interior are in the running for distinguished civil service awards.

The Partnership for Public Service yesterday announced 27 finalists for its Samuel J. Heyman Service to America Medals, known as the "Sammies" for short.

The group will be honored at a ceremony tomorrow to commemorate Public Service Recognition Week, and seven winners will be crowned at an Oct. 2 gala in Washington.

"Amid the political headlines, it's easy to overlook our nation's career public servants who perform the essential day-to-day work of government," said Max Stier, president and CEO of the Partnership for Public Service, in a statement. "That's why the Service to America Medals are so important — they showcase the many remarkable men and women who assist their fellow Americans with passion to maintain the safety, health and prosperity of the nation."

Newspapers find dangers in Philadelphia schools

Published: Monday, May 7, 2018

Schools in Philadelphia contain environmental hazards like lead paint chips that endanger students, according to an investigation by *The Philadelphia Inquirer* and the *Philadelphia Daily News*.

Dean Pagan, 6, was hospitalized last November with severe lead poisoning after eating paint chips that fell from the ceiling of his first-grade classroom.

"When you send your child to school, you think he's going to be safe and you don't have to worry," said Dean's father, David Pagan.

According to Dean's parents, he lost the ability to do simple math.

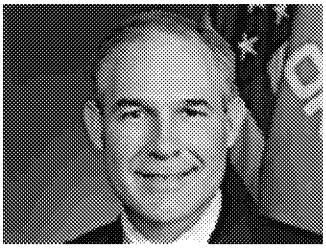
Pruitt Seeks to Constrict EPA Use of Scientific Studies for Rules

EPA Administrator Scott Pruitt wants to make a lasting change to the way the agency uses science to make policy, a move environmental groups say will sharply limit the public health studies the EPA can rely on.

Pruitt Must Address 'Drip, Drip' of Allegations, a GOP Leader Says



The Senate's third-ranking Republican said April 24 that Scott Pruitt has to address ethics questions, which he suggested are making it difficult for the EPA chief to do his job.

Facing Legal Hurdles, EPA's 'Secret Science' Plan Punts On Key Issues

EPA Administrator Scott Pruitt has signed a long-promised plan barring the agency's use of any information in decision-making that is not publicly available, but the proposed rule punts on a host of tricky legal and implementation issues, including statutory mandates to use the best available science and how to address confidential trade secrets and medically protected data.

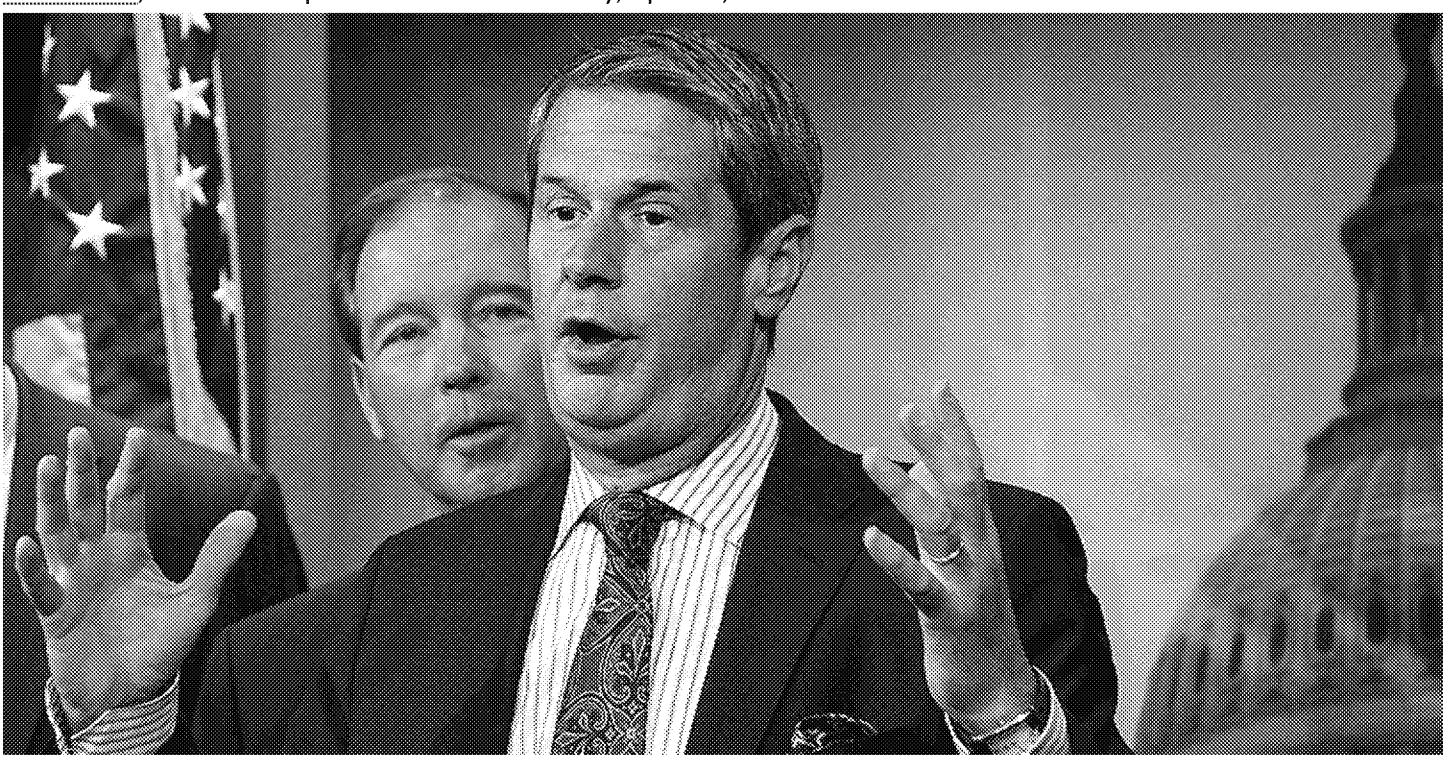
Rollout of Lautenberg law divides senators who championed it

Corbin Hiar, E&E News reporter Published: Tuesday, April 24, 2018



Sen. Tom Udall (D-N.M.) and then-Sen. David Vitter (R-La.) speak during a news conference on chemical safety reform in 2015. Manuel Balce Ceneta/Associated Press

A conservative and a liberal stood side by side in June 2016 as President Obama signed into law the senators' hard-fought compromise legislation to overhaul the nation's bedrock chemical safety law for the first time in its 40-year history.

Today, Louisiana's David Vitter is out of Congress, lobbying for the chemical industry that long supported him, and Sen. Tom Udall (D-N.M.), who remains in office, is battling his former legislative partner over the implementation of the Toxic Substances Control Act reform they championed.

Their quick retreat from common ground to familiar opposition positions is an indication to policy experts that the TSCA reform deal was an extraordinary agreement that would be impossible to make today — and one which is now being viewed very differently by the lawmakers who pushed to enshrine it in law.

Agency merges teams, launches FOIA office

Kevin Bogardus, E&E News reporter

Published: Tuesday, April 24, 2018

EPA headquarters in Washington. Claudine Hellmuth/E&E News

EPA has created a new national office to help handle its Freedom of Information Act requests.

General counsel Matt Leopold said in an internal email obtained by E&E News that the agency will bring together two teams of EPA staffers from different programs who manage the public records requests and house them in one place in EPA's legal office.

"I am pleased to announce the creation of a new National Freedom of Information Act (FOIA) Office at EPA," Leopold told EPA employees in the email sent yesterday. "The FOIA Office brings together the FOIA program staff from the Office

of Environmental Information and the staff from the FOIA Expert Assistance Team from the Office of General Counsel (OGC) into OGC."

Leopold also said EPA's General Law Office in OGC will continue to handle FOIA litigation for the agency as well as provide legal counseling and response to appeals. In addition, Neil Bigioni, deputy regional counsel in EPA's Region 3 office in Philadelphia, will be the new FOIA office's acting director until the position is filled permanently.

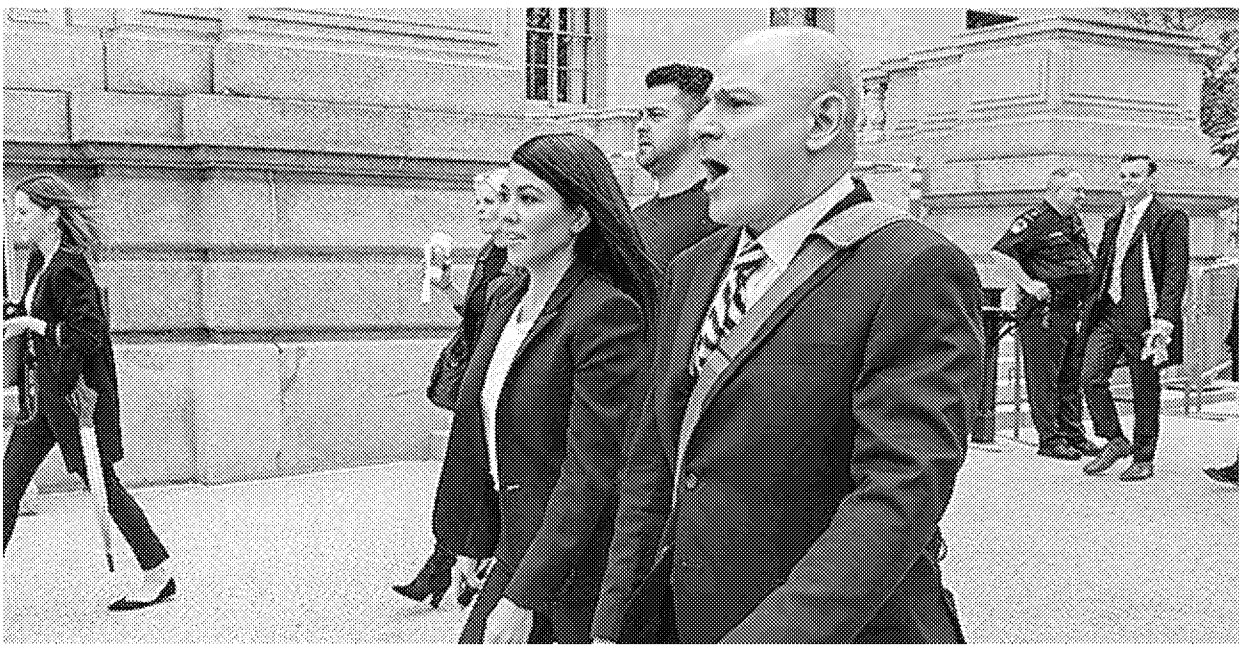
Cosmetics safety bill gets Kardashian backing

Corbin Hiar, E&E News reporter

Published: Tuesday, April 24, 2018



Reality TV star Kourtney Kardashian (center) is on Capitol Hill today to advocate for overhauling the nation's cosmetic safety law. Corbin Hiar/E&E News

A bipartisan cosmetics safety bill is getting a boost from a reality television star who is both an avid consumer and purveyor of personal care products.

Kourtney Kardashian, the eldest sister in the hit show "Keeping Up with the Kardashians," arrived fashionably late to a morning briefing for Capitol Hill staffers and reporters set up by the Environmental Working Group.

The 38-year-old mother of three argued that the "Personal Care Products Safety Act," S. 1113, from Sens. Dianne Feinstein (D-Calif.) and Susan Collins (R-Maine), is necessary so that consumers can feel confident the products they and their families are using don't contain potentially harmful chemicals.

US EPA, Health Canada and Echa collaborate on testing alternatives

Case studies will boost regulatory acceptance of NAMs, authorities hope

24 April 2018 / Alternative approaches to testing, Canada, Europe, United States

Scientists from regulatory agencies across the world will soon publish the first results from a series of joint case studies, set up to increase the use of new approach methodologies (NAMs) for chemical prioritisation, screening and quantitative risk assessment.

The US EPA, Health Canada and Echa are coordinating an initiative called Accelerating the Pace of Chemical Risk Assessment (APCRA). Through meetings and workshops, the group has identified some key barriers to accepting NAMs for regulatory decision making. These include the current practice of benchmarking new tests against lab animal studies as well as a general lack of understanding and confidence in applying NAMs.

The initiative began with a meeting hosted by the EPA in September 2016, followed by a workshop last year. Its aim is to "enhance collaboration across international organisations with an emphasis on learning by doing", explains Rusty Thomas from the EPA, Tara Barton-Maclaren from Health Canada and Mike Rasenberg from Echa, co-authors of a recent APCRA paper in *Chemical Research in Toxicology*.

"Through case studies, the collaborators are engaging in two-way dialogues to exchange information about how these NAMs can be applied to various decisions. As these case studies progress, training and communication through webinars, workshops and meetings will occur as well as expanding case studies to other applications with more collaborators," they add.

APCRA has developed six case studies, on:

- risk evaluation;
- chemical categorisation; and
- exposure evaluation

A first risk evaluation case study looks into using bioactivity as a conservative estimate of no– and low effect levels in animal studies. The project compares the point of departure on dose-response curves, corresponding to the no- or low effect level, from NAMs and animal studies for several hundred chemicals. It will be published in a scientific journal in the next few months.

A second case study takes a "prospective" approach, generating NAM data for a number of substances. "Traditional" animal tests will then be carried out on a subset of the chemicals to help analyse the results and improve the NAMs

approach. It is a collaboration between Echa, the EPA, the US National Toxicology Programme, Health Canada, the European Commission's Joint Research Centre, and Singapore's A*Star programme.

Meanwhile, one of the chemical categorisation case studies involves a systematic literature review of per- and polyfluoroalkyl substances, followed by NAMs analysis; another attempts to integrate NAM profiles for categorisation.

For exposure, the group has chosen to focus on computational exposure science and *in silico* approaches.

Future case studies will need to explore new ways of describing hazard in ways that fit with the information that NAMs provide, such as looking at whether bioactivity in a certain pathway can predict adverse effects, according to the journal article.

They should also examine new ways of describing risk, "being protective without the requirement of being predictive", add the authors.

NGOs urge member states to support REACH nano amendments

Calls to back restrictions on phthalates and CMRs, ahead of REACH Committee meeting

24 April 2018 / Alternatives assessment & substitution, CMRs, Europe, Nanomaterials, Phthalates, REACH, Textiles & apparel

A group of NGOs has written to EU member states, urging them to support proposals to amend REACH annexes for nanomaterials and to restrict carcinogenic, mutagenic and reprotoxic (CMR) substances in textiles.

In the letter, which has been sent ahead of a REACH Committee meeting on 25-26 April, the group also asks members to vote in favour of the European Commission's proposal for a restriction on four phthalates.

The group of seven NGOs includes:

- the European Environmental Bureau (EEB);
- ClientEarth;
- the Center for International Environmental Law (Ciel); and
- the Health and Environment Alliance (HEAL).

After several years of delays, the Commission proposed changes to REACH annexes to address substances in nanoforms last year.

These include the addition of a new section to Annex IX, which calls for further testing if specific additional particle properties "significantly influence the hazard or the exposure to those nanoforms".

The NGOs say its placing there is "contrary to the spirit of REACH" and defeats the purpose of adapting the annexes for nanomaterials.

The provision should be inserted in Annex VI, they say, as this would make REACH more "future proof" at no extra cost for registrants. Annex VI details the information needed for the submission of a registration dossier and evaluation.

Textiles CMR restriction

The NGOs say the restriction on CMRs in textiles should cover all that are category 1A and 1B substances with a harmonised classification. It should not be "just those 40 plus substances for which the European Commission was able to find evidence of use in the textiles sector".

Additionally, consumer organisations Beuc and Anec provided comments ahead of the meeting, calling for a "systematic, comprehensive approach" on the restriction.

The proposal should be amended, they say, to ensure:

- better protection of small children;
- regular updates to the list of restricted substances and applicable concentration limits; and
- the addition of disposable textile within the scope of the restriction.

Phthalates restriction proposal

Regarding the intention to restrict four phthalates – bis(2-ethylhexyl) phthalate (DEHP), dibutyl phthalate (DBP), benzyl butyl phthalate (BBP) and diisobutyl phthalate (DIBP) – the NGOs say member states should reject an exemption on exports to non-EU countries.

This is to avoid "completely unacceptable double standards", they add.

The group has also called on member states to reject exemptions for outdoor, industrial and agriculture uses, as well as for spare parts for the automotive and aerospace sectors.

And they say they "firmly oppose" a proposal to defer the restriction on automotive and aerospace articles for 60 months.

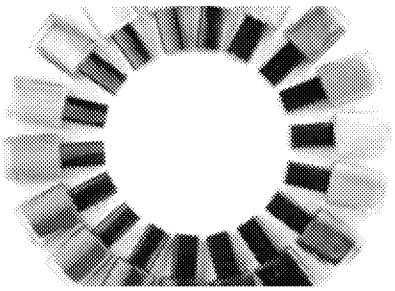
California launches healthy nail salon certification programme

Guidelines bar products containing tolulene, DBP, formaldehyde, MMA monomer

25 April 2018 / Personal care, United States, Voluntary action



California's Department of Toxic Substances Control (DTSC) has issued guidelines for local governments that choose to establish healthy nail salon programmes.

The initiative, mandated by the state legislature in 2016, aims to reduce exposure to toxic chemicals for employees and customers.

The department estimates that California has 48,000 nail salons. Of these, about 200 have been designated as 'healthy' in five jurisdictions that already have a similar programme: Alameda, San Mateo and Santa Clara counties; the city of Santa Monica; and the city and county of San Francisco.

In order to be certified as a healthy nail salon, a business must:

- choose polishes and related products that do not contain dibutyl phthalate (DBP), toluene, formaldehyde, or liquid methyl methacrylate (MMA) monomer;
- avoid using nail polish thinners, if possible, and use none that contain toluene or methyl ethyl ketone (MEK);
- choose polish removers that do not contain ethyl acetate or butyl acetate;
- obtain safety data sheets (SDSs) for all products used;
- have employees use disposable gloves and evaluate whether respirator masks are needed to prevent exposure to dust;
- follow approved practices for handling, storing and disposing of toxic substances, as well as approved sanitation practices; and
- provide at least basic ventilation.

To receive a 'gold' certification, salons must also have air conditioning and/or a job-specific ventilation system; employ protective goggles; use environmentally friendly cleaning products; provide ergonomic seating and lighting; and train employees on healthy work practices.

The DTSC is separately considering naming nail salon products as a 'priority product' under the Safer Consumer Products (SCP) programme.

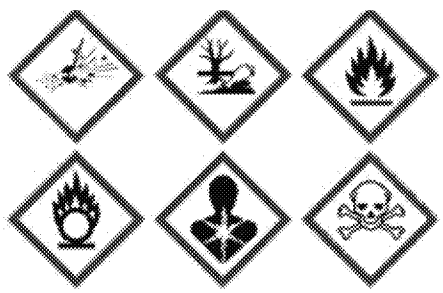
Majority of EU online chemical mixtures ads lack hazard warnings

Echa enforcement project leads to hundreds of fines for CLP breaches

25 April 2018 / Classification, labelling and packaging Regulation, Enforcement, Europe, Substances of concern



A major Echa Enforcement Forum project that checked more than 1,300 online adverts for hazardous chemical mixtures across the EU has found over 82% were non-compliant under the CLP Regulation.

Of the 1,083 non-compliant internet adverts, 903 did not mention the type or types of hazard indicated on the product label, the agency said. And only 220 – 16.7% of inspected online adverts – had the correct information on hazard.

Nearly all of the inspected websites – 95.9% – belonged to professional suppliers.

Checks were carried out on the following product types:

- household, e.g. cleaning products (37.7%);

- construction, e.g. paints, coatings, adhesives (16.7%);
- motor, e.g. cleaning agents, coatings, lubricants (14%);
- hobby, e.g. glues, paints, solvents (11.9%);
- garden, e.g. plant protection agents, biocides (9.3%); and
- others (10.4%).

The Forum embarked on the project in 2016 with an objective to focus on the compliance of online sales with Article 48(2) of CLP. This states that an advert must mention hazards indicated on the label if the mixture can be purchased without seeing this.

National enforcement authorities from 15 European countries took part in the pilot project. Its scope also included compliance with the requirement under Article 17(2) that hazard warnings are written in the official language of the member state.

Outcomes

Desktop inspections were carried out between January and August last year, with most taking place in Germany (508), followed by the Czech Republic (361), Echa said in a report.

Inspectors issued 280 fines, 124 verbal advice and 460 written advice statements. In four cases, enforcement authorities undertook a criminal complaint or referred the case to the public prosecutor's office.

For 321 cases, follow-up activities continued after the operational phase of the project finished on 31 August last year. In 223 cases, information was forwarded to another enforcement authority in the same member state for further action.

Recommendations

Echa issued a set of recommendations, based on the findings of the project, as well as feedback from the questionnaires completed by national authorities.

Industry and trade associations could develop "common strategies" to clarify what is a lawful sale on the internet, Echa said. A collection of "positive examples" could also be compiled by industry and distributed to associations to pass to the companies concerned.

In recommendations to the European Commission, the agency called for "specification of the wording of Article 48 (2)" to avoid undefined legal concepts. The Commission should also consider developing a guideline for online retailers to facilitate their implementation of Article 48 (2), it said.

Enforcement authorities should continue to perform inspections and Forum members that did not participate in the project should consider conducting their own, the agency added.

Additionally, given the high rate of non-compliance detected, the Forum could include the topic in a future REACH-En-Force (Ref) project.

The Forum's Ref-6 project is currently underway to check whether the classification and labelling (C&L) of a mixture corresponds to the information presented in the safety data sheet (SDS).

Canada clears 59 inorganic, organometallic substances from further assessment

Included in earlier assessments and management plans

25 April 2018 / Canada, Environmental Protection Act, Inorganics, Metals

The Canadian government has listed 59 inorganic and organometallic substances it considers have been addressed in other assessment activities and will, therefore, not undergo further evaluation at this time under the Canadian Environmental Protection Act (Cepa).

The 20 April list includes:

- an arsenic-containing substance (10H-phenoxarsine, 10,10'-oxybis-) that was included in the assessment of "arsenic and its compounds";
- a cadmium-containing substance (hexanoic acid, 2-ethyl-, cadmium salt), included in the assessment of cadmium compounds;
- 11 substances that were included in the assessment of chromium compounds;
- two fluoride compounds addressed in the assessment of inorganic fluorides;
- four substances that were included in the assessment of nickel compounds;
- 26 ammonia compounds, addressed in the assessment of "ammonia in the aquatic environment";
- four uranium-containing substances, addressed in the assessment of "releases of radionuclides from nuclear facilities" and drinking water guidelines for uranium;
- two substances covered by Health Canada's risk assessment strategy for mercury and its compounds and the drinking water guidelines for mercury; and
- eight lead-containing substances considered to have been addressed by Health Canada's *Final human health state of the science report on lead* and risk management strategy on lead.

Environment and Climate Change Canada will accept public comment for 60 days.

Swedish chemicals agency withdraws report on ecolabelling

25 April 2018 / Labelling, Sweden

The Swedish Chemicals Agency, Kemi, says it has found errors in its study, *Mapping of dangerous substances in ecolabelling systems*, and has suspended publication. The agency discovered "certain ambiguities" and incorrect references to rules, it says. A corrected version will be published as soon as the changes are made.

The study, looking at the role of ecolabelling in chemical restriction, was published in March.

Bayer CEO Tries to Calm Nerves After $289 Million Roundup Award

Posted Aug. 23, 2018, 7:41 AM

- Bayer plans to appeal the jury award
- Company could face up to $5 billion in costs linked to glyphosate cases

Bayer AG Chief Executive Officer Werner Baumann sought to soothe investors' worries after a $289 million jury award over the controversial weed-killer Roundup, saying the $66 billion purchase of Monsanto Co. still makes sense.

There is "no reason to break out in nervousness" in the aftermath of the Aug. 10 verdict, Baumann told Germany's Handelsblatt newspaper in his first interview since the jury's decision.

"The fact is that absolutely nothing has changed about the compelling logic of the Monsanto takeover, about the potential for value creation for our shareholders, about the attractiveness of the agriculture market and about the goals we have communicated."

The California court awarded a school groundskeeper the damages over claims that exposure to Roundup caused his non-Hodgkin's lymphoma. The trial was the first over allegations that the herbicide causes cancer. Bayer has said it will appeal, and U.S. jury awards against companies are often overturned or reduced. But the German company could still face as much as $5 billion in costs linked to cases over glyphosate, the main ingredient in Roundup, analysts at Sanford C. Bernstein & Co. estimate.

The verdict—the first of what may be thousands of cases—shocked observers both inside and outside Bayer, erasing $16 billion from the company's market value in a week. Baumann has contended that facts should rule over emotion in the debate over whether Roundup causes cancer.

Chemical Groups Cite Duty Relief Bill at China Hearing

By Len Bracken
Posted Aug. 22, 2018, 6:36 PM

Congress is likely to suspend duties on upwards of one thousand chemicals, two industry representatives said Aug. 22 at a hearing reviewing China-specific tariffs.

Pruitt's Cameo in Beef Industry Video OK, Watchdog Says (1)

By Sylvia Carignan
Posted Aug. 22, 2018, 4:04 PM Updated Aug. 22, 2018, 4:55 PM

Former EPA Administrator Scott Pruitt's appearance in a beef industry association video didn't violate lobbying, publicity, or propaganda regulations, according to a government watchdog.

Wheeler Sees Need For EPA Staff Succession Plans But Major Union Wary

Acting EPA Administrator Andrew Wheeler in a recent meeting with Region 5 employees signaled he agrees with their concerns about declining personnel levels and the need to plan for hiring younger people to replace a slew of retiring staffers, though a major EPA union remains wary that his deregulatory agenda will deter new hires.

TSCA problem formulations set 'improper precedents', say former EPA staff

'Questionable exclusions and loopholes' scrutinised in risk evaluations

22 August 2018 / TSCA, United States

Former US EPA staff members have cautioned that the approach to TSCA 'problem formulations' sets "improper precedents for future chemical risk evaluations" under the recently reformed law.

The comments from the Environmental Protection Network – an EPA alumni group formed last year to provide a "defense against efforts to undermine" the agency's mission – came in response to a consultation on TSCA problem formulations. These further refine the scope of the first ten risk evaluations that the EPA is conducting following the update of the law in 2016.

In line with comments raised by consumer advocacy groups, the EPN's concerns centred on the EPA's decision to exclude certain conditions of use from its evaluations. The group says this runs counter to its mandate to consider risks resulting from all intended, known and reasonably foreseen uses of a chemical.

And, because all ten chemicals addressed in the problem formulations have chronic toxic effects, "a comprehensive aggregate assessment of all co-occurring exposures is critical, since excluding even one pathway will underestimate cancer and non-cancer effects."

Public health professionals group AHPA said in comments that by not considering all uses, the EPA is likely to conclude the total exposure level to a substance is lower than it is. And it may therefore "determine incorrectly" that the substance does not present an unreasonable risk – a decision they say is "unlawful and lacks scientific credibility".

A coalition of NGOs lead by Safer Chemicals, Healthy Families agreed in its response that the EPA is "on a path to produce evaluations that ignore important exposure pathways and at-risk populations, disregard evidence of adverse effects and reach misleading and incomplete conclusions that understate risks and weaken public health protection."

It has called on the agency to put the risk evaluations on hold in order to "rethink how they are being conducted, and [to] initiate them in accordance with the law and principles of sound science".

Excluded uses questioned

Comments from an array of groups have focused on the "questionable exclusions and loopholes" in the problem formulations.

Among those omitted, the Environmental Defense Fund said, are exposures:

- that could potentially be covered by another EPA-administered statute;
- resulting from past conditions of use that could reasonably recur;
- from accidents; and
- resulting from imperfect compliance with existing regulations.

The EPA "cannot ignore ongoing, real-world exposures" such as these, the NGO said.

The SCHF coalition cautioned that by excluding discontinued uses, industry could cease production of a specific use to prevent its inclusion in the risk evaluation, and then re-enter the marketplace without restriction or a risk determination. But if the agency were to evaluate those abandoned uses, it would have the authority to permanently

ban or restrict them under section 6(a) of TSCA, "providing certainty to the marketplace and long-term public health protection".

The coalition added that it "appears that EPA will examine each source of exposure in isolation and will not consider either the combined effect of multiple exposures or the contribution of environmental releases to overall exposure and risk". This, it said, is in violation of the law's mandate to evaluate a chemical in its totality.

And it cited a "minimal effort" to identify data gaps and assess how they will impact conclusions. It has called on the EPA to use its authorities to require testing to address these.

Industry generally supportive

The American Chemistry Council said in its comments that it "generally supports the approach taken to addressing conditions of use" in the first ten problem formulations.

Focusing on those uses that "raise the greatest potential for risk ... allows EPA to be efficient, while still addressing the highest priority conditions of use", it said.

The trade group, however, has called for the development of a framework that "articulates its process for deciding when conditions of use are in or out of scope".

This would "streamline future efforts, provide greater understanding of EPA's decisions, increase transparency and reproducibility and enable industry to identify the types of information that may be most helpful" to develop and/or share with EPA, it said.

The problem formulations consultation closed on 16 August. The EPA must finalise its risk evaluations by December 2019.

EU committee gives Opinion on safety of sunscreen ingredient

23 August 2018 / Europe, Personal care, Substances of concern

The EU's Scientific Committee on Consumer Safety (SCCS) concluded that the use of phenylene bisdiphenyltriazine – S86 – is safe as a UV-filter in sunscreen products at a concentration of up to 5%.

Because of the insoluble nature of S86 and as no data were provided on safety via inhalation exposure, the SCCS said it considers its use safe only in dermally applied products and not in products that would lead to inhalation exposure.

It added that S86 may contain impurities (NMP and hydrazine), which are classified as category 1B carcinogenic, mutagenic and reprotoxic (CMR) chemicals and identified in the EU as SVHCs.

Therefore, the SCCS recommended the level of NMP and hydrazine be kept to trace levels. Potential effects of the substance on the environment were not assessed by committee.

Further Information:

- Opinion on the safety of cosmetic ingredient S86

Echa round-up

23 August 2018 / Classification, labelling and packaging Regulation, Europe, REACH

Norwegian intention to identify an SVHC

Norway has submitted its intention for identification of perfluorobutane sulfonic acid (PFBS), its salts and related substances as an SVHC. It is expected to submit the proposal in March next year.

New public consultations on testing proposals

Echa has started 19 new public consultations on testing proposals. The deadline to comment these is 24 September. There are currently 30 public consultations open on testing proposals.

CLH consultation

The agency is consulting on a harmonised classification and labelling proposal for 7-oxa-3-oxiranylbicyclo[4.1.0]heptane.

The Netherlands is proposing a future entry in Annex VI of the CLP Regulation for carcinogenicity 1B, reproductive toxicity 1B, acute toxicity 3 and 4. The substance has an existing classification.

The deadline for comments is 19 October.

The substance is mainly used a chemical intermediate and as a reactive diluent in epoxy resins.

CLH intentions

Echa has received new intentions to harmonise the classification and labelling of:

- dimethomorph (ISO);
- 1,3-bis(isocyanatomethyl)benzene;
- 1,3-bis(1-isocyanato-1-methylethyl)benzene;
- 2,4,6-triisopropyl-m-phenylene diisocyanate;
- 3,3'-dimethylbiphenyl-4,4'-diyl diisocyanate; and
- 1,5-naphthylene diisocyanate.

Do you need to notify trichloroethylene uses?

Echa has advised companies on their notification obligations in relation to uses authorised this month for the substance trichloroethylene.

The Commission granted authorisation for five uses to the company Blue Cube Germany Assets on 10 August.

If this company supplies the substance directly or indirectly, the authorisation numbers should be included in their extended safety data sheet (e-SDS) and on the labels.

Conditions of authorisation must be complied with as described in the eSDS. Within three months of first delivery of the substance, Echa must be notified and provided with occupational exposure data. A written declaration as described in the decision, if relevant, is also required.

The agency sends this information to the authorisation holder, who uses it in preparing review reports for extending the authorisation period.

As the first exposure measurements are due by 3 February 2019, the agency needs the information as soon as possible, it says. The review report is due by 21 April 2019.

Lead in gunshot Opinion available

The final Opinion of the Committees for Risk Assessment (Rac) and Socio-economic Analysis (Seac) to restrict lead in gunshot used on wetlands is available on the agency's website.

Updated publications

Echa has updated its factsheet on information on chemicals and its leaflet 'Chemical safety and your business'.

They are both available in 23 EU languages.

EU CLP poison centres notification deadline 'impossible' to meet

Cefic concern over IT delays and Commission's 2020 cut-off

23 August 2018 / Accidents, emergency response & poison centres, Classification, labelling and packaging Regulation, Europe

Delays and unresolved issues mean it will be "impossible" for the European Commission to deliver the IT tools needed for the 1 January 2020 deadline for harmonised information relating to emergency health response (poison centres), Cefic says.

The deadline falls under Annex VIII of the classification, labelling and packaging (CLP) Regulation. It will require importers and downstream users to notify national appointed bodies if they are placing hazardous substances on the market specifically for consumer use by this date.

Trade associations and member states have been commenting on the requirements at recent meetings of the competent authorities for REACH and CLP (Caracal).

In a paper published after the 12 June meeting, Cefic said that with 18 months to go, the Commission would be unable to "deliver results for a quality workability study" and solve "highly important issues".

The workability study was launched shortly after the Cefic paper. It will address stakeholder concerns over the practicalities of new requirements on the submission of information. The year-long exercise will focus on industries with complex material inputs and supply chains and propose solutions to the problems raised.

Interim results will be discussed in the study steering group and stakeholder advisory group at the start of 2019, as well as at Caracal meetings.

Cefic said it anticipates the study will "demonstrate the need [for] amending the text of the annex to make it workable". It added that progress on an Echa notification portal has been "slow" and the decision to develop an agency database is "still open".

The trade body also said that the time allowed for building the poison centres notification (PCN) format and the "delays the pilot projects have suffered make the proposed dates unrealistic for such a complex project".

Industry, it said, will need to dedicate "considerable resources" to comply with Annex VIII and therefore it "cannot accept" the use of "overcomplicated" tools.

"Cefic considers it will be impossible for companies to prepare for compliance with this amount of uncertainty remaining over basic features."

The notification deadline for companies marketing substances for professional use is 1 January 2021, and for industrial use 2024.

Member states

Meanwhile, member states are considering the possibility of hosting their own database in case Echa does not have a centralised one in place, Cefic said.

They are also preparing to include national requirements. "The exercise of harmonisation will be completely futile if this happens," it said. Cefic has asked the Commission to convey this message to member states to "ensure alignment".

However, Cefic added that it accepts parallel national submission systems "if when no additional information is required the PCN format can be used and when submissions through the central portal are also accepted".

In its paper, Poland's competent authority said it expects the Commission to adopt the draft of its Decision "as soon as possible" so it is ready for a vote in the Echa Management Board meeting on 20-21 September.

It added that although a "keen supporter" of the EU central system, it is concerned about future financing. It would like the Commission to provide certainty, via a legal instrument, that member states would be free from additional Echa fee requirements.

A spokesperson for the European Commission told Chemical Watch that some of the tools, such as the Unique Formula Identifier (UFI) generator and a first version of the notification format, have already been released via Echa's website. "The first version of the notification portal should also be released in 2019 and further developed over time with additional features and search capacities."

US NGOs: 'Science transparency' policy contravenes TSCA

Groups urge EPA to withdraw 'unlawful' proposal

23 August 2018 / Confidentiality & right-to-know, TSCA, United States

Environmental and consumer advocacy groups say that the US EPA's proposed 'science transparency' rule is in direct contravention to TSCA mandates, and are urging the agency to withdraw the "unlawful" proposal.

The latest opposition has come in a consultation on the agency's controversial proposed rule, 'Strengthening transparency in regulatory science'. This seeks to ensure that science underpinning regulatory decisions is available for public validations.

Nearly half a million individuals and organisations have weighed in on the rule, with the majority reiterating concerns that the proposal could require the agency to discard legitimate science. But recent comments have also highlighted the ways in which the proposal runs counter to EPA's requirements under the recently reformed TSCA law.

TSCA science requirements

As amended by the 2016 Lautenberg Act, TSCA requires the EPA to rely on "best available science" and "reasonably available information". And it must make decisions consistent with the "weight of scientific evidence".

But in comments submitted on behalf of nearly 90 organisations, Earthjustice argued that the proposal "directly contravenes the specific mandate" of TSCA.

TSCA establishes a "comprehensive scheme for how EPA is to consider scientific data", wrote the environmental law nonprofit. "A rule that deliberately excludes this best science cannot be reconciled with these firm Congressional mandates and public health purposes," it added.

The Environmental Protection Network – a group of former EPA employees – commented that although Congress detailed the types of science that EPA should use in TSCA, "availability of sufficient underlying data for the public to 'validate' or 'reproduce' study results is not even among the factors the agency is to consider, much less a determinative factor nullifying all those enumerated".

And the group argued the proposal runs against the requirement for decisions to be based on the "weight of the scientific evidence", as it blocks evidence from the weighting process entirely.

Earthjustice also pointed out that because the proposal only applies to 'significant regulatory actions', EPA could arguably use non-public science to support a determination that a substance does not pose an unreasonable risk – as this would result in no regulatory activity – but not to regulate a harmful one. This, it says, is "arbitrary and capricious and cannot stand".

"In sum, EPA's proposed rule is inconsistent with TSCA's plain text," wrote the Environmental Defense Fund (EDF). "EPA should not adopt the proposed rule because it cannot be reconciled with the agency's duties under TSCA."

Industry view

The American Sustainable Business Council – representing more than a quarter million businesses – agreed with NGO comments that the rule would run counter to TSCA's 'best available science' mandate.

"The more research the EPA considers, the more informed and appropriate their response can be to findings about harmful effects of chemicals," said the business coalition.

But a joint comment from three paving, stone and concrete associations – the NAPA, NSSGA, and NRMCA – said that increased transparency under the rule would help EPA carry out its 'best available science' requirements, particularly with respect to its mandates surrounding "suitability, documentation and consideration of uncertainty and variability."

And the American Chemistry Council said in a public statement that it believes that the approach outlined in the proposed rule is one Congress demonstrated its support of when it modified TSCA's science provisions in the law's 2016 overhaul.

"When it comes to the science, EPA should 'show its work'," said the trade group.

And it suggested in its comments that the EPA's Integrated Risk Information System (IRIS) programme should also be subject to the new policy.

Nonetheless, the ACC said that the rule should be tailored to each environmental law it affects, and "implemented by regulations specific to the objective and scientific disciplines of each statute," including TSCA.

San Francisco bans single-use food service ware containing PFAS

Requirements to take effect from 1 January 2020

23 August 2018 / Food contact, PFCs, United States

San Francisco is set to ban the sale or use of single-use food service ware made with perfluoroalkyl and polyfluoroalkyl substances (PFAS).

Earlier this month, the California city's mayor approved Ordinance 201-18, amending existing food service and packaging waste reduction laws.

The updated law will require single-use items used for prepared, takeout and leftover food – such as bowls, plates, trays, cups, lids, straws, utensils and napkins – to be 'fluorinated chemical free'.

It also covers single-use food service ware accessories, such as condiment packets, chopsticks, cup sleeves, napkins, stirrers and toothpicks.

Restaurants, food retailers, vendors, city contractors and city departments will all be subject to the requirements, which come into force on 1 January 2020.

'Unnecessary action'

Jonathan Corley, a spokesperson for the chemical industry trade association, FluoroCouncil said the ban was "unnecessary, contrary to sound science and will provide no further benefits to public health or the environment."

The use of PFAS in food packaging is already thoroughly regulated by the US Food and Drug Administration (FDA), Mr Corley told Chemical Watch, and the agency has determined the chemicals "are safe for their intended use".

They "help protect the quality and integrity of food, extend shelf life and help in the safe transportation and storage of food," he added.

But Gretchen Lee Salter, interim director of the NGO Safer States, praised San Francisco's "forward thinking" on the issue.

"Taking PFAS out of food packaging will not only prevent exposure during the use of the packaging but also after it is disposed, since they have been shown to leak into compost," she told Chemical Watch.

She called on other US cities and states to follow the example.

Pressure on PFAS

San Francisco's move comes as the use of PFAS in food contact materials (FCMs) faces mounting pressure.

In March, Washington became the first US state to pass a law prohibiting the substances in certain FCMs. The ban takes effect from 1 January 2022, subject to the availability of safer alternatives.
And New York has restricted state agency purchasing of food containers containing them.

The American Academy of Pediatrics named fluorinated chemicals as an "additive of most concern" in a July policy statement calling for increased regulation of food contact materials.

And in March, the industry-backed Food Safety Alliance for Packaging issued a guidance document, urging suppliers to avoid such substances as PFAS when alternatives exist.

Meanwhile, the NGO Mind the Store campaign is speaking with major food retailers to speed their removal from FCMs and will announce its progress in its 'retailer report card' later this year.
Policies like San Francisco's mark the "beginning of the end" for PFAS, said the NGO.

EPA News Highlights 4.25.18

The Detroit News: Va. Tech. Expert, Team Win $2M For Lead Water Research

Federal officials are giving nearly $2 million for research to a team led by the Virginia Tech researcher who uncovered elevated lead levels in Flint's drinking water to research preventing such problems nationwide. Staffers are slated to use the money to create a consumer-based framework to detect and control lead in drinking water, the agency said in a statement. The "community science project" aims to raise awareness while helping "the most vulnerable communities to actively participate in identifying risks and evaluating opportunities to mitigate those risks." "Our team will establish one of the largest citizen-science engineering projects in U.S. history to help individuals and communities deal with our shared responsibility for controlling exposure to lead in drinking water through a combination of low-cost sampling, outreach, direct collaboration and modeling," said a statement by Marc Edwards, the principal investigator on the project at Virginia Polytechnic Institute and State University, where he has long worked.

NBC Bay Area: EPA Fines East Bay Cities, Water Agencies For Allowing Sewage Into Bay

Oakland, Alameda, Berkeley, Albany and two municipal districts in the East Bay have been fined almost $400,000 for allowing untreated sewage to enter the Bay, U.S. Environmental Protection Agency officials said Tuesday. The East Bay Municipal Utility District and the Stege Sanitary District for El Cerrito, Kensington and parts of Richmond were also fined for the violations, which occurred between September 2014 and June 2017. EPA officials said the cities violated the terms of a 2014 Clean Water Act settlement "consent decree" that required upgraded sewer infrastructure to protect local waters. In 2014, the eight cities and agencies paid $1.5 million for past sewage penalties and agreed to upgrade 1,500 miles of infrastructure over 21 years, according to the EPA. EPA officials said the cities and districts have inspected 720 miles of sewer pipe and spent $80 million to upgrade 100 miles of sewers since the settlement.

The Washington Examiner: Scott Pruitt Announces New EPA Rule To Combat 'Secret Science'

Environmental Protection Agency Administrator Scott Pruitt announced a proposed rule Tuesday that would block the agency from using scientific studies that do not make public the raw data used in the research. The embattled EPA administrator was surrounded by conservative allies when he announced the change at agency headquarters, with no media present because the agency did not invite reporters. Pruitt argues the proposed rule, subject to a 30-day comment period, would improve transparency and ensure science used in policymaking can be independently verified. It fits with a policy he implemented last year to boot scientists from key advisory boards to the EPA.

The Hill: Pruitt Signs Proposed Rule To Erase 'Secret Science' From EPA

Environmental Protection Agency (EPA) Administrator Scott Pruitt signed a rule proposal Tuesday aimed at increasing "transparency" in science all while limiting reporter, environmentalist and scientist access to the event. The proposal, signed at EPA headquarters, aims to expose the methodology behind scientific findings and cut back on what Pruitt has deemed "secret science." Speaking in front of a number of well-known climate change skeptics including the Competitive Enterprise Institute's Myron Ebell, Pruitt announced that the new rule would require science to "be transparent, reproducible and able to be analyzed by those in the marketplace." Reporters were not invited to attend

the event, and details surrounding the announcement and rule proposal were kept secret until 30 minutes before the EPA's Twitter account announced it would be live-streamed.

The Wall Street Journal: Trump Faces Pressure To Choose Sides In Fight Between Corn Growers And Oil Refiners
President Donald Trump is caught between two powerful business constituents of the Republican Party as he faces growing pressure to resolve a dispute between the oil industry and the Farm Belt. Oil refineries want out of a costly requirement to blend ethanol into the gasoline they produce. Corn growers say the requirement diversifies the U.S. fuel supply, and insist Mr. Trump fulfill promises to at least hold the ethanol mandate. Both sides have close ties to the GOP and the White House. Tensions between the two industries have been building since well before Mr. Trump became president, the result of a 2005 law that requires refineries to blend about 10% plant-based ethanol into the fuel they produce, or buy credits from rivals to cover their blending obligations. Congress created the mandate in hopes of reducing carbon emissions and weaning the U.S. from foreign crude at a time when oil prices had begun soaring.

National News Highlights 4.25.18

The New York Times: Trump's Travel Ban Faces A Supreme Court Test
The Supreme Court will hear a challenge on Wednesday to President Trump's latest effort to limit travel from countries said to pose a threat to the nation's security. The case, a major test of presidential power, will require the justices to decide whether Mr. Trump's campaign promises to impose a "Muslim ban" were reflected in executive orders that restricted travel from several predominantly Muslims nations. Just a week after he took office, President Trump issued his first travel ban, causing chaos at the nation's airports and starting a cascade of lawsuits and appeals. Fifteen months later, after two revisions of the ban and a sustained losing streak in the lower courts, the Supreme Court took up the case in its last scheduled argument of the term. A decision is expected by late June. The case, Trump v. Hawaii, No. 17-965, concerns Mr. Trump's third and most considered bid to make good on his campaign promise to secure the nation's borders. Challengers to the latest ban, issued as a presidential proclamation in September, said it was tainted by religious animus and not adequately justified by national security concerns.

The Washington Post: Trump Rallies Behind VA Nominee After Suggesting He Drop Out Because Of 'Ugly' Process
The White House rallied around Ronny L. Jackson's nomination to lead the Department of Veterans Affairs late Tuesday as the president's doctor was besieged by accusations that he improperly dispensed drugs, created a hostile workplace and became intoxicated on duty. The administration's decision to fight on in defense of the nomination came hours after President Trump publicly suggested that Jackson should consider pulling out because of the "abuse" he was facing. But by late afternoon, Trump had huddled with Jackson, and White House aides vowed to fight the charges. "I don't want to put a man through a process like this," Trump had said earlier when asked about Jackson's nomination during a joint news conference with French President Emmanuel Macron. "It's too ugly, and it's too disgusting."

TRUMP TWEETS

The Detroit News

Va. Tech. Expert, Team Win $2M For Lead Water Research
By The Detroit News, 4/24/18

Federal officials are giving nearly $2 million for research to a team led by the Virginia Tech researcher who uncovered elevated lead levels in Flint's drinking water to research preventing such problems nationwide.

Staffers are slated to use the money to create a consumer-based framework to detect and control lead in drinking water, the agency said in a statement. The "community science project" aims to raise awareness while helping "the

most vulnerable communities to actively participate in identifying risks and evaluating opportunities to mitigate those risks."

"Our team will establish one of the largest citizen-science engineering projects in U.S. history to help individuals and communities deal with our shared responsibility for controlling exposure to lead in drinking water through a combination of low-cost sampling, outreach, direct collaboration and modeling," said a statement by Marc Edwards, the principal investigator on the project at Virginia Polytechnic Institute and State University, where he has long worked.

"We will tap a growing 'crowd' of consumers who want to learn how to better protect themselves from lead, and in the process, also create new knowledge to protect others. Whether from wells or municipalities, we all consume water, and we can collectively work to reduce health risks."

The U.S. Environmental Protection Agency is expected to announce the funding Wednesday.

The grant dovetails with federal efforts to tackle lead exposure and comes weeks after Edwards testified in the district court case involving Nick Lyon, the state Health and Human Services director, who is charged with involuntary manslaughter linked to the Flint water crisis.

The Flint water crisis began when the city's water supply was contaminated with lead in April 2014, when a state-appointed emergency manager switched the source of the city's drinking water supply from Lake Huron to the Flint River. When the move was made, the Michigan Department of Environmental Quality did not require adequate corrosion-control chemicals to treat the water, causing lead to leach from joints, pipes and fixtures

Prosecutors have said the switch helped create the conditions for a Legionnaires' outbreak that killed 12 and sickened 79 others.

Edwards, an environmental engineer, tested the water of Flint resident Lee-Anne Walter in 2015 and found elevated lead levels he had not seen in 25 years. He assembled a team of Virginia Tech researchers, took them to Flint to test the water, launched a website and paid $150,000 to complete the work.

He also found documents showing that state leaders knew in the summer of 2015 that there was lead contamination in Flint's water. Edwards testified before Congress in March 2016 about the crisis.

The EPA grant follows the launch of a task force this year to address childhood lead exposure.

"Lead exposure is one of the greatest environmental threats we face as a country, and it's especially dangerous for our children," EPA Administrator Scott Pruitt said. "This research will move us one step closer to advancing our work to eradicate lead in drinking water."

NBC Bay Area

EPA Fines East Bay Cities, Water Agencies For Allowing Sewage Into Bay

By Bay City News, 4/24/18

Oakland, Alameda, Berkeley, Albany and two municipal districts in the East Bay have been fined almost $400,000 for allowing untreated sewage to enter the Bay, U.S. Environmental Protection Agency officials said Tuesday.

The East Bay Municipal Utility District and the Stege Sanitary District for El Cerrito, Kensington and parts of Richmond were also fined for the violations, which occurred between September 2014 and June 2017.

EPA officials said the cities violated the terms of a 2014 Clean Water Act settlement "consent decree" that required upgraded sewer infrastructure to protect local waters.

In 2014, the eight cities and agencies paid $1.5 million for past sewage penalties and agreed to upgrade 1,500 miles of infrastructure over 21 years, according to the EPA.

EPA officials said the cities and districts have inspected 720 miles of sewer pipe and spent $80 million to upgrade 100 miles of sewers since the settlement.

The current violations include sanitary sewer overflows reaching the water, failure to meet limits for chlorine and coliform and failing to repair small defects within a year.

Oakland incurred the highest fines at $226,500, with EBMUD paying the second-highest portion at $134,000.

"We knew heading into the consent decree that we could not eliminate these issues overnight, and we knew some stipulated penalties would be unavoidable," Oakland Public Works spokesman Sean Maher said in an email.

Oakland has reduced sewage spills into the Bay by 16 percent since 2014, and the agency is reaching multiple goals outlined in the decree, like pipe rehabilitation, Maher said.

EBMUD spokeswoman Jenesse Miller said the fines are reasonable and the district is confident that it can improve in the next few years.

Miller said the violations stemmed from numerous issues, but a main cause was a very wet winter that came after a five-year drought.

"We discovered our operators needed better muscle memory, if you will, to manage the sudden and enormous inflow of storm water into our system," Miller said in an email.

The district is organizing more on-site trainings before storms and evaluating standard operating procedures. Miller said the training has paid off and there weren't any violations during the most recent set of late-winter storms.

Trump, Macron Make a Show as Best Buds But Tussle Over Iran
The district will pay the fines with wastewater revenue, which comes from taxpayers, according to Miller.

The Washington Examiner

Scott Pruitt Announces New EPA Rule To Combat 'Secret Science'
By Josh Siegel, 4/24/18

Environmental Protection Agency Administrator Scott Pruitt announced a proposed rule Tuesday that would block the agency from using scientific studies that do not make public the raw data used in the research.

The embattled EPA administrator was surrounded by conservative allies when he announced the change at agency headquarters, with no media present because the agency did not invite reporters.

Pruitt argues the proposed rule, subject to a 30-day comment period, would improve transparency and ensure science used in policymaking can be independently verified. It fits with a policy he implemented last year to boot scientists from key advisory boards to the EPA.

"The science that we use is going to be transparent, reproducible and able to be analyzed by those in the marketplace," Pruitt said. "This is the right approach. Today is a red letter today. It's a banner day. It's an agency taking responsibility for how we do our work and respect the process to make sure we can enhance confidence in our decision making."

The proposal is modeled after legislation proposed by House Science Committee Chairman Lamar Smith, R-Texas, who tried to impose a similar requirement through legislation, but it failed to pass. Smith attended Pruitt's announcement, with Sen. Mike Rounds, R-S.D., who authored a mirroring bill in the Senate.

Supporters of the idea said they want to end the use of “secret science” in rulemaking.

"Surely, we can all agree on two things," Smith said. "We need clean air and water, and EPA's regulations should be supported by legitimate and publicly available data. Today’s announcement ensures data will be secret no more."

The proposed rule would have the effect of restricting the science the EPA could use when drafting environmental regulations, which critics say would allow the agency to justify weaker rules because it has less research to work with and can favor information that fits its goals, rather than relying on the best science.

Some scientific research uses personal health information from individuals who participate knowing the details are not to be made public but used to inform policymaking.

“Administrator Pruitt is very clearly trying to exclude and ignore longstanding pollution and medical science that is peer-reviewed, embraced by the National Academy of Sciences among others, and also based on health data that people were promised would be kept confidential,” John Walke, the clean air director of the Natural Resources Defense Council, told the Washington Examiner.

Walke argues the rule would be struck down in court because it is an arbitrary and capricious decision under the Administrative Procedure Act, which governs agency rule-making and requires regulatory decisions to be backed by data.

It also could violate laws that mandate the use of "best available science," including the Toxic Substances Control Act and Safe Drinking Water Act, opponents of the policy said.

“It is arbitrary and illegal for EPA to condition use of science and relevant information on the public availability of confidential health information, confidential business information, computer codes, and the like, rather than the validity and integrity of that science and information,” Walke said. “Moreover, EPA is very likely to tie itself up knots trying, unsuccessfully, to allow confidential information desired by industry, while disallowing health studies based on confidential patient data that would support stronger health safeguards.”

Major studies that have depended on confidential information include a major 1993 study by Harvard University linking air pollution to premature deaths.

Companies can’t reveal proprietary information either, so businesses also could be subject to the policy. That means the EPA could be blocked from considering confidential business information, such as data submitted by auto companies intended to aid in determining fuel-efficiency standards.

“It seems like this will handicap the EPA in making rules based on public health or industry data, and I think we should tread cautiously,” Joseph Majkut, director of climate policy at the Niskanen Center, a free-market think tank, told the Washington Examiner. “Private industry data and public health surveys cannot be as transparent as Pruitt would like to protect their property or the privacy of people in the studies. Insofar as the science behind them is solid, and in the case of Harvard and others it seems to be, then we risk losing valuable sources of information. I'm all for an open and transparent scientific process, but we probably don't want to throw the baby out with the bathwater.”

But the text of the proposed rule says Pruitt may grant exemptions on a case-by-case basis when publishing underlying data is "impracticable."

It lists exposing "confidential business information" as a possible exception, so corporate-funded research could potentially get an opt-out. Information that is "sensitive to national and homeland security" also can be kept private.

Pruitt's announcement of the new rule comes as he is slated to visit Capitol Hill Thursday for the first time since a flood of allegations about his spending, ethics, and hiring practices prompted investigations by Congress, the White House, and the EPA's inspector general.

He is scheduled to testify before a House Energy and Commerce subcommittee in the morning and at a House Appropriations subcommittee in the afternoon.

The EPA administrator, in the lead-up to the hearings, is losing Republican support.

Three key Senate Republicans on Monday called for Pruitt to face more hearings about his recent controversies, including Sen. Jim Inhofe, R-Okla., a reliable Pruitt ally from his home state.

Sen. Lisa Murkowski, R-Alaska, told reporters Tuesday she plans to invite Pruitt to testify next month before the Senate appropriations subcommittee that oversees the EPA's budget.

Smith and Rounds, however, sought to reinforce support that Pruitt maintains from many conservatives.

"I know of no administration official who goes on the offensive, is not intimidated, and does the right thing regardless," Smith said. "We couldn't have a better head of the EPA."

The Hill

Pruitt Signs Proposed Rule To Erase 'Secret Science' From EPA

By Miranda Green, 4/24/18

Environmental Protection Agency (EPA) Administrator Scott Pruitt signed a rule proposal Tuesday aimed at increasing "transparency" in science all while limiting reporter, environmentalist and scientist access to the event.

The proposal, signed at EPA headquarters, aims to expose the methodology behind scientific findings and cut back on what Pruitt has deemed "secret science."

Speaking in front of a number of well-known climate change skeptics including the Competitive Enterprise Institute's Myron Ebell, Pruitt announced that the new rule would require science to "be transparent, reproducible and able to be analyzed by those in the marketplace." Reporters were not invited to attend the event, and details surrounding the announcement and rule proposal were kept secret until 30 minutes before the EPA's Twitter account announced it would be live-streamed.

Pruitt said the new ruling shows "an agency taking responsibility for how we do our work, in respecting process ... so that we can enhance confidence in our decision making." He also dubbed the current process which had, until now, allowed science to be peer reviewed rather than open to public scrutiny, "simply wrong headed."

The rule will replicate, through agency action, two bills previously introduced in the House and Senate meant to restrict the kind of science the EPA can use when writing regulations.

The House bill authored by Rep. Lamar Smith (R-Texas), now called the Honest and Open New EPA Science Treatment Act, would mandate all scientific data and findings be made publicly available before they are used to justify agency regulations. Versions of Smith's bill passed the GOP-controlled House three times, but the Senate hasn't taken it up.

Last week, internal documents released by a Freedom of Information Act request by the Union of Concerned Scientists found that EPA political staffers have been working for months in conjunction with Smith and his staff to mimic the bill.

Speaking at the event Tuesday, Smith thanked Pruitt for being a "courageous leader" of the agency and blamed the "liberal media and alarmist environmental groups," for finding negatives in his legislation.

"For too long, EPA has withheld data that has been hidden from the American people," Smith said.

Opponents of the new rule say it would limit the number of available scientific studies that could be used by the agency in its rulemaking, namely by excluding a number of public health studies.

Timed with Pruitt's announcement, seven Democratic Lawmakers sent a letter to Pruitt on Tuesday denouncing the new policy. The letter, led by Sen. Tom Carper (D-Del.), tells Pruitt, "Your proposed new policy likely violates several laws with which EPA must comply as the agency writes rules to protect our air, water and land from harmful pollution."

The lawmakers said Pruitt's new policy likely would run afoul of a number of laws that mandate rulemaking be based on the "best available science ... because it would require EPA to ignore some of the 'best' scientific studies."

"Courts have explained that 'best available science' means that agencies 'should seek out and consider all existing scientific evidence relevant to the decision' and 'cannot ignore existing data,' " the letter read.

https://www.wsj.com/articles/trump-faces-pressure-to-choose-sides-in-fight-between-corn-growers-and-oil-refiners-1524648602

Trump Faces Pressure To Choose Sides In Fight Between Corn Growers And Oil Refiners

By Tim Puko and Bradley Olson, 4/25/18

President Donald Trump is caught between two powerful business constituents of the Republican Party as he faces growing pressure to resolve a dispute between the oil industry and the Farm Belt.

Oil refineries want out of a costly requirement to blend ethanol into the gasoline they produce. Corn growers say the requirement diversifies the U.S. fuel supply, and insist Mr. Trump fulfill promises to at least hold the ethanol mandate. Both sides have close ties to the GOP and the White House.

Tensions between the two industries have been building since well before Mr. Trump became president, the result of a 2005 law that requires refineries to blend about 10% plant-based ethanol into the fuel they produce, or buy credits from rivals to cover their blending obligations. Congress created the mandate in hopes of reducing carbon emissions and weaning the U.S. from foreign crude at a time when oil prices had begun soaring.

By the time Mr. Trump took office, though, oil and gas supplies had gone from shortage to saturation thanks to the shale-drilling boom. Now, oil refiners—and some Trump advisers—consider a rollback of the 2005 regulation years overdue.

That leaves Mr. Trump stuck between conflicting promises to cut government regulation and to support ethanol mandates. He was one of the few in the Republican presidential primary race to emphasize the mandate in Iowa—the nation's biggest corn-producing state and home to the first nominating contests.

The Trump White House has failed to broker a deal, even after hosting supporters from both sides in the Oval Office. The administration has struggled for months after several proposals for administrative solutions have run into opposition from corn or oil backers.

"I can't see any obvious middle ground," said Sandy Fielden, director of oil and products research at Morningstar. "If there was an easy answer, we'd all be looking at it."

The impasse has refineries taking matters into their own hands, appealing directly to the Environmental Protection Agency for relief in the form of waivers. The agency has stepped up waiver approvals. That has infuriated agricultural interests and put more pressure on the White House to come up with a permanent solution.

The agricultural lobby has been uncomfortable with EPA chief Scott Pruitt, who, before coming to Washington, had called the ethanol mandate "unworkable" and filed a legal brief in 2013 backing a lawsuit challenging it when he was Oklahoma attorney general. Mr. Pruitt landed the EPA role in part because of a recommendation from Carl Icahn, a billionaire adviser to Mr. Trump's transition team and an owner of a small refinery operator that faces around $250 million in costs to comply with the ethanol mandate.

More oil refiners are looking to take advantage of a loophole in the law that has only widened since Mr. Pruitt took over the agency. Small refineries with less than 75,000 barrels a day of capacity—even if owned by a large company—can get a waiver if they prove the mandates are causing "disproportionate economic hardship," according to the EPA website.

To get a waiver, each refinery gets evaluated on its own finances—independent from the health of its parent company. Compliance costs could still be tens of millions of dollars, which alone appears to be enough now to prove economic harm, industry lobbyists said.

For years, the EPA regularly rejected requests from refiners seeking waivers from ethanol requirements. Then this March, the agency agreed to waive millions in obligations for Philadelphia Energy Solutions, a major East Coast refiner that filed for bankruptcy after its costs to comply with the program rose to $231 million in 2016. The EPA then began granting a number of waivers to the small refineries able to demonstrate economic harm, including one owned by Andeavor Corp. , one of the country's largest independent refiners and a company big enough to be part of the S&P 500.

The agency has rejected just one of about 30 applicants so far this year, encouraging more refiners to consider applying for the first time. It has received applications from oil giants Exxon Mobil Corp. and Chevron Corp.

Many now see an EPA waiver as a given. Some are even asking for waivers that would allow them recoup costs from years past. "If you can show economic harm—which is pretty easy to do—you have to consider it," according to one oil-industry lobbyist who has been pushing the Trump administration for a waiver for a client. "People never imagined they would be eligible."

One factor behind the change at EPA is a federal appeals-court decision last year that found the agency had been too restrictive in doling out waivers. Mr. Pruitt has since decided to accept every recommendation on a waiver from the Energy Department—which is responsible for calculations evaluating a refinery's claim of economic harm—and grant full waivers even when the Energy Department recommended only partial waivers. This is opening the floodgates for applications and approvals, analysts and refiners say.

"The criteria used to grant waivers has not changed since previous administrations," EPA spokeswoman Liz Bowman said. "EPA follows a longstanding, established process."

Many in both the refining and farming industries dispute that assertion, and see a significant change in EPA policy. There are 38 plants across the U.S. that could qualify for the exemptions, according to the agency. Based on their capacity, the number of qualifying refineries could make up as much as 10% of the nation's fuel supply, according to a Wall Street Journal analysis. More than half have already received them.

One result of the increase in waivers is a falling price for credits that many refineries need to buy to cover their obligations for ethanol blending. The cost of credits has halved in recent months as traders and companies have grown increasingly confident that the Trump administration will take action to reduce the burden oil refiners face in complying with the law.

Sen. Chuck Grassley, a Republican from Iowa, in a call with reporters Tuesday accused the EPA of abusing the waivers to cap the price of ethanol credits. EPA officials deny undermining the ethanol program.

While Mr. Trump has received support from Mr. Icahn and frequently touts his own backing of the fossil-fuel business, he has to be mindful of Iowa's political clout and Mr. Grassley's in particular. Aside from Iowa's early primary, Mr. Grassley runs the powerful Senate Judiciary Committee, which oversees the confirmation of judges and has launched investigations into matters related to the president's campaign and businesses.

"The president has said to me both publicly and privately many times that he intends, and he is keeping his commitment to ethanol," Mr. Grassley said Tuesday. Mr. Pruitt is "undercutting the president's promises."

The New York Times

https://www.nytimes.com/2018/04/25/us/politics/trump-travel-ban-supreme-court.html

Trump's Travel Ban Faces A Supreme Court Test

By Adam Liptak and Michael Shear, 4/25/18

WASHINGTON — The Supreme Court will hear a challenge on Wednesday to President Trump's latest effort to limit travel from countries said to pose a threat to the nation's security. The case, a major test of presidential power, will require the justices to decide whether Mr. Trump's campaign promises to impose a "Muslim ban" were reflected in executive orders that restricted travel from several predominantly Muslims nations.

Just a week after he took office, President Trump issued his first travel ban, causing chaos at the nation's airports and starting a cascade of lawsuits and appeals. Fifteen months later, after two revisions of the ban and a sustained losing streak in the lower courts, the Supreme Court took up the case in its last scheduled argument of the term. A decision is expected by late June.

The case, Trump v. Hawaii, No. 17-965, concerns Mr. Trump's third and most considered bid to make good on his campaign promise to secure the nation's borders. Challengers to the latest ban, issued as a presidential proclamation in September, said it was tainted by religious animus and not adequately justified by national security concerns.

But the administration said the third order was the product of careful study by several agencies of the security and information-sharing practices of nations around the world. Mr. Trump's lawyers urged the courts to ignore Mr. Trump's statements and Twitter posts and to focus solely on the text of the proclamation and the process that produced it.

Mr. Trump's first travel ban, issued in January 2017, was promptly blocked by courts around the nation. A second version, issued two months later, fared little better, though the Supreme Court allowed part of it go into effect in June when it agreed to hear the Trump administration's appeals from two appeals court losses. But the Supreme Court dismissed those appeals in October after the second ban expired.

The current ban initially restricted travel from eight nations — Iran, Libya, Syria, Yemen, Somalia, Chad, Venezuela and North Korea — six of which were predominantly Muslim. Chad was recently removed from the list.

The restrictions vary in their details, but, for the most part, citizens of the countries are prohibited from immigrating to the United States, and many are barred from working, studying or vacationing here.

In December, in a sign that the Supreme Court may uphold the latest order, the court allowed it to go into effect as the case moved forward. The decision effectively overturned a compromise in place since last June, when the court said travelers with connections to the United States could continue to travel here notwithstanding restrictions in an earlier version of the ban.

Justices Ruth Bader Ginsburg and Sonia Sotomayor dissented from the December ruling.

Hawaii, several individuals and a Muslim group challenged the latest ban's limits on travel from the predominantly Muslim nations; they did not object to the portions concerning North Korea and Venezuela. They prevailed before a

Federal District Court there and before a three-judge panel of the United States Court of Appeals for the Ninth Circuit, in San Francisco.

The appeals court ruled that Mr. Trump had exceeded the authority that Congress had given him over immigration and had violated a part of the immigration laws barring discrimination in the issuance of visas.

In a separate decision that is not directly before the justices, the United States Court of Appeals for the Fourth Circuit, in Richmond, Va., blocked the ban on different grounds, saying it violated the Constitution's prohibition of religious discrimination.

The Supreme Court said it would consider both the statutory and constitutional questions when it agreed to hear the case.

Lawyers for the challengers have said Mr. Trump's own statements provided powerful evidence of anti-Muslim animus. The latest order, they said, was infected by the same flaws as the previous ones.

The Washington Post

https://www.washingtonpost.com/politics/white-house-stands-by-embattled-nominee-to-lead-veterans-affairs/2018/04/24/3013860e-47a6-11e8-9072-f6d4bc32f223_story.html?utm_term=.e17d7add401d

Trump Rallies Behind VA Nominee After Suggesting He Drop Out Because Of 'Ugly' Process

By Josh Dawsey, Seung Min Kim, Lisa Rein and John Wagner, 4/24/18

The White House rallied around Ronny L. Jackson's nomination to lead the Department of Veterans Affairs late Tuesday as the president's doctor was besieged by accusations that he improperly dispensed drugs, created a hostile workplace and became intoxicated on duty.

The administration's decision to fight on in defense of the nomination came hours after President Trump publicly suggested that Jackson should consider pulling out because of the "abuse" he was facing. But by late afternoon, Trump had huddled with Jackson, and White House aides vowed to fight the charges.

"I don't want to put a man through a process like this," Trump had said earlier when asked about Jackson's nomination during a joint news conference with French President Emmanuel Macron. "It's too ugly, and it's too disgusting."

Trump added: "I said to Dr. Jackson, what do you need it for? To be abused by a bunch of politicians? . . . If I was him . . . I wouldn't do it."

Jackson's worsening problems flared into public view Tuesday when lawmakers nixed his confirmation hearing scheduled for Wednesday. The hearing was officially postponed by Sen. Johnny Isakson (Ga.), the Republican chairman of the Veterans' Affairs Committee, and Sen. Jon Tester (Mont.), the ranking Democrat.

Later Tuesday, Tester said during an interview with NPR that the committee had heard complaints from more than 20 current and former military members that Jackson had improperly dispensed drugs, become intoxicated on professional trips and belittled staff members.

"We were told stories where he was repeatedly drunk while on duty, where his main job was to take care of the most powerful man in the world," Tester said. "That's not acceptable."

Tester said concerns about the allegations were "bipartisan in nature," including from Isakson.

A spokeswoman for Isakson said the senator remained undecided about the nomination but continued to harbor serious concerns.

Hours after the president's news conference, more allegations emerged about Jackson, including a 2012 government report that said he exhibited "unprofessional behavior" and should be removed from his post.

"There is a severe and pervasive lack of trust in the leadership that has deteriorated to the point that staff walk on 'eggshells,' " the report found. It described morale under his leadership as in the doldrums and said the office was beset by fighting between Jackson and Jeffrey Kuhlman, President Barack Obama's doctor at the time.

It was another episode where a previously respected figure was lifted to prominence in Trump's orbit — only to have their sheen and reputation tarnished. Jackson had been widely hailed by three presidents and their aides as competent, charming and fiercely protective before Trump stunned Washington last month by picking the doctor to run the country's second-largest federal agency.

Jackson declined to comment on the accusations, and senior aides said he showed no willingness to drop out Tuesday afternoon as he trudged through meetings with senators on Capitol Hill. Privately, he dismissed some of the charges to senior aides, according to administration officials, and said he was being unfairly attacked.

"No, I'm looking forward to the hearing," Jackson said. "I was looking forward to doing it tomorrow, so I'm looking forward to getting it rescheduled and answering all the questions."

White House officials said they were aware of accusations that Jackson dispensed medicine to aides or others, including reporters, without rigorous scrutiny. But several senior officials said the drugs were usually nonnarcotic ones, such as Ambien. They also said that Jackson was never intoxicated or drinking while working in the White House near Trump, but may have had too much to drink on occasion while taking overseas trips.

The White House released several other reports that were laudatory regarding Jackson late Tuesday, including his performance reviews for the past four years.

"Ronny does a great job — genuine enthusiasm, poised under pressure, incredible work ethic and follow through. Ronny continues to inspire confidence with the care he provides to me, my family and my team. Continue to promote ahead of peers," a 2016 note from Obama read.

In a private meeting with Sen. Jerry Moran (R-Kan.) on Capitol Hill, Jackson denied any wrongdoing, according to the senator. During that meeting, the White House doctor also specifically denied ever drinking on duty, according to a spokesman for the senator.

"He does deny that he's done anything wrong in his service to the country and particularly his time at the White House as a physician in the medical unit," Moran said, adding that Jackson "indicated that he knows of nothing that would prohibit him from being qualified, capable and the right person to be secretary of the Department of Veterans Affairs."

Two senior officials said that Jackson's nomination had been handled "disastrously," in the words of one, who spoke on the condition of anonymity, and that it had been overshadowed by fights over secretary of state nominee Mike Pompeo and CIA director nominee Gina Haspel. In the future, one of these people said, more attention will be put on Jackson.

Senior White House officials said Trump was convinced by a coterie of aides, and Jackson, that the accusations were overblown. In the meeting Tuesday afternoon, Jackson offered to withdraw, a senior administration official said, but said he would prefer to push forward. Others present in the meeting included White House Chief of Staff John F. Kelly and press secretary Sarah Huckabee Sanders, an administration official said.

Jackson said the accusations were unfair "and just not true," a senior administration official said, describing the meeting.

Trump later told aides he had already taken a lot of flak for an unorthodox pick — and didn't want to give in.

"The president gave us the full green light to push back hard," the official said.

Jackson's nomination also marked the shattering of another norm in Trump's Washington: VA secretaries have historically been approved unanimously, even sometimes by a voice vote. The president nominated David Shulkin, who had led VA's health system under Obama, in the tradition of having a bipartisan Cabinet. But he soured on Shulkin and removed him after an inspector's general report showed that Shulkin took exorbitantly costly trips and misled others about them.

There was uncertain congressional support for Jackson, a longtime presidential physician with little management experience, even before questions were raised about his conduct.

It was unclear why White House aides had not reviewed the allegations before Jackson was nominated last month. He was picked seemingly on a whim by Trump, who fondly calls him "the Doc" and did not formally interview him before nominating him — and ousting Shulkin — by tweet.

Concerns about Jackson were bipartisan. Senate Majority Leader Mitch McConnell (R-Ky.) remained uncommitted to supporting the nominee, and a number of senior GOP aides on Capitol Hill estimated that his chances of confirmation were slim.

Isakson had called Kelly twice in recent days to express concerns about new information, spokeswoman Amanda Maddox said.

Isakson and Tester wrote to Trump on Tuesday morning, asking the White House to provide all documents related to Jackson's service in the White House medical unit as well as all communications between the Pentagon and the White House military office since 2006 that involve allegations or incidents connected to the physician. The senators also requested information the White House has about any allegations involving Jackson that were never relayed to the Pentagon.

In addition to Jackson's lack of management experience at a large organization, the physician had come under fire for his glowing appraisal of Trump's health after the president had his annual physical in January. Jackson declared that the president might live to the age of 200 with a healthier diet.

Isakson said the confirmation hearing is being delayed because the committee needs "some time to get more information."

"I'm concerned that the press is making up far too many stories that aren't true before we even get a chance to have a meeting," Isakson said after meeting privately with Tester on Tuesday morning. "So I think Mr. Jackson and myself and Senator Tester and everybody in Congress need to take a deep breath."

A leading veterans group said Tuesday that it was important for the Senate to fully vet a nominee to lead the department, which has had seven secretaries since the start of the war in Afghanistan.

"On this critical leadership position at this turbulent time, [the United States] cannot afford a misfire by the White House," said Paul Rieckhoff, the founder of Iraq and Afghanistan Veterans of America. "IAVA members nationwide are calling on the Senate to do its job at this defining time and ensure that any nominee for VA Secretary will live up to this awesome responsibility."

Sen. Patty Murray (D-Wash.), a member of the Veterans' Affairs Committee, said Trump didn't take the time to send over a fully vetted nominee.

"It is sloppy, it is disrespectful to our veterans, and it is wrong," Murray said.

The Detroit News: Va. Tech. Expert, Team Win $2M For Lead Water Research

Federal officials are giving nearly $2 million for research to a team led by the Virginia Tech researcher who uncovered elevated lead levels in Flint's drinking water to research preventing such problems nationwide. Staffers are slated to use the money to create a consumer-based framework to detect and control lead in drinking water, the agency said in a statement. The "community science project" aims to raise awareness while helping "the most vulnerable communities to actively participate in identifying risks and evaluating opportunities to mitigate those risks." "Our team will establish one of the largest citizen-science engineering projects in U.S. history to help individuals and communities deal with our shared responsibility for controlling exposure to lead in drinking water through a combination of low-cost sampling, outreach, direct collaboration and modeling," said a statement by Marc Edwards, the principal investigator on the project at Virginia Polytechnic Institute and State University, where he has long worked.

NBC Bay Area: EPA Fines East Bay Cities, Water Agencies For Allowing Sewage Into Bay

Oakland, Alameda, Berkeley, Albany and two municipal districts in the East Bay have been fined almost $400,000 for allowing untreated sewage to enter the Bay, U.S. Environmental Protection Agency officials said Tuesday. The East Bay Municipal Utility District and the Stege Sanitary District for El Cerrito, Kensington and parts of Richmond were also fined for the violations, which occurred between September 2014 and June 2017. EPA officials said the cities violated the terms of a 2014 Clean Water Act settlement "consent decree" that required upgraded sewer infrastructure to protect local waters. In 2014, the eight cities and agencies paid $1.5 million for past sewage penalties and agreed to upgrade 1,500 miles of infrastructure over 21 years, according to the EPA. EPA officials said the cities and districts have inspected 720 miles of sewer pipe and spent $80 million to upgrade 100 miles of sewers since the settlement.

The Washington Examiner: Scott Pruitt Announces New EPA Rule To Combat 'Secret Science'

Environmental Protection Agency Administrator Scott Pruitt announced a proposed rule Tuesday that would block the agency from using scientific studies that do not make public the raw data used in the research. The embattled EPA administrator was surrounded by conservative allies when he announced the change at agency headquarters, with no media present because the agency did not invite reporters. Pruitt argues the proposed rule, subject to a 30-day comment period, would improve transparency and ensure science used in policymaking can be independently verified. It fits with a policy he implemented last year to boot scientists from key advisory boards to the EPA.

The Hill: Pruitt Signs Proposed Rule To Erase 'Secret Science' From EPA

Environmental Protection Agency (EPA) Administrator Scott Pruitt signed a rule proposal Tuesday aimed at increasing "transparency" in science all while limiting reporter, environmentalist and scientist access to the event. The proposal, signed at EPA headquarters, aims to expose the methodology behind scientific findings and cut back on what Pruitt has deemed "secret science." Speaking in front of a number of well-known climate change skeptics including the Competitive Enterprise Institute's Myron Ebell, Pruitt announced that the new rule would require science to "be transparent, reproducible and able to be analyzed by those in the marketplace." Reporters were not invited to attend the event, and details surrounding the announcement and rule proposal were kept secret until 30 minutes before the EPA's Twitter account announced it would be live-streamed.

The Wall Street Journal: Trump Faces Pressure To Choose Sides In Fight Between Corn Growers And Oil Refiners

President Donald Trump is caught between two powerful business constituents of the Republican Party as he faces growing pressure to resolve a dispute between the oil industry and the Farm Belt. Oil refineries want out of a costly requirement to blend ethanol into the gasoline they produce. Corn growers say the requirement diversifies the U.S. fuel supply, and insist Mr. Trump fulfill promises to at least hold the ethanol mandate. Both sides have close ties to the GOP and the White House. Tensions between the two industries have been building since well before Mr. Trump became president, the result of a 2005 law that requires refineries to blend about 10% plant-based ethanol into the fuel they produce, or buy credits from rivals to cover their blending obligations. Congress created the mandate in hopes of reducing carbon emissions and weaning the U.S. from foreign crude at a time when oil prices had begun soaring.

Va. Tech. Expert, Team Win $2M For Lead Water Research

By The Detroit News, 4/24/18

Federal officials are giving nearly $2 million for research to a team led by the Virginia Tech researcher who uncovered elevated lead levels in Flint's drinking water to research preventing such problems nationwide.

Staffers are slated to use the money to create a consumer-based framework to detect and control lead in drinking water, the agency said in a statement. The "community science project" aims to raise awareness while helping "the most vulnerable communities to actively participate in identifying risks and evaluating opportunities to mitigate those risks."

"Our team will establish one of the largest citizen-science engineering projects in U.S. history to help individuals and communities deal with our shared responsibility for controlling exposure to lead in drinking water through a combination of low-cost sampling, outreach, direct collaboration and modeling," said a statement by Marc Edwards, the principal investigator on the project at Virginia Polytechnic Institute and State University, where he has long worked.

"We will tap a growing 'crowd' of consumers who want to learn how to better protect themselves from lead, and in the process, also create new knowledge to protect others. Whether from wells or municipalities, we all consume water, and we can collectively work to reduce health risks."

The U.S. Environmental Protection Agency is expected to announce the funding Wednesday.

The grant dovetails with federal efforts to tackle lead exposure and comes weeks after Edwards testified in the district court case involving Nick Lyon, the state Health and Human Services director, who is charged with involuntary manslaughter linked to the Flint water crisis.

The Flint water crisis began when the city's water supply was contaminated with lead in April 2014, when a state-appointed emergency manager switched the source of the city's drinking water supply from Lake Huron to the Flint River. When the move was made, the Michigan Department of Environmental Quality did not require adequate corrosion-control chemicals to treat the water, causing lead to leach from joints, pipes and fixtures

Prosecutors have said the switch helped create the conditions for a Legionnaires' outbreak that killed 12 and sickened 79 others.

Edwards, an environmental engineer, tested the water of Flint resident Lee-Anne Walter in 2015 and found elevated lead levels he had not seen in 25 years. He assembled a team of Virginia Tech researchers, took them to Flint to test the water, launched a website and paid $150,000 to complete the work.

He also found documents showing that state leaders knew in the summer of 2015 that there was lead contamination in Flint's water. Edwards testified before Congress in March 2016 about the crisis.

The EPA grant follows the launch of a task force this year to address childhood lead exposure.

"Lead exposure is one of the greatest environmental threats we face as a country, and it's especially dangerous for our children," EPA Administrator Scott Pruitt said. "This research will move us one step closer to advancing our work to eradicate lead in drinking water."

NBC Bay Area

EPA Fines East Bay Cities, Water Agencies For Allowing Sewage Into Bay

By Bay City News, 4/24/18

Oakland, Alameda, Berkeley, Albany and two municipal districts in the East Bay have been fined almost $400,000 for allowing untreated sewage to enter the Bay, U.S. Environmental Protection Agency officials said Tuesday.

The East Bay Municipal Utility District and the Stege Sanitary District for El Cerrito, Kensington and parts of Richmond were also fined for the violations, which occurred between September 2014 and June 2017.

EPA officials said the cities violated the terms of a 2014 Clean Water Act settlement "consent decree" that required upgraded sewer infrastructure to protect local waters.

In 2014, the eight cities and agencies paid $1.5 million for past sewage penalties and agreed to upgrade 1,500 miles of infrastructure over 21 years, according to the EPA.

EPA officials said the cities and districts have inspected 720 miles of sewer pipe and spent $80 million to upgrade 100 miles of sewers since the settlement.

The current violations include sanitary sewer overflows reaching the water, failure to meet limits for chlorine and coliform and failing to repair small defects within a year.

Oakland incurred the highest fines at $226,500, with EBMUD paying the second-highest portion at $134,000.

"We knew heading into the consent decree that we could not eliminate these issues overnight, and we knew some stipulated penalties would be unavoidable," Oakland Public Works spokesman Sean Maher said in an email.

Oakland has reduced sewage spills into the Bay by 16 percent since 2014, and the agency is reaching multiple goals outlined in the decree, like pipe rehabilitation, Maher said.

EBMUD spokeswoman Jenesse Miller said the fines are reasonable and the district is confident that it can improve in the next few years.

Miller said the violations stemmed from numerous issues, but a main cause was a very wet winter that came after a five-year drought.

"We discovered our operators needed better muscle memory, if you will, to manage the sudden and enormous inflow of storm water into our system," Miller said in an email.

The district is organizing more on-site trainings before storms and evaluating standard operating procedures. Miller said the training has paid off and there weren't any violations during the most recent set of late-winter storms.

Trump, Macron Make a Show as Best Buds But Tussle Over Iran
The district will pay the fines with wastewater revenue, which comes from taxpayers, according to Miller.

The Washington Examiner
https://www.washingtonexaminer.com/policy/energy/scott-pruitt-announces-new-epa-rule-to-combat-secret-science
Scott Pruitt Announces New EPA Rule To Combat 'Secret Science'
By Josh Siegel, 4/24/18

Environmental Protection Agency Administrator Scott Pruitt announced a proposed rule Tuesday that would block the agency from using scientific studies that do not make public the raw data used in the research.

The embattled EPA administrator was surrounded by conservative allies when he announced the change at agency headquarters, with no media present because the agency did not invite reporters.

Pruitt argues the proposed rule, subject to a 30-day comment period, would improve transparency and ensure science used in policymaking can be independently verified. It fits with a policy he implemented last year to boot scientists from key advisory boards to the EPA.

"The science that we use is going to be transparent, reproducible and able to be analyzed by those in the marketplace," Pruitt said. "This is the right approach. Today is a red letter today. It's a banner day. It's an agency taking responsibility for how we do our work and respect the process to make sure we can enhance confidence in our decision making."

The proposal is modeled after legislation proposed by House Science Committee Chairman Lamar Smith, R-Texas, who tried to impose a similar requirement through legislation, but it failed to pass. Smith attended Pruitt's announcement, with Sen. Mike Rounds, R-S.D., who authored a mirroring bill in the Senate.

Supporters of the idea said they want to end the use of “secret science” in rulemaking.

"Surely, we can all agree on two things," Smith said. "We need clean air and water, and EPA's regulations should be supported by legitimate and publicly available data. Today’s announcement ensures data will be secret no more."

The proposed rule would have the effect of restricting the science the EPA could use when drafting environmental regulations, which critics say would allow the agency to justify weaker rules because it has less research to work with and can favor information that fits its goals, rather than relying on the best science.

Some scientific research uses personal health information from individuals who participate knowing the details are not to be made public but used to inform policymaking.

“Administrator Pruitt is very clearly trying to exclude and ignore longstanding pollution and medical science that is peer-reviewed, embraced by the National Academy of Sciences among others, and also based on health data that people were promised would be kept confidential,” John Walke, the clean air director of the Natural Resources Defense Council, told the Washington Examiner.

Walke argues the rule would be struck down in court because it is an arbitrary and capricious decision under the Administrative Procedure Act, which governs agency rule-making and requires regulatory decisions to be backed by data.

It also could violate laws that mandate the use of "best available science," including the Toxic Substances Control Act and Safe Drinking Water Act, opponents of the policy said.

“It is arbitrary and illegal for EPA to condition use of science and relevant information on the public availability of confidential health information, confidential business information, computer codes, and the like, rather than the validity and integrity of that science and information,” Walke said. “Moreover, EPA is very likely to tie itself up knots trying, unsuccessfully, to allow confidential information desired by industry, while disallowing health studies based on confidential patient data that would support stronger health safeguards.”

Major studies that have depended on confidential information include a major 1993 study by Harvard University linking air pollution to premature deaths.

Companies can’t reveal proprietary information either, so businesses also could be subject to the policy. That means the EPA could be blocked from considering confidential business information, such as data submitted by auto companies intended to aid in determining fuel-efficiency standards.

“It seems like this will handicap the EPA in making rules based on public health or industry data, and I think we should tread cautiously,” Joseph Majkut, director of climate policy at the Niskanen Center, a free-market think tank, told the Washington Examiner. “Private industry data and public health surveys cannot be as transparent as Pruitt would like to protect their property or the privacy of people in the studies. Insofar as the science behind them is solid, and in the case of Harvard and others it seems to be, then we risk losing valuable sources of information. I'm all for an open and transparent scientific process, but we probably don't want to throw the baby out with the bathwater.”

But the text of the proposed rule says Pruitt may grant exemptions on a case-by-case basis when publishing underlying data is "impracticable."

It lists exposing "confidential business information" as a possible exception, so corporate-funded research could potentially get an opt-out. Information that is "sensitive to national and homeland security" also can be kept private.

Pruitt’s announcement of the new rule comes as he is slated to visit Capitol Hill Thursday for the first time since a flood of allegations about his spending, ethics, and hiring practices prompted investigations by Congress, the White House, and the EPA’s inspector general.

He is scheduled to testify before a House Energy and Commerce subcommittee in the morning and at a House Appropriations subcommittee in the afternoon.

The EPA administrator, in the lead-up to the hearings, is losing Republican support.

Three key Senate Republicans on Monday called for Pruitt to face more hearings about his recent controversies, including Sen. Jim Inhofe, R-Okla., a reliable Pruitt ally from his home state.

Sen. Lisa Murkowski, R-Alaska, told reporters Tuesday she plans to invite Pruitt to testify next month before the Senate appropriations subcommittee that oversees the EPA's budget.

Smith and Rounds, however, sought to reinforce support that Pruitt maintains from many conservatives.

"I know of no administration official who goes on the offensive, is not intimidated, and does the right thing regardless," Smith said. "We couldn't have a better head of the EPA."

The Hill

Pruitt Signs Proposed Rule To Erase 'Secret Science' From EPA

By Miranda Green, 4/24/18

Environmental Protection Agency (EPA) Administrator Scott Pruitt signed a rule proposal Tuesday aimed at increasing "transparency" in science all while limiting reporter, environmentalist and scientist access to the event.

The proposal, signed at EPA headquarters, aims to expose the methodology behind scientific findings and cut back on what Pruitt has deemed "secret science."

Speaking in front of a number of well-known climate change skeptics including the Competitive Enterprise Institute's Myron Ebell, Pruitt announced that the new rule would require science to "be transparent, reproducible and able to be analyzed by those in the marketplace." Reporters were not invited to attend the event, and details surrounding the announcement and rule proposal were kept secret until 30 minutes before the EPA's Twitter account announced it would be live-streamed.

Pruitt said the new ruling shows "an agency taking responsibility for how we do our work, in respecting process … so that we can enhance confidence in our decision making." He also dubbed the current process which had, until now, allowed science to be peer reviewed rather than open to public scrutiny, "simply wrong headed."

The rule will replicate, through agency action, two bills previously introduced in the House and Senate meant to restrict the kind of science the EPA can use when writing regulations.

The House bill authored by Rep. Lamar Smith (R-Texas), now called the Honest and Open New EPA Science Treatment Act, would mandate all scientific data and findings be made publicly available before they are used to justify agency regulations. Versions of Smith's bill passed the GOP-controlled House three times, but the Senate hasn't taken it up.

Last week, internal documents released by a Freedom of Information Act request by the Union of Concerned Scientists found that EPA political staffers have been working for months in conjunction with Smith and his staff to mimic the bill.

Speaking at the event Tuesday, Smith thanked Pruitt for being a "courageous leader" of the agency and blamed the "liberal media and alarmist environmental groups," for finding negatives in his legislation.

"For too long, EPA has withheld data that has been hidden from the American people," Smith said.

Opponents of the new rule say it would limit the number of available scientific studies that could be used by the agency in its rulemaking, namely by excluding a number of public health studies.

Timed with Pruitt's announcement, seven Democratic Lawmakers sent a letter to Pruitt on Tuesday denouncing the new policy. The letter, led by Sen. Tom Carper (D-Del.), tells Pruitt, "Your proposed new policy likely violates several laws with which EPA must comply as the agency writes rules to protect our air, water and land from harmful pollution."

The lawmakers said Pruitt's new policy likely would run afoul of a number of laws that mandate rulemaking be based on the "best available science … because it would require EPA to ignore some of the 'best' scientific studies."

"Courts have explained that 'best available science' means that agencies 'should seek out and consider all existing scientific evidence relevant to the decision' and 'cannot ignore existing data,' " the letter read.

The Wall Street Journal

https://www.wsj.com/articles/trump-faces-pressure-to-choose-sides-in-fight-between-corn-growers-and-oil-refiners-1524648602

Trump Faces Pressure To Choose Sides In Fight Between Corn Growers And Oil Refiners

By Tim Puko and Bradley Olson, 4/25/18

President Donald Trump is caught between two powerful business constituents of the Republican Party as he faces growing pressure to resolve a dispute between the oil industry and the Farm Belt.

Oil refineries want out of a costly requirement to blend ethanol into the gasoline they produce. Corn growers say the requirement diversifies the U.S. fuel supply, and insist Mr. Trump fulfill promises to at least hold the ethanol mandate. Both sides have close ties to the GOP and the White House.

Tensions between the two industries have been building since well before Mr. Trump became president, the result of a 2005 law that requires refineries to blend about 10% plant-based ethanol into the fuel they produce, or buy credits from rivals to cover their blending obligations. Congress created the mandate in hopes of reducing carbon emissions and weaning the U.S. from foreign crude at a time when oil prices had begun soaring.

By the time Mr. Trump took office, though, oil and gas supplies had gone from shortage to saturation thanks to the shale-drilling boom. Now, oil refiners—and some Trump advisers—consider a rollback of the 2005 regulation years overdue.

That leaves Mr. Trump stuck between conflicting promises to cut government regulation and to support ethanol mandates. He was one of the few in the Republican presidential primary race to emphasize the mandate in Iowa—the nation's biggest corn-producing state and home to the first nominating contests.

The Trump White House has failed to broker a deal, even after hosting supporters from both sides in the Oval Office. The administration has struggled for months after several proposals for administrative solutions have run into opposition from corn or oil backers.

"I can't see any obvious middle ground," said Sandy Fielden, director of oil and products research at Morningstar. "If there was an easy answer, we'd all be looking at it."

The impasse has refineries taking matters into their own hands, appealing directly to the Environmental Protection Agency for relief in the form of waivers. The agency has stepped up waiver approvals. That has infuriated agricultural interests and put more pressure on the White House to come up with a permanent solution.

The agricultural lobby has been uncomfortable with EPA chief Scott Pruitt, who, before coming to Washington, had called the ethanol mandate "unworkable" and filed a legal brief in 2013 backing a lawsuit challenging it when he was Oklahoma attorney general. Mr. Pruitt landed the EPA role in part because of a recommendation from Carl Icahn, a billionaire adviser to Mr. Trump's transition team and an owner of a small refinery operator that faces around $250 million in costs to comply with the ethanol mandate.

More oil refiners are looking to take advantage of a loophole in the law that has only widened since Mr. Pruitt took over the agency. Small refineries with less than 75,000 barrels a day of capacity—even if owned by a large company—can get a waiver if they prove the mandates are causing "disproportionate economic hardship," according to the EPA website.

To get a waiver, each refinery gets evaluated on its own finances—independent from the health of its parent company. Compliance costs could still be tens of millions of dollars, which alone appears to be enough now to prove economic harm, industry lobbyists said.

For years, the EPA regularly rejected requests from refiners seeking waivers from ethanol requirements. Then this March, the agency agreed to waive millions in obligations for Philadelphia Energy Solutions, a major East Coast refiner that filed for bankruptcy after its costs to comply with the program rose to $231 million in 2016. The EPA then began granting a number of waivers to the small refineries able to demonstrate economic harm, including one owned by Andeavor Corp. , one of the country's largest independent refiners and a company big enough to be part of the S&P 500.

The agency has rejected just one of about 30 applicants so far this year, encouraging more refiners to consider applying for the first time. It has received applications from oil giants Exxon Mobil Corp. and Chevron Corp.

Many now see an EPA waiver as a given. Some are even asking for waivers that would allow them recoup costs from years past. "If you can show economic harm—which is pretty easy to do—you have to consider it," according to one oil-industry lobbyist who has been pushing the Trump administration for a waiver for a client. "People never imagined they would be eligible."

One factor behind the change at EPA is a federal appeals-court decision last year that found the agency had been too restrictive in doling out waivers. Mr. Pruitt has since decided to accept every recommendation on a waiver from the Energy Department—which is responsible for calculations evaluating a refinery's claim of economic harm—and grant full waivers even when the Energy Department recommended only partial waivers. This is opening the floodgates for applications and approvals, analysts and refiners say.

"The criteria used to grant waivers has not changed since previous administrations," EPA spokeswoman Liz Bowman said. "EPA follows a longstanding, established process."

Many in both the refining and farming industries dispute that assertion, and see a significant change in EPA policy. There are 38 plants across the U.S. that could qualify for the exemptions, according to the agency. Based on their capacity, the number of qualifying refineries could make up as much as 10% of the nation's fuel supply, according to a Wall Street Journal analysis. More than half have already received them.

One result of the increase in waivers is a falling price for credits that many refineries need to buy to cover their obligations for ethanol blending. The cost of credits has halved in recent months as traders and companies have grown increasingly confident that the Trump administration will take action to reduce the burden oil refiners face in complying with the law.

Sen. Chuck Grassley, a Republican from Iowa, in a call with reporters Tuesday accused the EPA of abusing the waivers to cap the price of ethanol credits. EPA officials deny undermining the ethanol program.

While Mr. Trump has received support from Mr. Icahn and frequently touts his own backing of the fossil-fuel business, he has to be mindful of Iowa's political clout and Mr. Grassley's in particular. Aside from Iowa's early primary, Mr. Grassley runs the powerful Senate Judiciary Committee, which oversees the confirmation of judges and has launched investigations into matters related to the president's campaign and businesses.

"The president has said to me both publicly and privately many times that he intends, and he is keeping his commitment to ethanol," Mr. Grassley said Tuesday. Mr. Pruitt is "undercutting the president's promises."

Trump's Travel Ban Faces A Supreme Court Test

By Adam Liptak and Michael Shear, 4/25/18

WASHINGTON — The Supreme Court will hear a challenge on Wednesday to President Trump's latest effort to limit travel from countries said to pose a threat to the nation's security. The case, a major test of presidential power, will require the justices to decide whether Mr. Trump's campaign promises to impose a "Muslim ban" were reflected in executive orders that restricted travel from several predominantly Muslims nations.

Just a week after he took office, President Trump issued his first travel ban, causing chaos at the nation's airports and starting a cascade of lawsuits and appeals. Fifteen months later, after two revisions of the ban and a sustained losing streak in the lower courts, the Supreme Court took up the case in its last scheduled argument of the term. A decision is expected by late June.

The case, Trump v. Hawaii, No. 17-965, concerns Mr. Trump's third and most considered bid to make good on his campaign promise to secure the nation's borders. Challengers to the latest ban, issued as a presidential proclamation in September, said it was tainted by religious animus and not adequately justified by national security concerns.

But the administration said the third order was the product of careful study by several agencies of the security and information-sharing practices of nations around the world. Mr. Trump's lawyers urged the courts to ignore Mr. Trump's statements and Twitter posts and to focus solely on the text of the proclamation and the process that produced it.

Mr. Trump's first travel ban, issued in January 2017, was promptly blocked by courts around the nation. A second version, issued two months later, fared little better, though the Supreme Court allowed part of it go into effect in June when it agreed to hear the Trump administration's appeals from two appeals court losses. But the Supreme Court dismissed those appeals in October after the second ban expired.

The current ban initially restricted travel from eight nations — Iran, Libya, Syria, Yemen, Somalia, Chad, Venezuela and North Korea — six of which were predominantly Muslim. Chad was recently removed from the list.

The restrictions vary in their details, but, for the most part, citizens of the countries are prohibited from immigrating to the United States, and many are barred from working, studying or vacationing here.

In December, in a sign that the Supreme Court may uphold the latest order, the court allowed it to go into effect as the case moved forward. The decision effectively overturned a compromise in place since last June, when the court said travelers with connections to the United States could continue to travel here notwithstanding restrictions in an earlier version of the ban.

Justices Ruth Bader Ginsburg and Sonia Sotomayor dissented from the December ruling.

Hawaii, several individuals and a Muslim group challenged the latest ban's limits on travel from the predominantly Muslim nations; they did not object to the portions concerning North Korea and Venezuela. They prevailed before a

Federal District Court there and before a three-judge panel of the United States Court of Appeals for the Ninth Circuit, in San Francisco.

The appeals court ruled that Mr. Trump had exceeded the authority that Congress had given him over immigration and had violated a part of the immigration laws barring discrimination in the issuance of visas.

In a separate decision that is not directly before the justices, the United States Court of Appeals for the Fourth Circuit, in Richmond, Va., blocked the ban on different grounds, saying it violated the Constitution's prohibition of religious discrimination.

The Supreme Court said it would consider both the statutory and constitutional questions when it agreed to hear the case.

Lawyers for the challengers have said Mr. Trump's own statements provided powerful evidence of anti-Muslim animus. The latest order, they said, was infected by the same flaws as the previous ones.

https://www.washingtonpost.com/politics/white-house-stands-by-embattled-nominee-to-lead-veterans-affairs/2018/04/24/3013860e-47a6-11e8-9072-f6d4bc32f223_story.html?utm_term=.e17d7add401d

Trump Rallies Behind VA Nominee After Suggesting He Drop Out Because Of 'Ugly' Process

By Josh Dawsey, Seung Min Kim, Lisa Rein and John Wagner, 4/24/18

The White House rallied around Ronny L. Jackson's nomination to lead the Department of Veterans Affairs late Tuesday as the president's doctor was besieged by accusations that he improperly dispensed drugs, created a hostile workplace and became intoxicated on duty.

The administration's decision to fight on in defense of the nomination came hours after President Trump publicly suggested that Jackson should consider pulling out because of the "abuse" he was facing. But by late afternoon, Trump had huddled with Jackson, and White House aides vowed to fight the charges.

"I don't want to put a man through a process like this," Trump had said earlier when asked about Jackson's nomination during a joint news conference with French President Emmanuel Macron. "It's too ugly, and it's too disgusting."

Trump added: "I said to Dr. Jackson, what do you need it for? To be abused by a bunch of politicians? . . . If I was him . . . I wouldn't do it."

Jackson's worsening problems flared into public view Tuesday when lawmakers nixed his confirmation hearing scheduled for Wednesday. The hearing was officially postponed by Sen. Johnny Isakson (Ga.), the Republican chairman of the Veterans' Affairs Committee, and Sen. Jon Tester (Mont.), the ranking Democrat.

Later Tuesday, Tester said during an interview with NPR that the committee had heard complaints from more than 20 current and former military members that Jackson had improperly dispensed drugs, become intoxicated on professional trips and belittled staff members.

"We were told stories where he was repeatedly drunk while on duty, where his main job was to take care of the most powerful man in the world," Tester said. "That's not acceptable."

Tester said concerns about the allegations were "bipartisan in nature," including from Isakson.

A spokeswoman for Isakson said the senator remained undecided about the nomination but continued to harbor serious concerns.

Hours after the president's news conference, more allegations emerged about Jackson, including a 2012 government report that said he exhibited "unprofessional behavior" and should be removed from his post.

"There is a severe and pervasive lack of trust in the leadership that has deteriorated to the point that staff walk on 'eggshells,' " the report found. It described morale under his leadership as in the doldrums and said the office was beset by fighting between Jackson and Jeffrey Kuhlman, President Barack Obama's doctor at the time.

It was another episode where a previously respected figure was lifted to prominence in Trump's orbit — only to have their sheen and reputation tarnished. Jackson had been widely hailed by three presidents and their aides as competent, charming and fiercely protective before Trump stunned Washington last month by picking the doctor to run the country's second-largest federal agency.

Jackson declined to comment on the accusations, and senior aides said he showed no willingness to drop out Tuesday afternoon as he trudged through meetings with senators on Capitol Hill. Privately, he dismissed some of the charges to senior aides, according to administration officials, and said he was being unfairly attacked.

"No, I'm looking forward to the hearing," Jackson said. "I was looking forward to doing it tomorrow, so I'm looking forward to getting it rescheduled and answering all the questions."

White House officials said they were aware of accusations that Jackson dispensed medicine to aides or others, including reporters, without rigorous scrutiny. But several senior officials said the drugs were usually nonnarcotic ones, such as Ambien. They also said that Jackson was never intoxicated or drinking while working in the White House near Trump, but may have had too much to drink on occasion while taking overseas trips.

The White House released several other reports that were laudatory regarding Jackson late Tuesday, including his performance reviews for the past four years.

"Ronny does a great job — genuine enthusiasm, poised under pressure, incredible work ethic and follow through. Ronny continues to inspire confidence with the care he provides to me, my family and my team. Continue to promote ahead of peers," a 2016 note from Obama read.

In a private meeting with Sen. Jerry Moran (R-Kan.) on Capitol Hill, Jackson denied any wrongdoing, according to the senator. During that meeting, the White House doctor also specifically denied ever drinking on duty, according to a spokesman for the senator.

"He does deny that he's done anything wrong in his service to the country and particularly his time at the White House as a physician in the medical unit," Moran said, adding that Jackson "indicated that he knows of nothing that would prohibit him from being qualified, capable and the right person to be secretary of the Department of Veterans Affairs."

Two senior officials said that Jackson's nomination had been handled "disastrously," in the words of one, who spoke on the condition of anonymity, and that it had been overshadowed by fights over secretary of state nominee Mike Pompeo and CIA director nominee Gina Haspel. In the future, one of these people said, more attention will be put on Jackson.

Senior White House officials said Trump was convinced by a coterie of aides, and Jackson, that the accusations were overblown. In the meeting Tuesday afternoon, Jackson offered to withdraw, a senior administration official said, but said he would prefer to push forward. Others present in the meeting included White House Chief of Staff John F. Kelly and press secretary Sarah Huckabee Sanders, an administration official said.

Jackson said the accusations were unfair "and just not true," a senior administration official said, describing the meeting.

Trump later told aides he had already taken a lot of flak for an un-or-tho-dox pick — and didn't want to give in.

"The president gave us the full green light to push back hard," the official said.

Jackson's nomination also marked the shattering of another norm in Trump's Washington: VA secretaries have historically been approved unanimously, even sometimes by a voice vote. The president nominated David Shulkin, who had led VA's health system under Obama, in the tradition of having a bipartisan Cabinet. But he soured on Shulkin and removed him after an inspector's general report showed that Shulkin took exorbitantly costly trips and misled others about them.

There was uncertain congressional support for Jackson, a longtime presidential physician with little management experience, even before questions were raised about his conduct.

It was unclear why White House aides had not reviewed the allegations before Jackson was nominated last month. He was picked seemingly on a whim by Trump, who fondly calls him "the Doc" and did not formally interview him before nominating him — and ousting Shulkin — by tweet.

Concerns about Jackson were bipartisan. Senate Majority Leader Mitch McConnell (R-Ky.) remained uncommitted to supporting the nominee, and a number of senior GOP aides on Capitol Hill estimated that his chances of confirmation were slim.

Isakson had called Kelly twice in recent days to express concerns about new information, spokeswoman Amanda Maddox said.

Isakson and Tester wrote to Trump on Tuesday morning, asking the White House to provide all documents related to Jackson's service in the White House medical unit as well as all communications between the Pentagon and the White House military office since 2006 that involve allegations or incidents connected to the physician. The senators also requested information the White House has about any allegations involving Jackson that were never relayed to the Pentagon.

In addition to Jackson's lack of management experience at a large organization, the physician had come under fire for his glowing appraisal of Trump's health after the president had his annual physical in January. Jackson declared that the president might live to the age of 200 with a healthier diet.

Isakson said the confirmation hearing is being delayed because the committee needs "some time to get more information."

"I'm concerned that the press is making up far too many stories that aren't true before we even get a chance to have a meeting," Isakson said after meeting privately with Tester on Tuesday morning. "So I think Mr. Jackson and myself and Senator Tester and everybody in Congress need to take a deep breath."

A leading veterans group said Tuesday that it was important for the Senate to fully vet a nominee to lead the department, which has had seven secretaries since the start of the war in Afghanistan.

"On this critical leadership position at this turbulent time, [the United States] cannot afford a misfire by the White House," said Paul Rieckhoff, the founder of Iraq and Afghanistan Veterans of America. "IAVA members nationwide are calling on the Senate to do its job at this defining time and ensure that any nominee for VA Secretary will live up to this awesome responsibility."

Sen. Patty Murray (D-Wash.), a member of the Veterans' Affairs Committee, said Trump didn't take the time to send over a fully vetted nominee.

"It is sloppy, it is disrespectful to our veterans, and it is wrong," Murray said.

TRUMP TWEETS

Donald J. Trump @realDonaldTrump · 1h

Congratulations to Republican Debbie Lesko on her big win in the Special Election for Arizona House seat. Debbie will do a Great Job! Press is so silent.

Chemical, Oil Companies to Save Millions From Safety Program Rollback

Posted May 17, 2018, 4:00 PM Updated May 17, 2018, 4:58 PM
By Sam Pearson

- EPA administrator issues proposed rule in meeting with industry
- Revisions grant industry requests to tighten security, reduce audit burdens

Dow DuPont Inc., Chevron Corp., and other companies that own high-risk chemical facilities stand to benefit from relaxed safety provisions despite the concerns of first responders and communities close to these plants.

Live Updates From Scott Pruitt's Senate Appearance

Updated May 16, 2018, 1:14 PM
By Abby Smith and David Schultz

At a press conference shortly after senators grilled Scott Pruitt over four rounds of questions, Democratic Sens. Chris Van Hollen (Md.) and Tom Udall (N.M.) spoke about the EPA administrator's conduct that has brought about ethics questions and probes.

Wehrum sidesteps queries on SAB review of science rule

May 17, 2018
EPA air chief Bill Wehrum sidestepped questions from a Democratic lawmaker on whether the agency's Science Advisory Board (SAB) should review Administrator Scott Pruitt's science transparency rule, raising questions on whether officials will urge the board later this month to reject calls from one of its working groups to review the rule.

GREENWIRE ARTICLES

Who's donating to Pruitt's defense? Time will tell

Kevin Bogardus, E&E News reporter Published: Thursday, May 17, 2018

You may wait a long time to see who is contributing to EPA Administrator Scott Pruitt's legal defense fund. Like other federal officials, the EPA chief is required to report gifts, like travel and tickets to events, he has received on his public financial disclosure report. That also includes contributions to the legal defense fund established for his benefit, according to guidance on the Office of Government Ethics' website.

Emails: EPA all ears as industry pitched 'secret science'

Maxine Joselow, E&E News reporter

Published: Thursday, May 17, 2018

Industry groups pitched EPA a proposal last spring that closely resembled what became Administrator Scott Pruitt's "secret science" plan, according to emails released this week under Freedom of Information Act litigation.

Glyphosate study defender tapped to lead cancer agency

Corbin Hiar, E&E News reporter
Published: Thursday, May 17, 2018

This article was updated at 4:02 p.m. EDT.

The World Health Organization's leadership has tapped to lead its embattled cancer bureau a Brazilian researcher who has vigorously defended its controversial study of the herbicide glyphosate.

Chemicals could be making workers sick at coffee roasters

Published: Thursday, May 17, 2018

A Centers for Disease Control and Prevention investigation suggests chemicals in the air at coffee roasting operations could present a widespread health threat to employees. A small group of CDC researchers spent the last two years investigating tiny coffee shops and large roasters around the country.

NGO warns against rushing to alternative methods under TSCA

- Public consultation on US EPA's strategy attracts more than 1,500 comments
- 17 May 2018 / Alternative approaches to testing, New TSCA/LCSA, United States

NGO the Natural Resources Defense Council has voiced concern that new technologies will be deployed too fast under the US EPA's draft strategy for alternative test methods under TSCA.

PRTR 'critical' for Chinese hazardous chemicals management, report says

- 104 substances suggested for pollution monitoring
- 17 May 2018 / Chemical manufacturing, China, Electrical & electronics, Metals, Persistent, bioaccumulative & toxic, Persistent organic pollutants, Substance notification & inventories

The adoption of a pollutant release and transfer register system is critical for the management of hazardous chemicals in China, according to a recently released NGO report.

Echa 2025 goal to identify all harmful substances 'unrealistic'

- Agency's five-year plan needs clear commitments to address gaps, NGOs say
- 17 May 2018 / Alternatives assessment & substitution, Europe, REACH, Substances of concern, SVHCs

Doubts have been raised about Echa's ability to deliver its objective of identifying all substances of concern and to start action on them by 2025.

The agency set the goal in its recently published draft strategic plan for the next five years. This named new substance identification and data generation as top priorities.

To: Beck, Nancy [/o=ExchangeLabs/ou=Exchange Administrative Group (FYDIBOHF23SPDLT)/cn=Recipients/cn=168ecb5184ac44de95a913297f353745-Beck, Nancy]
Subject: Morning Energy, presented by America's Pledge: First SAB meeting to eye EPA reg rollbacks — Cramer hits Trump's legislative director — DOE: U.S. generally 'well prepared' for grid hacks

By Kelsey Tamborrino | 05/31/2018 05:43 AM EDT

With help from Eric Wolff

PRUITT'S SAB STORY: EPA's independent Science Advisory Board will meet today and Friday for the first time since Administrator Scott Pruitt barred scientists on the committee from receiving EPA grants and boosted its ranks with industry representatives — and the group's agenda is packed. The SAB will look at Pruitt's "secret science" proposal to bar EPA from using studies that don't make public all their data, as well as the Clean Power Plan repeal, Pruitt's decision to relax 2022-25 auto emissions standards, changes to the 2016 methane rule for new oil and gas wells and effort to repeal a rule regulating emissions from "glider" trucks — and that's not all.

A lot to dive into: The heavy slate of issues is unusual for the advisory board, Pro's Alex Guillén reports. Several current and former SAB members say it's unprecedented for the board to consider reviewing so many regulatory actions. But like green groups and critics of Pruitt, the SAB scientists say EPA has declined to share information about its regulatory rollbacks. "The agency has not been forthcoming about how they're developing the relevant science work products," said Chris Frey, a professor of environmental engineering at North Carolina State University and a SAB member since 2012.

EPA keeps quiet: SAB has been conducting twice-yearly reviews of EPA's planned regulatory actions since 2012, members said. It's an effort designed to enable the advisory board to help guide EPA before its rules are finalized. But this time around, the SAB's working groups say EPA wasn't being forthcoming with information. "Basically they just didn't provide us with any answers," said Frey. "That kind of put us in a position where all we can really do is say EPA has not identified the science or any plan to review it, and clearly there are science issues that are in the proposed rule."

What to expect: It's not immediately clear whether the full SAB will vote today to advance the reviews. But Frey noted that some of the members appointed by Pruitt had been on the working groups, giving him hope that the full board will back the recommendations to look deeper into the regulatory rollbacks. Should SAB adopt them, Alex reports, it likely would mean setting up special subcommittees that include current members plus outside experts to question EPA further. Read more here.

IT'S THURSDAY! I'm your host Kelsey Tamborrino, and Entergy's Rob Hall correctly identified former President William Howard Taft as the first to see a Major League Baseball game in his hometown of Cincinnati. Register for the Pro Summit: Join Pro subscribers, expert reporters and key decision-makers from the executive branch, federal agencies and Congress for a full day of incisive policy conversations on July 17. Learn more.

THE LONG AND SHORT OF IT: In an unusual attack on the White House's legislative affairs director, North Dakota Rep. Kevin Cramer blamed Marc Short explicitly for the party's legislative failures in the Senate, including ending the Obama rule on flaring and venting from oil and gas wells. After POLITICO published a story outlining the awkward dynamic between Heidi Heitkamp, Cramer and the White House, Cramer told North Dakota radio host Rob Port that he had done some digging and believes that there "are some people in the White House that think, you know, the president's too friendly too her," Burgess Everett recaps.

Moreover, Cramer laid specific blame at Short's feet for failed GOP efforts in the Senate to roll back an Obama-era regulation limiting flaring and venting, as well as repealing Obamacare. Heitkamp voted against gutting that flaring rule, something Cramer has criticized her for, in particular. "If Marc Short was very good at his job, you know, we'd have a repeal and replacement of Obamacare, we'd have a replacement of the venting and flaring rule," Cramer said. Read that story here.

PRUITT'S MEDIA BLITZ: The EPA administrator visited Rosslyn, Va., on Wednesday to sit for interviews with two conservative media outlets. One was conducted by Boris Epshteyn for his Sinclair Broadcasting segment, "Bottom Line with Boris." (Watch that here .) The other was with the Washington Free Beacon, where Pruitt repeated familiar talking points in defense of the ongoing scandals and investigations that have surrounded him over the past few months. Pruitt said he still has President Donald Trump's backing, noting that Trump has "spoken very strongly and consistently" about their working relationship. "It's been intense the last couple of months, but he's been very encouraging, very empathetic and very supportive rather consistently," Pruitt said. The administrator also discusses the Paris climate agreement, "The Bachelorette" and, of course, baseball in the 13-minute segment, which you can listen to here.

GRID AND BEAR IT: In response to an executive order signed last year, the Energy Department released a new report Wednesday that said senior government officials and electric sector executives don't know enough about how energy companies could recover from a disruptive cyberattack, and those companies aren't thinking about cyber threats enough when building out their supply chains. While the report mainly hammered home some long-known problems with the grid, DOE highlighted how grid resilience efforts suffer because of "gaps in incorporating cybersecurity concerns, including planning for long-term disruption events, into state emergency response and energy assurance planning." Generally, however, the report said the U.S. is "well prepared to manage most electricity disruptions." Read more from Pro's Eric Geller here.

WHERE'S PERRY? Energy Secretary Rick Perry delivers remarks this morning on critical infrastructure at DOE's Texas-Israel Cyber Security Conference in Dallas. The department also announced that Perry would address the DOE's annual Cyber Conference in Austin on Monday. During both events Perry is expected to discuss DOE's new Cybersecurity, Energy Security and Emergency Response office, as well as efforts at DOE to address cyber vulnerabilities in the energy sector.

ABOUT THAT GLIDER RULE: The New York Times' Eric Lipton tweeted out new documents late Wednesday that give new details into the controversial Tennessee Technological University study on truck emissions that Pruitt used to consider rewriting part of the Phase 2 truck rules. "The letters obtained via open records request show that the principal investigator at Tenn Tech who conducted study funded by Fitzgerald, the company that makes the so-called glider trucks, disavowed the work, saying that it had been distorted in a fraudulent way," Lipton tweeted.

BY THE NUMBERS: The federal government spent $13.2 billion across 19 agencies during fiscal 2017 on programs related to climate change, a report from the Government Accountability Office says. That's an overall $1.5 billion increase across the federal government over fiscal 2016, Pro's Anthony Adragna reports. And it's an increase of $4.4 billion since fiscal 2010, according to the report, which was request by House Science Chairman Lamar Smith. Read more .

CALIFORNIA GETS CHARGED UP FOR EVs: The California Public Utilities Commission is expected to approve a $589 million program for its four investor-owned utilities to build out their electric vehicle charging infrastructure. The plan is part of the implementation of California's aggressive greenhouse gas law passed in 2015. Most of the money — which will ultimately come from ratepayers — will go toward setting up electric vehicle charging stations and related infrastructure. California leads the nation by far in electric vehicle sales and adoption.

NO MAJOR FLAWS IN FERC PROCESS: Auditors in the DOE inspector general's office said they found no major flaws in FERC's process for reviewing interstate natural gas pipelines, according to a new report . But they also flagged concerns about FERC's transparency and how it handles public comments. The auditors said that "nothing came to our attention to indicate that FERC had not performed its due diligence" in how it balanced public benefits of a proposed project with its adverse impacts. But the report also said regulators' "had not fully ensured" that the certification process was transparent to those who want to participate, and it hit the agency's eLibrary documentation system as difficult to use, Pro's Darius Dixon reports.

FERC DENIES PENNEAST REHEARING: FERC on Wednesday denied a rehearing sought by the Delaware Riverkeeper Network and Sourland Conservancy on the controversial PennEast pipeline. Commissioner Richard Glick issued a separate statement on the agency's use of tolling orders. "This proceeding, in particular, illustrates the need for prompt action on rehearing requests," Glick wrote . " ... I also have serious concerns regarding the Commission's practice of issuing conditional certificates — which, notwithstanding their name, vest the pipeline developer with full eminent domain authority — in cases where the record does not contain adequate evidence to conclude definitively that the pipeline is in the public interest."

GREENS ENDORSE DE LEON OVER FEINSTEIN: 350.org co-founder Bill McKibben and 350 Action said Wednesday it is backing Kevin de León in his bid to challenge California Sen. Dianne Feinstein. McKibben said de León, a current California state senator, "has been a strong champion of clean energy — and an effective one, using his power in Sacramento to make change happen against the strong opposition of the fossil fuel industry." Read De León's candidate questionnaire answers here.

SELC SUES OMB OVER REORG: The Southern Environmental Law Center sued the Office of Management and Budget Wednesday for its failure to release information under FOIA on the reorganization at federal agencies that manage public lands. SELC says OMB has not provided requested information under a November 2017 FOIA request , nor has it made a determination or otherwise responded to the request, and has subsequently stopped communicating with SELC. The center is seeking "all records in the custody or control of OMB submitted in connection with Executive Order 13781 by any agency responsible for the management of federal public lands," including the Forest Service, National Park Service, BLM and the Fish and Wildlife Service. The EO in question directed each agency head to submit a report to OMB outlining proposed changes to their agency. Read the lawsuit.

CRES BACKS McMASTER IN SOUTH CAROLINA: Citizens for Responsible Energy Solutions will announce a $175,000 television and digital ad buy today highlighting South Carolina Gov. Henry McMaster's record on clean energy. "First as lieutenant governor and now as governor, his commitment to the development of advanced energy technologies like natural gas and solar power is helping the state's economy and job market thrive," CRES Chairman and Executive Director James Dozier said.

McCARTHY NAMED DIRECTOR OF HARVARD CENTER: Harvard T.H. Chan School of Public Health announced former EPA Administrator Gina McCarthy will lead its newly launched Center for Climate, Health,

and the Global Environment. Under McCarthy, C-CHANGE announced a collaboration between Harvard University and Google to reduce the use of harmful chemicals in construction and renovation projects. "C-CHANGE will ensure that cutting-edge science produced by Harvard Chan School is actionable — that the public understands it, and that it gets into the hands of decision-makers so that science drives decisions," McCarthy said in a statement.

MOVER, SHAKER: Mitch Schwartz started this week as communications director for Jason Crow's campaign in Colorado's 6th Congressional District. Schwartz previously worked for SKDKnickerbocker.

— **PUSH Buffalo, a sustainable housing group,** announced Rahwa Ghirmatzion as its new executive director as of August 2018. Ghirmatzion has served as the organization's deputy director since 2017.

EPA boosts industry membership on key advisory boards Back

By Alex Guillén | 11/03/2017 01:41 PM EDT

EPA officially announced the new line ups for several key advisory boards today, bolstering their membership with employees of energy companies and state agencies just days after Administrator Scott Pruitt ordered scientists who have received agency grant money to give up their EPA funding or their seat.

As POLITICO reported on Tuesday, the Science Advisory Board's new additions include representatives from Phillips 66, Total, Southern Co., the American Chemistry Council and NERA Economic Consulting, a firm frequently hired by industry interests. Their additions boost the industry membership of SAB, although the panel had previously included members from Dow Chemical and other industries or companies.

The Clean Air Scientific Advisory Committee, which provides health advice for air quality standards, also has three new members. Aside from new Chairman Tony Cox, an independent consultant, the new members are Larry Wolk of the Colorado Department of Public Health and Environment and James Boylan of the Georgia Department of Natural Resources.

EPA also announced a slate of new additions to the Board of Scientific Counselors, which advises on research issues. The former chairwoman, Deborah Swackhamer of the University of Minnesota, is now listed as member, while Paul Gilman of waste-to-energy company Covanta has taken over as chair.

Other new BOSC members include representatives from the North Dakota Petroleum Council, Eli Lilly and Co., the Defense Threat Reduction Agency, the Arkansas Department of Environmental Quality, the California Energy Commission and the consulting firm Ramboll Environ.

EPA's science advisers turn eyes on Pruitt's rollbacks Back

By Alex Guillén | 05/31/2018 05:00 AM EDT

EPA's influential Science Advisory Board will meet on Thursday for its first time since Administrator Scott Pruitt filled it with a slate of industry representatives — and it's got a long list of controversial rule rollbacks to review.

The SAB plans to pore over the science EPA is using to justify rollbacks on emissions regulators for cars, trucks, power plants and oil and gas wells — as well as Pruitt's proposed "transparency" rule for scientific studies.

Several current and former SAB members told POLITICO that it was unprecedented for the board to consider diving into so many regulatory actions, but the heightened scrutiny from the outside experts came about because the agency stonewalled the scientists' questions about Pruitt's deregulatory decisions. That echoes the complaints from environmentalists and public advocacy groups who say EPA has declined to share information about how it was justifying easing the regulations put in place during the Obama administration.

"The agency has not been forthcoming about how they're developing the relevant science work products," said Chris Frey, a professor of environmental engineering at North Carolina State University and a SAB member since 2012.

In a move critics derided as an attempt to stack the 44-member board with industry-friendly voices, Pruitt last year broke with the tradition of reappointing first-term SAB members for second three-year stints by removing several advisers who received grants from the agency. In their places, he installed scientists from the fossil fuel and chemicals sectors and several Republican environmental officials. Among the new members are representatives from Phillips 66, Total, Southern Co., the American Chemistry Council and NERA Economic Consulting.

In addition to studying Pruitt's proposal to bar EPA from using studies that don't make public all their data, the SAB's working groups suggested the full group take a closer look at the repeal of the Clean Power Plan and EPA's reconsideration of its related rule limiting carbon emissions from future power plants. Also up for review are Pruitt's decision to relax 2022-2025 auto emissions standards, changes to the 2016 methane rule for new oil and gas wells, and EPA's effort to repeal a rule regulating emissions from "glider" trucks.

The working groups also deferred decisions on two other rulemakings: the Waters of the U.S. rewrite and rules on a special class of "persistent, bioaccumulative and toxic chemicals" under the Toxic Substances Control Act. SAB can decide whether to conduct a deeper review into those once EPA has reviewable regulatory language available, the groups said.

Frey, who has been a SAB member for six years, said having multiple rules up for review was very unusual for the board.

"It's very rare that we've recommended to the full Science Advisory Board that there should be an SAB action," he said.

SAB has been conducting twice-yearly reviews of EPA's planned regulatory actions since 2012, members said, an effort designed to enable the advisory board to help guide EPA before its rules are finalized.

In the early days, getting information from EPA was "like pulling teeth," said Kimberly Jones, a SAB member from 2011 through 2017 and the chair of environmental engineering at Howard University. But that quickly improved once EPA knew the scope of SAB inquiries, she added.

The SAB's working groups review how EPA uses scientific studies in its rulemakings, including whether and how a study was peer-reviewed and if EPA has properly accounted for uncertainties in the scientific findings. The groups typically find that further reviews aren't needed.

But this time around, the working groups said EPA didn't respond to their questions about many of Pruitt's highest-profile rollbacks.

"Basically, they just didn't provide us with any answers," Frey said. "That kind of put us in a position where all we can really do is say EPA has not identified the science or any plan to review it, and clearly there are science issues that are in the proposed rule."

Frey pointed to lengthy memos from the working groups that included multiple pages of questions that had been posed to EPA for each rulemaking. EPA responded with short statements promising to keep the issues in mind as it develops the final rules.

"The response from the agency was basically a non-response," Frey said.

An agency spokesman said in a statement that SAB "plays an important role" advising EPA.

"We value the Board's expertise, and we welcome feedback from the chartered panel on areas in which they are interested in getting additional scientific information that is relevant to the rulemaking process," the spokesman said.

It was not clear whether the full SAB will vote on Thursday to advance the reviews.

Frey noted that some of the members appointed by Pruitt had been on the working groups, giving him hope that the full board will back the recommendations to look deeper into the regulatory rollbacks.

Should SAB adopt them, it likely would mean setting up special subcommittees that include current members plus outside experts to question EPA further.

The board can advise EPA only on scientific matters, not policy or legal issues. In several cases, like with the repeals of the Clean Power Plan and the glider rule, EPA says it has a legal argument about statutory authority that does not rely on scientific issues.

But even then, Frey said, EPA must keep the science in mind.

"It's in the best interest of the agency to make sure that it's using appropriately developed and reviewed science in its rules," Frey said. "And the flip side of that is if the agency's not doing that, it could open itself up to legal challenges for not following appropriate procedures to develop the science."

GOP sweats Trump's Heitkamp flirtation Back

By Alex Isenstadt and Burgess Everett | 05/30/2018 05:08 AM EDT

When a small group of alarmed White House aides caught wind that Sen. Heidi Heitkamp — one of the most endangered Democrats up for reelection in 2018 — would be attending President Donald Trump's bill signing last week, they raced to stop it.

Word eventually reached Senate Majority Leader Mitch McConnell, who has made unseating Heitkamp a top priority. He opted not to intervene, and the invitation stood: As the president signed a banking deregulation bill into law before a national audience, Heitkamp was right next to him, the only Democrat in the room.

As the election year kicks into high gear, Republicans have grown increasingly frustrated with Trump's ongoing flirtation with the freshman senator. At a time when many in the GOP fear that the president's unpredictable style will undercut their best-laid midterm plans, the relationship has given Heitkamp — who is seeking reelection in a state where Trump won nearly two-thirds of the vote — fodder to portray herself as a presidential ally.

Her office keeps a running list of the dozen-plus meetings Heitkamp has had with Trump and his top advisers since the 2016 election. And the senator is fond of noting that she forged close ties with Trump's former top economist, Gary Cohn. The president met with Heitkamp in Trump Tower after the 2016 election to discuss a

possible Cabinet position, asked her to join him on Air Force One, and invited her onstage to join him and her Republican opponent, Rep. Kevin Cramer, during an appearance in North Dakota.

"Everyone is saying, 'What's she doing up here?'" the president said at the September event to sell his tax reform plan, which Heitkamp eventually opposed. "But I'll tell you what. Good woman, and I think we'll have your support, I hope we'll have your support. And thank you very much, senator, thank you for coming up."

After last week's bill signing, Heitkamp's allies raced to capitalize. The North Dakota Democratic Party sent out a tweet with an image of Cramer looking on uncomfortably as the president stood next to Heitkamp.

"At a bill signing today, @HeidiHeitkamp got a shout out and all @kevincramer got was a photo op next to a chair," the state party boasted.

"We will see footage of this on every platform," said Doug Heye, a former top Republican National Committee official. "It's a huge gift for her campaign."

Trump aggressively recruited Cramer to give up his House seat to take on Heitkamp, and his actions since have left some of Cramer's closest allies feeling snubbed. They note that while Trump has savaged Democratic incumbents Joe Donnelly of Indiana and Jon Tester of Montana and visited a growing list of states to pump up Republican Senate hopefuls — most recently Tennessee, where he appeared Tuesday on behalf of Rep. Marsha Blackburn — he has yet to make a campaign appearance with Cramer. Nor has the attack dog-in-chief attacked Heitkamp.

After Cramer learned last year that Heitkamp would be accompanying the president on Air Force One to North Dakota, he complained bitterly to the White House, according to two people with direct knowledge of the discussions. Heitkamp, Cramer predicted at the time, would try to use it to her political advantage. (A Cramer adviser, Pat Finken, denied that the congressman had complained about the senator riding on Air Force One.)

The administration has taken steps to assure Cramer that he has the president's full support. The congressman has been regularly in touch with White House political director Bill Stepien, and the two met earlier this month. Trump has agreed to hold a rally for Cramer later this year.

In an interview, Cramer shrugged off Heitkamp's attendance at the bill signing and said there would soon be "clarity" on who Trump supports in the race.

Yet the congressman declined to predict whether the president would go after Heitkamp aggressively, as Trump has done with other Democratic incumbents. Cramer seemed aware of the warmth between the president and the senator. Trump has asked Cramer whether he likes Heitkamp, and when the congressman responds yes, the president seems to be "relieved," Cramer said.

"Politically, North Dakota's a pretty nice state. So I don't know that turning it on her is necessarily politically helpful to me," Cramer said. "They may just be concerned that she's a woman and maybe that has an impact. I just don't know."

Heitkamp said she's proud of her ability to work with the president.

"I have a friendly relationship. I have a very important working relationship," she said in an interview, "not just with him but other members of the administration."

Trump's reluctance to go after Heitkamp stems in part from the simple fact that he needs her vote. With Republicans clinging to a narrow Senate majority, the White House has pushed for her support on several

contentious votes, including the recent confirmations of CIA Director Gina Haspel and Secretary of State Mike Pompeo. She also backed Trump's nominations of Supreme Court Justice Neil Gorsuch and Environmental Protection Agency Administrator Scott Pruitt.

Last week's signing ceremony was organized by White House Office of Legislative Affairs Director Marc Short. He said he extended an invitation to Heitkamp because she played a central role in passing the banking deregulation law.

"She was an original cosponsor of the bill," Short said. "But she's also someone who opposed tax relief, who opposed repeal of Obamacare, and someone who will always support Chuck Schumer. So you can be sure the president will be actively campaigning in North Dakota this cycle."

Cramer's February entry into the race followed an intense pursuit from Trump and top White House officials. After Cramer initially said in January that he wouldn't run for Senate, he received overtures from Trump, White House counselor Kellyanne Conway, and energy executive and Trump donor Harold Hamm within a three-day period. Trump also met with Cramer's wife, Kris.

Cramer said Trump told him at the time that he'll "be out there campaigning more than you are." Trump's entreaties, Republicans contend, helped to push Cramer into the contest. Cramer won his statewide, at-large House seat in 2012, the same year Heitkamp entered the Senate.

"The president leaned on him very hard. The president wanted the best candidate, and everyone in the state thought Kevin was the best candidate to beat Heidi," said Gary Emineth, a former North Dakota GOP chairman who is close with the congressman. "You know how the president is. He just doesn't quit."

Heitkamp predicted that Trump would attack her eventually. While she has maintained a positive working relationship with the president, she said it pales in comparison to Cramer's staunch loyalty.

"I don't think anyone can match his Trump credentials," Heitkamp said. "He is somebody who will always do what the president asks him to do, regardless of whether it's good for North Dakota."

As of late, the senator has been airing commercials that highlight her balancing act. "When I agree with the president I vote with him — and that's over half my votes," she says in a spot that began airing this month. "And if his policies hurt North Dakota, he knows I'll speak up."

Cramer accused Heitkamp of acting like a "Republican wannabe" with her occasional support for key Trump nominees.

"Her trying to cozy up to Donald Trump has resulted in good votes," Cramer said. "But every time she tries to become more like me, it's more flattering to me than it is to her."

Democrats, however, couldn't be happier to portray Cramer as a jilted lover.

Last week, the North Dakota Democratic Party released a video featuring a montage of clips of the president praising Heitkamp and shaking her hand as Cramer looks on — set to the sad sounds of R.E.M.'s "Everybody Hurts."

GOP Senate candidate lashes out at Trump's legislative director Back

By Burgess Everett | 05/30/2018 06:27 PM EDT

Rep. Kevin Cramer, one of the GOP's top Senate recruits, launched an unusual attack on the White House's legislative director Wednesday, blaming him explicitly for the party's legislative failures in the Senate.

The comments from Cramer (R-N.D.) come amid rising GOP angst over President Donald Trump's close relationship with his opponent in the North Dakota Senate race, Democratic Sen. Heidi Heitkamp.

Heitkamp was the only Democrat invited to the White House last week for a bank deregulation bill signing, alarming some White House aides and Republicans. After POLITICO published a story on Wednesday outlining the awkward dynamic between Heitkamp, Cramer and the White House, Cramer told North Dakota radio host Rob Port that he had done some digging and believes that there "are some people in the White House that think, you know, the president's too friendly too her."

Then Cramer laid into White House legislative affairs director Marc Short for two prominent failed GOP efforts in the Senate: Repeal of Obamacare and the rollback of an Obama-era regulation that would limit flaring and venting from oil and gas wells. Heitkamp voted against both and Cramer has criticized her in particular over the flaring vote.

"If Marc Short was very good at his job, you know, we'd have a repeal and replacement of Obamacare, we'd have a replacement of the venting and flaring rule," Cramer said.

In an interview last week with POLITICO, Cramer insisted he is not angry over Trump's political flirtations with Heitkamp: "Not the case at all. I've been fine with it. I just don't think it hurts me." And on Wednesday on Port's show, Cramer said the spat over Heitkamp's attendance at the banking bill signing "just seems to be an argument between Marc Short and other people in the White House."

Short extended an invitation to Heitkamp to the bill signing, but also has knocked Heitkamp for opposing the GOP's tax law. He did not respond to a request for comment for this story.

Heitkamp has tried to stay out of the back and forth, though she is playing up her collaborations with a president that won her state in 2016 by more than 35 points.

"The president has got bigger fish to fry and bigger problems to solve than whether Kevin likes him more than I do," Heitkamp said.

DOE report: U.S. generally 'well prepared' for grid hacking, but gaps remain Back

By Eric Geller | 05/30/2018 06:05 PM EDT

Senior government officials and electric sector executives don't know enough about how energy companies could recover from a disruptive cyberattack, and those companies don't consider cyber threats enough when building out their supply chains, according to a new Energy Department report.

Grid resilience efforts also suffer because of "gaps in incorporating cybersecurity concerns, including planning for long-term disruption events, into state emergency response and energy assurance planning," said the report.

"The United States is, in general, well prepared to manage most electricity disruptions," the Energy Department said in its report. But gaps still exist in areas like situational awareness, workforce development, separation of roles and responsibilities and the coordinated use of resources like digital defense tools.

DOE completed the report last August as part of President Donald Trump's May 2017 cyber executive order but did not publish it until today.

The report mostly hammered home long-understood problems with protecting the power grid from hackers, including the challenges of sharing cyber threat data between partners

"The variation in infrastructure ownership and operation and the jurisdictional overlap add complexity to sharing actionable information in a timely manner," the report said. "These complexities are compounded when information is classified or sensitive due to the limited options and access to facilitate sharing."

It also warned of compounding problems in the event of a major power outage. For example, "as cyber incidents may impact disparate systems across the country, the impacted owner-operators may not be familiar with each other's systems and procedures."

DOE working to stand up new cyber unit in fiscal 2018 Back

By Darius Dixon | 03/01/2018 01:11 PM EDT

The Energy Department is aiming to have its new cybersecurity office fired up before the end of the fiscal year, Bruce Walker, the agency's top electricity official, said today.

"We're working with Congress because we put it into the FY 2019 budget proposal ... and we're looking to stand it up earlier because of the importance and our sector-specific agency authority [for cyber incidents]," he told reporters after testifying before the Senate Energy and Natural Resources Committee.

Walker has previously noted that DOE wouldn't need additional congressional authority to create the office or a new assistant secretary job to lead it. Today, he also said that the design change is meant to elevate cyber issues as well as to divide up the agency's infrastructure work into short-term and long-term operations.

Creating the Office of Cybersecurity, Energy Security and Emergency Response is a reaction to a range of issues, including Congress giving DOE more emergency authorities in the 2015 FAST Act (H.R. 22 (114)), the relentless need to improve cyber defenses, and the deepening marriage between the natural gas and electric sectors.

Walker would still lead the electricity office, which would focus on long-term infrastructure plans and set research-and-development goals, including for cybersecurity. Meanwhile, the new CESER office would be "actionable, near-term and highly responsive" recovery work like the devastation in Puerto Rico or the immediate response to a cyberattack, he said.

"One basically feeds the other," Walker said. "[CESER] responds to the incidents, OE will design them out of the system on a going-forward basis."

GAO: Government spent $13.2B on climate change last year Back

By Anthony Adragna | 05/30/2018 04:34 PM EDT

The federal government spent $13.2 billion across 19 agencies during fiscal 2017 for various programs related to climate change, according to a report from the Government Accountability Office released today.

Overall, climate change-related spending across the federal government rose $1.5 billion between fiscal 2016 and 2017 and grew $4.4 billion since fiscal 2010, according to the report.

GAO examined the budget justifications for six agencies accounting for 89 percent of all climate change spending and found just 18 of 533 programs within those agencies whose primary purpose is to address climate change. It further concluded that those programs primarily dedicated to addressing the problem "serve different purposes, target different audiences, or operate at different time periods and scales, which minimizes potential overlap or duplication." The other programs had multiple purposes beyond addressing climate change.

The White House Office of Management and Budget reports the government has spent over $154 billion since 1993 to understand and address climate change.

House Science Chairman Lamar Smith (R-Texas) requested the report.

DOE IG: No big flaws in FERC pipeline review process, but transparency should improve Back

By Darius Dixon | 05/30/2018 03:21 PM EDT

Federal watchdogs said they found no major flaws in FERC's process for reviewing interstate natural gas pipelines, but they flagged concerns about its transparency and how it handles public comments, according to new report.

Auditors in the Energy Department inspector general's office who reviewed FERC's pipeline certification process said that "nothing came to our attention to indicate that FERC had not performed its due diligence" in how it balanced public benefits of a proposed project with its adverse impacts.

But the report said regulators' "had not fully ensured" that the certification process was transparent to those who want to participate and that its eLibrary documentation system was difficult to use. And it said FERC lacked a consistent method for tracking and addressing comments submitted on a proposed project.

"FERC had not specifically designed its public-facing systems for use by the general public," the IG report said, noting that "although available to the general public, eLibrary had been designed for use by practitioners, the legal community, and other stakeholders."

The report also said parts of the eLibrary website "did not contain a sufficient explanation of the entire process" and that a document for landowners who could be affected by a project was not clear about key aspects of the certification process.

"While nothing came to our attention to indicate that natural gas certification applications had been inappropriately approved or disapproved," watchdogs wrote, "FERC can take steps to improve aspects of the natural gas certification process."

WHAT'S NEXT: FERC is in the process of a broad review of its natural gas pipeline certification process but there's no established deadline.

EPA May Invite Hazard, Exposure Data on Dozens of Chemicals

By Pat Rizzuto

Posted May 15, 2018, 9:37 AM

The EPA may invite chemical manufacturers and others to submit toxicity and exposure information on dozens of chemicals already on its radar for potential scrutiny.

House Panel Refutes Trump, Proposes $12M for Chemical Board

By Bruce Rolfsen

Posted May 14, 2018, 6:15 PM

The Trump administration's proposal to disband the Chemical Safety and Hazard Investigation Board is once again running into opposition from Congress.

Pruitt Adds New EPA Office to Further Efficiency Effort

By Abby Smith

Posted May 14, 2018, 5:35 PM

EPA head Scott Pruitt's efficiency push throughout the agency will get its own office, the administrator announced May 14.

Industry Coalition Forms to Lobby For EPA Safer Labels Program (1)

By Pat Rizzuto

Posted May 14, 2018, 3:24 PMUpdated May 14, 2018, 5:53 PM

Companies making cleaners, automobile products, and other consumer chemicals are launching a coalition June 1 to support a threatened EPA labeling program that recognizes safer chemicals.

INSIDEEPA.COM ARTICLES

On Eve Of EPA Summit, Agencies At Odds Over Calculating PFAS Risks

On the eve of a major EPA summit over how to address contamination from widespread exposures to per- and polyfluoroalkyl substances (PFAS), EPA and other agencies are split over how to calculate the substances' risks, a division that recently prompted EPA and the Defense Department (DOD) to ask the White House to block a federal health agency from releasing draft risk values stricter than EPA's.

After Families' Push, EPA Plans To Finalize Obama-Era Paint-Stripper Ban

Amid lobbying by families of consumers and workers killed from exposure to the paint-stripper chemical methylene chloride, EPA has reversed course, saying it now intends to soon finalize an Obama-era rule expected to ban certain uses of the substance, though environmentalists are cautioning that the final rule should preserve the proposed ban.

IG Adds Data Quality, Reporting To List Of EPA's Management 'Challenges'

EPA's Inspector General (IG) is updating and adding two entries to its annual list of management "challenges" facing the agency, warning EPA that it needs to address "systemic" problems in the quality of data used in decisions and separately its inability to meet statutory deadlines for reports to Congress on various EPA programs.

EPA Sends Final TSCA Mercury Inventory Rule For White House Review

EPA has sent to White House review its final rule requiring workers who handle mercury to report those uses to the agency, a rule the agency is required to promulgate by June 22, per the 2016 law that reformed the Toxic Substances Control Act (TSCA).

CEQ Submits Draft NEPA Rule Update To OIRA For Review

The White House Council on Environmental Quality (CEQ) is advancing a long-anticipated measure to reform its National Environmental Policy Act (NEPA) implementing rules, submitting an advance notice of proposed rulemaking (ANPR) to the White House Office of Information& Regulatory Affairs (OIRA) for review.

Industry Urges OMB To Back EPA Rule Boosting Policy Cost Considerations

Industry groups are pressing the Office of Management and Budget (OMB) to support a draft preliminary EPA rule that would establish greater "consistency" when considering the costs of its regulatory policies, urging OMB to devote resources to the effort and broadly playing down legal obstacles to consideration of costs in future rules.

EPA Science Plan Skirted Usual Process, Raising Finalization, Legal Doubts

The Trump EPA's controversial plan requiring use of publicly available research to justify rules appears to have been developed by political appointees without following the agency's usual action development process (ADP) for crafting important rules, leaving career staff and program offices out of the loop but raising doubts about how it will be finalized without them.

House Floats $100 Million Cut To EPA In FY19 Targeting Regulatory Programs

House lawmakers are floating draft legislation to cut EPA's budget from its current $8.058 billion funding by $100 million down to $7.958 billion, a modest cut compared to prior GOP efforts to slash the agency's funding that primarily targets EPA's science and rulemaking accounts for reductions while boosting state grants and Superfund spending.

CPSC Guide Could Give EPA Alternative To Partial Methylene Chloride Ban

The Consumer Product Safety Commission's (CPSC) recent guidance calling for product labels to warn of acute inhalation hazards of paint strippers containing methylene chloride could give EPA an alternative to calls for a first-time ban on some uses of the substance, such as industry calls to promote risk management options.

State AGs request withdrawal of US EPA science proposal

14 May 2018 / Confidentiality & right-to-know, Data, United States

Attorneys General from seven states and the District of Columbia have requested the US EPA withdraw its 'science transparency' proposal, owing to the "far-reaching impact" it could have on the agency's core activities.

The proposed rule – which seeks to allow increased transparency and public validation of studies underpinning agency regulatory decisions – has met heavy criticism from NGOs who fear it could be used to discard important health and safety data.

And the state AGs have joined a chorus of stakeholders requesting that the agency put the brakes on it.

In a letter submitted to the public docket, the states' chief legal advisors noted concerns "both from the truncated timeline under which EPA seeks to change fundamental agency policy, and from the vagueness of the proposal".

They have requested the agency withdraw its proposed rule and begin a consultation with the National Academy of Sciences and other independent scientists before deciding whether changes are needed to the agency's current approaches.

Should the agency decline this path, the AGs requested that the EPA extend the consultation by at least 150 days. "A full six-month comment period would be consistent with past practice for matters of similar importance and complexity, and is necessary to provide the public and other stakeholders a meaningful opportunity to evaluate the proposal and its implications for the agency's ability to meet its obligation to protect public health and the environment under federal environmental laws," they wrote.

The current 30-day consultation is "woefully insufficient", they added. Unless extended, this is set to expire on 30 May.

The letter is co-signed by the AGs from New York, California, Delaware, Iowa, Maine, Minnesota, Pennsylvania, and Washington, DC.

EU Commission publishes 11th ATP to CLP Regulation

14 May 2018 / Classification, labelling and packaging Regulation, Europe

The European Commission has published amendments to the Regulation on the classification, labelling and packaging of substances and mixtures (CLP).

This is the 11th adaptation to technical and scientific progress (ATP). It includes the chemical names of substances subject to harmonised classification and labelling listed in Table 3 of Annex VI CLP in all languages.

The 11th ATP has neither added substances nor amended information on any of the chemicals regulated under CLP. It was published in the *Official Journal* on 16 April and will apply from 1 December 2019.

The 10th ATP to CLP was published a year ago. It introduced new and revised entries for the harmonised classification and labelling of 37 substances.

EU regulation of FCMs 'outdated and full of holes'

Industry efforts seen to be filling a void

14 May 2018 / Europe, Food & drink, Food contact, Food contact Regulation 10/2011

The EU's regulation of food contact materials is "outdated, ineffective and full of holes", a Chemical Watch Food Contact Regulations Europe summit has heard.

Speaking at last week's event in Brussels, Michael Warhurst, executive director of NGO CHEM Trust, said: "it's not a pretty picture. The public would be very surprised at the lack of effective food contact material regulations.

"They expect protection. The fact that it's not under control is a potential scandal, even if it's not visible at the moment."

Legislation

The overarching piece of FCM legislation is the 2004 EU Framework Regulation. This works in tandem with the good manufacturing practice for materials and articles intended to come into contact with food Regulation (GMP) from 2006.

Both harmonised and non-harmonised materials sit under the framework's umbrella. Harmonised materials, which include, for example, plastics, ceramics and regenerated cellulose, are subject to EU-wide rules. Non-harmonised

materials, which include adhesives, printing inks and paper, have no specific European legislation covering them, and are subject to member states' national provisions.

According to Dr Warhurst the regulatory approach in this area has not been systematically assessed since it was introduced in 1976. There has also been no formal evaluation work or reports done on the 2004 framework.

"The world is moving on," he said, "and Europe is rather a long way behind".

Review

Late last year the Commission consulted on a roadmap for evaluating the legislation. Among the responses were a number of calls for fully harmonised rules for all FCMs, including from Cefic and the European Printing Ink Association (EuPIA).

Peter Oldring, European regulatory affairs manager at coatings company Sherwin Williams, told the conference that the EU executive is now planning a study to determine how the present legislation is functioning. It is expected, he said, that a contractor will start work in the Autumn.

And, Dr Oldring (pictured) told the summit that industry is as frustrated as the NGOs at the lack of Commission action.

"We keep getting roadmaps," he said. "Somehow the Commission's roadmaps and actions are subject to delays – often considerable – against their original target. We need to come up with a strategy to show those outside the Commission that something needs to be done."

To this end Dr Oldring directed the summit's attention to the work of an industry cross-sector group that has been in existence for 18 months and takes in 25 associations.

"The Commission is overloaded and the rate of progress is perhaps not as much as industry would like," he said. "In the absence of legislation, industry has been trying to tackle this problem so that we can fill a void that is there."

Fit for purpose?

However, Anna Gergely (also pictured), director of environment, health and safety regulatory at law firm Steptoe and Johnson, drew attention to the role REACH plays in the regulation of FCMs.

In response to the question "is the food contact regime fit for purpose?" she answered that there is great complexity to the legislation and FCMs are not exempt from REACH restrictions.

"Don't let people spread the news that food contact materials are not properly regulated," she said.

"There are some exemptions for food and feed in the REACH Regulation, and they include food additives, but there are no such exemptions for food contact materials. So don't be mistaken, packaging is not exempt in any way from the Regulation."

Northern Ireland to ban microbeads in rinse-off cosmetics

14 May 2018 / Alternatives assessment & substitution, Microplastics, Personal care, United Kingdom

Northern Ireland is to ban the manufacture and sale of rinse-off cosmetics and personal care products containing plastic microbeads, from September this year.

The UK government implemented the first phase of its ban, which applies to the manufacture of such items, in January. The second phase will prohibit their sale from the end of June.

In its notification to the European Commission, Northern Ireland said there are currently no known manufacturers using plastic microbeads in the region, which prompted it to implement the ban on manufacture and sale at the same time.

The regulations apply to Northern Ireland only. However, the various UK administrations have developed legislation collaboratively to ensure the definition of the ban is consistent. The objective is that it will eventually apply across the UK.

The devolved governments of Scotland and Wales have submitted separate notifications, with their bans coming into effect on 19 June and 30 June respectively.

The difference between the various UK regions is in the enforcement regime, according to the notification from Northern Ireland.

Casper Start-Tribune: EPA head Scott Pruitt visits major Wyoming coal mine, preaches end of 'war on fossil fuels'
Two days after a crowd of 300 gathered in Gillette to debate the Environmental Protection Agency's authority to regulate emissions at the cost of the coal industry, the head of that agency stood 20 miles away in one of the largest surface coal mines in the country: Black Thunder. Scott Pruitt, the controversial leader of the EPA, came to Wyoming at the invitation of Sens. John Barrasso and Mike Enzi to see the coal industry first hand. The state provides about 40 percent of the thermal coal burned in the U.S. for power and would be uniquely affected by a carbon dioxide rule like the Clean Power Plan. The rule's goal of cutting carbon dioxide emissions in the electricity sector by about 30 percent compared to 2005 levels would have pressured utilities that buy Wyoming coal, wiping away customers that the coal industry around Wright and Gillette depend on.

Gillette News Record: EPA chief Pruitt visits Campbell County, touts importance of coal exports
The future of Powder River Basin coal lies overseas, something EPA Administrator Scott Pruitt stressed during a Thursday morning visit to the heart of Wyoming coal country. As the guest of U.S. Sens. Mike Enzi and John Barrasso, both R-Wyoming, Pruitt toured Arch Coal's Black Thunder mine south of Wright, the second-largest producing thermal coal mine in the world. Pruitt said he was impressed by the "size and scope" of the operation. Black Thunder produced 70.5 million tons of coal in 2017. "Look at this and how impressive it is," he said. "To see what is done here with the amount of production, the automation, the technology and the commitment of the employees. … It was just impressive to see. And the most impressive were the people."

Breitbart: Scott Pruitt Is #Winning, Bans Junk Science from Environmental Protection Agency
Junk science is no longer welcome at the Environmental Protection Agency. Administrator Scott Pruitt has declared war on what he calls "secret science" – the process whereby EPA regulators have been able to craft rules using non-publicly-available science data…This decision will correct a longstanding injustice at the EPA, perpetrated against the U.S. taxpayer. For years the EPA has been able to behave as a law unto itself, cavalierly passing regulations which restrict freedoms, hamper business and hold back the U.S. economy for reasons which have much more to do with left-leaning environmentalist politics than with objective science.

New York Times: E.P.A. Prepares to Roll Back Rules Requiring Cars to Be Cleaner and More Efficient
The Trump administration is expected to launch an effort in coming days to weaken greenhouse gas emissions and fuel economy standards for automobiles, handing a victory to car manufacturers and giving them ammunition to potentially roll back industry standards worldwide. The move — which undercuts one of President Barack Obama's signature efforts to fight climate change — would also propel the Trump administration toward a courtroom clash with California, which has vowed to stick with the stricter rules even if Washington rolls back federal standards. That fight could end up creating one set of rules for cars sold in California and the 12 states that follow its lead, and weaker rules for the rest of the states, in effect splitting the nation into two markets.

Bloomberg: EPA Chief's $50-a-Night Rental Raises White House Angst
Environmental Protection Agency Administrator Scott Pruitt's lease at a Washington apartment owned by a lobbyist friend allowed him to pay $50 a night for a single bedroom -- but only on the nights when he actually slept there. White House officials are growing dismayed about the questions surrounding Pruitt's living arrangement, including his initial inability to produce any documentation about his lease or his actual payments, according to three officials. The landlord provided EPA officials with a copy of the lease and proof of the payments Pruitt made. The questions follow criticism of Pruitt for traveling first class on airline flights.

National News Highlights 3.30.18

The Wall Street Journal: Trump Dilemma: Give Businesses More Low-Skilled Work Visas or Not

Demand for low-skilled worker visas for the summer season starting Sunday is again far outstripping supply, with the Trump administration forced to choose between helping businesses seeking more visas or trying to save those jobs for American workers. Some lawmakers tried and failed this month to secure an increase in the number of H-2B visas available for this summer as part of a large spending bill. One Senate proposal would have permanently raised the annual cap from 66,000 to 90,000, with no limits for certain jobs in areas affected by disasters. A House version would have increased the annual cap to 132,000. The White House warned some lawmakers not to kick the decision to the Department of Homeland Security as they did in 2017, congressional aides said. "We did not want the discretion," an administration official said.

Politico: Trump's VA pick blindsides staff, deepens agency disarray

The timing of President Donald Trump's announcement to name Rear Admiral Ronny Jackson to lead Veterans Affairs was a snap decision that surprised his own chief of staff and knocked the government's second-largest agency, already bedeviled by scandal, deeper into disarray. White House chief of staff John Kelly had spoken with David Shulkin by phone Wednesday morning, reassuring the now-former VA secretary that he wouldn't be fired by tweet that afternoon. Hours later, Kelly had to phone Shulkin again telling him plans had changed. Trump declared Jackson's nomination on Twitter at 5:31 p.m. The tweet was big news — not just to the public, but to some senior aides, according to one White House official.

EPA head Scott Pruitt visits major Wyoming coal mine, preaches end of 'war on fossil fuels'

By Heather Richards, 3/29/18

Two days after a crowd of 300 gathered in Gillette to debate the Environmental Protection Agency's authority to regulate emissions at the cost of the coal industry, the head of that agency stood 20 miles away in one of the largest surface coal mines in the country: Black Thunder.

Scott Pruitt, the controversial leader of the EPA, came to Wyoming at the invitation of Sens. John Barrasso and Mike Enzi to see the coal industry first hand. The state provides about 40 percent of the thermal coal burned in the U.S. for power and would be uniquely affected by a carbon dioxide rule like the Clean Power Plan.

The rule's goal of cutting carbon dioxide emissions in the electricity sector by about 30 percent compared to 2005 levels would have pressured utilities that buy Wyoming coal, wiping away customers that the coal industry around Wright and Gillette depend on.

Those in favor of the rule are largely concerned about emissions' contribution to climate change. Those opposed see it as an attack on the coal industry.

Pruitt echoed that sentiment in an interview after touring Black Thunder. He said it was time for the agency to reverse what he described as a political attack on the fossil fuel industry. The review of the Clean Power Plan, a signature regulation from the Obama administration, is part of that, he said

"Our job is not to coerce markets," Pruitt said. "Our job is not to come in and say this type of fuel is good or this fuel is not good."

The EPA's regulations and guidelines should follow behind industry choices, not dictate them, he said.

President Donald Trump, who appointed Pruitt, made repealing the emissions-cutting plan a central tenet of his campaign, promising a return of coal jobs.

Pruitt said Thursday the final decision on the Clean Power Plan is not certain. The agency would review the new round of comments on repeal and move forward.

"What we are in the process of doing is providing regulatory certainty," he said. "Then we need to look forward and say what authority do we have?"

However, Pruitt also said the Clean Power Plan appeared to be outside the bounds of the agency's authority under the Clean Air Act.

That is a position shared by others present at the mine Thursday including the senators, Gillette mayor Louise Carter King, Campbell County Commissioner Mark Christensen and the mayor of nearby Wright, Ralph Kingan.

"We cannot allow this incredible resource to be stranded in the ground," Barrasso said. "There is just so much energy here."

Enzi, once the mayor of Gillette, thanked Pruitt for coming in person. It's one thing to tell people about the size and scope of a mine like Black Thunder, owned by Arch Coal. But a visit to coal country, he said, "is worth a thousand pictures."

The Gillette News Record

http://www.gillettenewsrecord.com/news/article_21c9accd-9375-55b1-8716-d1e050b33078.html

EPA chief Pruitt visits Campbell County, touts importance of coal exports

By Greg Johnson, 3/29/18

The future of Powder River Basin coal lies overseas, something EPA Administrator Scott Pruitt stressed during a Thursday morning visit to the heart of Wyoming coal country.

As the guest of U.S. Sens. Mike Enzi and John Barrasso, both R-Wyoming, Pruitt toured Arch Coal's Black Thunder mine south of Wright, the second-largest producing thermal coal mine in the world.

Pruitt said he was impressed by the "size and scope" of the operation. Black Thunder produced 70.5 million tons of coal in 2017.

"Look at this and how impressive it is," he said. "To see what is done here with the amount of production, the automation, the technology and the commitment of the employees. … It was just impressive to see. And the most impressive were the people."

Since being named to head the EPA shortly after President Donald Trump took office, Pruitt said his agency has been working to pull back after acting beyond its mission during the Barack Obama administration.

"We were overstepping. Now we're correcting it," he said. "We have a job to do and I think what's been done the last several years was not the job of the agency. They were picking winners and losers, using regulatory power to influence and penalize certain forms of energy to help others.

"That's not the job of the EPA."

He said regulations like the Clean Power Plan are more punitive than helpful.

"Nowhere in the statute does it say 'penalize coal' or 'penalize fossil fuels,'" he said about the EPA's mandate.

Export potential

Pruitt also said coal should play a significant role in a balanced energy portfolio. Also, because of its low sulfur content, Powder River Basin coal can be a key to drastically reducing power plant emissions worldwide.

"If we really care about our air quality, we'll export Powder River Basin coal," he said. "The reason you want to export Powder River Basin coal is because countries internationally are using coal from Indonesia and other places, and it's not as good as it is here.

"Guess what that impacts? Our air quality. We have to figure out a way to get this coal exported to (those) countries. The demand is there. We're working on that, as others are."

That export bottleneck, where Wyoming coal can't be moved to or out of West Coast ports, is a priority for the EPA as well as the state, Pruitt said.

"We've got to get it worked out and we're looking at all options," he said. "We're on it. If you care about air quality, and I think we do as a country, then you want to export Powder River Basin coal."

Enzi expanded on that thought, saying that just burning a better quality coal will have a trickle down impact for West Coast states that are actively anti-coal.

"We could really clean up California, Oregon and Washington if we could get our coal to China and Japan," he said. "They're having to burn really bad stuff over there and the wind blows this way. It doesn't blow from out here to California, it blows from China to California.

"So, they really ought to be concerned about the pollution in China."

Seeing is believing

Enzi also thanked Pruitt for visiting the Black Thunder mine.

"We have been inviting secretaries of everything to Wyoming for a long time," he said. "This is a major coup to actually get him to come and see us."

He said visiting Gillette and the surrounding area does more to bust myths about coal mining than any amount of lobbying.

"I've said for a long time, a picture's worth 1,000 words, but a visit is worth 1,000 pictures," Enzi said. "Just with the size of the coal wall itself, it's hard to see a picture of that and get a feel for what this is all about."

Barrasso agreed, saying even more impressive than the scale of mining that happens here is the people who do it.

"You talk about dedicated, committed, conscientious people proud of the job they're doing to power America," he said. "There's no way words can describe what (Pruitt) saw here."

Before capping off his whirlwind visit to southern Campbell County, Pruitt said he believes the market should determine success or failure for the oil, gas and coal industries, not government policy.

"We're out of the business of picking winners and losers," he said.

Breitbart

http://www.breitbart.com/big-government/2018/03/29/delingpole-winning-scott-pruitt-bans-junk-science-from-environmental-protection-agency/

Scott Pruitt Is #Winning, Bans Junk Science from Environmental Protection Agency

By James Delingpole, 3/29/18

Junk science is no longer welcome at the Environmental Protection Agency. Administrator Scott Pruitt has declared war on what he calls "secret science" – the process whereby EPA regulators have been able to craft rules using non-publicly-available science data.

Pruitt told Daily Caller:

> "We need to make sure their data and methodology are published as part of the record. Otherwise, it's not transparent. It's not objectively measured, and that's important."

This decision will correct a longstanding injustice at the EPA, perpetrated against the U.S. taxpayer. For years the EPA has been able to behave as a law unto itself, cavalierly passing regulations which restrict freedoms, hamper business and hold back the U.S. economy for reasons which have much more to do with left-leaning environmentalist politics than with objective science.

The problem dates back to the early 1990s when the EPA decided it wanted to regulate fine particulate matter known as PM2.5 but couldn't find any hard scientific evidence proving it was harmful.

Steve Milloy takes up the story in the Wall Street Journal:

> PM2.5 was not known to cause death, but by 1994 EPA-supported scientists had developed two lines of research purporting to show that it did. When the studies were run past the EPA's Clean Air Science Advisory Committee, it balked. It believed the studies relied on dubious statistical analysis and asked for the underlying data. The EPA ignored the request.
>
> As the EPA prepared to issue its proposal for PM2.5 regulation in 1996, Congress stepped in. Rep. Thomas Bliley, chairman of the House Commerce Committee, sent a sharply written letter to Administrator Carol Browner asking for the data underlying studies. Ms. Browner delegated the response to a subordinate, who told Mr. Bliley the EPA saw "no useful purpose" in obtaining the data. Congress responded by inserting a provision in a 1998 bill requiring that data used to support federal regulation must be made available to the public via the Freedom of Information Act. But it was hastily written, and a federal appellate court held the law unenforceable in 2003.
>
> The controversy went dormant until 2011, when a newly Republican Congress took exception to the Obama EPA's anticoal rules, which relied on the same PM2.5 studies. Again the EPA was defiant. Administrator Gina McCarthy refused requests for the data sets and defied a congressional subpoena.

The EPA has form here. Its first administrator, William Ruckelshaus banned the use of DDT in the U.S. despite copious evidence that it was not harmful to human life. A seven month EPA hearing, presided over by Judge Edmund Sweeney, concluded in a 9,000 page document:

> "DDT is not a carcinogenic hazard to man...DDT is not a mutagenic or teratogenic hazard to man...The use of DDT under the regulations involved here do not have a deleterious effect on freshwater fish, estuarine organisms, wild birds or other wildlife."

Ruckelshaus simply ignored it because it did not suit the result he wanted.

Needless to say, the environmentalists are furious that the EPA now has to stick to science rather than political activism.

The New York Times has billed it as "an attack on science" – as if, somehow, scientific experiments conducted in secret for political ends are somehow more representative of "science" than experiments which are both open and independently reproducible.

Milloy, who has followed this scandal more closely than any journalist, has had great fun parsing the more absurd claims made by the NYT.

His comments on the article (in bold) can be found at his Junk Science website:

> Under the proposed policy, the agency would no longer consider scientific research unless the underlying raw data can be made public for other scientists and industry groups to examine. As a result, regulators crafting future rules would quite likely find themselves restricted from using some of the most consequential environmental research of recent decades, such as studies linking air pollution to premature deaths or work that measures human exposure to pesticides and other chemicals. [If you read my book "Scare Pollution," you cannot escape reaching the conclusion that the "studies linking air pollution to premature death" are not science, but fraud. After all, what reputable scientist would hide their data from public scrutiny for 20+ years? Only frauds do that. The NYTimes has elevated this fraud to the status of "research" when it has never been fairly reviewed or replicated.]
>
> Opponents and supporters agree that the proposed new policy has its roots in the fossil fuel industry's opposition to a groundbreaking 1993 Harvard University study that definitively linked polluted air to premature deaths. ["Definitively"? Really? Total ignorance on the part of the NYTimes or just, gotta keep that narrative going.] The "Six Cities" study, widely considered one of the most influential public health examinations ever conducted, tracked thousands of people for nearly two decades and ultimately formed the backbone of federal air pollution regulations. [The Six City Study is and always has been total fraud. That's why the Harvard researchers been hiding their data for 24 years. It has two types of defenders — the ignornant and the lying.]
>
> In that study, which began in the mid-1970s, scientists signed confidentiality agreements so they could track the private medical and occupational histories of more than 22,000 individuals in six cities around the country. They combined that personal data with home air-quality data in order to study the link between chronic exposure to air pollution and mortality. [Half of this study population were smokers or former smokers and virtually all were exposed to secondhand smoke. The exposure to PM2.5 from tobacco smoke far outweighs (by orders of magnitude) and PM2.5 in the outdoor air. Once again, no one cares about their personal information.]

Never mind the leftist #fakenews spin, though. For the moment – possibly for the first time since the organization was founded by Richard Nixon – genuine, reproducible science reigns at the EPA.

On energy and the environment, thanks to able administrators like Scott Pruitt, President Trump is most definitely #winning.

E.P.A. Prepares to Roll Back Rules Requiring Cars to Be Cleaner and More Efficient

By Coral Davenport and Hiroko Tabuchi, 3/29/18

The Trump administration is expected to launch an effort in coming days to weaken greenhouse gas emissions and fuel economy standards for automobiles, handing a victory to car manufacturers and giving them ammunition to potentially roll back industry standards worldwide.

The move — which undercuts one of President Barack Obama's signature efforts to fight climate change — would also propel the Trump administration toward a courtroom clash with California, which has vowed to stick with the stricter rules even if Washington rolls back federal standards. That fight could end up creating one set of rules for cars sold in California and the 12 states that follow its lead, and weaker rules for the rest of the states, in effect splitting the nation into two markets.

Scott Pruitt, the head of the Environmental Protection Agency, is expected to frame the initiative as eliminating a regulatory burden on automakers that will result in more affordable trucks, vans and sport utility vehicles for buyers, according to people familiar with the plan.

An E.P.A. spokeswoman confirmed that Mr. Pruitt had sent a draft of the 16-page plan to the White House for approval.

The particulars of the plan are still being worked out. Those specifics, which are expected this year, could substantially roll back the Obama-era standards, according to two people familiar with the deliberations.

"This is certainly a big deal," said Robert Stavins, director of the Harvard environmental economics program. "The result will be more gas-guzzling vehicles on the road, greater total gasoline consumption, and a significant increase in carbon dioxide emissions."

According to two people familiar with the E.P.A.'s plans, Mr. Pruitt was scheduled to formally announce his proposal on Tuesday at an auto dealership in the Virginia suburbs, but the schedule remained in flux.

Major automakers would welcome the change. They are prepared to participate in making new rules that meet "our customers' needs for affordable, safe, clean and fuel-efficient transportation," said Gloria Bergquist, a spokeswoman for the Alliance of Automobile Manufactures, which represents many of the world's largest automakers.

In California, state lawyers said they were expecting a fight. The state has a special waiver under the 1970 Clean Air Act empowering it to enforce stronger air pollution standards than those set by the federal government, a holdover from California's history of setting its own air pollution regulations before the federal rules came into force. "We're prepared to do everything we need to defend the process," said Xavier Becerra, the attorney general of California, in an interview.

The California waiver gives the state considerable power to require automakers to stick to stricter standards. Not only is California a huge car market itself, but 12 other states including New York, Massachusetts and Pennsylvania have historically followed its lead. Together they represent more than a third of the domestic auto market.

"We're going to defend first and foremost existing federal greenhouse gas standards," Mr. Becerra said. "We're defending them because they're good for the entire nation. No one should think it's easy to undo something that's been not just good for the country, but good for the planet."

Mr. Pruitt has signaled that he is ready to take on such a challenge. "California is not the arbiter of these issues," he said in an interview with Bloomberg TV this month.

Under the Obama administration, the federal government toughened tailpipe pollution standards to match California's. Mr. Pruitt said the state standards "shouldn't and can't dictate to the rest of the country what these levels are going to be."

The E.P.A.'s senior clean air adviser, William Wehrum, this week traveled to California and met with the state's top clean air official, Mary Nichols. Both sides declined to detail what was discussed.
On Wednesday, a coalition of free-market groups including the Competitive Enterprise Institute urged Mr. Pruitt to take California on. "It is time for the E.P.A. to act," the groups said. If the agency did not act quickly, the groups said, "people across the state of California will be facing unrealistic and costly mandates which threaten their basic right to choose."

President Trump has also spoken about rolling back the efficiency rules, known as Corporate Average Fuel Economy, or Cafe. "I'm sure you've all heard the big news that we're going to work on the Cafe standards so you can make cars in America again," Mr. Trump said at a Detroit auto research facility in March last year. "We want to be the car capital of the world again. We will be, and it won't be long."

The rules, aimed at cutting tailpipe emissions of carbon dioxide, a major contributor to global warming, were one of the two pillars of Mr. Obama's climate change legacy. Put forth in 2012, they would have required automakers to nearly double the average fuel economy of new cars and trucks to 54.5 miles per gallon by 2025.

If fully implemented, the rules would have cut oil consumption by about 12 billion barrels and reduced carbon dioxide pollution by about six billion tons over the lifetime of all the cars affected by the regulations, according to E.P.A. projections.

The rules also would have put the United States, historically a laggard in fuel economy regulations, at the forefront worldwide in the manufacture of electric and highly fuel efficient vehicles. The United States and Canada are the only major nations that have adopted mandatory emissions standards through 2025. The European Union has only recently proposed standards for 2025 and 2030, while China has only started to work on standards for those years.

Less restrictive regulations in the United States could provide an opening for automakers to push for more lenient standards elsewhere as well, leading to the emission of more pollution by cars around the world. While sales of electric vehicles are starting to take off, they still represent barely 1 percent of global car sales. A shift among car buyers toward larger cars and trucks is already impeding progress in fuel economy.

"The concern is that automakers will go around the world basically trying to lobby regulators, saying, look, because the United States has reduced the pace, everywhere else should too," said Anup Bandivadekar, a researcher at the International Council on Clean Transportation, a think tank that focuses on clean car technology and policy. Global carmakers "apply developments in one region to lobby for changes in other regions."

American automakers initially accepted the plan by Mr. Obama in 2009 to harmonize what was then a hodgepodge of pollution and efficiency standards set by the E.P.A., the National Highway Traffic Safety Administration and California. And the automakers weren't in much of a position to resist; they had just taken an $80 billion bailout to survive a global economic crisis.

The plan would have spurred automakers to speed their development of highly fuel-efficient vehicles including hybrid and electric cars. But within weeks of Mr. Trump's inauguration last year, the chief executives of the nation's Big Three auto companies met with him in the Oval Office to say that the Obama tailpipe standard was too difficult to achieve.

Mr. Trump directed the E.P.A. under Mr. Pruitt to craft a new, less strict set of standards. The announcement expected on Tuesday would represent the first legal step in the process.

While Mr. Pruitt's proposal to open up the Obama rules to review isn't expected to include specific targets, "The proposed rollback is going to be quite a significant number," said Myron Ebell, who led Mr. Trump's E.P.A. transition team and directs the energy and environment policy at the Competitive Enterprise Institute, a Washington research organization that questions the established science of human-caused climate change. "It will be more than a couple m.p.g.," he said.

If the legal fight between California and the Trump administration escalates, one possibility is that the federal government might try to revoke the waiver allowing California to set its own rules. Some presidents, including George W. Bush, have considered revoking the waiver, but none have tried.

The announcement by Mr. Pruitt was not expected to include a decision on challenging the waiver.

Mr. Ebell suggested that one possible legal tactic for the Trump administration could be to announce that it will refuse to renew the current waiver on tailpipe emissions, which expires in 2025, rather than to revoke it outright. That would likely delay a court fight until California moves to set standards that go beyond 2025.

But such a move would also likely formalize, at least for the time being, two different sets of rules in the United States — the federal emissions rules, and California's stricter ones — a logistical headache for the industry.

While California and its ally states have long followed separate smog standards, those have been easier for automakers to meet because a car can be brought into compliance by adding a catalytic converter, for example. Designing for separate mileage standards is more difficult, because fuel economy is dependent on a car's weight and design.

A divided market could require substantially different car designs, experts say, putting the American auto industry into uncharted territory. It remains unclear how the issue might be resolved. One possibility is that two very different auto markets emerge, one with cleaner cars generally along the coasts, and another with more polluting cars concentrated in Middle America. On the other hand, automakers might also opt to generally adhere to the stricter California standards nationwide, blunting the impact of any Trump administration rollback of federal rules.

The automakers had hoped to avoid these complex scenarios by using their clout with the Trump administration to force California to go along with a relaxation of federal regulations. But "if they thought this would end by California rolling over and giving up its more stringent standards," said Kevin Poloncarz, a San Francisco lawyer who focuses on air and climate change law, "that was a miscalculation."

As a result, the automakers' victory might come with unexpected headaches for them, said Jody Freeman, a Harvard law professor and former counsel to the Obama administration.

For instance, if the rest of the world moves toward stricter rules anyway, the American market could find itself an industry laggard, ceding leadership in clean vehicle technology to markets like China or the European Union. "I don't really know if the auto industry wants what this administration might be doing," she said. "It might be like the dog that caught the car."

North Jersey

https://www.northjersey.com/story/news/environment/2018/03/28/epa-begins-monitoring-air-residential-areas-fumes-wafting-edgewater-superfund-site/458747002/

EPA begins monitoring air in residential areas for fumes wafting from Edgewater Superfund site By Scott Fallon, 3/29/18

Environmental regulators have begun monitoring the air at residential developments near the Quanta Superfund site to see if elevated levels of a potentially dangerous chemical are wafting from cleanup work on the property that residents have been complaining about for months, officials said Wednesday.

The news came as more than 100 people packed a public meeting at Borough Hall where U.S. Environmental Protection Agency officials detailed steps they are taking to control fumes from the site, including elevated levels of naphthalene.

Agency officials said they would suppress the fumes with foam, air misters along the fence, plastic sheeting and other methods. EPA officials maintained that the naphthalene levels are not a public health risk although many in the audience remained skeptical.

"You have to take responsibility," Jane Hoffman, who lives adjacent to the site, said at the meeting to EPA officials. "There are people who have spent their life savings to buy a home here."

Residents have been complaining about the fumes for months, saying they are unrelenting even when work at the site has been halted. As a result, the EPA has established a new 24-hour hotline that residents can call if they smell odors from the site: 201-807-0991.

The site is undergoing a controversial $78 million cleanup by Honeywell and supervised by EPA where workers have to dig up contaminated soil to pump in cement that will keep coal tar, arsenic and oil byproducts from migrating offsite. Many residents had wanted the pollution excavated at the Hudson River site not entombed in perpetuity under a proposed housing complex.

Elevated levels of naphthalene have been emanating from the site almost every work day since May, according to air monitoring data provided by Honeywell.

Naphthalene continued to exceed the site's risk screening level of 4.62 micrograms per cubic meter in March with a high in recent weeks of 120 micrograms per cubic meter on March 19, which is 26 times the screening level.

EPA has begun taken air samples at three residential developments near the Quanta site – City Place, iPark and Independence Harbor. Two samples taken this month – one at City Place and another at iPark – had naphthalene levels slightly above 4.62 micrograms per cubic meter. The rest were either below the level or no naphthalene was detected. Samples taken last year did not exceed any risk levels, EPA officials said.

Naphthalene is "reasonably anticipated" to be a human carcinogen by the U.S. Department of Health and Human Services because studies showed that lab rats formed lung and nose tumors when breathing in the chemical daily. The EPA and the World Health Organization classify naphthalene as a possible human carcinogen.

EPA has said even the highest levels of naphthalene recorded at Quanta – 1,000 micrograms per cubic meter on Sept. 15 – do not present a health risk.

The screening level is based on the assumption that an individual is located at the perimeter of the Quanta site for 10 hours per day, five days per week, for 1½ years, regulators said.

"It's meant to be very conservative," Lora Smith, an EPA human health risk assessor, said of the 4.62 level. She said the Occupational Health and Safety Administration's exposure limit for workers is 50,000 micrograms per cubic meter and that is why workers do not wear respirators on site.

"Exceedances are not unexpected and they do not indicate there is an imminent public health threat," she said.

But residents have argued that condos, apartments, restaurants, stores and a hotel surround the Quanta site allowing prolonged exposure to the fumes in close proximity. Work at the site was temporarily halted following an article in The Record detailing the site's problems.

Dana Prigge, who lives near the site, said the fumes from Quanta can be noxious. She said she was overcome one day last month while walking near River Road.

"My eyes were burning, my nose was burning, my lungs were pulling in," she said in an interview before the meeting. "I knew there were chemicals in the air because I never react this way."

The fumes have become so bad that Prigge plans to move out of Edgewater when her lease is up in a few months.

"If I could move out tomorrow, I would," she said.

Bloomberg

https://www.bloomberg.com/news/articles/2018-03-30/epa-chief-s-50-a-night-rental-said-to-raise-white-house-angst

EPA Chief's $50-a-Night Rental Raises White House Angst

By Jennifer Dlouhy and Jennifer Jacobs

Environmental Protection Agency Administrator Scott Pruitt's lease at a Washington apartment owned by a lobbyist friend allowed him to pay $50 a night for a single bedroom -- but only on the nights when he actually slept there.

White House officials are growing dismayed about the questions surrounding Pruitt's living arrangement, including his initial inability to produce any documentation about his lease or his actual payments, according to three officials. The landlord provided EPA officials with a copy of the lease and proof of the payments Pruitt made.

The questions follow criticism of Pruitt for traveling first class on airline flights.

In all, Pruitt paid $6,100 to use the room for roughly six months, according to copies of the checks reviewed by Bloomberg. Those checks show varying amounts paid on sporadic dates -- not a traditional monthly "rent payment" of the same amount each month.

That was because of the unusual rent schedule -- not a single monthly amount, but a daily amount charged only for days used for a single bedroom in the two-bedroom unit just blocks from the Capitol. The owner is a health care lobbyist, Vicki Hart. Her husband J. Steven Hart, is also a lobbyist and his firm represents clients in industries regulated by the EPA.

One person familiar with the lease compared it to an Airbnb-style arrangement, but Pruitt wasn't a transient and instead made the apartment his home on nights he was in Washington. The lease -- reviewed by Bloomberg -- says that he was charged $50 a night "based on days of actual occupancy."

Six Canceled Checks
Bloomberg reviewed six canceled checks paid by Pruitt totaling $6,100 from March 18 through Sept 1, 2017. He paid $450 on March 18, $900 on April 26, $850 on May 15, $700 on June 4, $1,500 on July 22 and $1,700 on Sept 1.

Justina Fugh, who has been ethics counsel at the EPA for a dozen years, said the arrangement wasn't an ethics issue because Pruitt paid rent. An aide said the agency had not reviewed the arrangement in advance.

The payments covered Pruitt's room in the two-bedroom unit, but did not afford him liberal use of common areas, where the owners had dinner parties and other functions, according to a person familiar with the situation. Someone else rented the other bedroom. According to the lease agreement, Pruitt's bedroom could not be locked.

After ABC News reported the living arrangement on Thursday, EPA aides had to seek documentation from the building's owners to prove he had paid rent, raising concerns at the White House, said two of the people, who asked not to be named discussing a sensitive matter involving a Cabinet secretary. Pruitt was in Wyoming on Thursday.

Related: Bumped? EPA Chief Signals He Will Be Flying Coach After Backlash

The disclosure follows revelations about Pruitt's reliance on first-class flights to travel around the globe and a series of pricey trips, including a visit by Pruitt and agency staff to Italy that cost $120,249. EPA officials have defended Pruitt's use of first-class flights on security grounds, but after a series of reports, he shifted to coach.

J. Steven Hart is the chairman of Williams & Jensen, a firm with a stable of energy industry clients including Oklahoma Gas & Electric Co., which paid the firm $400,000 in 2017, according to data compiled from the Environmental Integrity Project from disclosure forms.

Pruitt, the former attorney general of Oklahoma, has been an enthusiastic crusader against Obama-era regulations meant to combat climate change and limit air pollution. When Pruitt was in Oklahoma, he sued the EPA more than a dozen times.

Hart's individual lobbying clients include liquefied natural gas exporter Cheniere Energy Inc., the American Automotive Policy Council and Smithfield Foods Inc. But the Department of Energy -- not the EPA -- plays the major federal role overseeing LNG exports, and it is not clear Hart had direct contact with the EPA on behalf of any of his lobbying clients in 2017, according to a Bloomberg News review of disclosures.

"At the very least, it doesn't look good for the administrator of EPA to have rented an apartment from the wife of an energy industry lobbyist who represents companies regulated by EPA," said Eric Schaeffer, director of the Environmental Integrity Project.

Schaeffer called on EPA's inspector general and Congress to investigate.

Fugh, the EPA's ethics counsel, said no gift was involved. It was a routine business arrangement between Pruitt and an individual, not a lobbying firm, she added.

"He paid a fair price for what amounts to just a room," Fugh said. "So I don't even think that the fact that the house is owned by a person whose job is to be a lobbyist causes us concern."

Trump Dilemma: Give Businesses More Low-Skilled Work Visas or Not

By Laura Meckler, 3/30/18

Demand for low-skilled worker visas for the summer season starting Sunday is again far outstripping supply, with the Trump administration forced to choose between helping businesses seeking more visas or trying to save those jobs for American workers.

Some lawmakers tried and failed this month to secure an increase in the number of H-2B visas available for this summer as part of a large spending bill. One Senate proposal would have permanently raised the annual cap from 66,000 to 90,000, with no limits for certain jobs in areas affected by disasters. A House version would have increased the annual cap to 132,000.

The White House warned some lawmakers not to kick the decision to the Department of Homeland Security as they did in 2017, congressional aides said. "We did not want the discretion," an administration official said.

Nonetheless, DHS is now under pressure from the business community to provide more visas after the spending bill authorized the department's Secretary Kirstjen Nielsen to offer tens of thousands of extra visas if she sees fit.

A DHS spokeswoman, Katie Waldman, said no decision has been made. "We are currently looking at last year's implementation of the H-2B plus-up to determine how best to proceed this fiscal year," she said.

The H-2B visas, issued for low-skilled, seasonal foreign workers, are typically employed by landscaping companies, Alaskan fisheries, ski resorts and vacation spots, including some of President Donald Trump's properties.

Backers say the program provides needed foreign workers, often in remote locations where Americans are scarce. They say the problem is particularly acute given the current unemployment rate of 4.1%, the lowest in a decade.

"We rebranded 8,000 vehicles and put 'now hiring' on everything we own. We cannot get enough workers," said Todd Chambers, chief marketing officer for BrightView Landscapes, LLC, a large landscaping company that has used H-2B workers for more than a decade.

Opponents say businesses should try harder and raise wages if needed. "We should want the labor market to tighten and employers have to work overtime trying to entice American workers, especially those who've dropped out of the labor market," said Mark Krikorian of the conservative Center for Immigration Studies.

Ultimately, Democratic leaders killed the proposals to increase the visas, congressional aides in both parties said. Democratic aides said that was partly because they weren't willing to import more foreign workers at a time when Congress was failing to protect hundreds of thousands of young undocumented immigrants brought to the U.S. as children, known as Dreamers.

By statute, a total of 66,000 H-2B visas are available each year, divided evenly between winter and summer seasons. In past years, Congress has effectively raised the cap by exempting workers who are returning to jobs they had in previous seasons, but didn't do so last year nor this year.

For this summer season, businesses filed requests for more than 81,000 workers with the Labor Department on Jan. 1, the first day possible, a record, and more since then. Many firms tried to file applications after midnight on New Year's Eve to be near the front of the line.

This year, for the first time, DHS conducted a lottery among early applicants to pick winners, saying it was only fair given the crush of demand. Administration officials said that applications cleared by the Labor Department by mid-February were eligible. But several people who use the program said they were confused about why some petitions were included in the draw and others weren't.

BrightView Landscapes filed 94 petitions requesting a total of 3,500 visas, but was awarded fewer than 500, compared with 1,600 last year, said Sarah Powenski, vice president and associate general counsel at the company.

Company officials say they are frustrated that the program has been caught up in the larger immigration debate. "This thing has become more of an immigration issue in people's minds," said Mr. Chambers. "It's been attached to a third rail issue."

Faced with the same situation last year, John Kelly, then DHS secretary and now White House chief of staff, fumed. He argued that if Congress wanted more visas, then lawmakers should have approved them.

Many lawmakers lobbied him to approve additional visas. His boss, President Donald Trump, ran for office promising to protect American workers against foreign competition, and White House officials pressured him against it, according to people familiar with the decision making.

Ultimately, Mr. Kelly allowed up to 15,000 additional visas for guest workers, though not until the summer was half over. He set a high bar for businesses that wanted to apply and described the approval as a "one-time" move.

Trump's VA pick blindsides staff, deepens agency disarray

By Lorraine Woellert, Eliana Johnson, and Connor O'Brien, 3/29/18

The timing of President Donald Trump's announcement to name Rear Admiral Ronny Jackson to lead Veterans Affairs was a snap decision that surprised his own chief of staff and knocked the government's second-largest agency, already bedeviled by scandal, deeper into disarray.

White House chief of staff John Kelly had spoken with David Shulkin by phone Wednesday morning, reassuring the now-former VA secretary that he wouldn't be fired by tweet that afternoon. Hours later, Kelly had to phone Shulkin again telling him plans had changed.

Trump declared Jackson's nomination on Twitter at 5:31 p.m. The tweet was big news — not just to the public, but to some senior aides, according to one White House official.

The chaos — by now a typical part of the president's management style — has for months upended Kelly's attempts to ensure that an unorthodox White House adheres to traditional processes. But while White House aides are left unpacking the day's events, the drama at the VA is just beginning.

Deputy Secretary Thomas Bowman, a Trump appointee who is the agency's No. 2, is widely expected to leave soon, either by choice or by force. Kelly and other aides wanted Bowman gone before Shulkin left to avoid installing the deputy at the helm, even temporarily. Bowman had pushed back on broad privatization efforts, leading Trump to berate him in an Oval Office meeting for his lack of loyalty.

Trump got around the Bowman problem by naming Robert Wilkie, an undersecretary at the Department of Defense, to the temporary job. A Capitol Hill veteran and member of Trump's transition team, Wilkie is a former senior adviser to Sen. Thom Tillis (R-N.C.), who supports expanding service members' access to private doctors.

"He's got a department that's in turmoil. It's in crisis. There's warfare there," said Anthony Principi, who led the agency under former President George W. Bush. "And you have an acting secretary who doesn't know the VA."

But if and when Bowman departs, Wilkie will be left with a shallow bench at an agency already paralyzed by political mistrust, some veterans' advocates say. The VA's health and benefit agencies — which administer tens of billions of dollars in health programs, pensions, survivor benefits and other forms of assistance to some 9 million service members — have been without Senate-confirmed officials since the Obama administration.

Veterans Affairs is the second-largest federal agency, behind only the Department of Defense, with 377,000 employees. And it has proven unwieldy even when led by highly decorated, experienced administrators such as Eric Shinseki, a retired four-star Army general who resigned during the Obama administration amid a scandal over lengthy wait times and faulty scheduling practices for medical appointments.

Shinseki was followed by Bob McDonald, an Army veteran and former Procter & Gamble CEO. Shulkin, McDonald's successor, was the first non-veteran to lead the VA.

As recently as two weeks ago, the Trump White House was still making overtures to potential candidates for the top job, according to a person with direct knowledge of the inquiries. Trump reportedly agonized over the decision, changing his mind several times, a senior administration official said.

"Instead of going through the paces to convince the best possible person to take this job, they're going with the person who's still on active duty in the Navy and can't say no to the commander in chief," said one Obama White House aide, who spoke highly of Jackson as a doctor and individual. "You could look at it as them giving up trying to find a competent commander or manager to fix the problems."

Shulkin had come under fire after a VA inspector general's report accused him of improperly accepting tickets to the Wimbledon tennis tournament and using his agency staff to arrange a sightseeing tour of Denmark and England. He repaid the VA for the trip. The longtime hospital administrator, who was engaged in open warfare with conservatives in the department intent on privatizing the VA, contended he was set up.

Veterans' groups remained loyal to Shulkin, whom they saw as their best line of defense of against privatization. During his campaign, Trump made promises that veterans would be allowed to seek medical treatment outside the VA's system, statements taken by some to mean a step toward handing the system to commercial companies to manage.

Jackson, while well-liked by both Republicans and Democrats, is a cipher on privatization and other policy issues. With no agency experience to speak of, veterans suspect he could be installed as a figurehead, leaving lower-level appointees to steer the agency toward privatization.

"He's a blank slate. Nobody knows really anything about his competency or capacity for this job," said Paul Rieckhoff, CEO of Iraq and Afghanistan Veterans of America. "We especially know that being a veteran doesn't qualify you to run the VA any more than being a soldier qualifies you to run the DoD."

Principi urged Jackson to move quickly on his own agenda.

"The new secretary, really, if he wants to accomplish anything, has to hit the deck running and has to bring in some very, very good people," he said. "I hope and pray he's a success. Because if he's not, American veterans are going to be the losers."

Casper Start-Tribune: EPA head Scott Pruitt visits major Wyoming coal mine, preaches end of 'war on fossil fuels'

Two days after a crowd of 300 gathered in Gillette to debate the Environmental Protection Agency's authority to regulate emissions at the cost of the coal industry, the head of that agency stood 20 miles away in one of the largest surface coal mines in the country: Black Thunder. Scott Pruitt, the controversial leader of the EPA, came to Wyoming at the invitation of Sens. John Barrasso and Mike Enzi to see the coal industry first hand. The state provides about 40 percent of the thermal coal burned in the U.S. for power and would be uniquely affected by a carbon dioxide rule like the Clean Power Plan. The rule's goal of cutting carbon dioxide emissions in the electricity sector by about 30 percent compared to 2005 levels would have pressured utilities that buy Wyoming coal, wiping away customers that the coal industry around Wright and Gillette depend on.

Gillette News Record: EPA chief Pruitt visits Campbell County, touts importance of coal exports

The future of Powder River Basin coal lies overseas, something EPA Administrator Scott Pruitt stressed during a Thursday morning visit to the heart of Wyoming coal country. As the guest of U.S. Sens. Mike Enzi and John Barrasso, both R-Wyoming, Pruitt toured Arch Coal's Black Thunder mine south of Wright, the second-largest producing thermal coal mine in the world. Pruitt said he was impressed by the "size and scope" of the operation. Black Thunder produced 70.5 million tons of coal in 2017. "Look at this and how impressive it is," he said. "To see what is done here with the amount of production, the automation, the technology and the commitment of the employees. … It was just impressive to see. And the most impressive were the people."

Breitbart: Scott Pruitt Is #Winning, Bans Junk Science from Environmental Protection Agency

Junk science is no longer welcome at the Environmental Protection Agency. Administrator Scott Pruitt has declared war on what he calls "secret science" – the process whereby EPA regulators have been able to craft rules using non-publicly-available science data…This decision will correct a longstanding injustice at the EPA, perpetrated against the U.S. taxpayer. For years the EPA has been able to behave as a law unto itself, cavalierly passing regulations which restrict freedoms, hamper business and hold back the U.S. economy for reasons which have much more to do with left-leaning environmentalist politics than with objective science.

New York Times: E.P.A. Prepares to Roll Back Rules Requiring Cars to Be Cleaner and More Efficient

The Trump administration is expected to launch an effort in coming days to weaken greenhouse gas emissions and fuel economy standards for automobiles, handing a victory to car manufacturers and giving them ammunition to potentially roll back industry standards worldwide. The move — which undercuts one of President Barack Obama's signature efforts to fight climate change — would also propel the Trump administration toward a courtroom clash with California, which has vowed to stick with the stricter rules even if Washington rolls back federal standards. That fight could end up creating one set of rules for cars sold in California and the 12 states that follow its lead, and weaker rules for the rest of the states, in effect splitting the nation into two markets.

The Wall Street Journal: Trump Dilemma: Give Businesses More Low-Skilled Work Visas or Not
Demand for low-skilled worker visas for the summer season starting Sunday is again far outstripping supply, with the Trump administration forced to choose between helping businesses seeking more visas or trying to save those jobs for American workers. Some lawmakers tried and failed this month to secure an increase in the number of H-2B visas available for this summer as part of a large spending bill. One Senate proposal would have permanently raised the annual cap from 66,000 to 90,000, with no limits for certain jobs in areas affected by disasters. A House version would have increased the annual cap to 132,000. The White House warned some lawmakers not to kick the decision to the Department of Homeland Security as they did in 2017, congressional aides said. "We did not want the discretion," an administration official said.

Politico: Trump's VA pick blindsides staff, deepens agency disarray
The timing of President Donald Trump's announcement to name Rear Admiral Ronny Jackson to lead Veterans Affairs was a snap decision that surprised his own chief of staff and knocked the government's second-largest agency, already bedeviled by scandal, deeper into disarray. White House chief of staff John Kelly had spoken with David Shulkin by phone Wednesday morning, reassuring the now-former VA secretary that he wouldn't be fired by tweet that afternoon. Hours later, Kelly had to phone Shulkin again telling him plans had changed. Trump declared Jackson's nomination on Twitter at 5:31 p.m. The tweet was big news — not just to the public, but to some senior aides, according to one White House official.

http://trib.com/business/energy/epa-head-scott-pruitt-visits-major-wyoming-coal-mine-preaches/article_81c4e5f5-3cd9-569a-89fd-71cd4f9d91b1.html
EPA head Scott Pruitt visits major Wyoming coal mine, preaches end of 'war on fossil fuels'
By Heather Richards, 3/29/18

Two days after a crowd of 300 gathered in Gillette to debate the Environmental Protection Agency's authority to regulate emissions at the cost of the coal industry, the head of that agency stood 20 miles away in one of the largest surface coal mines in the country: Black Thunder.

Scott Pruitt, the controversial leader of the EPA, came to Wyoming at the invitation of Sens. John Barrasso and Mike Enzi to see the coal industry first hand. The state provides about 40 percent of the thermal coal burned in the U.S. for power and would be uniquely affected by a carbon dioxide rule like the Clean Power Plan.

The rule's goal of cutting carbon dioxide emissions in the electricity sector by about 30 percent compared to 2005 levels would have pressured utilities that buy Wyoming coal, wiping away customers that the coal industry around Wright and Gillette depend on.

Those in favor of the rule are largely concerned about emissions' contribution to climate change. Those opposed see it as an attack on the coal industry.

Pruitt echoed that sentiment in an interview after touring Black Thunder. He said it was time for the agency to reverse what he described as a political attack on the fossil fuel industry. The review of the Clean Power Plan, a signature regulation from the Obama administration, is part of that, he said

"Our job is not to coerce markets," Pruitt said. "Our job is not to come in and say this type of fuel is good or this fuel is not good."

The EPA's regulations and guidelines should follow behind industry choices, not dictate them, he said.

President Donald Trump, who appointed Pruitt, made repealing the emissions-cutting plan a central tenet of his campaign, promising a return of coal jobs.

Pruitt said Thursday the final decision on the Clean Power Plan is not certain. The agency would review the new round of comments on repeal and move forward.

"What we are in the process of doing is providing regulatory certainty," he said. "Then we need to look forward and say what authority do we have?"

However, Pruitt also said the Clean Power Plan appeared to be outside the bounds of the agency's authority under the Clean Air Act.

That is a position shared by others present at the mine Thursday including the senators, Gillette mayor Louise Carter King, Campbell County Commissioner Mark Christensen and the mayor of nearby Wright, Ralph Kingan.

"We cannot allow this incredible resource to be stranded in the ground," Barrasso said. "There is just so much energy here."

Enzi, once the mayor of Gillette, thanked Pruitt for coming in person. It's one thing to tell people about the size and scope of a mine like Black Thunder, owned by Arch Coal. But a visit to coal country, he said, "is worth a thousand pictures."

EPA chief Pruitt visits Campbell County, touts importance of coal exports

By Greg Johnson, 3/29/18

The future of Powder River Basin coal lies overseas, something EPA Administrator Scott Pruitt stressed during a Thursday morning visit to the heart of Wyoming coal country.

As the guest of U.S. Sens. Mike Enzi and John Barrasso, both R-Wyoming, Pruitt toured Arch Coal's Black Thunder mine south of Wright, the second-largest producing thermal coal mine in the world.

Pruitt said he was impressed by the "size and scope" of the operation. Black Thunder produced 70.5 million tons of coal in 2017.

"Look at this and how impressive it is," he said. "To see what is done here with the amount of production, the automation, the technology and the commitment of the employees. ... It was just impressive to see. And the most impressive were the people."

Since being named to head the EPA shortly after President Donald Trump took office, Pruitt said his agency has been working to pull back after acting beyond its mission during the Barack Obama administration.

"We were overstepping. Now we're correcting it," he said. "We have a job to do and I think what's been done the last several years was not the job of the agency. They were picking winners and losers, using regulatory power to influence and penalize certain forms of energy to help others.

"That's not the job of the EPA."

He said regulations like the Clean Power Plan are more punitive than helpful.

"Nowhere in the statute does it say 'penalize coal' or 'penalize fossil fuels,'" he said about the EPA's mandate.

Export potential

Pruitt also said coal should play a significant role in a balanced energy portfolio. Also, because of its low sulfur content, Powder River Basin coal can be a key to drastically reducing power plant emissions worldwide.

"If we really care about our air quality, we'll export Powder River Basin coal," he said. "The reason you want to export Powder River Basin coal is because countries internationally are using coal from Indonesia and other places, and it's not as good as it is here.

"Guess what that impacts? Our air quality. We have to figure out a way to get this coal exported to (those) countries. The demand is there. We're working on that, as others are."

That export bottleneck, where Wyoming coal can't be moved to or out of West Coast ports, is a priority for the EPA as well as the state, Pruitt said.

"We've got to get it worked out and we're looking at all options," he said. "We're on it. If you care about air quality, and I think we do as a country, then you want to export Powder River Basin coal."

Enzi expanded on that thought, saying that just burning a better quality coal will have a trickle down impact for West Coast states that are actively anti-coal.

"We could really clean up California, Oregon and Washington if we could get our coal to China and Japan," he said. "They're having to burn really bad stuff over there and the wind blows this way. It doesn't blow from out here to California, it blows from China to California.

"So, they really ought to be concerned about the pollution in China."

Seeing is believing

Enzi also thanked Pruitt for visiting the Black Thunder mine.

"We have been inviting secretaries of everything to Wyoming for a long time," he said. "This is a major coup to actually get him to come and see us."

He said visiting Gillette and the surrounding area does more to bust myths about coal mining than any amount of lobbying.

"I've said for a long time, a picture's worth 1,000 words, but a visit is worth 1,000 pictures," Enzi said. "Just with the size of the coal wall itself, it's hard to see a picture of that and get a feel for what this is all about."

Barrasso agreed, saying even more impressive than the scale of mining that happens here is the people who do it.

"You talk about dedicated, committed, conscientious people proud of the job they're doing to power America," he said. "There's no way words can describe what (Pruitt) saw here."

Before capping off his whirlwind visit to southern Campbell County, Pruitt said he believes the market should determine success or failure for the oil, gas and coal industries, not government policy.

"We're out of the business of picking winners and losers," he said.

Breitbart

http://www.breitbart.com/big-government/2018/03/29/delingpole-winning-scott-pruitt-bans-junk-science-from-environmental-protection-agency/

Scott Pruitt Is #Winning, Bans Junk Science from Environmental Protection Agency

By James Delingpole, 3/29/18

Junk science is no longer welcome at the Environmental Protection Agency. Administrator Scott Pruitt has declared war on what he calls "secret science" – the process whereby EPA regulators have been able to craft rules using non-publicly-available science data.

Pruitt told Daily Caller:

> "We need to make sure their data and methodology are published as part of the record. Otherwise, it's not transparent. It's not objectively measured, and that's important."

This decision will correct a longstanding injustice at the EPA, perpetrated against the U.S. taxpayer. For years the EPA has been able to behave as a law unto itself, cavalierly passing regulations which restrict

freedoms, hamper business and hold back the U.S. economy for reasons which have much more to do with left-leaning environmentalist politics than with objective science.

The problem dates back to the early 1990s when the EPA decided it wanted to regulate fine particulate matter known as PM2.5 but couldn't find any hard scientific evidence proving it was harmful.

Steve Milloy takes up the story in the Wall Street Journal:

> PM2.5 was not known to cause death, but by 1994 EPA-supported scientists had developed two lines of research purporting to show that it did. When the studies were run past the EPA's Clean Air Science Advisory Committee, it balked. It believed the studies relied on dubious statistical analysis and asked for the underlying data. The EPA ignored the request.
>
> As the EPA prepared to issue its proposal for PM2.5 regulation in 1996, Congress stepped in. Rep. Thomas Bliley, chairman of the House Commerce Committee, sent a sharply written letter to Administrator Carol Browner asking for the data underlying studies. Ms. Browner delegated the response to a subordinate, who told Mr. Bliley the EPA saw "no useful purpose" in obtaining the data. Congress responded by inserting a provision in a 1998 bill requiring that data used to support federal regulation must be made available to the public via the Freedom of Information Act. But it was hastily written, and a federal appellate court held the law unenforceable in 2003.
>
> The controversy went dormant until 2011, when a newly Republican Congress took exception to the Obama EPA's anticoal rules, which relied on the same PM2.5 studies. Again the EPA was defiant. Administrator Gina McCarthy refused requests for the data sets and defied a congressional subpoena.

The EPA has form here. Its first administrator, William Ruckelshaus banned the use of DDT in the U.S. despite copious evidence that it was not harmful to human life. A seven month EPA hearing, presided over by Judge Edmund Sweeney, concluded in a 9,000 page document:

> "DDT is not a carcinogenic hazard to man...DDT is not a mutagenic or teratogenic hazard to man...The use of DDT under the regulations involved here do not have a deleterious effect on freshwater fish, estuarine organisms, wild birds or other wildlife."

Ruckelshaus simply ignored it because it did not suit the result he wanted.

Needless to say, the environmentalists are furious that the EPA now has to stick to science rather than political activism.

The New York Times has billed it as "an attack on science" – as if, somehow, scientific experiments conducted in secret for political ends are somehow more representative of "science" than experiments which are both open and independently reproducible.

Milloy, who has followed this scandal more closely than any journalist, has had great fun parsing the more absurd claims made by the NYT.

His comments on the article (in bold) can be found at his Junk Science website:

Under the proposed policy, the agency would no longer consider scientific research unless the underlying raw data can be made public for other scientists and industry groups to examine. As a result, regulators crafting future rules would quite likely find themselves restricted from using some of the most consequential environmental research of recent decades, such as studies linking air pollution to premature deaths or work that measures human exposure to pesticides and other chemicals. [If you read my book "Scare Pollution," you cannot escape reaching the conclusion that the "studies linking air pollution to premature death" are not science, but fraud. After all, what reputable scientist would hide their data from public scrutiny for 20+ years? Only frauds do that. The NYTimes has elevated this fraud to the status of "research" when it has never been fairly reviewed or replicated.]

Opponents and supporters agree that the proposed new policy has its roots in the fossil fuel industry's opposition to a groundbreaking 1993 Harvard University study that definitively linked polluted air to premature deaths. ["Definitively"? Really? Total ignorance on the part of the NYTimes or just, gotta keep that narrative going.] The "Six Cities" study, widely considered one of the most influential public health examinations ever conducted, tracked thousands of people for nearly two decades and ultimately formed the backbone of federal air pollution regulations. [The Six City Study is and always has been total fraud. That's why the Harvard researchers been hiding their data for 24 years. It has two types of defenders — the ignornant and the lying.]

In that study, which began in the mid-1970s, scientists signed confidentiality agreements so they could track the private medical and occupational histories of more than 22,000 individuals in six cities around the country. They combined that personal data with home air-quality data in order to study the link between chronic exposure to air pollution and mortality. [Half of this study population were smokers or former smokers and virtually all were exposed to secondhand smoke. The exposure to PM2.5 from tobacco smoke far outweighs (by orders of magnitude) and PM2.5 in the outdoor air. Once again, no one cares about their personal information.]

Never mind the leftist #fakenews spin, though. For the moment – possibly for the first time since the organization was founded by Richard Nixon – genuine, reproducible science reigns at the EPA.

On energy and the environment, thanks to able administrators like Scott Pruitt, President Trump is most definitely #winning.

E.P.A. Prepares to Roll Back Rules Requiring Cars to Be Cleaner and More Efficient

By Coral Davenport and Hiroko Tabuchi, 3/29/18

The Trump administration is expected to launch an effort in coming days to weaken greenhouse gas emissions and fuel economy standards for automobiles, handing a victory to car manufacturers and giving them ammunition to potentially roll back industry standards worldwide.

The move — which undercuts one of President Barack Obama's signature efforts to fight climate change — would also propel the Trump administration toward a courtroom clash with California, which has vowed to stick with the stricter rules even if Washington rolls back federal standards. That fight could

end up creating one set of rules for cars sold in California and the 12 states that follow its lead, and weaker rules for the rest of the states, in effect splitting the nation into two markets.

Scott Pruitt, the head of the Environmental Protection Agency, is expected to frame the initiative as eliminating a regulatory burden on automakers that will result in more affordable trucks, vans and sport utility vehicles for buyers, according to people familiar with the plan.

An E.P.A. spokeswoman confirmed that Mr. Pruitt had sent a draft of the 16-page plan to the White House for approval.

The particulars of the plan are still being worked out. Those specifics, which are expected this year, could substantially roll back the Obama-era standards, according to two people familiar with the deliberations.

"This is certainly a big deal," said Robert Stavins, director of the Harvard environmental economics program. "The result will be more gas-guzzling vehicles on the road, greater total gasoline consumption, and a significant increase in carbon dioxide emissions."

According to two people familiar with the E.P.A.'s plans, Mr. Pruitt was scheduled to formally announce his proposal on Tuesday at an auto dealership in the Virginia suburbs, but the schedule remained in flux.

Major automakers would welcome the change. They are prepared to participate in making new rules that meet "our customers' needs for affordable, safe, clean and fuel-efficient transportation," said Gloria Bergquist, a spokeswoman for the Alliance of Automobile Manufactures, which represents many of the world's largest automakers.

In California, state lawyers said they were expecting a fight. The state has a special waiver under the 1970 Clean Air Act empowering it to enforce stronger air pollution standards than those set by the federal government, a holdover from California's history of setting its own air pollution regulations before the federal rules came into force. "We're prepared to do everything we need to defend the process," said Xavier Becerra, the attorney general of California, in an interview.

The California waiver gives the state considerable power to require automakers to stick to stricter standards. Not only is California a huge car market itself, but 12 other states including New York, Massachusetts and Pennsylvania have historically followed its lead. Together they represent more than a third of the domestic auto market.

"We're going to defend first and foremost existing federal greenhouse gas standards," Mr. Becerra said. "We're defending them because they're good for the entire nation. No one should think it's easy to undo something that's been not just good for the country, but good for the planet."

Mr. Pruitt has signaled that he is ready to take on such a challenge. "California is not the arbiter of these issues," he said in an interview with Bloomberg TV this month.

Under the Obama administration, the federal government toughened tailpipe pollution standards to match California's. Mr. Pruitt said the state standards "shouldn't and can't dictate to the rest of the country what these levels are going to be."

The E.P.A.'s senior clean air adviser, William Wehrum, this week traveled to California and met with the state's top clean air official, Mary Nichols. Both sides declined to detail what was discussed.
On Wednesday, a coalition of free-market groups including the Competitive Enterprise Institute urged Mr. Pruitt to take California on. "It is time for the E.P.A. to act," the groups said. If the agency did not act quickly, the groups said, "people across the state of California will be facing unrealistic and costly mandates which threaten their basic right to choose."

President Trump has also spoken about rolling back the efficiency rules, known as Corporate Average Fuel Economy, or Cafe. "I'm sure you've all heard the big news that we're going to work on the Cafe standards so you can make cars in America again," Mr. Trump said at a Detroit auto research facility in March last year. "We want to be the car capital of the world again. We will be, and it won't be long."

The rules, aimed at cutting tailpipe emissions of carbon dioxide, a major contributor to global warming, were one of the two pillars of Mr. Obama's climate change legacy. Put forth in 2012, they would have required automakers to nearly double the average fuel economy of new cars and trucks to 54.5 miles per gallon by 2025.

If fully implemented, the rules would have cut oil consumption by about 12 billion barrels and reduced carbon dioxide pollution by about six billion tons over the lifetime of all the cars affected by the regulations, according to E.P.A. projections.

The rules also would have put the United States, historically a laggard in fuel economy regulations, at the forefront worldwide in the manufacture of electric and highly fuel efficient vehicles. The United States and Canada are the only major nations that have adopted mandatory emissions standards through 2025. The European Union has only recently proposed standards for 2025 and 2030, while China has only started to work on standards for those years.

Less restrictive regulations in the United States could provide an opening for automakers to push for more lenient standards elsewhere as well, leading to the emission of more pollution by cars around the world. While sales of electric vehicles are starting to take off, they still represent barely 1 percent of global car sales. A shift among car buyers toward larger cars and trucks is already impeding progress in fuel economy.

"The concern is that automakers will go around the world basically trying to lobby regulators, saying, look, because the United States has reduced the pace, everywhere else should too," said Anup Bandivadekar, a researcher at the International Council on Clean Transportation, a think tank that focuses on clean car technology and policy. Global carmakers "apply developments in one region to lobby for changes in other regions."

American automakers initially accepted the plan by Mr. Obama in 2009 to harmonize what was then a hodgepodge of pollution and efficiency standards set by the E.P.A., the National Highway Traffic Safety Administration and California. And the automakers weren't in much of a position to resist; they had just taken an $80 billion bailout to survive a global economic crisis.

The plan would have spurred automakers to speed their development of highly fuel-efficient vehicles including hybrid and electric cars. But within weeks of Mr. Trump's inauguration last year, the chief executives of the nation's Big Three auto companies met with him in the Oval Office to say that the Obama tailpipe standard was too difficult to achieve.

Mr. Trump directed the E.P.A. under Mr. Pruitt to craft a new, less strict set of standards. The announcement expected on Tuesday would represent the first legal step in the process.

While Mr. Pruitt's proposal to open up the Obama rules to review isn't expected to include specific targets, "The proposed rollback is going to be quite a significant number," said Myron Ebell, who led Mr. Trump's E.P.A. transition team and directs the energy and environment policy at the Competitive Enterprise Institute, a Washington research organization that questions the established science of human-caused climate change. "It will be more than a couple m.p.g.," he said.

If the legal fight between California and the Trump administration escalates, one possibility is that the federal government might try to revoke the waiver allowing California to set its own rules. Some presidents, including George W. Bush, have considered revoking the waiver, but none have tried.

The announcement by Mr. Pruitt was not expected to include a decision on challenging the waiver.

Mr. Ebell suggested that one possible legal tactic for the Trump administration could be to announce that it will refuse to renew the current waiver on tailpipe emissions, which expires in 2025, rather than to revoke it outright. That would likely delay a court fight until California moves to set standards that go beyond 2025.

But such a move would also likely formalize, at least for the time being, two different sets of rules in the United States — the federal emissions rules, and California's stricter ones — a logistical headache for the industry.

While California and its ally states have long followed separate smog standards, those have been easier for automakers to meet because a car can be brought into compliance by adding a catalytic converter, for example. Designing for separate mileage standards is more difficult, because fuel economy is dependent on a car's weight and design.

A divided market could require substantially different car designs, experts say, putting the American auto industry into uncharted territory. It remains unclear how the issue might be resolved. One possibility is that two very different auto markets emerge, one with cleaner cars generally along the coasts, and another with more polluting cars concentrated in Middle America. On the other hand, automakers might also opt to generally adhere to the stricter California standards nationwide, blunting the impact of any Trump administration rollback of federal rules.

The automakers had hoped to avoid these complex scenarios by using their clout with the Trump administration to force California to go along with a relaxation of federal regulations. But "if they thought this would end by California rolling over and giving up its more stringent standards," said Kevin Poloncarz, a San Francisco lawyer who focuses on air and climate change law, "that was a miscalculation."

As a result, the automakers' victory might come with unexpected headaches for them, said Jody Freeman, a Harvard law professor and former counsel to the Obama administration.

For instance, if the rest of the world moves toward stricter rules anyway, the American market could find itself an industry laggard, ceding leadership in clean vehicle technology to markets like China or the

European Union. "I don't really know if the auto industry wants what this administration might be doing," she said. "It might be like the dog that caught the car."

North Jersey

https://www.northjersey.com/story/news/environment/2018/03/28/epa-begins-monitoring-air-residential-areas-fumes-wafting-edgewater-superfund-site/458747002/

EPA begins monitoring air in residential areas for fumes wafting from Edgewater Superfund site By Scott Fallon, 3/29/18

Environmental regulators have begun monitoring the air at residential developments near the Quanta Superfund site to see if elevated levels of a potentially dangerous chemical are wafting from cleanup work on the property that residents have been complaining about for months, officials said Wednesday.

The news came as more than 100 people packed a public meeting at Borough Hall where U.S. Environmental Protection Agency officials detailed steps they are taking to control fumes from the site, including elevated levels of naphthalene.

Agency officials said they would suppress the fumes with foam, air misters along the fence, plastic sheeting and other methods. EPA officials maintained that the naphthalene levels are not a public health risk although many in the audience remained skeptical.

"You have to take responsibility," Jane Hoffman, who lives adjacent to the site, said at the meeting to EPA officials. "There are people who have spent their life savings to buy a home here."

Residents have been complaining about the fumes for months, saying they are unrelenting even when work at the site has been halted. As a result, the EPA has established a new 24-hour hotline that residents can call if they smell odors from the site: 201-807-0991.

The site is undergoing a controversial $78 million cleanup by Honeywell and supervised by EPA where workers have to dig up contaminated soil to pump in cement that will keep coal tar, arsenic and oil byproducts from migrating offsite. Many residents had wanted the pollution excavated at the Hudson River site not entombed in perpetuity under a proposed housing complex.

Elevated levels of naphthalene have been emanating from the site almost every work day since May, according to air monitoring data provided by Honeywell.

Naphthalene continued to exceed the site's risk screening level of 4.62 micrograms per cubic meter in March with a high in recent weeks of 120 micrograms per cubic meter on March 19, which is 26 times the screening level.

EPA has begun taken air samples at three residential developments near the Quanta site – City Place, iPark and Independence Harbor. Two samples taken this month – one at City Place and another at iPark – had naphthalene levels slightly above 4.62 micrograms per cubic meter. The rest were either below the level or no naphthalene was detected. Samples taken last year did not exceed any risk levels, EPA officials said.

Naphthalene is "reasonably anticipated" to be a human carcinogen by the U.S. Department of Health and Human Services because studies showed that lab rats formed lung and nose tumors when breathing in the chemical daily. The EPA and the World Health Organization classify naphthalene as a possible human carcinogen.

EPA has said even the highest levels of naphthalene recorded at Quanta – 1,000 micrograms per cubic meter on Sept. 15 – do not present a health risk.

The screening level is based on the assumption that an individual is located at the perimeter of the Quanta site for 10 hours per day, five days per week, for 1½ years, regulators said.

"It's meant to be very conservative," Lora Smith, an EPA human health risk assessor, said of the 4.62 level. She said the Occupational Health and Safety Administration's exposure limit for workers is 50,000 micrograms per cubic meter and that is why workers do not wear respirators on site.

"Exceedances are not unexpected and they do not indicate there is an imminent public health threat," she said.

But residents have argued that condos, apartments, restaurants, stores and a hotel surround the Quanta site allowing prolonged exposure to the fumes in close proximity. Work at the site was temporarily halted following an article in The Record detailing the site's problems.

Dana Prigge, who lives near the site, said the fumes from Quanta can be noxious. She said she was overcome one day last month while walking near River Road.

"My eyes were burning, my nose was burning, my lungs were pulling in," she said in an interview before the meeting. "I knew there were chemicals in the air because I never react this way."

The fumes have become so bad that Prigge plans to move out of Edgewater when her lease is up in a few months.

"If I could move out tomorrow, I would," she said.

Bloomberg

https://www.bloomberg.com/news/articles/2018-03-30/epa-chief-s-50-a-night-rental-said-to-raise-white-house-angst

EPA Chief's $50-a-Night Rental Raises White House Angst

By Jennifer Dlouhy and Jennifer Jacobs

Environmental Protection Agency Administrator Scott Pruitt's lease at a Washington apartment owned by a lobbyist friend allowed him to pay $50 a night for a single bedroom -- but only on the nights when he actually slept there.

White House officials are growing dismayed about the questions surrounding Pruitt's living arrangement, including his initial inability to produce any documentation about his lease or his actual

payments, according to three officials. The landlord provided EPA officials with a copy of the lease and proof of the payments Pruitt made.

The questions follow criticism of Pruitt for traveling first class on airline flights.

In all, Pruitt paid $6,100 to use the room for roughly six months, according to copies of the checks reviewed by Bloomberg. Those checks show varying amounts paid on sporadic dates -- not a traditional monthly "rent payment" of the same amount each month.

That was because of the unusual rent schedule -- not a single monthly amount, but a daily amount charged only for days used for a single bedroom in the two-bedroom unit just blocks from the Capitol. The owner is a health care lobbyist, Vicki Hart. Her husband J. Steven Hart, is also a lobbyist and his firm represents clients in industries regulated by the EPA.

One person familiar with the lease compared it to an Airbnb-style arrangement, but Pruitt wasn't a transient and instead made the apartment his home on nights he was in Washington. The lease -- reviewed by Bloomberg -- says that he was charged $50 a night "based on days of actual occupancy."

Six Canceled Checks
Bloomberg reviewed six canceled checks paid by Pruitt totaling $6,100 from March 18 through Sept 1, 2017. He paid $450 on March 18, $900 on April 26, $850 on May 15, $700 on June 4, $1,500 on July 22 and $1,700 on Sept 1.

Justina Fugh, who has been ethics counsel at the EPA for a dozen years, said the arrangement wasn't an ethics issue because Pruitt paid rent. An aide said the agency had not reviewed the arrangement in advance.

The payments covered Pruitt's room in the two-bedroom unit, but did not afford him liberal use of common areas, where the owners had dinner parties and other functions, according to a person familiar with the situation. Someone else rented the other bedroom. According to the lease agreement, Pruitt's bedroom could not be locked.

After ABC News reported the living arrangement on Thursday, EPA aides had to seek documentation from the building's owners to prove he had paid rent, raising concerns at the White House, said two of the people, who asked not to be named discussing a sensitive matter involving a Cabinet secretary. Pruitt was in Wyoming on Thursday.

Related: Bumped? EPA Chief Signals He Will Be Flying Coach After Backlash

The disclosure follows revelations about Pruitt's reliance on first-class flights to travel around the globe and a series of pricey trips, including a visit by Pruitt and agency staff to Italy that cost $120,249. EPA officials have defended Pruitt's use of first-class flights on security grounds, but after a series of reports, he shifted to coach.

J. Steven Hart is the chairman of Williams & Jensen, a firm with a stable of energy industry clients including Oklahoma Gas & Electric Co., which paid the firm $400,000 in 2017, according to data compiled from the Environmental Integrity Project from disclosure forms.

Pruitt, the former attorney general of Oklahoma, has been an enthusiastic crusader against Obama-era regulations meant to combat climate change and limit air pollution. When Pruitt was in Oklahoma, he sued the EPA more than a dozen times.

Hart's individual lobbying clients include liquefied natural gas exporter Cheniere Energy Inc., the American Automotive Policy Council and Smithfield Foods Inc. But the Department of Energy -- not the EPA -- plays the major federal role overseeing LNG exports, and it is not clear Hart had direct contact with the EPA on behalf of any of his lobbying clients in 2017, according to a Bloomberg News review of disclosures.

"At the very least, it doesn't look good for the administrator of EPA to have rented an apartment from the wife of an energy industry lobbyist who represents companies regulated by EPA," said Eric Schaeffer, director of the Environmental Integrity Project.

Schaeffer called on EPA's inspector general and Congress to investigate.

Fugh, the EPA's ethics counsel, said no gift was involved. It was a routine business arrangement between Pruitt and an individual, not a lobbying firm, she added.

"He paid a fair price for what amounts to just a room," Fugh said. "So I don't even think that the fact that the house is owned by a person whose job is to be a lobbyist causes us concern."

Trump Dilemma: Give Businesses More Low-Skilled Work Visas or Not

By Laura Meckler, 3/30/18

Demand for low-skilled worker visas for the summer season starting Sunday is again far outstripping supply, with the Trump administration forced to choose between helping businesses seeking more visas or trying to save those jobs for American workers.

Some lawmakers tried and failed this month to secure an increase in the number of H-2B visas available for this summer as part of a large spending bill. One Senate proposal would have permanently raised the annual cap from 66,000 to 90,000, with no limits for certain jobs in areas affected by disasters. A House version would have increased the annual cap to 132,000.

The White House warned some lawmakers not to kick the decision to the Department of Homeland Security as they did in 2017, congressional aides said. "We did not want the discretion," an administration official said.

Nonetheless, DHS is now under pressure from the business community to provide more visas after the spending bill authorized the department's Secretary Kirstjen Nielsen to offer tens of thousands of extra visas if she sees fit.

A DHS spokeswoman, Katie Waldman, said no decision has been made. "We are currently looking at last year's implementation of the H-2B plus-up to determine how best to proceed this fiscal year," she said.

The H-2B visas, issued for low-skilled, seasonal foreign workers, are typically employed by landscaping companies, Alaskan fisheries, ski resorts and vacation spots, including some of President Donald Trump's properties.

Backers say the program provides needed foreign workers, often in remote locations where Americans are scarce. They say the problem is particularly acute given the current unemployment rate of 4.1%, the lowest in a decade.

"We rebranded 8,000 vehicles and put 'now hiring' on everything we own. We cannot get enough workers," said Todd Chambers, chief marketing officer for BrightView Landscapes, LLC, a large landscaping company that has used H-2B workers for more than a decade.

Opponents say businesses should try harder and raise wages if needed. "We should want the labor market to tighten and employers have to work overtime trying to entice American workers, especially those who've dropped out of the labor market," said Mark Krikorian of the conservative Center for Immigration Studies.

Ultimately, Democratic leaders killed the proposals to increase the visas, congressional aides in both parties said. Democratic aides said that was partly because they weren't willing to import more foreign workers at a time when Congress was failing to protect hundreds of thousands of young undocumented immigrants brought to the U.S. as children, known as Dreamers.

By statute, a total of 66,000 H-2B visas are available each year, divided evenly between winter and summer seasons. In past years, Congress has effectively raised the cap by exempting workers who are returning to jobs they had in previous seasons, but didn't do so last year nor this year.

For this summer season, businesses filed requests for more than 81,000 workers with the Labor Department on Jan. 1, the first day possible, a record, and more since then. Many firms tried to file applications after midnight on New Year's Eve to be near the front of the line.

This year, for the first time, DHS conducted a lottery among early applicants to pick winners, saying it was only fair given the crush of demand. Administration officials said that applications cleared by the Labor Department by mid-February were eligible. But several people who use the program said they were confused about why some petitions were included in the draw and others weren't.

BrightView Landscapes filed 94 petitions requesting a total of 3,500 visas, but was awarded fewer than 500, compared with 1,600 last year, said Sarah Powenski, vice president and associate general counsel at the company.

Company officials say they are frustrated that the program has been caught up in the larger immigration debate. "This thing has become more of an immigration issue in people's minds," said Mr. Chambers. "It's been attached to a third rail issue."

Faced with the same situation last year, John Kelly, then DHS secretary and now White House chief of staff, fumed. He argued that if Congress wanted more visas, then lawmakers should have approved them.

Many lawmakers lobbied him to approve additional visas. His boss, President Donald Trump, ran for office promising to protect American workers against foreign competition, and White House officials pressured him against it, according to people familiar with the decision making.

Ultimately, Mr. Kelly allowed up to 15,000 additional visas for guest workers, though not until the summer was half over. He set a high bar for businesses that wanted to apply and described the approval as a "one-time" move.

Trump's VA pick blindsides staff, deepens agency disarray

By Lorraine Woellert, Eliana Johnson, and Connor O'Brien, 3/29/18

The timing of President Donald Trump's announcement to name Rear Admiral Ronny Jackson to lead Veterans Affairs was a snap decision that surprised his own chief of staff and knocked the government's second-largest agency, already bedeviled by scandal, deeper into disarray.

White House chief of staff John Kelly had spoken with David Shulkin by phone Wednesday morning, reassuring the now-former VA secretary that he wouldn't be fired by tweet that afternoon. Hours later, Kelly had to phone Shulkin again telling him plans had changed.

Trump declared Jackson's nomination on Twitter at 5:31 p.m. The tweet was big news — not just to the public, but to some senior aides, according to one White House official.

The chaos — by now a typical part of the president's management style — has for months upended Kelly's attempts to ensure that an unorthodox White House adheres to traditional processes. But while White House aides are left unpacking the day's events, the drama at the VA is just beginning.

Deputy Secretary Thomas Bowman, a Trump appointee who is the agency's No. 2, is widely expected to leave soon, either by choice or by force. Kelly and other aides wanted Bowman gone before Shulkin left to avoid installing the deputy at the helm, even temporarily. Bowman had pushed back on broad privatization efforts, leading Trump to berate him in an Oval Office meeting for his lack of loyalty.

Trump got around the Bowman problem by naming Robert Wilkie, an undersecretary at the Department of Defense, to the temporary job. A Capitol Hill veteran and member of Trump's transition team, Wilkie is a former senior adviser to Sen. Thom Tillis (R-N.C.), who supports expanding service members' access to private doctors.

"He's got a department that's in turmoil. It's in crisis. There's warfare there," said Anthony Principi, who led the agency under former President George W. Bush. "And you have an acting secretary who doesn't know the VA."

But if and when Bowman departs, Wilkie will be left with a shallow bench at an agency already paralyzed by political mistrust, some veterans' advocates say. The VA's health and benefit agencies — which administer tens of billions of dollars in health programs, pensions, survivor benefits and other forms of assistance to some 9 million service members — have been without Senate-confirmed officials since the Obama administration.

Veterans Affairs is the second-largest federal agency, behind only the Department of Defense, with 377,000 employees. And it has proven unwieldy even when led by highly decorated, experienced administrators such as Eric Shinseki, a retired four-star Army general who resigned during the Obama administration amid a scandal over lengthy wait times and faulty scheduling practices for medical appointments.

Shinseki was followed by Bob McDonald, an Army veteran and former Procter & Gamble CEO. Shulkin, McDonald's successor, was the first non-veteran to lead the VA.

As recently as two weeks ago, the Trump White House was still making overtures to potential candidates for the top job, according to a person with direct knowledge of the inquiries. Trump reportedly agonized over the decision, changing his mind several times, a senior administration official said.

"Instead of going through the paces to convince the best possible person to take this job, they're going with the person who's still on active duty in the Navy and can't say no to the commander in chief," said one Obama White House aide, who spoke highly of Jackson as a doctor and individual. "You could look at it as them giving up trying to find a competent commander or manager to fix the problems."

Shulkin had come under fire after a VA inspector general's report accused him of improperly accepting tickets to the Wimbledon tennis tournament and using his agency staff to arrange a sightseeing tour of Denmark and England. He repaid the VA for the trip. The longtime hospital administrator, who was engaged in open warfare with conservatives in the department intent on privatizing the VA, contended he was set up.

Veterans' groups remained loyal to Shulkin, whom they saw as their best line of defense of against privatization. During his campaign, Trump made promises that veterans would be allowed to seek medical treatment outside the VA's system, statements taken by some to mean a step toward handing the system to commercial companies to manage.

Jackson, while well-liked by both Republicans and Democrats, is a cipher on privatization and other policy issues. With no agency experience to speak of, veterans suspect he could be installed as a figurehead, leaving lower-level appointees to steer the agency toward privatization.

"He's a blank slate. Nobody knows really anything about his competency or capacity for this job," said Paul Rieckhoff, CEO of Iraq and Afghanistan Veterans of America. "We especially know that being a veteran doesn't qualify you to run the VA any more than being a soldier qualifies you to run the DoD."

Principi urged Jackson to move quickly on his own agenda.

"The new secretary, really, if he wants to accomplish anything, has to hit the deck running and has to bring in some very, very good people," he said. "I hope and pray he's a success. Because if he's not, American veterans are going to be the losers."

Subject: Morning Energy: Perry's latest bid to save coal — NEPA focus of hearing today — More on the Pruitt front

By Kelsey Tamborrino | 04/25/2018 05:54 AM EDT

With help from Anthony Adragna

PERRY'S LATEST BID TO SAVE COAL: So far, Energy Secretary Rick Perry has had no success in his effort to construct a safety net to keep alive coal-fired and nuclear power plants threatened with shutdowns — a mission that's come straight from President Donald Trump. And Perry's latest potential gambit to use the 1950 Defense Production Act in hopes of designating the plants as crucial for national security may not fare better than his previous efforts, energy experts tell Pro's Eric Wolff.

Experts say the bid would stretch the definition of the law and almost certainly draw legal challenges. Plus invoking the act that was last used by the Obama administration to push advanced biofuels would probably hit a snag in Congress, since lawmakers would need to approve perhaps billions of dollars in funding to keep the plants afloat, the experts say.

Using the Korean War-era law to protect the plants could be a novel approach to aiding power plants, Eric writes, especially after Perry failed to gain FERC's support for his proposal to give the plants financial backing. And since Energy Department lawyers stymied a push last year to invoke the agency's authority under the Federal Power Act to force the plants to run, Perry and his staff appear to have very few viable options left.

But the fresh take on the act doesn't necessarily mean it'll work. "To me, it's a tough argument to make. It's a specious argument on its surface that seems like a perversion of the intended use of the Defense Production Act," said Tom Hicks, a former acting undersecretary of the U.S. Navy under former President Barack Obama and now a principal at the advisory firm The Mabus Group. WELCOME TO WEDNESDAY! I'm your host Kelsey Tamborrino, and James Daniel was the first to guess the most recent senator to appear on a U.S. postage stamp. It was Maine's Margaret Chase Smith, who appeared during the Distinguished Americans Issue in 2007, worth a whopping 58 cents face value. A geography question for today: The Blue Nile and the White Nile combine to form the Nile River at which capital city? Send your tips, energy gossip and comments to ktamborrino@politico.com, or follow us on Twitter @kelseytam, @Morning_Energy and @POLITICOPro.

POLITICO's Ben White is bringing Morning Money to the Milken Institute Global Conference to provide coverage of the day's events and evening happenings. The newsletter will run April 29 — May 2, 2018. Sign up to keep up with your daily conference coverage.

DON'T FEAR THE NEPA? House Natural Resources will hold an oversight hearing this afternoon on what it calls the "weaponization" of the National Environmental Policy Act, and it could be a doozy. The committee notice calls NEPA — the seminal law that requires an environmental review on all federal actions — activists' "weapon of choice." Republicans have long-sought to undo parts of the law, and today's hearing will likely echo some of the rhetoric out of the Trump administration, which has supported faster NEPA reviews as part of its infrastructure push . The hearing will review challenges from NEPA and will evaluate reforms to "de-

weaponize" the law to "minimize opportunities for bad faith litigation, and restore the law to its original intent," according to a committee notice.

The committee previously took up the topic last year, holding a similar hearing in November on modernizing the law for the 21st century. James Coleman, a law professor at the Southern Methodist University, is expected to say the current NEPA process is "broken" and that bipartisan efforts to fix the problem have failed. "As President Obama's regulatory czar put it, 'If the permitting bureaucracy were a supervillain, it would be the Blob,'" he'll say, according to his testimony. "Right now, the Blob is winning: We have lost decades of investment while environment reviews grow longer and longer. How can we ensure that the U.S. does not fall behind our global competitors?"

Meanwhile, Laura Alice Watt of Sonoma State University, who says she is a proponent of environmental reviews that are conducted consistently, will discuss the effect of NEPA on the Point Reyes National Seashore, where a review over the last 20 years has contributed to the erosion of active ranches. Melissa Hamsher of Eclipse Energy Resource Corporation and former CEQ official Horst Greczmiel will also testify. Democratic Rep. Donald McEachin , ranking member of the Oversight subcommittee, will say that he'll hold the administration and Republicans to account on NEPA. "Many communities — and especially vulnerable minority and low-income communities — have had to endure a decades-long pattern of environmental injustice, in no small part because they were denied a say in important decisions that affected them," McEachin is expected to say. **If you go:** The hearing kicks off at 2 p.m. in 1324 Longworth.

SPEAKING OF NEPA: The League of Conservation Voters sent this letter to House members Tuesday urging them to oppose H.R. 3144 (115), which LCV says would "attack" the Endangered Species Act and NEPA by "mandating dam operations harmful to endangered salmon and steelhead in the Pacific Northwest."

ADD THIS TO THE LIST: Two days before two House hearings and fresh off an announcement on EPA's plan to bar scientific studies that don't publicly disclose data, Administrator Scott Pruitt got another appointment to testify on his agency's budget. This time Pruitt will appear in May before the Senate appropriations subcommittee that oversees EPA's budget, Lisa Murkowski said Tuesday.

OH, TO BE A FLY ON THE WALL: Sen. Shelley Moore Capito, one of the Republican EPW members open to a hearing with Pruitt, told ME Tuesday she has a "well-timed" phone call with him scheduled for this week. "I think he wants to talk about some regulatory measures," she said. "But I'm going to probably ask him questions on the current state of some of the things that I've read and we'll see where it goes." She said the call had been set up last week.

McConnell voices support ... again: Majority Leader Mitch McConnell told reporters Tuesday he remained a supporter of Pruitt's, while noting the EPA chief's busy Thursday on the Hill. "We'll just see," he said. "I expect there will be a lot of interest."

PERROTTA WORKED FOR TRUMP-BACKED MEDIA COMPANY: Pasquale "Nino" Perrotta — the Secret Service veteran who heads Pruitt's security detail — previously worked on assignments for the tabloid publishing company American Media Inc. during the 2016 presidential campaign, The New York Times reported Tuesday. While it is unclear when Perrotta started working at AMI, the Times reports some of his activities at the company included physical security, cybersecurity and investigative services involving litigation. Read more.

OLD AD-AGE: The Natural Resources Defense Council is sponsoring an ad today in The Washington Post that calls for Pruitt's ouster. The ad — which says: "President Trump promised to drain the swamp. He should start with EPA Administrator Scott Pruitt" — will run as an insert in 3,000 copies of the Post and will be delivered to Capitol Hill on Thursday. See it.

IF YOU PLAY YOUR CARDS RIGHT: The Environmental Defense Fund mapped out what it says are Pruitt's unanswered questions surrounding scandals while he helms EPA and during his time as Oklahoma attorney general — 86 of them to be exact. The group will also hand out a deck of "Non Trivial Pruitt Questions" during Thursday's hearings with a sampling of the ethical questions. See the cards here.

Rally cry: Separately, the American Federation of Government Employees will hold a rally today from noon until 1 p.m. in support of EPA workers. Democratic Reps. Salud Carbajal, Don Beyer, Bill Foster, Sheila Jackson Lee, Alan Lowenthal, Grace Meng, Jamie Raskin and Debbie Wasserman Schultz are all set to attend the rally, which will take place outside of EPA headquarters.

MACRON ADDRESS LAWMAKERS: French President Emmanuel Macron hits the Hill this morning to address a joint session of Congress. Earlier this week, the French president said he'd call for continued U.S. intervention in Syria in his speech. "I will advocate for multilateralism," Macron said in an interview on "Fox News Sunday." But it's also possible issues concerning climate will come up — which would likely receive a welcome reception from Democrats.

Macron, a staunch supporter of the Paris accord, also briefly mentioned climate during a joint press conference with the president Tuesday. "We also talked about the climate. And here, also, we know where we stand," Macron said vaguely. "France will continue to work on major pieces, including the global compact for the environment. But I think I can say that our economic — our businesses, our researchers can continue to work on — can create solutions in the field." Both he and Trump are "attached to that," he said.

Bold move: It's probably not an indication of environmental topics to come, but Apple CEO Tim Cook brought former EPA chief Lisa Jackson to Tuesday's state dinner with Macron. Jackson, who now works as vice president of environment, policy and social initiatives at Apple, has attended events with Cook in the past — but it's an interesting move considering Jackson's not been known to mince words about the Trump administration. For what its worth, Cook will meet today with Trump in the Oval Office.

MORE NOMS: Trump sent James Hubbard's nomination to be undersecretary of Agriculture for natural resources and the environment to the Senate Tuesday. Hubbard, of Colorado, replaces Robert Bonnie, who resigned from the post.

DEMOCRATS CITE SAFETY: Three Energy and Commerce Democratic leaders on Tuesday called on the Government Accountability Office to probe EPA's enforcement of federal health and environmental safeguards. "We are concerned that President Trump's and Administrator Pruitt's policies to 'streamline' permitting processes, reduce regulatory 'burdens' for industry, and defer to states on enforcement will lead to more environmental law violations due to lax enforcement at both the state and federal level," ranking member Frank Pallone and Reps. Diana DeGette and Paul Tonko write in a letter to GAO Comptroller Gene Dodaro. Read it here.

MAIL CALL! GOING NUCLEAR: Former national security officials and nonproliferation experts will send this letter today to congressional foreign affairs leadership stating that for national security reasons, it is in the U.S.' best interest to have a nuclear cooperation agreement — a so-called 123 Agreement — with Saudi Arabia.

— **Democratic Sens. Maria Cantwell and Jeff Merkley** and Reps. Raúl Grijalva and Jared Huffman sent a letter to Interior Secretary Ryan Zinke on Tuesday, calling on him to undo plans for a 2019 lease sale in Alaska's Beaufort Sea. Read it here.

— **Sen. John Barrasso, chairman of the Senate EPW Committee and Capito,** subcommittee chairwoman on clean air and nuclear safety, sent a letter to Pruitt and Perry, asking them to protect the confidential business information of U.S. small refineries. Read the letter here.

AT IT AGAIN: Michigan GOP Rep. Fred Upton officially filed for reelection in the state's 6th District, MLive reports. "We are full steam ahead and excited about the future," the Energy and Commerce lawmaker said in a statement.

A TANGLED WEB: The Environmental Data & Governance Initiative is out with a new monitoring report this morning that says EPA removed pages related to "international priorities" and "international grants and cooperative agreements," as well as corresponding links, from its International Cooperation web page. The page in question listed priority areas including "strong environmental institutions," "climate change" and "clean water," among other terms, which EDGI says were removed in December 2017. Read the report here and see screenshots here.

GROUPS TO SUE OVER DRINKING WATER IN NEW JERSEY: The NRDC and Newark Education Workers Caucus say they will sue the city of Newark, N.J., and Catherine McCabe, the acting commissioner of the New Jersey Department of Environmental Protection, over lead contamination in the city's drinking water, Pro New Jersey's Danielle Muoio reports. A Newark city official said Tuesday that the complaint filed by the groups is "absolutely and outrageously false."

OLYMPIANS HEAD TO HILL FOR CLIMATE: Five Winter Olympians will brief House and Senate offices today on the impact of climate change on winter sports and outdoor recreation. Cross-country skier Jessie Diggins, freestyle skier David Wise, halfpipe snowboarder Arielle Gold, biathlete Maddie Phaneuf and alpine skier Stacey Cook all will appear on the panel, which is co-hosted by nonprofit Protect Our Winters, Citizens Climate Lobby, and Sens. Michael Bennet and Susan Collins. **If you go** : The briefing begins at 12:30 p.m. in 538 Dirksen.

CORRECTION: The April 24 edition of Morning Energy misstated the purpose of H.R. 3144 (115). The bill would codify the 2014 Biological Opinion until 2022, while the NEPA and the environmental impact statement processes continue.

QUICK HITS

Stories from POLITICO Pro

Perry's latest bid to help coal faces uphill battle Back

By Eric Wolff | 04/25/2018 05:08 AM EDT

Energy Secretary Rick Perry's latest idea to protect coal-fired and nuclear power plants may not fare much better than his previous efforts, according to energy experts.

Perry is considering invoking the 1950 Defense Production Act to keep money-losing power plants running by designating them as crucial for national security. But that would stretch the definition of the law and almost certainly draw legal challenges — and it would hit a big hurdle in Congress, which would need to approve perhaps billions of dollars in funding to keep the plants afloat, the experts said.

At the urging of President Donald Trump, Perry has sought to keep open coal and nuclear power plants that are threatened with shutdowns amid the stagnant demand for power — and even as natural gas and renewable power sources grab a growing share of the market.

So far, Perry's had no luck. FERC earlier this year rejected his proposal to give the plants financial support, and Energy Department lawyers stymied a push last year to invoke the agency's authority under the Federal Power Act to force the plants to run.

Some experts said any attempt to use the DPA is likely to meet the same fate.

"To me, it's a tough argument to make. It's a specious argument on its surface that seems like a perversion of the intended use of the Defense Production Act," said Tom Hicks, a former acting undersecretary of the Navy under former President Barack Obama and now a principal at the advisory firm The Mabus Group. "Defense Production Act is on the vanguard of the need for resources, not on the back end for an industry being challenged by economic forces."

But the effort has been a priority for Trump and Perry, who sees saving coal-fired power generation as vital to U.S. security, according to a source familiar with the conversations on the issue.

The Cold War-era law grants the federal government powerful authorities to inject cash into companies essential for national defense in order to preserve domestic supplies of key products. But DOE will have to make the case that electricity produced specifically from coal and nuclear power plants, and not other types of power, is a critical resource.

Using the act to protect the plants when there appeared to be no immediate shortage of power supplies would be a novel application that would almost certainly face legal challenge.

"If the administration uses DPA, they're going to be using it very creatively," said Ari Peskoe, director of the Electricity Law Initiative at the Harvard Law School Environmental and Energy Law Program. "They may come up with reasoning for higher rates and who's going to pay for it. Whether that will hold up, I don't know."

Perry and his staff appear to have very few viable options for bailing out coal and nuclear power, a major energy priority for Trump, who has promised to revive the coal industry. DOE has opened a comments process for interested parties to weigh in on its use of the Federal Power Act's 202(c) emergency provisions, though that would require the agency to go through FERC, which unanimously rejected a similar Perry effort in January.

The 202(c) effort has been pushed by coal magnate Bob Murray, owner of Murray Energy, and by FirstEnergy Solutions, the unit of of FirstEnergy Corp. that is in bankruptcy proceedings and which expects to shut down four coal and nuclear power plants. That company asked DOE to use the emergency authority to save not only its plants, but all 85 coal and nuclear power plants in the PJM Interconnection power market.

The DPA was last used by the Obama administration starting in 2012 to help spur the biofuels industry to develop the kind of advanced biofuels that could power ships and aircraft. The government can purchase capital equipment for the cause of national security, and it can fund advertising to support the effort.

And it allows the government to become the buyer of last resort, which could put Washington on the hook to buy excess power generated by coal and nuclear plants. Technically, this electricity could only be purchased at the "cost of production," a level that in the past has been determined by a team within the Defense Department.

While no hard estimate for the cost of a DPA subsidy exists, consultants analyzing Perry's previous bailout proposal estimated costs between $4 billion and $10.6 billion annually.

That's a far higher level than Congress typically allocates for the DPA. It provided $67.4 million in the omnibus passed in March, H.R. 1625 (115), down slightly from the $76 million it provided for all projects in 2017, according to a report submitted to Congress.

And Congress — and the Republican Party — is deeply divided on using government subsidies to save these plants. Rep. David McKinley (R-W.Va.) has some allies from other coal districts for the effort, but other free market-oriented lawmakers like Rep. Pete Olson (R-Texas) say they want to see markets function unimpeded.

McKinley's staff has been in touch with DOE and the White House, as has West Virginia Sen. Joe Manchin (D).

"I think it's an emergency national concern for the national defense of our country. I think Rick Perry agrees with it, and I think the president does also," Manchin told POLITICO.

PJM has itself said the retirement of FirstEnergy's coal plants did not pose a threat to the region's power supplies, and that it had ample generation to meet demand. It has opposed any effort to mandate to require the plants to stay online.

"We believe that a market-oriented approach consistent with the American free-enterprise system offers better results than government-mandated subsidies," said PJM spokesman Jeff Shields.

Anthony Adragna contributed to this report.

Pruitt scales back EPA's use of science Back

By Emily Holden and Annie Snider | 04/24/2018 03:28 PM EDT

Environmental Protection Agency chief Scott Pruitt announced Tuesday he would seek to bar the agency from relying on studies that don't publicly disclose all their data, a major policy change that has long been sought by conservatives that will sharply reduce the research the agency can rely on when crafting new regulations.

The unveiling of the proposed rule delivers a win to Republicans like House Science Chairman Lamar Smith (R-Texas), who unsuccessfully pushed legislation to impose the same type of change. The move also demonstrates Pruitt's persistence in pursuing President Donald Trump's anti-regulation agenda just two days before the embattled EPA chief is due to face fierce questioning from lawmakers about his hefty spending, expanded security detail and cheap condominium rental from the wife of an energy lobbyist.

At an invitation-only meeting at EPA headquarters with Smith, Sen. Mike Rounds (R-S.D.) and other supporters of the policy, Pruitt said the proposed rule was critical in ensuring that the agency was transparent about how it is making decisions to justify costly new regulations. It is the latest step Pruitt has taken to fundamentally shift the agency's approach to science.

"It is a codification of an approach that says as we do our business at the agency the science that we use is going to be transparent, it's going to be reproduceable, it's going to be able to be analyzed by those in the marketplace. And those who watch what we do can make informed decisions about whether we've drawn the proper conclusions or not," Pruitt said.

Text of the proposed rule was not immediately available.

The proposal, based on legislation pushed by Smith, is intensely controversial, and scientists and public health groups say it will prevent federal regulators from enacting health and safety protections. Nearly 1,000 scientists, including former EPA career staffers, signed a letter opposing the policy sent by the Union of Concerned Scientists to Pruitt on Monday.

Their primary concern was that many of the country's bedrock air and water quality regulations are based on research that cannot disclose raw data because it includes the personal health information.

But industry has its own version of the same problem. EPA often relies on industry studies that are considered by companies to be confidential business information when determining whether new pesticides and toxic chemicals are safe to use. Internal EPA emails obtained under the Freedom of Information Act show that EPA political officials, including Nancy Beck, who became the chief of the agency's chemical safety office last year after working for years at a chemical industry lobbying group, worried that the new policy would limit the agency's ability to consider industry data or would force companies to make this proprietary data public.

"We will need to thread this one real tight!" Richard Yamada, political official who led work on the new policy wrote to Beck after she raised the concerns.

It was not immediately clear if the new proposed rule included measures to address those concerns.

Rush Holt, CEO of the American Association for the Advancement of Science, said Pruitt's changes could keep the agency from revising public health regulations as problems arise or new data comes to light.

"On the surface it sounds so innocuous or even beneficial. What could be wrong with transparency? Well it's clear to me that this is not based on an effort to be transparent. It is rather based on an effort to be just the opposite," he said.

"EPA is particularly important because when science is misused, people die," he added.

Pruitt has been discussing the new scientific policy publicly for weeks, but it only went to the White House for interagency review last week. Such swift review is very rare for the Office of Management and Budget, which often takes months to vet a new policy. At least one group, the Environmental Defense Fund, has requested a meeting with OMB officials to discuss the rule, but OMB's website shows that no meetings have been scheduled with interested groups.

Many public health studies can't be replicated without exposing people to contaminants, and environmental disasters such as the Deepwater Horizon oil spill cannot be recreated, the group said, raising intellectual property, proprietary and privacy concerns.

Pruitt's predecessor Gina McCarthy, and her air chief Janet McCabe, in an op-ed in The New York Times in March said concerns about studies are dealt with through the existing peer-review process, which ensures scientific integrity.

"[Pruitt] and some conservative members of Congress are setting up a nonexistent problem in order to prevent the E.P.A. from using the best available science," they said.

Murkowski: Pruitt will testify to Senate appropriators Back

By Anthony Adragna | 04/24/2018 03:03 PM EDT

EPA Administrator Scott Pruitt is scheduled to testify in May before the Senate appropriations subcommittee that oversees his budget, Sen. Lisa Murkowski (R-Alaska), who chairs the panel, said today.

Murkowski did not elaborate on her plans for the hearing or how much it would delve into Pruitt's ethics and spending. But she said it was "absolutely appropriate" for the Environment and Public Works Committee to hold an oversight hearing on the administrator's conduct in office, an idea that has been endorsed by multiple Republicans on the authorization committee.

"I'm hoping they move on it sooner than later," Murkowski said of the EPW committee.

EPW Chairman John Barrasso (R-Wyo.) said today he has "serious questions" about how Pruitt has handled taxpayer dollars but stopped short of announcing plans for Pruitt to testify.

"We'll see what comes out of the hearings this Thursday," Barrasso said, referring to Pruitt's scheduled appearance of two House hearings that day.

Barrasso said he planned to send additional letters to EPA, following his recent request for details on the administrator's use of four separate email accounts. In response to that earlier letter, EPA told him all of Pruitt's accounts are searched in response to public records requests.

"You want to make sure taxpayers are getting value for their dollars," Barrasso told reporters today. "We want to make sure money is being spent appropriately."

WHAT'S NEXT: Murkowski declined to say when Pruitt would appear before her Appropriations Subcommittee on Interior, Environment and Related Agencies, but she has said previously it was expected to be the week of May 7.

Pruitt support in Senate erodes as GOP lawmakers seek hearings Back

By Anthony Adragna | 04/23/2018 08:32 PM EDT

Scott Pruitt's wall of GOP support is developing new cracks, with three key Senate defenders calling for hearings into the embattled EPA administrator's recent controversies — and Sen. Lisa Murkowski announcing Tuesday that she plans to bring him before her appropriations panel in May.

Three other Republicans, including staunch Pruitt ally Sen. Jim Inhofe (R-Okla.), told POLITICO on Monday that they would also support hearings by the Senate Environment and Public Works Committee to look into the former Oklahoma attorney general's actions. Their words came as Pruitt, who has managed to hold onto President Donald Trump's public support for now, faces a pair of House hearings Thursday that could be make-or-break for his hopes of remaining in the Cabinet.

"I think that a couple of us on the committee think it's appropriate to have a hearing in so far as any accusation having to do with his office is concerned," Inhofe told POLITICO.

Inhofe said he was troubled by a report over the weekend in The New York Times detailing a sweetheart deal Pruitt received on an Oklahoma City home previously owned by a lobbyist while serving in a state government. The Oklahoma Republican declined to discuss which allegations he found disturbing, but said "there are some things in there that I'd like to check out and see."

Joining his call for a Senate hearing were two other senior GOP members of the EPW panel, Sens. Shelley Moore Capito (W.Va.) and John Boozman (Ark.).

"Most people have concerns about some of the allegations," Boozman said. "At some point he'll be before the committee and we'll dig deeper and see exactly what's going on."

EPW Chairman John Barrasso (R-Wyo.) said Tuesday that he has "serious questions" about how Pruitt has handled taxpayer dollars, but he stopped short of announcing plans for Pruitt to testify.

"We want to make sure money is being spent appropriately," Barrasso said.

Murkowski (R-Alaska), who chairs the subcommittee that oversees EPA's appropriations, did not elaborate on her plans for her own hearing with Pruitt, or how much it would delve into his ethics and spending. But she said it would be "absolutely appropriate" for Barrasso's panel to hold an oversight hearing on the administrator's conduct in office, an idea that multiple Republicans on the authorization committee have endorsed.

"I'm hoping they move on it sooner than later," Murkowski said of the EPW Committee.

To date, four House Republicans have called on Pruitt to resign, along with scores of elected Democrats. And Sen. Susan Collins (R-Maine), has said Pruitt was "the wrong person" to lead the agency based on his policies.

Pruitt has drawn criticism about his ethics and lavish spending in recent months. Three congressional committees, the White House and EPA's inspector general are all probing his behavior, ranging from his security expenses, high pay raises for aides, first-class travel and meetings with a coal group.

The House Oversight Committee has requested interviews with five senior agency aides. The White House said it would formally investigate Pruitt's expenses after the Government Accountability Office last week found EPA broke the law by failing to notify Congress about a $43,000 privacy booth Pruitt had built in his office.

Pruitt will go to the Hill on Thursday to testify before a House Energy and Commerce subcommittee in the morning and at a House Appropriations subpanel in the afternoon. Those appearances will mark his first time before Congress since the recent allegations broke.

Both Inhofe and Capito said they thought those House hearings would prove pivotal for Pruitt's long-term future in the administration.

"It's really important," Capito said. "He's going to have to answer some tough questions. I'm sure they'll be put to him by both sides and we'll see what his response is."

Meanwhile, EPW ranking member Tom Carper (D-Del.) said he had a good conversation with House Oversight Chairman Trey Gowdy (R-S.C.) regarding Pruitt, but he said there was no formal bipartisan agreement to work together on an investigation.

"I just gave him plenty of encouragement that he's doing the right thing," he said.

But the mounting public criticism from Republicans suggests GOP lawmakers' patience in defending the EPA chief's behavior is waning.

"Some of the things that he's done and that he's been alleged to do are just indefensible," Sen. John Kennedy (R-La.) said. "You just can't put lipstick on those pigs. You can't."

French president to call for American role in Syria Back

By Ian Kullgren | 04/22/2018 10:03 AM EDT

French President Emmanuel Macron said Sunday he will call for continued U.S. intervention in Syria before a joint session of Congress this week.

"I will advocate for multilateralism," Macron said in an interview on "Fox News Sunday."

Macron is visiting Washington this week in the first official state visit of the Trump presidency. In an interview with Chris Wallace at the presidential palace in Paris, Macron said he has a "special relationship" with President Donald Trump, describing them both as political outsiders.

"Both of us are probably the maverick of the systems on both sides," Macron said. "President Trump's election was unexpected in your country and probably my election was unexpected in my country."

Macron said that the United States is still an indispensable player for achieving peace in the Middle East, adding that France will rely on the U.S. in Syria once the conflict comes to an end.

"We will have to build a new Syria afterwards," he said.

Apple's Tim Cook attending White House state dinner for Macron Back

By POLITICO Pro Staff | 04/24/2018 07:15 PM EDT

Apple CEO Tim Cook is attending tonight's White House state dinner for French President Emmanuel Macron.

Cook was spotted arriving for the dinner with former EPA Administrator Lisa Jackson, who is now vice president of environment, policy and social initiatives for Apple, according to a pool report.

Jackson served as head of the EPA under former President Barack Obama.

Subject: Morning Energy: Another mess for Pruitt — Virgin Islands party boss: Zinke ties improved hurricane response — Coal magnate delivered draft orders to Trump

By Kelsey Tamborrino | 06/07/2018 05:41 AM EDT

With help from Darius Dixon, Anthony Adragna and Annie Snider

ANOTHER MESS FOR PRUITT: Scott Pruitt has an appetite for food from the White House mess — a U.S. Navy-run restaurant for use only by White House officials, Cabinet members and other dignitaries. In fact, he loves eating there so much, the White House asked him to stop coming by so often, POLITICO's Emily Holden, Andrew Restuccia and Anthony Adragna report.

The message was clear, according to one person close to Pruitt: "We love having Mr. Pruitt, but it's not meant for everyday use." A member of the White House's Cabinet affairs team told agency chiefs of staff last year that their bosses shouldn't treat the mess like their personal dining hall — a comment that came in response to Pruitt's recurring use of the restaurant, sources said.

Pruitt's allies privately disputed that the warning about overuse of the mess was aimed squarely at him, but nobody contests that he's a frequent presence at the establishment in the basement of the West Wing. The White House did not respond when asked about his lunch habits, and EPA declined to comment.

A billing statement from July 2017 offered a glimpse into Pruitt's trips to the mess, racking up a bill of $400 over nine trips that month — a relative bargain in downtown Washington considering the menu. A cheeseburger at the White House runs just $6.35, according to Pruitt's bill. Compare that to the $17 you'd pay for a burger from another favorite Pruitt spot, French bistro Le Diplomate. Read more.

Support for Pruitt is also falling on Capitol Hill, Anthony and Emily report, in the wake of this week's news that Pruitt sought to buy a used mattress from the Trump Hotel and inquired about securing a Chick-fil-A franchise for his wife. Two more top aides to Pruitt — scheduler Millan Hupp and counsel Sarah Greenwalt — also are leaving the agency. "I'm not going to come down here, just because he happens to be a nominee of a president I support or a nominee from my party, and try to defend the indefensible," Sen. John Neely Kennedy said. More here.

On the other hand, Cory Gardner, who heads the Senate GOP campaign arm, told reporters he doesn't think Pruitt's ongoing ethics woes will harm his party in the midterms. "The states like Missouri, Indiana, North Dakota have benefited from a regulatory approach this administration has taken," Gardner said.

Environmentalists' "Boot Pruitt" campaign will gather a "group of cows" outside the Capitol South Metro station today from 8 a.m. to 9:15 a.m. to hand out fake Chick-fil-A coupons for a free chicken sandwich with a donation to Pruitt's legal defense fund. They'll hold signs reading: "Breeth Mor Carbun" and "What the Cluck, Pruitt?"

VIRGIN ISLANDS BOSS PLAYS UP ZINKE RELATIONSHIP: The head of the Virgin Islands Republican Party suggested his fundraising group's longstanding relationship with Interior Secretary Ryan Zinke helped improve the department's response to last year's hurricanes that struck the island territory, Pro's

Ben Lefebvre reports. John Canegata said he had direct access to Interior officials after the storm thanks to money his group raised for Zinke when he was a member of Congress.

Calling Zinke a "close friend," Canegata boasted of his connections in a televised appearance that aired in the Virgin Islands last month but has not received widespread attention outside of the territory. While numerous officials played a role in helping the islands recover from hurricanes Maria and Irma, "behind the scenes, trust me, a lot of telephone calls, a lot of maneuvering was going on because, I think, some of the relationships we built," Canegata said of Zinke.

Interior acknowledged that officials contacted Canegata after the hurricanes but said they did so as part of a wider effort to contact business leaders based in the territory and Zinke did not call him personally. Canegata works for Cruzan Rum, but a company representative told Ben he was not involved in coordinating its relief efforts. Interior expedited the reimbursement of taxes on Virgin Islands rum following the storms, but it was unclear whether Canegata influenced that decision; he did not respond to a request for comment.

For his part, Zinke has known Canegata since at least 2015, Ben reports. The secretary previously came under fire for a fundraiser for the VIGOP, as the group is known, during an official trip to the islands in his first month in President Donald Trump's Cabinet. Read more.

IT'S THURSDAY! I'm your host Kelsey Tamborrino. NRECA's Dan Riedinger correctly identified John Tyler as the only president to have not been a resident of the U.S. when he died. Tyler resided in Virginia at the time, which was part of the Confederate States of America. Today's question: Which Congress had the largest number of veterans in office? Send your tips, energy gossip and comments to ktamborrino@politico.com, or follow us on Twitter @kelseytam, @Morning_Energy and @POLITICOPro.

MURRAY DELIVERED EXECUTIVE ORDERS TO TRUMP: Coal magnate Bob Murray handed off drafts of six executive orders that would roll back Obama-era environmental regulations to Trump during the beginning of his administration, according to documents from DOE released under FOIA. The documents include a letter to Energy Secretary Rick Perry from Murray praising Trump's March 2017 energy independence executive order, and included a note where Murray wrote, "we have developed the enclosed materials for your review and consideration, consisting of: six (6) Executive Orders further rescinding anti-coal regulations of the Obama administration; and one (1) memorandum outlining the legal rationale for each of these action, and others."

While Trump did not sign those exact orders, the administration has moved to enact similar policies, Pro's Darius Dixon reports. The documents, which were sent to DOE the day Trump signed his energy independence order and one day before Murray met with Perry and DOE chief of staff Brian McCormack, also included concepts about grid security and "resiliency" that Perry later touted as part of his push to stop coal power plants from closing. Read more.

BAILOUT ON HIS MIND: In private remarks given during his visit to FEMA headquarters Wednesday, Trump mentioned a slew of topics that had nothing to do with hurricanes, The Washington Post reports, while only briefly mentioning Puerto Rico. Trump instead encouraged Perry to make an announcement about rescuing economically struggling coal and nuclear power plants, the Post reports. "I'd love to put it out — 'clean coal, nuclear,' it's a very important message," he said, telling Perry he needed to hold a news conference.

WRDA MOVES AHEAD: The House passed the Water Resources Development Act of 2018 (H.R. 8 (115)) last night, marking the first major piece of infrastructure legislation to move under the Trump administration, Pro's Annie Snider reports. Lawmakers signed off on the measure on a broadly bipartisan vote of 408-2. The bill — markedly narrower than the Senate's measure — would authorize six new Army Corps of Engineers projects and enact a suite of policy reforms at the red tape-laden agency.

What about the Senate? For those wondering, EPW Chairman John Barrasso told ME he'd not yet locked down a time for the Senate to consider its broader version of the water resources infrastructure legislation. Separately, Sen. Tammy Baldwin sent this letter to Trump, calling on him to urge Congress to include a permanent Buy America provision in the legislation.

MUM'S THE WORD: Barrasso, whose state produces a lot of coal and uranium, told ME he isn't ready to back Trump's proposed bailout for coal and nuclear power plants. "I've read the article but I want to actually see what the proposal is," he said. DOE is still formulating the details of how it would intervene to save the struggling plants.

RESCISSIONS VOTE TODAY: The House is set to vote today on Trump's $15 billion rescissions bill, Pro's Sarah Ferris reports. The House Rules Committee teed up the bill, H.R. 3 (115), on Wednesday, a quick turnaround that surprised even some GOP lawmakers.

ALL ABOARD: After the rescissions package, the House is ready to start debate on its "minibus" appropriations package, which includes energy and water, legislative branch and military construction-VA spending bills, Pro's Kaitlyn Burton reports. The Rules Committee has set up floor votes on 50 amendments to the energy and water title. A final vote on the overall bill is expected Friday.

SHIMKUS SPEAKS: Rep. John Shimkus, one of the most ardent Yucca Mountain champions in Congress, said his loud floor dispute with Paul Ryan on Tuesday was simply a dispute over "strategy going forward." Other members suggested it had to do with the timing of the Energy-Water bill, since Shimkus thinks delaying until after the midterms might allow Yucca language to make it into the title. The Senate has avoided tackling Yucca due to Sen. Dean Heller's close reelection contest.

POWER OF THE PEN: The House Appropriations Committee agreed to bar EPA from spending more than $50 on a fountain pen. The amendment — an apparent reference to the $1,560 Pruitt spent on a dozen fancy writing implements — passed on a voice vote at Wednesday's markup. The panel cleared its version of the fiscal 2019 EPA-Interior bill, on a vote of 25-20. Committee Republicans blocked an effort from Democrats to boost EPA's Office of Inspector General by $12 million, but approved an amendment that would change revenue sharing for drilling in the Arctic National Wildlife Refuge. And while the pen amendment passed, the committee shot down another amendment from Democratic Rep. Mike Quigley related to Pruitt's travel.

MEETING WITH A FULL DECK: The last time the leadership of FERC and the Nuclear Regulatory Commission got together, there were just enough commissioners between the two agencies to fill one five-member board. Fast-forward to today, and it's a full house for the first time in years thanks to confirmation of two new NRC leaders last month. The get-together is slated to run for just over two hours. An agenda hasn't been released but the meetings usually involve staff presentations on grid reliability — and how it might be impacted by the retirement of nuclear plants — and cybersecurity regulations. Finding the areas where an

economic regulator overlaps with a safety watchdog isn't always obvious. The meeting is slated to run from 9 a.m. to 11:15 a.m. at FERC headquarters, and will be webcast.

ROYALTY RUMPUS: Interior's Royalty Policy Committee approved recommendations Wednesday aimed at expanding energy lease sales and lowering royalty rates, Ben recaps. But during the advisory committee's meeting, two members questioned whether it had the power to suggest changes to federal environmental review. "NEPA is not referred to in the [committee] charter," Rod Eggert, a professor at the Colorado School of Mines, said during the meeting. "The text in the charter refers to royalties and collections of royalties." Read more here.

Later Wednesday, BLM sent out a memo instructing field offices to look for ways to speed up permit processing, including by using categorical exclusions, Ben reports.

— **Meanwhile, the Central Arizona Project will meet today** on proposals for sourcing cheaper power to run the Navajo Generating Station. The Bureau of Land Reclamation last week sought to delay the coal-fired power plant's closure, arguing that a 1968 law gives Zinke the authority to require the Arizona water project buy energy from the power plant. Reuters has the rundown here.

GROUPS WARY OF INTERIOR DRAFT BILL: A coalition of sportsmen's groups is concerned about draft legislation that appeared before the House Natural Resources Energy Subcommittee on Wednesday. According to the draft bill, it would enable Interior to recover the costs of administrative protests to oil and gas lease sales, drilling permits and other applications. The bill, they say, would make it more difficult for sportsmen and women to comment on oil and gas lease sales on public land.

BLANKENSHIP IS BACK: Former coal baron Don Blankenship hasn't given up hope to take on the establishment and earn himself a spot in the Senate. After losing a primary bid to West Virginia Attorney General Patrick Morrisey, Blankenship's campaign announced Wednesday it is petitioning to gain ballot access for the general election as the nominee for the Constitution Party.

BIPARTISAN LETTER ASKS PRUITT TO DROP 'SECRET SCIENCE': More than 100 lawmakers — including Republican Reps. Brian Fitzpatrick, Carlos Curbelo, Ryan Costello and Ileana Ros-Lehtinen — signed onto a letter to Pruitt today, asking him to withdraw EPA's so-called secret science proposal to bar EPA from using studies that don't make public all their data. Read the letter here.

DEMS WARN AGAINST E15: Democratic Sens. Tom Udall and Peter Welch are calling on EPA to abide "by all legal and regulatory requirements" as the Trump administration weighs the year-round sale of 15 percent ethanol blends of gasoline. "We are very concerned that career EPA officials may be being directed to reverse over 25 years of the agency's position to manufacture legal and scientific justifications for a politically-directed decision on E15," they write. Read the letter.

MAIL CALL! RELEASE THE STUDY: A coalition of environmental groups will send this letter today to HHS Secretary Alex Azar, calling on him to release the controversial federal chemical pollution study blocked by EPA officials.

— **Nineteen environmental groups filed a letter** to the House in opposition of H.R. 5895 (115), the so-called minibus, which they say sets up an improper use of water and natural resources, and undermines safe nuclear waste disposal. Read it here.

FOR YOUR RADAR: The International Wildlife Conservation Council, which came under fire for the big-game trophy hunters added to its ranks, will hold its next meeting June 19 in Atlanta, according to the Federal Register.

ON THE WEB: The Center for American Progress is launching a new website today that is dedicated to tracking legal challenges to the Trump administration's conservation agenda. See it here.

QUICK HITS

Stories from POLITICO Pro

Another mess for Pruitt: Overstaying his White House welcome at lunch Back

By Emily Holden, Andrew Restuccia and Anthony Adragna | 06/06/2018 10:17 PM EDT

EPA Administrator Scott Pruitt loves eating at the White House mess, an exclusive U.S. Navy-run restaurant open only to White House officials, Cabinet members and other dignitaries.

But apparently he liked it too much, and the White House asked him to please eat elsewhere sometimes.

In response to Pruitt's recurring use of the restaurant next to the Situation Room in the basement of the West Wing, a member of the White House's Cabinet affairs team told agency chiefs of staff in a meeting last year that Cabinet members shouldn't treat the mess as their personal dining hall, according to three people with knowledge of the issue.

The message was clear, according to one person close to Pruitt: "We love having Mr. Pruitt, but it's not meant for everyday use." Another person added that the White House asked Cabinet members to visit the mess only occasionally because there are few tables available.

A renovation to update the West Wing HVAC last August included the mess kitchen and may have limited space, one person said. The renovation came shortly after the president tapped John Kelly as chief of staff, and he implemented several day-to-day changes to bring order to the White House.

The White House did not respond to a request for comment and EPA declined to comment. Pruitt's allies privately disputed that the warning about overuse of the mess was aimed squarely at him, but nobody contests that he's a frequent presence at the White House for lunch.

Pruitt has been known to complain that EPA headquarters has no cafeteria of its own and no private dining quarters, according to multiple sources, who said Pruitt still often heads to the White House for lunch. One source said EPA officials called the White House to explain that Pruitt didn't have a place to eat at EPA and would like to continue to visit. Pruitt's EPA office is only a few blocks up Pennsylvania Avenue from the White House.

A billing statement from July 2017 offered a glimpse into Pruitt's use of the mess, showing the EPA chief or people linked to him dined at the mess at least nine times that month, racking up a bill of $400, a relative bargain in downtown Washington. Pruitt and his guests dined on dishes like "cowboy" skirt steak, popcorn chicken and waffles, spinach strawberry salad and beer-braised brisket tacos.

While the food is considered to be top-notch, the prices are a real bargain. Skirt steak runs just $10.25, while coriander beef kabobs were just $11.95 each. And a cheeseburger runs just $6.35, according to his bill. The burger at another of Pruitt's haunts, French bistro Le Diplomate, runs $17.

Records obtained through a Sierra Club Freedom of Information Act request also show Pruitt often sought to bring friends from Oklahoma to the White House mess.

Five friends from Tulsa — Charlie Polston, Carlyn Mattox, David Mattox, Bob Wagoner and Jerry Dillon — were invited for a September lunch there with him, though it didn't appear in Pruitt's detailed calendar obtained through FOIA.

That lunch came just two weeks after Pruitt made a lunch date there with Bob Funk, a wealthy Oklahoma Republican with whom he bought a major stake in the minor league Oklahoma City RedHawks baseball team back in 2003.

"Please have Mr. Funk arrive at EPA building at 11:40am to ride with Administrator Pruitt to the WH," Lincoln Ferguson, a senior adviser for public affairs, wrote in an email. There was no entry in Pruitt's calendar for the time when the lunch was to have taken place.

Calendars from Pruitt's senior aides show he made frequent use of the space in the month following his February 2017 Senate confirmation. He dined there on Feb. 27, March 2 and met with Ivanka Trump, the president's daughter and West Wing adviser, on March 13. Chief of staff Ryan Jackson's calendar also lists a lunch in the "Mess" on March 16.

Pruitt also hosted representatives from the Oklahoma Farm Bureau on March 29, according to Jackson's calendar. And he returned for lunch with Mike Catanzaro, a senior White House energy aide, and several senior aides on April 7.

Pruitt and his guests also seemed to have a sweet tooth, partaking of a dessert called "Chocolate Freedom" on multiple occasions. As POLITICO reported in January 2017, the dish — a molten cake made with imported French chocolate that must be ordered at the beginning of lunch because of the baking time — was also popular among Obama administration staffers on their way out the door.

Chocolate Freedom has garnered rave reviews online, and once prompted comedian Zach Galifianakis to ask whether it was also the staff's nickname for former President Barack Obama.

Also available to diners: boxes of red, white and blue M&Ms featuring the presidential seal.

Pruitt wanted to buy 'old mattress' from Trump International Hotel Back

By Anthony Adragna | 06/04/2018 10:43 AM EDT

Two senior House Oversight Democrats are demanding Chairman Trey Gowdy (R-S.C.) subpoena Scott Pruitt for documents after one of his closest aides told congressional investigators the EPA administrator had her book a personal flight to the Rose Bowl, search for housing for him and try to buy him an "old mattress" from the Trump International Hotel.

Ranking member Elijah Cummings (D-Md.) and Gerry Connolly (D-Va.) demanded that Gowdy compel Pruitt to turn over all documents related to the potential mattress purchase, efforts to secure personal flights, and work that agency employees performed on non-EPA tasks for Pruitt that have been withheld from an earlier April Democratic request. That followed a May 18 transcribed interview with Millan Hupp, Pruitt's scheduler.

"If Ms. Hupp's statements to the Committee are accurate, Administrator Pruitt crossed a very clear line and must be held accountable," they wrote. "Federal ethics laws prohibit Administrator Pruitt from using his official position for personal gain and from requesting and accepting services from a subordinate employee that are not part of that employee's official duties."

As part of its investigation into Pruitt, the Oversight Committee said it has conducted several transcribed interviews and obtained 2,350 pages of documents, and a spokeswoman criticized the release of Hupp's testimony.

"Selectively releasing portions of witness interview transcripts damages the credibility of our investigation and discourages future witnesses from coming forward. The Committee will continue conducting a serious, fact-driven investigation, and therefore will wait until the conclusion of our investigation to release our findings," committee spokeswoman Amanda Gonzalez said in a statement.

White House Press Secretary Sarah Huckabee Sanders said Monday the administration is "looking into" the issues in the Democrats' letter, but didn't outline any more specific steps.

"I couldn't comment on the specifics of the furniture use in his apartment and certainly would not attempt to," she said, referring to Pruitt's interest in the mattress.

According to the Democrats' letter, Hupp told Oversight staff she worked with the managing director of the Trump International Hotel in hopes of securing an old mattress. She said Pruitt had told her someone at the hotel indicated he could purchase the mattress, though she did not know why he wished to do so and did not know if he ultimately bought it.

In addition, Hupp said she sent several emails to real estate agents over a period of several months last summer during work hours to help Pruitt find housing after he verbally asked for her help. She said she visited a "probably more than 10" properties during her lunch hour over the course of several months. Hupp said she didn't use work email for the searches and was not paid for her efforts.

Pruitt and his wife ultimately settled on an apartment on 13th and U streets, but left it shortly afterwards because "they were not comfortable in the area," according to Hupp.

Democratic lawmakers have honed in on Pruitt's admission during a May 16 Senate subcommittee hearing that Hupp had searched for housing for him without pay on her own personal time.

"It doesn't cut it that they're a friend or that kind of thing," Sen. Tom Udall (D-N.M.) told Pruitt at the hearing, because having a subordinate staff member voluntarily conduct tasks on personal time would constitute a gift.

"That's in violation of federal law," Udall told Pruitt.

An EPA spokesman said the agency continued to give the information it was seeking.

"We are working diligently with Chairman Gowdy and are in full cooperation in providing the Committee with the necessary documents, travel vouchers, receipts and witnesses to his inquiries." EPA spokesman Jahan Wilcox said in a statement.

According to the Democrats' letter, Hupp said around Christmas she used a personal credit card from Pruitt in her possession to arrange his personal trip to the Rose Bowl in California to watch the Oklahoma Sooners football team play. She did not know why Pruitt, who sent her the details for the trip, and couldn't book the flight on his own.

"He just sent me the flights details and asked me to book for him," Hupp said.

Hupp indicated she considered Pruitt a personal friend, which was why she did these tasks for him. She said the two had met for dinners that were attended by just the two of them.

"We worked very closely together and spent a lot of time together," she said. "I traveled with him, so naturally a friendship developed."

Republicans losing patience with scandal-scarred Pruitt Back

By Anthony Adragna and Emily Holden | 06/06/2018 05:37 PM EDT

Republicans on Capitol Hill are growing frustrated with EPA Administrator Scott Pruitt — and many are now publicly questioning whether he can hang on to his job amid the unending stream of scandals.

Several GOP lawmakers said their patience was running thin after this week's news that Pruitt sought to buy to buy a used mattress from the Trump Hotel and inquired about securing a Chick-fil-A franchise for his wife. And Pruitt's circle of confidantes inside the agency appeared to be shrinking as well, with two of his closest aides set to depart in the coming days.

"The constant drip needs to stop so the agency can get its footing and focus back," House Energy and Commerce Chairman Greg Walden (R-Ore.) told reporters. "They're doing some really good work in the environmental front, but this needs to stop."

"Sometimes people get tripped up on other things besides the core mission, and I think that's what you're seeing," Sen. Shelley Moore Capito (R-W.Va.) told reporters.

Pruitt's scheduler, Millan Hupp, is resigning following her interview by the House Oversight Committee during which she disclosed that she helped her boss find housing and inquired about purchasing a used mattress for him from the Trump International Hotel.

And his top legal counsel, Sarah Greenwalt, will also depart, according to sources. Both women had worked for Pruitt in the Oklahoma attorney general's office and both were among the staff that received raises that had been rejected by the White House.

"I think it's extremely fair to say her and Millan both are tired of the daily grind here," one EPA official said. "Everybody is painfully aware of that."

While acknowledging that President Donald Trump would ultimately make any decision about Pruitt's job, several Republicans indicated Pruitt's support was waning in their conference.

"I'm not going to come down here, just because he happens to be a nominee of a president I support or a nominee from my party, and try to defend the indefensible," Sen. John Kennedy (R-La.) said. "I thought that Mr. Pruitt would have learned his lesson."

Kennedy added: "I said the same thing about Tom Price," referring to Trump's former HHS secretary who resigned after spending lavishly on military and private jets.

Trump reaffirmed his support for Pruitt on Wednesday when they participated in a briefing on the 2018 hurricane season with several Cabinet officials.

"EPA is doing really, really well," Trump said. "You know, somebody has to say that about you a little bit. You know that, Scott."

But even staunch Pruitt allies like Sen. Jim Inhofe (R-Okla.) said the mounting scandals had them rethinking their support.

"Some are true, some are not true. Whether he can weather the storm, I'm not sure," Inhofe said. "The accusations are all troubling. They are."

A few Republicans stood by Pruitt, arguing he's been targeted by an environmental community and press corps eager to take him down.

"I like him," Sen. Roger Wicker (R-Miss.) said. "He is a target because he's keeping the president's campaign promises."

But a more common view among GOP lawmakers was the collective stream of scandals were taking their toll and making Pruitt's position untenable.

"Take a thousand cuts and [there's] not much energy left," Senate Appropriations Chairman Richard Shelby (R-Ala.) told reporters.

Rep. John Shimkus (R-Ill.), who leads the Energy and Commerce subcommittee overseeing EPA, joked he "can't keep up" with the flood of allegations and said he's concerned they haven't stopped.

"These unforced errors are unforced errors," he said. "I don't like being asked all the time about this."

But he raised a possible reason why Republicans weren't abandoning Pruitt: getting a replacement confirmed by the Senate would be nearly impossible.

"Are you going to promise me we could even get an administrator?" he said. "I think that's another concern."

In a video posted by a Nexstar Wednesday, Pruitt defended his attempts to set his wife up with a Chick-fil-A franchise Wednesday, while the president reaffirmed his support in the administrator.

Pruitt said that his wife is "an entrepreneur herself" and that the pair loved the fast-food franchise. As he has in the past, Pruitt dismissed criticism of his behavior as being driven by opposition to the Trump administration's deregulatory policies.

"With great change comes, I think, opposition," he said in a clip the reporter posted to Twitter.

Pruitt did not directly address whether he had asked an EPA aide to reach out to Chick-fil-A President Dan Cathy to inquire about his wife opening up her own restaurant, as the Washington Post first reported Tuesday.

"Chick-fil-A is a franchise of faith and it's one of the best in the country, so that was something we were very excited about," he told the Nextstar reporter Wednesday. "We need more of them in Tulsa, [Okla.]. We need more of them across the country."

Kelsey Tamborrino contributed to this report.

Trump's Interior chief 'hopping around from campaign event to campaign event' Back

By Ben Lefebvre and Esther Whieldon | 10/05/2017 05:01 AM EDT

Republican donors paid up to $5,000 per couple for a photo with Interior Secretary Ryan Zinke at a fundraiser held during a taxpayer-funded trip to the U.S. Virgin Islands, according to documents reviewed by POLITICO — raising questions about his habit of mixing official government business with political activism.

The new details about Zinke's March trip to the Caribbean, including the previously undisclosed invitation to the Virgin Islands Republican Party fundraiser, emerged after weeks of scrutiny of the former Montana GOP congressman's travels. The nearly two-hour event was one of more than a half-dozen times Zinke has met with big donors or political groups while on department-paid trips, Interior travel records and other documents show.

Ethics watchdogs say Zinke is combining politics with his Interior duties so frequently that he risks tripping over the prohibitions against using government resources for partisan activity, even though his appearance at the Virgin Islands event seems to have been legal. Democrats have also seized on the issue, including 26 House members who wrote in a letter Tuesday that Zinke's travels "give the appearance that you are mixing political gatherings and personal destinations with official business."

Zinke has said all his actions have obeyed the law, dismissing concerns about his travel as "a little BS."

But some ethics advocates say Zinke's attendance at a fundraiser during his first month as secretary is not in line with past administrations' conduct, even if he crossed no legal red lines.

"It happens on occasion with other Cabinet secretaries, perhaps even a little more often as you get near the election, but it is not a very common practice for Cabinet members to be hopping around from campaign event to campaign event like we're seeing with Zinke," said Craig Holman, government affairs specialist for government watchdog Public Citizen.

The secretary is already under investigation by his department's inspector general over his use of taxpayer-funded private planes for some of the trips, and the Office of Special Counsel is looking into an activist group's allegations that he violated the Hatch Act, the law limiting political activism by federal employees. The White House has cracked down on Cabinet members' travel habits following former HHS Secretary Tom Price's resignation on Friday, which occurred after POLITICO reported on his own expensive flights.

Zinke visited the Virgin Islands from March 30 to April 1 on an official trip related to the Interior Department's role overseeing the U.S. territory. On his first day, following a "veterans meet and greet" and a reception with Gov. Kenneth Mapp, he appeared in his personal capacity at a March fundraiser for the local Republican Party at the patio bar of the Club Comanche Hotel St. Croix, department records show.

Tickets for the fundraiser ranged from $75 per person to as much as $5,000 per couple to be an event "Patron," according to Zinke's official calendar and a copy of the invitation. Patrons and members of the host committee, who paid $1,500 per couple, could get a photo with Zinke at the start of the event, which was attended by local party members and elected officials.

The following day, Zinke took a $3,150 flight on a private plane, paid for by the department, from St. Croix to official functions on St. Thomas and returned later that evening. Interior Department officials said there was no

other way to accommodate his schedule, which included official events on both islands commemorating the 100th anniversary of the Dutch government transferring control of the islands to the United States.

Zinke is allowed to engage in partisan political activity in a "purely personal (not official) capacity," so long as he does not use government resources, according to Interior Department guidelines on the Hatch Act and other federal laws. The invitation to the GOP fundraiser did not identify Zinke by his official title and included a disclaimer that the money is being solicited by the local party and "not by any federal official."

All told, Zinke has spent around $20,000 for three charter flights as secretary, nowhere near the $1 million tab Price racked up on non-commercial trips. But he has on numerous occasions attended political receptions, spoken to influential conservative groups or appeared alongside past campaign donors during trips has taken outside of Washington, D.C., for official department business.

In one instance, Zinke gave a motivational speech for a professional hockey team owned by a major campaign contributor that he said was official business — and which required him to charter a $12,000 flight to Montana for an appearance at the Western Governors Association the next day.

In another case, during a speech to the Western Conservative Summit in Denver, he was introduced via a recorded voice as the Interior secretary and Zinke proceeded to talk about the agency's priorities. The summit was organized by the Centennial Institute, which bills itself as Colorado Christian University's think tank and is a part of the State Policy Network of organizations that collectively push for conservative state-level legislation.

An Interior spokeswoman said Zinke always follows the law but declined to answer specific questions about his appearance at the Virgin Islands fundraiser, nor say whether he would keep raising political money. The agency also has yet to post Zinke's trip expenses involving any of the political events.

"The Interior Department under the Trump Administration has always and will always work to ensure all officials follow appropriate rules and regulations when traveling, including seeking commercial options at all times appropriate and feasible, to ensure the efficient use of government resources," spokeswoman Heather Swift said in a statement.

Swift did not respond to questions about whether the department had gotten reimbursement for the political portion of Zinke's three-day Virgin Islands trip, as the head of one watchdog group says it should have.

"Some of this travel is clearly political and that part of the travel should have been paid for by the RNC, NRCC, state political parties, a campaign committee or Zinke personally," said Daniel Stevens, executive director of the Campaign for Accountability.

No payments to the department are listed in the Virgin Islands Republican Party's FEC records.

Zinke is not the first Interior secretary, or Cabinet member, to have his activities questioned.

In 2012, a watchdog group called Cause of Action urged the Office of Special Counsel to investigate whether President Barack Obama's then- Interior Secretary Ken Salazar had violated the Hatch Act while taking an Obama reelection campaign RV tour of Colorado with a couple of lawmakers and the state lieutenant governor. Local organizers of one stop on that tour had billed Salazar on its online events calendar as attending the political rally in his official role. OSC would not say whether its investigation uncovered any problems, but travel records Interior has posted show that one of Salazar's aides had told the tour's coordinator the schedule "should not refer to (Salazar as) 'secretary.'" Salazar did not respond to a request for comment.

A former Salazar aide, who was not authorized to speak on the record, said the Obama administration generally tried to avoid scheduling political events that coincided with official travel because it was difficult to divvy up what expenses should be reimbursed by a campaign.

The special counsel's office found Obama HHS Secretary Kathleen Sebelius in violation of the Hatch Act in 2012, saying she had made "extemporaneous partisan remarks" by endorsing a candidate for North Carolina governor during a speech she made in her official capacity. Sebelius tried to scrub the violation by reclassifying the appearance as political and reimbursing the Treasury Department for costs associated with the trip.

Sally Jewell, who was Interior secretary during Obama's second term, said Zinke was within his rights to appear at the fundraiser in the Virgin Islands. Jewell said she once appeared at a fundraiser for Democratic Sen. Maria Cantwell while in Obama's Cabinet, though she paid her own way to Washington state and was not identified by her official title.

"If he had legitimate business while he's on the island, to do a political thing on the side, I don't think that is that unusual," Jewell said in an interview.

EPA Administrator Scott Pruitt canceled his scheduled appearance at a fundraiser for the Oklahoma Republican Party in April because an invitation had identified him by his official title and said he would discuss his work at the agency. EPA ethics officials said he would have been cleared to attend the event if not for that language on the invitation.

Watchdog groups say Zinke's behavior fits a pattern for Trump's Cabinet.

"These government resources have been abused by this administration," said Virginia Canter, an executive branch ethics counsel for Citizens for Responsibility and Ethics in Washington who previously worked as an ethics official for Presidents George H.W. Bush, George W. Bush and Obama. "To the extent that some of that supports their political ambitions is inconsistent with the intent of this authority."

The Campaign for Accountability called on Interior's inspector general and the Office of Special Counsel to investigate whether Zinke violated the Hatch Act or department ethics rules with his speech to the hockey team, which the group said appeared to be a favor for a donor. Interior's IG office announced its investigation earlier this week, and OSC told the Campaign for Accountability that it was looking into the group's complaint, according to an email shared with POLITICO. The OSC declined to comment.

Reps. Raúl Grijalva (D-Ariz.) and Donald McEachin (D-Va.) have asked Interior's IG to also look into any trips on which the secretary was accompanied by his wife, Lola Zinke, who is chairing the campaign of Montana Republican Troy Downing, a candidate to unseat Democratic Sen. Jon Tester next year. Swift said Lola Zinke was not in the Virgin Islands and has paid her own way whenever she has traveled with her husband on official trips.

Many who know him see Zinke's travels as an attempt to keep in touch with political contacts as he contemplates what he will do after leaving the Trump administration. Back home, the 55-year-old former Montana congressman is seen as an attractive candidate for the open-seat governor's race in 2020, when Democratic Gov. Steve Bullock will have to step down because of term limits.

"I think he's definitely got political aspirations; that's one of the reasons why he is where he is at right now," said Land Tawney, executive director of Backcountry Hunters and Anglers, a Montana-based sportsman group that supported Zinke's bid for Interior secretary. "You don't go from being a Montana legislator to a first-term congressman to [Interior] secretary without having ambition."

The Virgin Islands trip was Zinke's first interaction with big donors or influential conservative groups during his travel as Interior secretary.

A weeklong trip in May that took Zinke through Montana, Utah and California also offered a chance to squeeze in some political events.

Zinke delivered the keynote speech at the RNC spring meeting on May 11 in Coronado, Calif. Zinke had flown to California the previous night, after several days touring monuments in Utah, and the RNC speech was his only event in the state aside from a meeting earlier that afternoon with Rep. Amata Radewagen, the Republican delegate from American Samoa, and members of the American Tunaboat Association.

The next day, Zinke flew back to Montana, where he joined Sen. Steve Daines (R-Mont.) and Vice President Mike Pence to tour a coal mine on the Crow Indian reservation operated by the Westmoreland Coal Co.

The trip offered Zinke and Pence an opportunity to tout the Trump administration's work to promote new coal mining on federal lands — and it allowed them to make a brief detour to promote Zinke's congressional replacement. That Friday night, Zinke, Pence and Daines attended a political rally for GOP candidate Greg Gianforte, and Zinke attended a get-out-the vote event for the Montana GOP the next day.

Zinke apparently paid for his return trip to Washington out of his own pocket — it was marked "personal travel" on his calendar, a designation not applied to the other flights on that trip.

Gianforte, whose wife is a major political donor in Montana, won the May 25 special election to take over Zinke's House seat.

Greg and Susan Gianforte donated more than $10,000 to Zinke's 2016 congressional campaign and another $10,000 to a joint Zinke-Daines PAC, according to federal records. The couple donated $5,000 for his earlier run for Congress.

Zinke met with big influencers and donors in June as well.

On June 25, he flew from D.C. to Reno, Nev., where his only scheduled event was a meeting of the Rule of Law Defense Fund, a group of Republican attorneys general that has been linked to the Koch brothers, where he spoke and took questions for about 30 minutes, according to his schedule.

After his remarks, he sat at a dinner table with Montana's attorney general, the government relations specialist for the Venetian Resort Hotel Casino and Las Vegas Sands, and Koch Industries lobbyist Allen Richardson, Interior documents show.

The next day, Zinke flew to Las Vegas for an event on public lands in nearby Pahrump, Nev., and a speech that night to the National Hockey League's Vegas Golden Knights. Bill Foley, the team owner and chairman of Fidelity, introduced Zinke. Foley donated $7,800 to Zinke's 2014 campaign, while employees and PACs associated with Fidelity and related companies gave another $180,000. Interior officials said the speech to the NHL team was part of Zinke's official duties, and they pointed to scheduling conflicts it created to justify his use of a $12,000 private plane to get to a Western Governors Association meeting in Montana the next day.

In July, Zinke spoke to several conservative groups in Colorado during a three-day trip that also included tours of Interior Department facilities in the state. He flew into Denver on July 20 so he could appear that evening at a closed-door reception for the American Legislative Exchange Council, a group of conservative state legislators, lobbyists and industry groups that has pushed for more state control over federal lands.

And over the next two days, he was a featured speaker at a Republican committee roundtable and attended the Western Conservative Summit in Denver.

Zinke's political ties to Virgin Islands improved Interior's hurricane response, party boss says Back

By Ben Lefebvre | 06/07/2018 05:11 AM EDT

The top GOP official in the U.S. Virgin Islands suggested his fundraising group's "behind the scenes" relationship with Interior Secretary Ryan Zinke helped influence the department's response to last year's hurricanes in the island territory.

John Canegata, the head of the Virgin Islands Republican Party, said he had direct access to Interior officials after the storm thanks to money his group raised for Zinke, whom he described as a "close friend." Zinke, a former congressman, has known Canegata since at least 2015, and the secretary was at a fundraiser for the VIGOP, as the group is known, during an official trip to the islands in his first month in President Donald Trump's Cabinet.

Interior officials acknowledged reaching out to Canegata, who also works for a major rum distiller in the territory, although they said it was part of a wider effort to contact business leaders based in the territory and Zinke did not call him personally. However, a representative of the distiller said Canegata was not involved in their relief efforts, and a spokesman for the Virgin Islands' House delegate disputed Canegata's involvement in the hurricane response.

The department expedited reimbursements of rum taxes as part of its response to the hurricanes, although it's unclear whether Canegata's connection influenced that decision. Interior has jurisdiction over U.S. territories including the Virgin Islands but not Puerto Rico, which suffered more extensive devastation.

Disaster response experts say it would be inappropriate for Canegata's political connections to influence Interior's efforts in the Virgin Islands.

"These are processes that are supposed to be transparent and supposed to be above the board," said Eric LeCompte, executive director of Jubilee USA, an anti-poverty group that has been involved in hurricane disaster relief efforts. "So, it would not be something a political party would be part of."

VIGOP is not a typical political party and faces frequent inquiries from the FEC to better explain its fundraising practices and expenses. Some critics, including past Republican clients, say the group bilks conservative donors with promises to fight Democrats while spending the bulk of its money on overhead instead of political advocacy. The group spends the vast majority of its money on a small group of Washington-area political consultants who have also done work for Zinke's campaign and leadership PACs.

Zinke was introduced to the VIGOP in 2015 by a Washington fundraising consultant who also did work for his campaigns, and as a member of Congress he has traveled to at least two political conferences in the Virgin

Islands sponsored by the group, POLITICO reported last year. Zinke and Canegata are seen together during a prior trip in a photo posted to Facebook.

Canegata boasted about his Zinke ties in a televised appearance on WTJX Virgin Islands Public Broadcasting that aired last month but has not received widespread attention outside of the territory.

"We were in direct connection with the Department of Interior," Canegata said in the broadcast.

"Secretary Zinke, happens to be, I wouldn't say a personal friend, but a close friend," Canegata continued. "Prior to him being the secretary of Interior, we spent some time in Washington, we spent some time here in the Virgin Islands. We supported him when he was a congressman and, behold, he becomes the secretary of Interior."

While Canegata credited other officials with their part in aiding the island's response, he said the pre-existing connection to Zinke was key.

"Obviously, we have our congresswoman, our governor doing their job," Canegata continued. "But behind the scenes, trust me, a lot of telephone calls, a lot of maneuvering was going on because, I think, some of the relationships we built."

The Office of Special Counsel on Tuesday closed its investigation into Zinke's appearance at the Virgin Islands fundraiser in March 2017, finding that he had not violated the Hatch Act because he was there in his official capacity and VIGOP reimbursed Interior for its expenses. Interior's inspector general also recently said the appearance at the fundraiser was not inappropriate. It is unclear whether either of those investigations addressed any link between VIGOP and Interior's hurricane response; both offices declined to comment.

Interior's Office of Insular Affairs, which oversees the Virgin Islands, "reached out to dozens of local government employees as well as major private sector employers in the USVI to check their power status and to see how the office could help," Interior spokeswoman Heather Swift said in an email. Canegata "was contacted by those Insular Affairs officials because he works for one of those major private employers, Cruzan Rum."

Canegata, a supply chain specialist at the rum distillery, had no role in the company's disaster relief efforts, according to Cruzan Rum human resources manager Ayanda Daniels.

"He wasn't part of the coordination," Daniels told POLITICO. "Maybe he had a conversation with someone in order to do something, but we had another team for company response."

James Norton, a former Department of Homeland Security Deputy official during the George W. Bush administration, said it is important for disaster response efforts to be handled through the appropriate channels.

"As a matter of proper procedure, it would only be appropriate for all federal actions to be dealt with solely with official authorities at the Department of Defense, Interior, Homeland Security, FEMA, etc., and those local officials on the ground," said Norton, who is now head of the consulting agency Play-Action Strategies. "Anything other than raising awareness and reaching out to get an update on what's happening would be inappropriate, as a political party or other organization doesn't have command and control authority, nor would they be the designated principal federal official on the ground directing rescue operations."

A spokesman for Stacey Plaskett, the Democratic House delegate from the Virgin Islands, disputed Canegata's version of events.

"I cannot honestly remember hearing them or seeing them do anything to that effect," Plaskett's spokesman Mike McQuerry said. "The congresswoman was the person here in D.C. that worked extremely hard during that time to get those funds to the Virgin Islands."

Canegata did not respond to a request for comment this week.

Interior expedited reimbursement of $223 million in taxes on Virgin Islands rum imported into the mainland and provided a $567,500 grant to help with a post-hurricane finance audit. Other hurricane relief funds would have come from FEMA, an Insular Affairs spokesperson said.

Otherwise, Zinke and Insular Affairs head Doug Domenech met with Virgin Islands Gov. Kenneth Mapp to discuss recovery efforts, the Insular Affairs spokesperson said. In November, Domenech also met representatives of Cruzan Rum's parent company, Beam Suntory, to discuss the rum tax reimbursements Interior makes to the territory. Beam Suntory donated $1.5 million to hurricane relief efforts the previous month.

Swift said Zinke did not personally reach out to Canegata. "The only official in the USVI the Secretary called was Governor Mapp," she said.

Murray had early access to Perry to share coal plan Back

By Eric Wolff | 12/07/2017 04:22 PM EDT

Coal magnate Bob Murray pitched Energy Secretary Rick Perry on his plan to throw an economic lifeline to coal companies less than a month before Perry set in motion plans to aid the industry, according to newly disclosed photographs that show the two meeting.

The liberal magazine In These Times obtained pictures of Murray and Perry from a March 29 meeting at Energy Department headquarters, less than a month after Perry was sworn in. Several other officials were in attendance, including Andrew Wheeler, who at the time was a lobbyist for Murray and has since been nominated as EPA's No. 2 official.

The meeting puts Murray and Perry together at a crucial moment in the timeline of the Trump administration's push to save the struggling coal industry, an effort that would benefit Murray Energy in particular while hiking electricity prices for potentially millions of people. A month before the meeting, one of Murray's biggest customers, FirstEnergy Corp., had told investors it was seriously considering sending its merchant division, FirstEnergy Solutions, into bankruptcy, a move which would likely void its supply contracts with Murray's coal mines.

Three weeks after Murray's visit, Perry would order a grid study that later became part of the justification for a proposed rule to reward coal and nuclear power plants for providing "grid resiliency." FERC, which has jurisdiction over the proposal, must make a decision on it by Monday.

At the time of the meeting, Wheeler was already the leading candidate to become the deputy administrator for EPA. Wheeler, who represented Murray as a lobbyist for Faegre Baker Daniels, would not be officially

nominated for months. Wheeler, who has acknowledged participating in meetings on Murray's coal plan at DOE and on Capitol Hill, cleared committee last week and is awaiting Senate confirmation.

Murray is an outspoken supporter of President Donald Trump and held a fundraiser for him during the 2016 campaign.

DOE did not dispute the validity of the photos.

"Industry stakeholders visit the Department of Energy on a daily basis," DOE spokeswoman Shaylyn Hynes said, when asked about the meeting. "The DOE proposal to FERC was about the future and resiliency of the nation's power supply, an issue much bigger than one industry or company."

The photographs show Perry sitting at the head of a table in the Department of Energy, with Bob Murray, CEO of Murray Energy, to his left, and Wheeler down the table from Murray.

"Enclosed is an Action Plan for achieving reliable and low cost electricity ... and to assist in the survival of our Country's coal industry, which ... power grid reliability and low cost electricity," Murray writes in a cover letter to Perry, parts of which are visible in one photo from the meeting.

Though the document has never been publicly released, DOE critics say Murray's plan appears to have inspired DOE's grid study and the proposed rule Perry sent FERC in September. Copies are visible at the seats of most of the participants, including Perry and Murray. Wheeler, who told members of the Senate Environment Committee he had only seen the memo briefly, is not holding a copy in the photos obtained by In These Times. Murray told Greenwire in November he "didn't have any involvement" in writing the rule.

Murray has acknowledged sharing the plan with Trump.

"I gave Mr. Trump what I called an action plan very early," Murray said in a recent PBS Frontline documentary on EPA. "It's about three-and-a-half pages and — of what he needed to do in his administration. He's wiped out page one."

The meeting appears to have been successful for all. One of the photos shows Perry and Murray in a big bear hug.

Murray delivered executive orders on coal rules to Trump administration Back

By Darius Dixon | 06/06/2018 07:05 PM EDT

Coal magnate Bob Murray delivered six draft executive orders ready for President Donald Trump to sign to roll back Obama-era environmental regulations in the early weeks of the administration, according to newly released Energy Department documents.

The documents released Wednesday after a Freedom of Information Act request include a letter to Energy Secretary Rick Perry from Murray praising Trump's March 2017 energy independence executive order, which largely aimed to help the coal industry. And to bolster that effort, Murray wrote, "we have developed the

enclosed materials for your review and consideration, consisting of: six (6) Executive Orders further rescinding anti-coal regulations of the Obama administration; and one (1) memorandum outlining the legal rationale for each of these action, and others."

Those executive orders were also sent to EPA Administrator Scott Pruitt, whose agency had jurisdiction over most of the issues they involved, such as ozone rules and regulations on coal ash.

Trump has not signed executive orders resembling Murray's, but the administration has moved to enact the policies, such as pulling U.S. out of the Paris climate agreement. The documents, which were sent to DOE the day Trump signed his energy independence order and one day before Murray met with Perry and DOE chief of staff Brian McCormack, also included concepts about grid security and "resiliency" that Perry later touted as part of his push to stop coal power plants from closing.

"The Department of Energy ("DOE") must issue an emergency directive to have an immediate study done of the security and resiliency of our electric power grids," the document states. "DOE will direct that no power plants having an available fuel supply of at least forty-five (45) days be closed during the study period, or a minimum of two (2) years."

Perry later ordered his staff to write a study about the electric grid that was eventually tied to a regulatory proposal that FERC create financial rewards for power plants with a 90-day supply of fuel on-site. That condition would have overwhelming benefited coal and nuclear generators, but it was shot down by FERC in January.

Critics have said Murray would be the biggest beneficiary of Trump's efforts, since his company supplies coal to many of the power plants at risk of closing because of stiff competition from cheap natural gas and renewable power as well as lagging electricity demand from consumers.

Murray spokesman Gary Broadbent confirmed the company had submitted the documents to Perry "to assist in the reversal of the illegal, job-killing, anti-coal regulations of the Obama Administration."

"Mr. Murray has always sought to secure reliable, low-cost electricity for all Americans, as well as to preserve and protect the jobs and family livelihoods of thousands of coal mining families," he said in a statement. "We applaud the actions taken by President Trump's Administration, to date, to protect these jobs and to advance the energy security of the United States."

Murray has repeatedly called on DOE to issue must-run orders for FirstEnergy power plants that consume his coal, and he blasted the FERC commissioners who opposed the on-site fuel proposal.

On Tuesday, a top DOE official said the agency is still formulating a plan to keep struggling coal and nuclear power plants from closing, and it had no deadline to meet Trump's demand to rescue them.

"We are evaluating options," Energy Undersecretary Mark Menezes told reporters. Last week, Trump called on DOE to take "immediate steps" to stop a wave of coal and nuclear power plant retirements, and like Perry, he cast the shutdowns as a threat to national security.

House passes WRDA bill Back

By Annie Snider | 06/06/2018 09:42 PM EDT

The House has overwhelmingly approved the Water Resources Development Act of 2018, H.R. 8 (115), the first major infrastructure legislation to move under the Trump administration.

Lawmakers signed off on the measure on a broadly bipartisan vote of 408-2. The bill would authorize six new Army Corps of Engineers projects and enact a suite of policy reforms at the red tape-laden agency. It is significantly narrower than the Senate's measure, which would also make changes to EPA drinking water and wastewater programs.

And it includes a provision that could stir some controversy with the Senate, ordering a study of whether the Army Corps' civilian work should remain within the Department of Defense.

But House leaders dodged provisions that could have derailed the bill by blocking controversial amendments from floor consideration. Those included efforts to repeal the Obama administration's Waters of the U.S. rule, allow firearms at Army Corps recreational sites and exempt pesticide spraying from Clean Water Act permitting requirements.

WHAT'S NEXT: The Senate is expected to consider its version of the WRDA bill, America's Water Infrastructure Act of 2018, S. 2800 (115), this summer.

Trump calls for coal, nuclear power plant bailout Back

By Eric Wolff | 06/01/2018 02:29 PM EDT

President Donald Trump pressed for a quick regulatory bailout for struggling coal power plants on Friday — a move that would buoy a mining industry that offered him crucial support in 2016, but is riling other energy companies and even some free-market conservatives.

The White House called on Energy Secretary Rick Perry to take immediate steps to keep both coal and nuclear power plants running, backing Perry's claim that plant closures threaten national security. An administration strategy to do that laid out in a memo to the National Security Council circulated widely among industry groups on Friday, but it was not clear that intervention could survive the inevitable political and legal challenges.

It was the latest step in more than a year of efforts by the administration to compel power companies to keep operating the money-losing plants that are suffering from the rise of competing energy sources like natural gas. Those proposals have drawn opposition from most utilities, along with environmentalists, gas producers, power grid operators and conservatives who say it would be an unwarranted intrusion to the energy markets.

The White House statement calling for action came after days of Trump making similarly aggressive moves on international trade, slapping tariffs on the European Union, Canada and Mexico to protect U.S. industries like aluminum and steel. In this case, the president is acting on behalf of what he likes to call "beautiful, clean coal," a once-dominant fuel that still plays a major role in his stump speeches.

Trump "has directed Secretary of Energy Rick Perry to prepare immediate steps to stop the loss of these resources," White House press secretary Sarah Huckabee Sanders said in a statement Friday, referring to coal and nuclear plants.

She added that Trump believes "keeping America's energy grid and infrastructure strong and secure protects our national security... Unfortunately, impending retirements of fuel-secure power facilities are leading to a rapid depletion of a critical part of our nation's energy mix, and impacting the resilience of our power grid."

The statement came five months after federal energy regulators rejected Perry's call that they adopt his proposal to keep the struggling coal and nuclear power plants operating. That proposal would have overwhelmingly benefited mining magnate Bob Murray, an outspoken Trump supporter whose operations supply coal to several endangered plants in the Midwest and Northeast, according to a POLITICO analysis.

Trump's National Security Council gathered Friday to discuss the draft memo that lays out arguments why the administration should use federal authority to keep the money-losing power plants open — despite the assurances from some of the nation's grid operators that no such emergency exists.

"Any federal intervention in the market to order customers to buy electricity from specific power plants would be damaging to the markets and therefore costly to consumers," said the PJM Interconnection, which operates the nation's largest power grid and stretches from the Midwest the Atlantic Coast, in a statement. "There is no need for any such drastic action."

A broad swath of trade associations representing oil and gas, wind and solar power, consumer groups and advanced energy technologies slammed the plan, and they were joined by some congressional Democrats.

"This would be an egregious abuse of power," Sen. Ron Wyden (D-Ore.) said in a statement. "I fought this proposal before, and I will continue to fight this corrupt scheme to prop up the coal industry at the expense of American consumers."

That new 41-page memo, first revealed by Bloomberg News on Thursday evening, says that under the 2015 highway and transit bill known as the FAST Act, DOE must identify critical energy infrastructure, a process the agency is undertaking now with the help of its national labs. But because that is likely to take two years, DOE in the meantime should use the 1950 Defense Production Act and the Federal Power Act to require the plants to keep operating, the memo says.

Power sector experts have said using the two laws to keep specific plants operating would stretch both those measures, and would certainly trigger a major legal fight. Critics of the administration's strategy said the memo appears to signal that the White House is preparing for a fight.

"One way to view the release of this draft is that it is a trial balloon to see how fierce and fast the opposition will be," said Dena Wiggins, CEO of the industry lobby group Natural Gas Supply Association, which opposes the DOE plan. "We've known for some time that all of these federal authorities ... were in play, so the fact that we've now seen it in writing doesn't really change anything. It does, however, underscore how hard it is to cobble together a sound legal rationale to bail out otherwise uneconomic coal and nuclear plants."

And critics say the push to bail out the plants is simply Trump's effort to reward backers like Murray, the coal baron, and live up to his campaign promise to revive coal country. Perry first began work on the power plant issue in March 2017, when he met with Murray at DOE, and Trump himself personally directed Perry to take action on the issue since last summer.

Murray's coal mines have been a major supplier for power plants owned by FirstEnergy Solutions, a unit of Ohio-based utility giant FirstEnergy that sank into bankruptcy this spring. FirstEnergy Solutions has said it plans to close or sell five of its money-losing coal and nuclear power plants.

But the Federal Energy Regulatory Commission and the grid operator have said that even with the planned closures, the region has ample power to supply the market's needs. Stagnant power consumption growth, coupled with the rise of natural gas and renewable power sources like wind, has displaced many of the older coal and nuclear facilities in the markets.

The memo also calls for establishing a new requirement for the electric grid based on "resilience," a term Perry injected into the regulatory conversation last fall with a proposed rule that would have rewarded plants that could keep 90 days of fuel on site. FERC rejected that rule, but it also created a new proceeding to try to define "resilience," which some in the industry say pertains to the grid's ability to withstand and recover from a physical or cyberattack.

The memo largely focuses on the issue of resilience, which it says would suffer if coal and nuclear power plants retire. It specifically targets natural gas as a weakness, because the plants that burn the fuel rely on pipelines that could be disrupted, while coal and nuclear power plants can keep months' worth of fuel on site.

"Natural gas pipelines are increasingly vulnerable to cyber and physical attacks," the memo says. "The incapacitation of certain pipelines through the United States would have severe effects on electric generation necessary to supply critical infrastructure facilities."

House to vote Thursday on Trump's spending cuts plan Back

By Sarah Ferris | 06/06/2018 05:32 PM EDT

President Donald Trump's prized deficit-reduction package is rolling toward the House floor this week, though its prospects in the Senate remain in doubt — with little time to spare.

House leaders have set a vote Thursday on the Trump administration's roughly $15 billion rescissions bill, according to a GOP aide, nearly a full month after the proposal was first delivered to Capitol Hill.

The House Rules Committee will tee up the bill, H.R. 3 (115), on Wednesday evening, a lightning turnaround that surprised even some GOP lawmakers.

The last-minute scheduling change comes after the White House agreed this week not to slash hundreds of millions of dollars from politically sensitive programs, like Hurricane Sandy aid, which helped secure votes from numerous GOP holdouts.

Even with some of those unpopular cuts reversed, several House Republicans remain anxious about the plan's optics — specifically, cuts to the ultra-popular Children's Health Insurance Program.

At a closed-door meeting of House Republicans Wednesday, several GOP lawmakers stood up to complain that the kids' health cuts could hit hard on the campaign trail, despite assurance from neutral budget experts that the cuts wouldn't harm the program.

In fact, the vast majority of the White House's proposed spending cuts would exist only on paper. The bill would save only $1 billion over a decade, according to the CBO, which is far less than 1 percent of the size of Congress' last spending bill, H.R. 1625 (115).

Next, the White House will have to sell the bill to the Senate, where a single Republican "no" vote could sink the package.

Budget chief Mick Mulvaney has already met with Sen. Lisa Murkowski, an Alaska Republican who has raised issues with the cuts to CHIP. Sen. Susan Collins of Maine, another GOP moderate, has not yet said whether she supports the bill.

If the House clears the bill Thursday, the Senate will have roughly two weeks to send the measure to Trump's desk before its filibuster-proof powers expire June 22.

Minibus spending package ready for House floor action Back

By Kaitlyn Burton | 06/06/2018 07:46 PM EDT

The House Rules Committee today teed up a three-bill spending bundle for floor consideration as soon as Thursday.

All in all, the panel approved 50 Energy-Water amendments, 22 Military Construction-VA amendments and seven Legislative Branch amendments, setting them up for floor votes.

While the minibus, H.R. 5895 (115), will likely pass, House Democratic leaders threw a wrench in things when they urged lawmakers to oppose the bill, POLITICO reported Tuesday evening.

Votes on the package are expected to come after a separate Thursday vote on the White House's rescissions measure, H.R. 3 (115). Conservatives, including the Republican Study Committee, asked for the spending cuts to be taken up first, according to a House GOP aide. The Rules Committee teed up the rescissions proposal in a 9-3 vote tonight, allowing no amendment votes.

The minibus would be the first House-passed fiscal 2019 funding measure.

Sarah Ferris contributed to this alert.

House appropriators advance $35B Interior-EPA spending package Back

By Alex Guillén | 06/06/2018 05:04 PM EDT

The House Appropriations Committee today approved its $35 billion Interior-EPA spending bill by a party-line vote of 25-20.

Committee Republicans blocked an effort from Democrats to boost EPA's Office of Inspector General by $12 million, saying the watchdog already has "robust" appropriations. The bill funds the OIG at $12 million less than his request, but higher than the amount requested by the White House.

The committee voted down an amendment that would have required EPA's administrator and deputy administrator to report public details of travel costs within 10 days of a trip, along with various amendments targeting a repeal of the Waters of the U.S. rule and other policy riders, along with EPA's proposed science transparency policy, offshore drilling and other standard policy disputes.

Lawmakers approved an amendment that would change revenue sharing for drilling in the Arctic National Wildlife Refuge. The approved amendment would send 50 percent of revenue to the federal government, 47 percent to the state and 3 percent to the Alaskan Native claims settlement fund.

They also backed a tongue-in-cheek amendment from Rep. Marcy Kaptur (D-Mich.) that would limit EPA from spending more than $50 on any one fountain pen, a response to a recent Washington Post report that Pruitt spent $1,560 for a dozen personalized fountain pens. The amendment passed with no "nay" votes.

WHAT'S NEXT: Lawmakers hope to have the bill before the full House sometime this summer, but it is unclear whether the Senate will act on a similar timeframe. Like most other appropriations bills in recent years, Congress has passed an omnibus rather than conferencing directly.

GOP blocks funding increase for EPA watchdog probing Pruitt activities Back

By Alex Guillén | 06/06/2018 03:06 PM EDT

House Republicans today blocked a Democratic effort to increase funding for EPA's Office of Inspector General to help the watchdog deal with the increased workload stemming from Administrator Scott Pruitt's spending and ethics scandals.

Rep. Mark Pocan (D-Wis.) and a bloc of Democrats on the House Appropriations Committee pushed an amendment that would have boosted OIG funding for fiscal 2019. It ultimately was voted down on a party-line vote of 21-26.

"It's hard to imagine that there is a more overworked inspector general than at the EPA these days," Pocan said. "This is not a Democrat/Republican thing, this should be a good government thing."

Interior-EPA Appropriations Chairman Ken Calvert (R-Calif.) said the bill "already includes robust support for EPA's inspector general."

The House Interior-EPA spending package would provide the OIG funding of just over $50 million, about flat with 2018's level. Most of that is appropriated directly, though some of it is pulled from the Superfund program for OIG's work on Superfund-specific issues. Pocan's amendment would have drawn the extra $12 million from EPA's "workforce reshaping" account inside the $2.5 billion environmental programs.

In a February letter, EPA Inspector General Arthur Elkins said the president's proposed OIG budget of $46 million would "substantially inhibit the OIG from performing the duties of the office." He asked instead for a budget of $62 million. That request came before an avalanche of congressional requests to review various Pruitt-related issues on spending and ethics.

WHAT'S NEXT: The committee will vote later today on the full spending bill.

Interior advisory committee recommends streamlining environmental reviews for drilling Back

By Ben Lefebvre | 06/06/2018 06:31 PM EDT

An Interior Department advisory board on Wednesday approved a slew of recommendations aimed at expanding energy lease sales and lowering royalty rates, even as some members questioned whether it had the power to suggest changes to federal environmental reviews.

The Royalty Policy Committee wrapped up its latest meeting in New Mexico after approving nine recommendations for Secretary Ryan Zinke to change how the department collects payments from energy production on federal land. Most of the suggestions would benefit oil and gas companies operating on federal acres, while two recommendations were aimed at boosting renewable energy production.

Two committee members disagreed with a recommendation for the Bureau of Land Management to issue "categorical exclusions" for certain oil and gas projects, allowing those projects to forgo full environmental reviews under the National Environmental Protection Act.

"NEPA is not referred to in the [committee] charter," Rod Eggert, a professor at the Colorado School of Mines, said during the meeting. "The text in the charter refers to royalties and collections of royalties."

Committee member Monte Mills of the University of Montana agreed that recommending categorical exclusions fell outside of the committee's scope.

Western Energy Alliance President Kathleen Sgamma, another member of the committee, defended the recommendation, saying it would increase royalty payments to Interior by making it easier for companies to drill on public land.

"We're trying to increase competitiveness of federal lands," Sgamma said during the meeting. "NEPA is often the aspect of the federal process that takes the longest and decreases the competitiveness of public lands the most."

Ultimately, the committee approved the recommendation and deferred further discussion about the scope of its charter until its next meeting, yet to be scheduled.

The committee also suggested Interior make it easier for companies to pay lower royalty rates for mature oil and gas wells and those "difficult" to operate. And it recommended Zinke ask Congress to amend the Outer Continental Shelf Lands Act with language allowing Interior to hold offshore energy project lease sales in Guam and other U.S. territories.

The committee's two renewable power suggestions were that Interior offer annual lease sales for 2 gigawatts of offshore wind power every year for a decade starting in 2024; and to instruct BLM to reduce fees and streamline permit requirements for solar projects.

BLM tells field office to expedite drilling permit reviews Back

By Ben Lefebvre | 06/06/2018 08:20 PM EDT

The Bureau of Land Management instructed field offices to prioritize the use of old environmental reviews or categorical exclusions to expedite drilling permit applications for sites where work is already underway, according to a memo released today.

The bulletin posted on the BLM website said those methods will allow officials to process the applications "in the most expeditious and appropriate manner" under the National Environmental Policy Act.

The BLM bulletin directed its field offices that existing environmental analysis for new projects proposed for old sites "should be used to the greatest extent possible" instead of starting a new environmental review process.

If the old analysis isn't sufficient, field offices should determine whether the application falls under an existing categorical exclusion, meaning a new NEPA review would not be required. Criteria to determine whether an exclusion would be available include whether a similar project has already occurred on the same site within the previous five years.

BLM posted its memo soon after Interior's Royalty Policy Committee recommended earlier today that the agency increase its use of categorical exclusions.

WHAT'S NEXT: The environmental review priority list goes into effect immediately.

White House, EPA headed off chemical pollution study Back

By Annie Snider | 05/14/2018 12:43 PM EDT

Scott Pruitt's EPA and the White House sought to block publication of a federal health study on a nationwide water-contamination crisis, after one Trump administration aide warned it would cause a "public relations nightmare," newly disclosed emails reveal.

The intervention early this year — not previously disclosed — came as HHS' Agency for Toxic Substances and Disease Registry was preparing to publish its assessment of a class of toxic chemicals that has contaminated water supplies near military bases, chemical plants and other sites from New York to Michigan to West Virginia.

The study would show that the chemicals endanger human health at a far lower level than EPA has previously called safe, according to the emails.

"The public, media, and Congressional reaction to these numbers is going to be huge," one unidentified White House aide said in an email forwarded on Jan. 30 by James Herz, a political appointee who oversees environmental issues at the OMB. The email added: "The impact to EPA and [the Defense Department] is going to be extremely painful. We (DoD and EPA) cannot seem to get ATSDR to realize the potential public relations nightmare this is going to be."

More than three months later, the draft study remains unpublished, and the HHS unit says it has no scheduled date to release it for public comment. Critics say the delay shows the Trump administration is placing politics ahead of an urgent public health concern — something they had feared would happen after agency leaders like Pruitt started placing industry advocates in charge of issues like chemical safety.

Sen. Maggie Hassan (D-N.H.) called the delay "deeply troubling" on Monday, urging Pruitt and President Donald Trump "to immediately release this important study."

"Families who have been exposed to emerging contaminants in their drinking water have a right to know about any health impacts, and keeping such information from the public threatens the safety, health, and vitality of communities across our country," Hassan said, citing POLITICO's reporting of the issue.Details of the internal discussions emerged from EPA emails released to the Union of Concerned Scientists under the Freedom of Information Act.

Sen. Jeanne Shaheen, a fellow New Hampshire Democrat, called the delay "an egregious example of politics interfering with the public's right to know. ... [I]t's unconscionable that even the existence of this study has been withheld until now."

The emails portray a "brazenly political" response to the contamination crisis, said Judith Enck, a former EPA official who dealt with the same pollutants during the Obama administration — saying it goes far beyond a normal debate among scientists.

"Scientists always debate each other, but under the law, ATSDR is the agency that's supposed to make health recommendations," she said.

The White House referred questions about the issue to HHS, which confirmed that the study has no scheduled release date.

Pruitt's chief of staff, Ryan Jackson, defended EPA's actions, telling POLITICO the agency was helping "ensure that the federal government is responding in a uniform way to our local, state, and Congressional constituents and partners."

Still, Pruitt has faced steady criticism for his handling of science at the agency, even before the recent spate of ethics investigations into his upscale travels and dealings with lobbyists. In his year leading EPA, he has overhauled several scientific advisory panels to include more industry representatives and recently ordered limits on the kinds of scientific studies the agency will consider on the health effects of pollution.

On the other hand, Pruitt has also called water pollution one of his signature priorities.

The chemicals at issue in the HHS study have long been used in products like Teflon and firefighting foam, and are contaminating water systems around the country. Known as PFOA and PFOS, they have been linked with thyroid defects, problems in pregnancy and certain cancers, even at low levels of exposure.

The problem has already proven to be enormously costly for chemicals manufacturers. The 3M Co., which used them to make Scotchguard, paid more than $1.5 billion to settle lawsuits related to water contamination and personal injury claims.

But some of the biggest liabilities reside with the Defense Department, which used foam containing the chemicals in exercises at bases across the country. In a March report to Congress, the Defense Department listed 126 facilities where tests of nearby water supplies showed the substances exceeded the current safety guidelines.

A government study concluding that the chemicals are more dangerous than previously thought could dramatically increase the cost of cleanups at sites like military bases and chemical manufacturing plants, and force neighboring communities to pour money into treating their drinking water supplies.

The discussions about how to address the HHS study involved Pruitt's chief of staff and other top aides, including a chemical industry official who now oversees EPA's chemical safety office.

Herz, the OMB staffer, forwarded the email warning about the study's "extremely painful" consequences to EPA's top financial officer on Jan. 30. Later that day, Nancy Beck, deputy assistant administrator for EPA's Office of Chemical Safety and Pollution Prevention, suggested elevating the study to OMB's Office of Information and Regulatory Affairs to coordinate an interagency review. Beck, who worked as a toxicologist in that office for 10 years, suggested it would be a "good neutral arbiter" of the dispute.

"OMB/OIRA played this role quite a bit under the Bush Administration, but under Obama they just let each agency do their own thing...," Beck wrote in one email that was released to UCS.

Beck, who started at OMB in 2002, worked on a similar issue involving perchlorate, an ingredient in rocket fuel — linked with thyroid problems and other ailments — that has leached from defense facilities and manufacturing sites into the drinking water of at least 20 million Americans. Beck stayed on at OMB into the Obama administration, leaving the office in January 2012 and going to work for the American Chemistry Council, where she was senior director for regulatory science policy until joining EPA last year.

Yogin Kothari, a lobbyist with the Union of Concerned Scientists, called Beck's January email "extremely troubling because it appears as though the White House is trying to interfere in a science-based risk assessment."

Environmentalists say such interference was routine during the Bush administration.

"It's why the Obama administration issued a call for scientific integrity policies across the federal government," Kothari said in an email to POLITICO. "Dr. Beck should know firsthand that the Bush administration sidelined science at every turn, given that she spent time at OMB during that time."

Soon after the Trump White House raised concerns about the impending study, EPA chief of staff Ryan Jackson reached out to his HHS counterpart, as well as senior officials in charge of the agency overseeing the assessment to discuss coordinating work among HHS, EPA and the Pentagon. Jackson confirmed the outreach last week, saying it is important for the government to speak with a single voice on such a serious issue.

"EPA is eager to participate in and, contribute to a coordinated approach so each federal stakeholder is fully informed on what the other stakeholders' concerns, roles, and expertise can contribute and to ensure that the federal government is responding in a uniform way to our local, state, and Congressional constituents and partners," Jackson told POLITICO via email.

Pruitt has made addressing per- and polyfluoroalkyl substances, or PFAS, a priority for EPA. The unpublished HHS study focused on two specific chemicals from this class, PFOA and PFOS.

States have been pleading with EPA for help, and experts say that contamination is so widespread, the chemicals are found in nearly every water supply that gets tested.

In December, the Trump administration's nominee to head the agency's chemical safety office, industry consultant Michael Dourson, withdrew his nomination after North Carolina's Republican senators said they would not support him, in large part because of their state's struggles with PFAS contamination. Dourson's previous research on the subject has been criticized as too favorable to the chemical industry.

Shortly after Dourson's nomination was dropped, Pruitt announced a "leadership summit" with states to discuss the issue scheduled for next week.

In 2016, the agency published a voluntary health advisory for PFOA and PFOS, warning that exposure to the chemicals at levels above 70 parts per trillion, total, could be dangerous. One part per trillion is roughly the equivalent of a single grain of sand in an Olympic-sized swimming pool.

The updated HHS assessment was poised to find that exposure to the chemicals at less than one-sixth of that level could be dangerous for sensitive populations like infants and breastfeeding mothers, according to the emails.

Dave Andrews, a senior scientist with the Environmental Working Group, said those conclusions line up with recent studies on the health effects of PFAS.

"They are looking at very subtle effects like increased risk of obesity for children exposed in womb, lowered immune response, and childhood vaccines becoming not as effective," Andrews said.

The HHS document at issue is called a toxicological profile, which describes the dangers of a chemical based on a review of previous scientific studies. It would carry no regulatory weight itself, but could factor into cleanup requirements at Superfund sites.

EPA scientists, including career staffers, were already talking with the HHS researchers about the differences in their two approaches to evaluating the chemicals when officials at the White House raised alarm in late January, the emails show. Those differences, according to the correspondence, stemmed from the agencies' use of different scientific studies as a basis, and from taking different approaches to accounting for the harm that the chemicals can do to the immune system — an area of research that has burgeoned in the two years since EPA issued its health advisory.

Enck, the former EPA official, said she sees one troubling gap in the emails: They make "no mention of the people who are exposed to PFOA or PFOS, there's no health concern expressed here."

Fourth Pruitt Aide Leaving Amid Swirling Controversy at EPA

By Jennifer A. Dlouhy

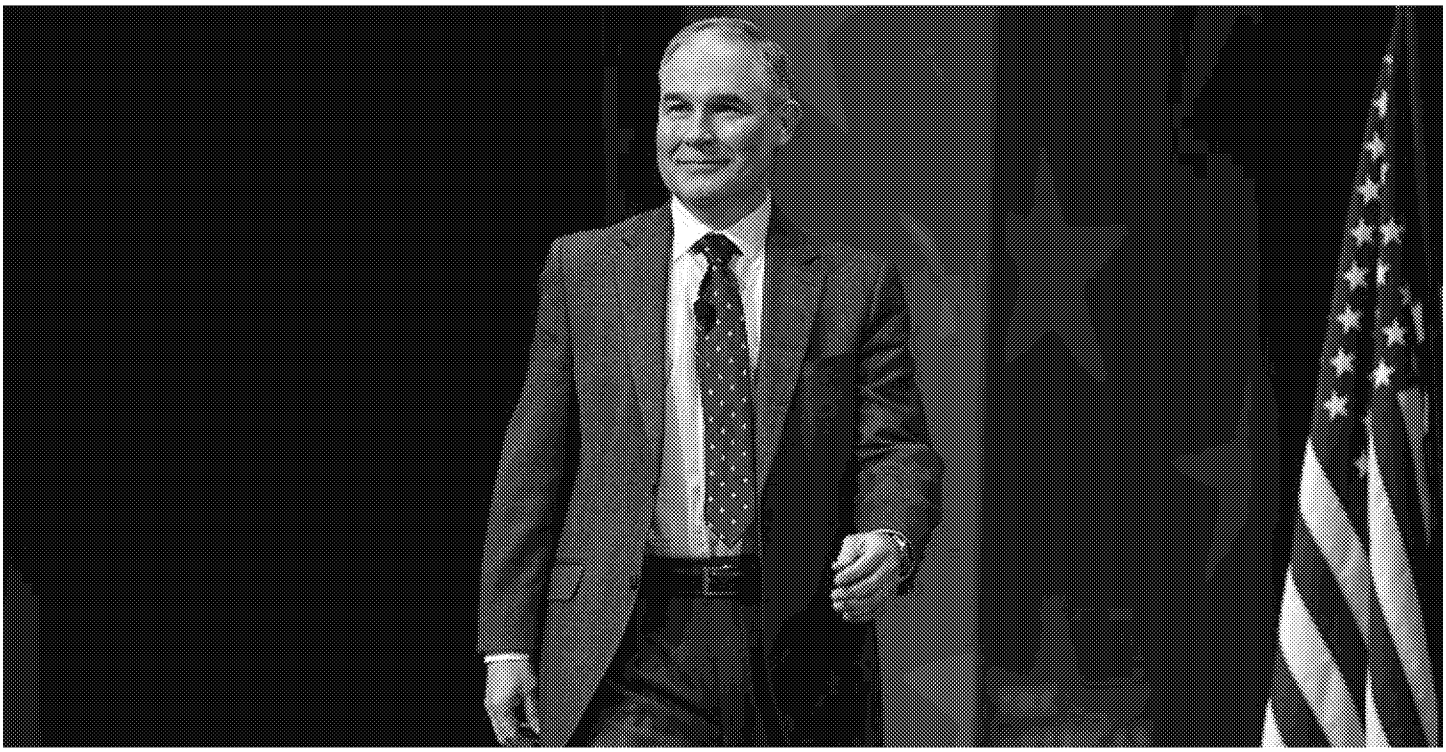
Posted May 4, 2018, 12:46 PM

A fourth departure this week of an Environmental Protection Agency official, announced May 4, may suggest continued fallout from the controversies swirling around Administrator Scott Pruitt.

GREENWIRE ARTICLES

Lobbyist with hand in Pruitt trips tied to gas-rich nation

Kevin Bogardus and Hannah Northey, E&E News reporters Published: Friday, May 4, 2018



EPA Adminstrator Scott Pruitt, shown here in a 2017 file photo. Gage Skidmore/Flickr

The lobbyist who helped arrange EPA Administrator Scott Pruitt's trip to Morocco has another foreign client with natural gas interests, East Timor.

The global law firm DLA Piper hired Richard Smotkin last November as a subcontractor to work on representing the government of the Democratic Republic of Timor-Leste, otherwise known as East Timor, according to Justice Department records.

Press deputy to leave

Kevin Bogardus, E&E News reporter

Published: Friday, May 4, 2018

John Konkus, one of EPA's top press officials, is departing the agency.

Konkus is heading to the Small Business Administration to help lead communications for the agency. As deputy associate administrator in EPA's public affairs shop, his exit marks the fourth high-profile staff departure on Administrator Scott Pruitt's team this week.

Konkus has been involved with EPA from the very beginning of the Trump administration, serving on the president's transition and "beachhead" teams for the agency, as well as helping to guide Pruitt's confirmation in the Senate.

House Dems want more time for comments on 'secret science'

Sean Reilly, E&E News reporter

Published: Friday, May 4, 2018

Democratic Reps. Eddie Bernice Johnson of Texas and Paul Tonko of New York. House/Wikipedia

This article was updated at 2:27 p.m. EDT.

More than 60 House Democrats are urging EPA to allow more time for public feedback on a fiercely disputed proposal to revamp how the agency handles scientific research.

"EPA has the critical mission of protecting human health and the environment," Rep. Paul Tonko (D-N.Y.) and 64 other lawmakers wrote yesterday to EPA Administrator Scott Pruitt. "With this mission in mind, any significant change should go through a serious discussion, a series of public hearings and a robust comment period."

In the proposed rule published Monday, EPA set a 30-day comment period that ends May 30.

The Democrats are asking Pruitt to extend the comment period to at least three months.

South Korea proposes universal chemical tracking system

Overseas manufacturers would submit details through appointed representatives

3 May 2018 / Confidentiality & right-to-know, Enforcement, K-REACH, Labelling, South Korea

South Korea's Ministry of Environment (MOE) has proposed a mandatory system of tracking chemicals from their import and manufacture to end use.

It would introduce a unique government-allocated "checking number" for all manufactured or imported chemical substances. These could then be tracked, regardless of how they are subsequently used or if some information is inaccurate or changes, for example, product name.

Companies must currently check whether substances are toxic and report on them if the case. This would be replaced with a mandatory reporting system for all substances.

The number would follow substances to downstream producers. Companies handling hazardous substances would have to use it on packaging and products.

The overall aim is to bring transparency to distribution and, in the case of accidents, allow the identification of a substance and distribution routes.

The ministry says it will also address problems of obtaining hazard information for the 8,000 under one tonne substances, exempted from registration under K-REACH.

Overseas manufacturers would have also have to submit details of substances for the Korean market. To allay CBI concerns, they will be able to appoint a domestic representative to act on their behalf.

The representative would provide full ingredient disclosure through the reporting system, which would be managed confidentially in the government's internal database.

The MOE says the new system would be implemented two years after legislation is passed. In the future, it expects barcodes/QR codes with the tracking identifier to become mandatory.

The proposal was published on 3 May.

UK's ability to keep pace with REACH changes threatened by Bill amendment

If passed, Lords' amendment to EU Withdrawal Bill would hamper ongoing adoption of authorisations, restrictions

3 May 2018 / Europe, REACH

As the UK government prepares for the end of the House of Lords review of its EU Withdrawal Bill, sources close to the process have warned that one of the amendments adopted by the Lords would, if included in the final text of the Bill, make it extremely difficult for the UK to adopt updates to REACH post Brexit.

During its passage through the Lords, a number of amendments were adopted including Amendment 11, which relates to enhanced protection for certain areas of EU law, including environmental standards and protection.

On the day the UK leaves, the amendment would ensure government ministers cannot change or repeal EU law – other than for technical changes – except by an Act of Parliament or by secondary legislation that must undergo greater parliamentary scrutiny than is usually the case.

Sources say this could mean that changes to a transposed REACH Regulation, such as adding chemicals to a UK authorisation list or introducing new restrictions, would therefore require an Act of Parliament or enhanced scrutiny.

'Not convinced'

The technical changes mentioned in Amendment 11 link to clause 7 of the EU Withdrawal Bill. This contains the power to make corrections to retained EU law in order to deal with deficiencies that arise as a consequence of the UK's exit.

Elizabeth Shepherd, partner at law firm Eversheds Sutherland, said "we are not convinced that the addition of more chemicals to a UK authorisation list, or to introduce new restrictions would fall within either of these provisions."

However, she added, even if they did and could – according to Amendment 11– be dealt with by secondary legislation, "this would not necessarily guarantee that UK legislation, including UK REACH, will remain the same as the EU".

The government has previously said that "certain areas of health and safety legislation, such as chemical regulation will require more fundamental review to ensure operability". And that these "will be dealt with in separate legislation which will also be made under EU Withdrawal Bill powers; these policy areas are cross-cutting and require a specific regime approach".

If Britain established a new environmental regulator "there will need to be a new set of delineated statutory powers and functions for that regulator", Ms Shepherd said.

Lord Whitty, a member of the House or Lords, who proposed an amendment concerning chemicals, said without an agreement on continued membership of REACH and Echa "there is no automatic reflection of new REACH provisions in UK law".

He added that amendment 11 "reflects the Lords' concern at the so called 'Henry VIII powers' that the bill would otherwise give to ministers in future to vary legislation with minimum or no parliamentary scrutiny – particularly in the areas designated. It does not prohibit changes being made under secondary legislation – it simply requires greater scrutiny."

Government response

When questioned on the potential problem for future chemicals management, a government spokesperson told Chemical Watch: "We are disappointed that Parliament voted for this amendment in spite of the assurances we provided.

"We will review this decision when the Bill returns to the House of Commons to ensure we deliver a workable piece of legislation that provides certainty as we leave.

"The purpose of this Bill," the spokesperson added "is to provide a functioning statute book on exit day and this amendment would prevent us from doing that. It would risk legislation in key areas not working after exit day."

Progress of Bill

The Bill started in the House of Commons where it underwent five stages before being passed to the House of Lords for scrutiny – first and second readings followed by a committee stage, a report stage and then a final reading.

It is currently completing its report stage - when amendments are voted on and adopted or rejected - in the House of Lords. After final reading it will be returned to MPs in the House of Commons for consideration of amendments and the two chambers will send final changes back and forth - a process known in Parliament as 'ping pong'. Once all differences between them have been solved, the Bill will receive royal assent from the Queen and become law.

Stockholm Convention factsheet lists POPs exemptions

4 May 2018 / Global, Persistent organic pollutants

The Stockholm Convention on persistent organic pollutants (POPs) has published a factsheet on exempted uses for perfluorooctane sulfonate (PFOS), its salts and perfluorooctanoic acid (PFOA).

The factsheet puts these in three categories:

- acceptable purposes, such as photo-imaging, medical devices, semiconductors and firefighting foam;
- time-limited exempted uses for SCCPs, such as rubber industry transmission belts, lubricant additives and adhesives; and
- time-limited exempted uses for synthetic substance c-deca-BDE, such as aircraft and vehicle parts, textiles and polyurethane foam.

The convention aims to eliminate or restrict the production and use of POPs.

Industry criticises 'misleading' baby products guide

NGO coalition advises avoiding items containing toxic chemicals

4 May 2018 / Children's products, Food & drink, Retail, United States

US children's products trade associations have criticised an NGO report that advises parents to avoid buying baby items containing a number of chemicals including certain plastics, flame retardants and solvents.

The Getting Ready for Baby coalition's *Safe baby guide* gives detailed guidelines for avoiding chemicals in baby products. It also recommends consumers buy items carrying the Made Safe independent labelling certification.

However, Kelly Mariotti, executive director of the Juvenile Products Manufacturers Association (JPMA), called the guide "misleading", and said children's products are already subject to stringent federal safety requirements.

"Simply put, hazardous substances cannot be accessible to a child so as to present either an acute or chronic hazard," she told Chemical Watch. If that were the case the product would already be banned, she said.

The coalition comprises more than 95 organisations that campaign for retailers to avoid selling baby products containing toxic chemicals. Other recommendations in the guide include avoiding:

- flame retardants, perfluoroalkyl and polyfluoroalkyl substances (PFASs), polyvinyl chloride (PVC) and microbial substances in mattresses;
- formaldehyde in baby furniture such as cots, changing tables and highchairs;
- bisphenol A (BPA) and bisphenol S (BPS) in baby bottles;
- PVC in teethers;
- flame retardants in baby changing mats;
- solvents and PVC in strollers; and
- flame retardants in car seats

Toy concern

The guide also provides guidance on purchasing toys and puzzles for babies.

It recommends consumers avoid giving their babies toys made before 2008, when the Consumer Product Safety Improvement Act set stricter limits on lead and certain phthalates. And it also advises that:

- clear hard plastic toys may contain bisphenols;
- plastic dolls may be made of PVC; and
- metal products may include cadmium, mercury and antimony.

But Alan Kaufman, senior vice president of technical affairs at the Toy Association, told Chemical Watch the advice was "needlessly frightening to new parents and not based on any credible underlying science".

All toys sold in the US must comply with strict toy safety regulations, tests, and requirements which "make it illegal to sell toys or children's products containing substances harmful to children and to which they might be exposed," he said.

Responding to the criticisms, Bobbi Wilding, deputy director of the NGO Clean and Healthy New York, which is a partner in the campaign, said: "All of the chemicals we highlight have scientific evidence of contributing to negative health problems. We have released a technical document that provides the rationale for our choices, and parents can, if they're interested, easily access this information on every page of our guide."

Subject: SIGNED: Strengthening Transparency in Regulatory Science

Good afternoon
Today, the Administrator signed the proposed rule "Strengthening Transparency in Regulatory Science."

This proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation.

In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

Attached is the signed and dated proposed rule. For your convenience, please go to p. 19 for the Administrator's signature.

Please contact me if you have any questions.

Sincerely,
Laura

EPA Floats 'Secret Science' Ban Rule, Signaling Possible Internal Fixes

EPA has sent for White House review a proposed rule to increase the transparency of regulatory science, advancing Administrator Scott Pruitt's controversial efforts to ban the use of "secret science" in a move that suggests officials have addressed at least some internal concerns that such a policy could violate statutory protections of medical privacy and trade secrets.

Environmentalists Launch Suit Challenging EPA's TSCA Framework Rules

Environmentalists have filed their opening brief in their suit challenging EPA's "framework" rules for prioritizing and assessing existing chemicals for possible regulation under the revised Toxic Substances Control Act (TSCA), arguing the rules violate a requirement to conduct a holistic review that considers all of a chemical's uses.

Agencies Wrestle With Lead Exposure Goals Ahead Of Strategy's Release

Two months before the planned release of a federal strategy for reducing children's lead exposures, EPA and other agencies are wrestling with key policy goals, including a planned schedule for eliminating exposures, whether the strategy will complement pending EPA rules and if EPA plans to account for stricter federal health standards that are slated to be adopted later this year.

EPA Sees TSCA Fee Increase If It Adopts New 'Small Business' Metric

EPA says it might have to hike the fees it charges companies for approving new and existing chemicals under the revised toxics law if it adopts one of two employee-based size metrics it is considering for defining “small businesses” that are charged lower fees.

Pruitt Scandals Prompt Agency Staff Anger At Ethics 'Double Standard'

EPA Administrator Scott Pruitt's mounting ethics problems are prompting an angry reaction from many agency staff who fear they would be reprimanded, suspended or even removed for conduct similar to Pruitt's, citing in part warnings in annual ethics trainings to avoid even the appearance of improper actions and to not waste government resources.

'Shocked' by noncompliance, enforcement chief warns industry

Sean Reilly, E&E News reporter

Published: Monday, April 23, 2018

With an expression of surprise at the continuing lack of compliance with environmental laws, EPA enforcement chief Susan Bodine warned businesses Friday against cutting corners to save money.

While that's bad for the environment and public health, it's also bad for the company, Bodine said at the EarthX festival in Dallas, "because you're going to lose whatever those savings were in penalties, lost reputation, even debarment from getting federal government contracts."

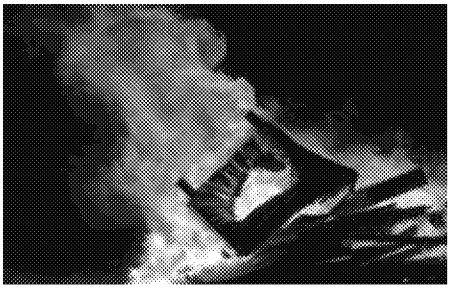
US body abandons plans for new flammability standard

NFPA hears concerns over flame retardants in furniture

24 April 2018 / Built environment, Halocarbons, United States



The National Fire Protection Association in the US has voted to halt development of a new flammability standard for residential upholstered furniture. The vote came amid stakeholder concern around the toxicity of the flame retardant chemicals that may have been needed to meet it.

Since 2014, a technical committee and two task groups at the NFPA have been working to develop a method to evaluate upholstered residential furniture subjected to a flaming ignition source. They were responding to a "significant fire issue" posed by burning upholstered furniture, according to Christian Dubay, NFPA vice president and chief engineer.

But the organisation received "numerous comments in opposition" to the draft – NFPA 277. Among these, many raised concerns that its implementation could increase the use of flame retardant chemicals in the furniture.

The NFPA's Standards Council voted to end development of the standard, citing a "fundamental lack of consensus on how to test and evaluate residential upholstered furniture flammability, exposed to a flaming ignition source."

Standards driving flame retardant use

The NFPA develops codes and standards through an open, consensus-based process. Although its standards are voluntary, many are adopted by local governments or firms.

Its work on standard 277 came though there has been a move away from 'open flame' flammability standards in favour of 'smoulder' tests in recent years.

Prior to 2014, California had in place an open-flame test for upholstered furniture. Many manufacturers used added chemical flame retardants in furniture sold nationwide to meet this.

Amid concerns of the possible harmful effects to human health and the environment of exposure to the substances, Governor Jerry Brown approved a new standard in November 2013 – Technical Bulletin (TB) 117-2013. This replaced the open-flame test in the original TB 113 with a smoulder test, which could more readily be met without added flame retardants.

Following that change, many foam suppliers and furniture manufacturers began removing flame retardants from products. Several US states have since acted to ban or restrict the substances' use in those applications.

Stakeholder opposition

The Polyurethane Foam Association is opposed to the standard. In comments to the NFPA, it said that, among other concerns, furniture assemblies would probably include the use of flame retardants to "score" well with NFPA 277.

And because some jurisdictions have restricted or prohibited them in furniture, "without the availability of such substances (either ethically or legally), it may be impossible for many furniture designs to achieve acceptable NFPA 277 performance," it said.

Dr Donald Lucas, a retired Lawrence Berkeley National Laboratory scientist who served on the NFPA 277 secondary task group, welcomed the decision to halt the standard's development. "Too many questions remain about [...] the health and environmental effects surrounding how flammability standards would be met to develop a meaningful method at this time," he said.

And Bifma, a trade group for commercial furniture, said it supports existing 'smoulder test' flammability standards as "appropriate regulation".

The Green Science Policy Institute (GPSI) – a longtime critic of flame retardant usage – also welcomed the decision.

But the NGO's executive director, Arlene Blum, told Chemical Watch she is concerned that the Consumer Product Safety Commission (CPSC) may be considering adopting a similar standard.

"Historically, the largest driver of the addition of flame retardant chemicals to furniture in the US was the open-flame flammability testing required by California's Technical Bulletin 117," said Dr Blum. "I question why the [CPSC] is still considering such a standard."

The CPSC is set to meet on 16 May to discuss furniture fire standards. The GSPI agrees with a coalition of petitioning furniture trade groups that the agency should adopt California's updated TB 117-13 as the national standard.

US EPA asked to extend consultation on alternative tests strategy

NGO advocates publication and review of 'robust and extensive' stakeholder analysis

24 April 2018 / Test methods, TSCA, United States

The Environmental Defense Fund has requested that the US EPA extend the public comment period for its draft plan to promote the development of alternative test methods under TSCA.

The EDF's call comes after it was revealed that the agency has yet to release a stakeholder analysis that could "significantly influence" its consideration of issues raised in the plan.

The EPA published its *Strategic plan to promote the development and implementation of alternative test methods* in early March. It outlines the move towards making TSCA determinations with new approach methodologies (NAMs) in place of vertebrate animal testing.

But, at a 10 April hearing, Nancy Beck, deputy assistant administrator for the Office of Chemical Safety and Pollution Prevention at the EPA, "prominently highlighted" the stakeholder-submitted analysis it is yet to release. The former American Chemistry Council staffer reportedly described the analysis as "robust and extensive".

The EPA said it would release it in the public docket, according to the EDF. But this has yet to happen.

The organisation has requested the agency make the document public and then extend the consultation by 30 days from this date.

"Given the importance that EPA itself publicly attributed to the analysis it received from a stakeholder, EPA should provide the public with sufficient opportunity to review and comment on that analysis," it says.

The comment period is currently set to close on 26 April.

The Washington Post: Pruitt to unveil controversial 'transparency' rule limiting what research EPA can use

Environmental Protection Agency Administrator Scott Pruitt is expected to propose a rule Tuesday that would establish new standards for what science could be used in writing agency regulations, according to individuals briefed on the plan. It is a sweeping change long sought by conservatives. The rule, which Pruitt has described in interviews with select media over the past month, would only allow EPA to consider studies for which the underlying data are made available publicly. Advocates describe this approach as an advance for transparency, but critics say it would effectively block the agency from relying on long-standing, landmark studies linking air pollution and pesticide exposure to harmful health effects.

Inside EPA: EPA's Ross Eyes Greater Water Policy 'Engagement,' Incremental Changes

EPA water chief David Ross is looking for ways to replicate in other rulemakings the type of engagement the agency used with states to discuss changes to the Obama-era Clean Water Act (CWA) jurisdiction rule, while stressing the need for incremental progress with water policies rather than trying to accomplish everything at once. Speaking at the National Water Policy Fly-In April 17 in Washington, D.C., Ross outlined his priorities as assistant administrator of the Office of Water, and said his overarching goal is to be proactive instead of reactive. The fly-in was sponsored by the National Association of Clean Water Agencies, the Water Environment Federation, the Water Research Foundation and WateReuse. One example of how Ross wants to change the way EPA does business is to change the process of consultation with state and local governments and the regulated community into one of "engagement," he said, pointing to the process used with the jurisdiction rule.

The Daily Caller: SOURCES: Most Of What EPA's Leaker Told Dems About Scott Pruitt Is 'False'

A former Environmental Protection Agency (EPA) official likely behind negative media stories about Administrator Scott Pruitt doesn't have all his facts straight, according to sources familiar with EPA's inner-workings. Former Trump campaign official Kevin Chmielewski, who's also former EPA deputy chief of staff operations, gave congressional Democrats a list of accusations against Pruitt, detailing the administrator's alleged "wasteful spending" and "disregard for ethical and legal requirements." Chmielewski is the likely source for media reports surrounding Pruitt's spending habits and alleged ethical lapses. Chmielewski was allegedly removed from his position at EPA for challenging Pruitt, but that hasn't been confirmed, reports said.

The Washington Examiner: EPA's Scott Pruitt says burning wood is renewable energy

The Environmental Protection Agency will begin treating energy created by burning trees as renewable, the same as wind and solar. Biomass from burning wood to produce electricity will be considered carbon-neutral, the EPA announced Monday. "Today's announcement grants America's foresters much-needed certainty and clarity with respect to the carbon neutrality of forest biomass," Administrator Scott Pruitt said Monday after meeting with forest industry representatives during a visit to a school in Georgia. "Managed forests improve air and water quality, while creating valuable jobs and thousands of products that improve our daily lives. This is environmental stewardship in action." The recent spending bill passed by Congress had directed the EPA, Energy Department and Agriculture Department to "reflect the carbon-neutrality of forest bioenergy and recognize biomass as a renewable energy source."

Reuters: Senate committee paves way for Pompeo to become top U.S. diplomat

A U.S. Senate committee approved the nomination of President Donald Trump's choice for secretary of state, Mike Pompeo, on Monday after a Republican senator who had been opposed threw his support behind the CIA director in the face of party pressure. The Senate Foreign Relations Committee approved the nomination on a party-line vote, with all 11 Republicans backing him, nine Democrats opposed and one Democrat, Chris Coons, voting "present" because one Republican was at a funeral out of town. Majority Leader Mitch McConnell said there were enough votes in the full Senate to confirm Pompeo this week. That would allow Pompeo to attend a NATO summit on Friday. Pompeo became one of Trump's closest advisers during his 15 months as CIA director. He most recently has been deeply involved in preparations for Trump's summit with North Korean leader Kim Jong Un, including meeting with him three weeks ago

The Wall Street Journal: Driver Plows Van Into Toronto Pedestrians, Kills 10

A man in his mid-20s plowed a rented van into people walking along a busy Toronto thoroughfare on Monday, killing 10 and injuring 15, and rattled one of North America's safest major cities. Police said they arrested the driver, Alek Minassian, 25 years old, of Ontario. Authorities said Monday evening that they were still trying to determine his motive. "We cannot come to any firm conclusions at this stage," said Canada's Public Safety Minister Ralph Goodale. But he said there was "no national security connection" to the attack, based on the evidence police have seen so far. Toronto Chief of Police Mark Saunders said the attack "looks intentional." The casualties occurred on one of the city's first warm spring days, along Toronto's main artery, Yonge Street. Mass killings have been much rarer in Canada than in the U.S. and Europe, and many said they were stunned.

Pruitt to unveil controversial 'transparency' rule limiting what research EPA can use

By Juliet Eilperin and Brady Dennis, 4/24/18

Environmental Protection Agency Administrator Scott Pruitt is expected to propose a rule Tuesday that would establish new standards for what science could be used in writing agency regulations, according to individuals briefed on the plan. It is a sweeping change long sought by conservatives.

The rule, which Pruitt has described in interviews with select media over the past month, would only allow EPA to consider studies for which the underlying data are made available publicly. Advocates describe this approach as an advance for transparency, but critics say it would effectively block the agency from relying on long-standing, landmark studies linking air pollution and pesticide exposure to harmful health effects.

In an interview Sunday with radio host John Catsimatidis on 970 AM in New York, Pruitt described the change as a way to let the public judge "the data, the methodology, the analytics" behind any scientific analysis presented to the EPA as it drafts regulations.

"That's transparency," he told Catsimatidis. "It gives people the opportunity in real time to peer review. It goes to the heart of what we should be about as an agency."

The individuals briefed on the rule, which will be subject to a 30-day comment period, spoke on the condition of anonymity in advance of the announcement.

Many scientists argue that applying a standard to public health and environmental studies that is not currently required by peer-reviewed journals would limit the information the EPA could take into account when crafting federal limits on everything from power-plant emissions to which chemicals can be used in agriculture and in homes. Some researchers collect personal data from subjects but pledge to keep it confidential — as was the case in a major 1993 study by Harvard University that established the link between fine-particle air pollution and premature deaths. That practice would not be allowed under the new rule.

House Science Committee Chairman Lamar Smith (R-Tex.) sought to establish a requirement similar to the one Pruitt will propose through legislation, but it failed to pass both chambers.

On Monday, 985 scientists signed a letter organized by the Union of Concerned Scientists urging Pruitt not to forge ahead with the policy change.

"There are ways to improve transparency in the decision-making process, but restricting the use of science would improve neither transparency nor the quality of EPA decision-making," they wrote. "If fully implemented, this proposal would greatly weaken EPA's ability to comprehensively consider the scientific evidence across the full array of health studies."

Under the proposed rule, third parties would be able to test and try to replicate the findings of studies submitted to EPA. But, the scientists wrote, "many public health studies cannot be replicated, as doing so would require intentionally and unethically exposing people and the environment to harmful contaminants or recreating one-time events."

Andrew Rosenberg, director of the Union of Concerned Scientists' Center for Science and Democracy, said in an email that Pruitt's move would expand on his earlier decision to change the standards for who can serve on EPA's advisory committees. Last year, Pruitt barred any scientists from serving if they received EPA grants for their work. Researchers funded by industries regulated by the agency to continue serving, however.

"First, they came after the agency's independent science advisers, and now, they're going after the science itself," Rosenberg said. "What is transparent is the unabashed takeover of EPA leadership by individuals who have demonstrated disinterest in helping communities combat pollution by using the best available science."

Inside EPA

http://insideepa.com/daily-news/epas-ross-eyes-greater-water-policy-engagement-incremental-changes

EPA's Ross Eyes Greater Water Policy 'Engagement,' Incremental Changes

By Laura Beaven, 4/23/18

EPA water chief David Ross is looking for ways to replicate in other rulemakings the type of engagement the agency used with states to discuss changes to the Obama-era Clean Water Act (CWA) jurisdiction rule, while stressing the need for incremental progress with water policies rather than trying to accomplish everything at once.

Speaking at the National Water Policy Fly-In April 17 in Washington, D.C., Ross outlined his priorities as assistant administrator of the Office of Water, and said his overarching goal is to be proactive instead of reactive. The fly-in was sponsored by the National Association of Clean Water Agencies, the Water Environment Federation, the Water Research Foundation and WateReuse.

One example of how Ross wants to change the way EPA does business is to change the process of consultation with state and local governments and the regulated community into one of "engagement," he said, pointing to the process used with the jurisdiction rule. In that case, EPA invited nine states to each bring three representatives, including state agriculture directors, for two days of talks with the agency, he said.

"We got really close to the vision I have for engagement," Ross said, adding that the challenge now is figuring out "how do I replicate that to other rulemakings."

In terms of other areas of focus, Ross said "aging infrastructure is priority 1, 2 and 3" and is part of Administrator Scott Pruitt's focus on "back to basics."

"Infrastructure at a high level is what I was focused on coming in," with a goal of making "incremental improvements on an annual basis," Ross said.

Using a baseball analogy, Ross said he prefers to "take the safe singles" rather than take bigger risks that may not work.

One aspect of aging infrastructure that has received great attention from Pruitt is the need to replace lead drinking water service lines, something that could be addressed in the agency's upcoming proposal to revise the Safe Drinking Water Act lead and copper rule (LCR).

Recommendations from the agency's National Drinking Water Advisory Council (NDWAC) in 2015 on how to change the LCR included a call for drinking water utilities to conduct full lead service line replacements (LSLRs), rather than partial replacements.

But legal and financial questions over how to accomplish this remain unanswered, and drinking water utilities recently urged EPA to focus on "financially prudent" ways to reduce human health risks when revising the LCR, noting that it may be impossible to include all of NDWAC's recommendation in the proposed rule.

Ross said EPA is "working hard to balance the competing needs" within the LCR revisions and that "you'll see some action this year."

During a panel discussion after Ross' speech, Peter Grevatt, director of the Office of Ground Water and Drinking Water, said Pruitt is very focused on LSLR and noted the administrator's recent visit to Cincinnati to meet with local water utilities and tour two LSLR construction sites.

Grevatt said he suggested the April 16 Cincinnati trip, in part because the city is proactively working to remove its lead pipes rather than doing so because of elevated levels of lead in its drinking water.

Lead Programs

In an April 16 EPA press release, Cathy Bailey, director of the Greater Cincinnati Water Works, said Pruitt's "visit gave us a chance to explain our enhanced lead program that includes education, outreach and removal of lead service lines. Our program wasn't mandated by regulations, but implemented because it is the right thing to do for our community, and we believe it can serve as a model across the country."

Grevatt echoed the agency's emphasis on helping utilities find a way to conduct LSLRs. "It's not just that we'll order you to do that," he said.

Ross also suggested that the Water Infrastructure Finance and Innovation Act (WIFIA) program could provide funding for LSLRs. EPA is prioritizing projects that reduce lead for its next round of WIFIA loans.

Another area Ross highlighted as a priority is nutrient pollution. "I want to aggressively go after it, but holistically," he said, adding that EPA has previously "missed the opportunity to engage with state agriculture directors" on ways to prevent nutrient runoff.

Ross said he wants EPA research to be focused on how to solve the problem. Later, during a question-and-answer session, he said that to date much of the agency's research has been focused on measuring nutrients downstream but he wants it to tackle the question of "how do you get source reduction?"

A water utility representative from Bowling Green, OH, asked Ross if there is any way to leverage WIFIA funds for agriculture projects.

Ross, after consulting with Office of Wastewater Management Director Andrew Sawyers, said, yes. "WIFIA is a very flexible program," Ross said. If a bunch of rural communities wanted to get together and develop a WIFIA proposal, they could, he said.

"Farmers are willing to do the work" to reduce nutrient runoff, especially if they can see the results, Ross said.

Ross also said he wants to "take a long hard look at trading," saying that it "hasn't been utilized enough" and that he likes the idea of utilizing nature to treat agricultural runoff.

Water Trading

During a second question-and-answer period, other EPA water officials reiterated Ross' interest in trading.

John Goodin, acting director of the Office of Wetlands, Oceans and Watersheds, said Ross is particularly interested in figuring out how to remove current hindrances to water quality trading.

And Sawyers said there are "some real opportunities around watershed permitting," adding that some states are looking how to enhance or retool their trading programs.

While water quality trading programs can be developed to address any number of pollutants, most have focused on nutrients. Nutrient credit trading programs are designed to allow a point source to purchase pollutant reduction credits from another point source or a nonpoint source in the same watershed with the intent of meeting the discharge limits established in a Clean Water Act discharge permit

The Government Accountability Office last year found that states with the greatest number of nutrient water quality trades are those with discharge limits dictated by a regulatory cleanup plan, and that without such a driver, trading is unlikely to occur. -- Lara Beaven (lbeaven@iwpnews.com)

SOURCES: Most Of What EPA's Leaker Told Dems About Scott Pruitt Is 'False'

By Michael Bastasch, 4/23/18

A former Environmental Protection Agency (EPA) official likely behind negative media stories about Administrator Scott Pruitt doesn't have all his facts straight, according to sources familiar with EPA's inner-workings.

Former Trump campaign official Kevin Chmielewski, who's also former EPA deputy chief of staff operations, gave congressional Democrats a list of accusations against Pruitt, detailing the administrator's alleged "wasteful spending" and "disregard for ethical and legal requirements."

Chmielewski is the likely source for media reports surrounding Pruitt's spending habits and alleged ethical lapses. Chmielewski was allegedly removed from his position at EPA for challenging Pruitt, but that hasn't been confirmed, reports said.

But many of Chmielewski's claims have been called into question by two sources familiar with EPA's inner-workings. One source told The Daily Caller News Foundation of Chmielewski's claims that "more than 60 percent is false, the other 40 percent is information he distorted."

In one instance Chmielewski alleged "a $30,000 contract with private Italian security personnel entered into by Mr. [Pasquele] Nino Perrotta," ahead of Pruitt's attendance of a G7 summit in Italy.

However, two sources familiar with Pruitt's security said that never happened, adding Perrotta, the special agent in charge of Pruitt's security detail, would have had no authority to enter into such a contract on his own.

The "special agent in charge has no authority to make purchase agreements or authorize people to make purchases," one source told TheDCNF. Perrotta would need approval from higher-ups in the Office of Criminal Enforcement and Forensic Training, the source said.

Perrotta did communicate with contacts in Italy but only to get an idea of what sort of security would be typical for a U.S. official of Pruitt's stature, not to negotiate a five-figure security contract, a second source said.

Before joining EPA in 2004, Perrotta joined the Secret Service in 1995. Before that, Perrotta served as an Army intelligence officer for three years and did tours in Italy, Bulgaria and Romania.

Like his boss, Perrotta's become the focus of intense media scrutiny, including a New York Times article that referred to the special agent as Pruitt's "sheriff." NYT's April 12 article, published the same day as Democrats' letter, repeated many of Chmielewski's accusations.

"Perrotta, has clashed — at least once physically — with top EPA officials who challenged Mr. Pruitt's spending, and has steered at least one EPA security contract to a business associate," current and former officials told NYT.

Likewise, "at least one security-related contract was awarded to an individual who works at Mr. Perrotta's private security firm, and he believes that other contracts may also have been awarded to friends or associates of Mr. Perrotta's," Chmielewski told Democrats.

It's true EPA hired Edwin Steinmetz to conduct a security sweep of Pruitt's office in 2017, costing the agency $3,000. Steinmetz is listed on the management team of Perrotta's security firm he operates on the side named Sequoia Security Group.

"It was an emergency; they needed it right away," Steinmetz told NYT. "I dropped everything and took care of it." None of the money Steinmetz was paid went to Sequoia Security Group, and there's no evidence Perrotta played a role in any other security contracts.

Both DCNF sources confirmed Steinmetz's security sweep but contested NYT's characterization Perrotta "steered" the contract toward them. EPA hadn't conducted a security sweep in years and asked Perrotta for a recommendation, the sources said.

EPA contracting officials took the ball from there, the source said. Steinmetz got the $3,000 job through an official agency process, both sources said.

"Very few people are qualified in that specific field and EPA had a hard time finding a vendor," one source said.

Perrotta got permission from EPA to operate a side business in 2013, during the Obama administration. As for "physically" clashing with an EPA official, as NYT alleged, that never happened, one source told TheDCNF.

"Things got so heated that a scuffle broke out during a meeting last summer of the agency's top security and administrative staff" where "Perrotta traded expletives with Mario Caraballo, who until recently served as the deputy

associate administrator of the homeland security office, and that the two men had to be physically separated," NYT reported.

The discussion between Caraballo and Perrotta got heated, but no physical altercation broke out, a source, who spoke with officials present at the meeting, said. Caraballo has since been removed from his position at EPA.

The Washington Examiner

https://www.washingtonexaminer.com/policy/energy/epas-scott-pruitt-says-burning-wood-is-renewable-energy

EPA's Scott Pruitt says burning wood is renewable energy

By Josh Siegel 4/23/18

The Environmental Protection Agency will begin treating energy created by burning trees as renewable, the same as wind and solar.

Biomass from burning wood to produce electricity will be considered carbon-neutral, the EPA announced Monday.

"Today's announcement grants America's foresters much-needed certainty and clarity with respect to the carbon neutrality of forest biomass," Administrator Scott Pruitt said Monday after meeting with forest industry representatives during a visit to a school in Georgia. "Managed forests improve air and water quality, while creating valuable jobs and thousands of products that improve our daily lives. This is environmental stewardship in action."

The recent spending bill passed by Congress had directed the EPA, Energy Department and Agriculture Department to "reflect the carbon-neutrality of forest bioenergy and recognize biomass as a renewable energy source."

Georgia and other large timber states had lobbied the EPA to consider biomass carbon-neutral when the states were facing limits on carbon emissions from power plants required by the Obama administration's Clean Power Plan, one of its key climate change initiatives. Pruitt has begun a process for repealing and replacing the Clean Power Plan, which was never implemented because of court challenges.

The EPA says it will consider biomass as carbon neutral when devising regulatory actions on energy production from power plants, such as a potentially revised, more modest Clean Power Plan.

"The use of biomass from managed forests can bolster domestic energy production, provide jobs to rural communities, and promote environmental stewardship by improving soil and water quality, reducing wildfire risk, and helping to ensure our forests continue to remove carbon from the atmosphere," the EPA said in a policy document explaining the move.

Despite Pruitt's action, EPA's science advisers haven't come to a consensus on whether biomass is carbon-neutral. Many scientists say that while biomass is a renewable resource, it is not carbon-neutral because burning wood for energy releases large amounts of carbon all at once, faster than what is absorbed by newly planted forests.

The EPA's policy statement contends that U.S. forests absorb more carbon from the air than burning wood releases. In 2015, forests offset about 11.2 percent of gross U.S. greenhouse gas emissions, the agency says.
The EPA said it will continue to enforce current air pollution regulations against power generation from biomass as it normally would, not treating it as carbon-neutral.

"This statement of agency policy is not a scientific determination and does not revise or amend any scientific determinations that EPA has previously made," the EPA document says. "Although this policy announcement does not itself alter sources' obligations with regard to [greenhouse gases] and CO2 in any particular regulatory program, the agency is committed to addressing regulatory uncertainty about how it treats biogenic CO2 emissions in forthcoming actions under various EPA programs."

Reuters

Senate committee paves way for Pompeo to become top U.S. diplomat

By Patricia Zengerle, 4/23/18

A U.S. Senate committee approved the nomination of President Donald Trump's choice for secretary of state, Mike Pompeo, on Monday after a Republican senator who had been opposed threw his support behind the CIA director in the face of party pressure.

The Senate Foreign Relations Committee approved the nomination on a party-line vote, with all 11 Republicans backing him, nine Democrats opposed and one Democrat, Chris Coons, voting "present" because one Republican was at a funeral out of town.

Majority Leader Mitch McConnell said there were enough votes in the full Senate to confirm Pompeo this week. That would allow Pompeo to attend a NATO summit on Friday.

Pompeo became one of Trump's closest advisers during his 15 months as CIA director. He most recently has been deeply involved in preparations for Trump's summit with North Korean leader Kim Jong Un, including meeting with him three weeks ago.

While many Democrats consider Pompeo too hawkish and worry about past harsh statements on homosexuality and Islam, he has the support of at least three Democratic senators not on the committee who are running for re-election in states Trump won easily in 2016. That all but assures Pompeo will be confirmed.

"I do not believe Director Pompeo is someone who will always prioritize diplomacy over conflict, particularly in the context of the aggressive foreign policy voices growing around him," said Senator Robert Menendez, the top Democrat on the Foreign Relations Committee, citing Pompeo's past openness to regime change in North Korea and Iran.

No Republican besides Senator Rand Paul, who changed his vote on Monday, had announced opposition.

Paul's late switch meant Pompeo avoided the embarrassment of being the first nominee for secretary of state to fail to secure the committee's endorsement since it began considering them in the late 19th century.

That would have weakened Pompeo's reputation internationally and cast a cloud over Trump's push to overhaul his national security team after firing Secretary of State Rex Tillerson and replacing his national security adviser, H.R. McMaster, with John Bolton, also known as a hawk.

The White House and Republican Party had thrown their weight behind the nomination, with unceasing attacks on Democrats for opposing Trump's pick.

Paul had opposed Pompeo for weeks, holding a news conference to announce his opposition to him, as well as Trump's pick to replace him at the CIA, Deputy CIA Director Gina Haspel.

Haspel, whose Senate confirmation hearing is next month, also faces a tough confirmation fight. Democrats, and some Republicans, are concerned about her links to the CIA's past use of "harsh interrogation techniques," widely seen as torture.

Paul has repeatedly threatened opposition on policy positions staked out by Trump, before changing his mind at the last minute. Trump recently predicted he would come around again on Pompeo, calling Paul "a good man" who has "never let us down."

The Wall Street Journal
https://www.wsj.com/articles/van-strikes-pedestrians-in-toronto-1524508659

Driver Plows Van Into Toronto Pedestrians, Kills 10

By Vipal Monga and Jacquie McNish, 4/24/18

A man in his mid-20s plowed a rented van into people walking along a busy Toronto thoroughfare on Monday, killing 10 and injuring 15, and rattled one of North America's safest major cities.

Police said they arrested the driver, Alek Minassian, 25 years old, of Ontario. Authorities said Monday evening that they were still trying to determine his motive.

"We cannot come to any firm conclusions at this stage," said Canada's Public Safety Minister Ralph Goodale. But he said there was "no national security connection" to the attack, based on the evidence police have seen so far.

Toronto Chief of Police Mark Saunders said the attack "looks intentional."

The casualties occurred on one of the city's first warm spring days, along Toronto's main artery, Yonge Street. Mass killings have been much rarer in Canada than in the U.S. and Europe, and many said they were stunned.

"I'm at a loss for words. I can't believe that this has happened here. Things like this don't happen in Canada," said, Melissa Phillips, a nurse who was walking her dog Monday evening just steps away from where pedestrians were hit earlier.

The van jumped up onto the sidewalk around 1:30 p.m. Monday, hitting pedestrians as it headed south for about a mile. Police said 26 minutes lapsed between the first 911 call and the driver's arrest.

The area where the incident occurred is home to people of many ethnic backgrounds, said John Filion, a city councilor representing the area where the incident took place, but is predominantly home to immigrants from Iran, Iraq, Korea and elsewhere in Asia. Businesses in the area include banks, pensions, and government buildings, as well as retail shops.

"This is the kind of community where you rarely even encounter angry people, let alone something like this," said Mr. Filion. "It's a such a shock."

Toronto resident Reza Bahramian said he was out enjoying the nice weather when he saw a van "cut everything." He and some other neighbors started chasing after the van and yelling for it to stop. They saw about four people get hit.

He said he helped one woman who was struck, with CPR, for about half-hour before paramedics arrived. "Blood flowed on the sidewalk," he said, referring to the numerous injuries of people who were hit.

Another witness said in an interview he saw two responders trying to give CPR to two people lying in the street, but eventually the responders covered their bodies with tarps.

Witness Alex Shaker told CTV news that the van was moving at high speed along the sidewalk, striking everything in its way.

"People just with a stroller, with their baby, everything was flying down one by one. And he was going really fast," Mr. Shaker told the network.

The CP24 channel aired witnesses' videos that showed a black-clad man by the white van appearing to point something at a police officer before he drops it and is forced to the ground and handcuffed.

In Canada, mass-casualty events are relatively rare, but when they happen, they loom large: The country reeled after 14 women were killed by gunman at the Universite du Montreal's Ecole Polytechnique in 1989, and again in 2016 after four people were killed in a shooting in La Loche, Saskatchewan.

On Monday afternoon, over a mile of Yonge Street was cordoned off with yellow police tape and the area was swarming with cars from both the Toronto police and the Ontario provincial police. Police were interviewing passersby and asking if they had witnessed the incident.

"I ask everyone to await the results of the police investigation and avoid speculation," Toronto Mayor John Tory said.

"It was with great sadness that I heard about the tragic and senseless attack that took place in Toronto," Canadian Prime Minister Justin Trudeau said in a statement Monday night. He said officials were monitoring events closely, and would work with law-enforcement agencies across the country to ensure Canadians' security.

"As of now, #ISIS channels are not promoting the #Toronto vehicular attack, which contains staples of ISIS-inspired events," said Rita Katz, executive director at SITE Intel Group, which monitors jihadist activity online, on Twitter. ISIS channels typically share images and statements celebrating jihadist attacks on the encrypted messaging app Telegram, and the terror group has previously used vehicles in attacks on the streets of major cities such as London and New York.

Attacks involving either a van or truck striking pedestrians have also unfolded in New York City and some of Europe's urban centers.

Sayfullo Saipov, a 29-year-old Uzbek man, was charged with killing eight people and injuring 12 others last October after driving a rented truck down a crowded Manhattan bike path. Law-enforcement officials say the deadly drive had been planned for weeks and was done in the name of Islamic State. Mr. Saipov has pleaded not guilty to the charges.

In Europe over the past two years, 86 people were killed after a truck drove through crowds watching Bastille Day fireworks in Nice, France; 12 people died after a rejected Tunisian asylum seeker rammed a stolen truck into a busy Christmas market in Berlin; and in Barcelona, 13 died and over 100 were injured after a van mowed down pedestrians on city's most famous central thoroughfare, Las Ramblas.

Politico

Ronny Jackson's VA nomination on the rocks

By Burgess Everett and Elana Schor, 4/23/18

Rear Adm. Ronny Jackson's nomination to be Veterans Affairs secretary may be in trouble, according to senators and aides in both parties.

Republicans are considering postponing his confirmation hearing this week as senators pore over potentially new negative information that committee members have received, according to GOP sources familiar with the matter. And Senate Democrats are digging into his record after being made aware of potential new problems with the nomination.

On Monday evening, committee Democrats huddled in the Capitol office of Sen. Jon Tester of Montana, the top committee Democrat, to plot strategy.

"There's a need for very exacting and close scrutiny and vetting," said Sen. Richard Blumenthal (D-Conn.) after the meeting. "And some questions that need to be answered. I'm not going to comment on any of the specifics, except to say we're going to be doing very close and careful scrutiny."

Republicans and Democrats alike have been talking over the weekend, and in person on Monday, about the potential for allegations to derail Jackson's nomination, senators said. But the nature of discussions now going on about the material is "conversational," said Sen. Thom Tillis (R-N.C.).

Tillis suggested that the Jackson confirmation hearing scheduled for Wednesday may be "pushed back pending a review of some of this stuff that, like I said, I've only heard on a conversational basis. I think that's where we'll spend our time this week."

Jackson is President Donald Trump's physician at the White House and is already facing major questions from Republicans over his lack of experience managing an agency as large as the VA. If he faces additional problems, his nomination could be derailed entirely.

"I would like to hear what he has to say about that. I'm not sure anybody can run the VA. It's so big," said Senate Majority Whip John Cornyn (R-Texas). "But I'm willing to give him the benefit of the doubt and listen to him and hear what he has in mind."

Axios was first to report that new information about Jackson's "professional conduct" was taken to Tester earlier this month.

Democrats declined to comment on the severity of the allegations that have been presented to the committee about Jackson.

"We're going to vet him. The Trump administration doesn't do a particularly good job," said Sen. Sherrod Brown (D-Ohio), another committee member. "That's all I'm going to say."

Spokespeople for the committee did not comment on whether Jackson's hearing has been postponed. But a Republican working on the nomination said it was unlikely the hearing would take place pending review of the new information, though that source cautioned that few have seen the documents rattling the nomination.

"You have to be concerned about any nomination" in a closely divided Senate, the Republican said.

Republicans currently hold just 51 seats and Sen. John McCain (R-Ariz.) is recovering from cancer treatment, leaving them no margin for error if Democrats unify to oppose the nomination.

The Washington Post

https://www.washingtonpost.com/news/energy-environment/wp/2018/04/24/pruitt-to-unveil-controversial-transparency-rule-limiting-what-research-epa-can-use/?utm_term=.ef6bdbd6cb3f

Pruitt to unveil controversial 'transparency' rule limiting what research EPA can use

By Juliet Eilperin and Brady Dennis, 4/24/18

Environmental Protection Agency Administrator Scott Pruitt is expected to propose a rule Tuesday that would establish new standards for what science could be used in writing agency regulations, according to individuals briefed on the plan. It is a sweeping change long sought by conservatives.

The rule, which Pruitt has described in interviews with select media over the past month, would only allow EPA to consider studies for which the underlying data are made available publicly. Advocates describe this approach as an advance for transparency, but critics say it would effectively block the agency from relying on long-standing, landmark studies linking air pollution and pesticide exposure to harmful health effects.

In an interview Sunday with radio host John Catsimatidis on 970 AM in New York, Pruitt described the change as a way to let the public judge "the data, the methodology, the analytics" behind any scientific analysis presented to the EPA as it drafts regulations.

"That's transparency," he told Catsimatidis. "It gives people the opportunity in real time to peer review. It goes to the heart of what we should be about as an agency."

The individuals briefed on the rule, which will be subject to a 30-day comment period, spoke on the condition of anonymity in advance of the announcement.

Many scientists argue that applying a standard to public health and environmental studies that is not currently required by peer-reviewed journals would limit the information the EPA could take into account when crafting federal limits on everything from power-plant emissions to which chemicals can be used in agriculture and in homes. Some researchers

collect personal data from subjects but pledge to keep it confidential — as was the case in a major 1993 study by Harvard University that established the link between fine-particle air pollution and premature deaths. That practice would not be allowed under the new rule.

House Science Committee Chairman Lamar Smith (R-Tex.) sought to establish a requirement similar to the one Pruitt will propose through legislation, but it failed to pass both chambers.

On Monday, 985 scientists signed a letter organized by the Union of Concerned Scientists urging Pruitt not to forge ahead with the policy change.

"There are ways to improve transparency in the decision-making process, but restricting the use of science would improve neither transparency nor the quality of EPA decision-making," they wrote. "If fully implemented, this proposal would greatly weaken EPA's ability to comprehensively consider the scientific evidence across the full array of health studies."

Under the proposed rule, third parties would be able to test and try to replicate the findings of studies submitted to EPA. But, the scientists wrote, "many public health studies cannot be replicated, as doing so would require intentionally and unethically exposing people and the environment to harmful contaminants or recreating one-time events."

Andrew Rosenberg, director of the Union of Concerned Scientists' Center for Science and Democracy, said in an email that Pruitt's move would expand on his earlier decision to change the standards for who can serve on EPA's advisory committees. Last year, Pruitt barred any scientists from serving if they received EPA grants for their work. Researchers funded by industries regulated by the agency to continue serving, however.

"First, they came after the agency's independent science advisers, and now, they're going after the science itself," Rosenberg said. "What is transparent is the unabashed takeover of EPA leadership by individuals who have demonstrated disinterest in helping communities combat pollution by using the best available science."

Inside EPA

http://insideepa.com/daily-news/epas-ross-eyes-greater-water-policy-engagement-incremental-changes

EPA's Ross Eyes Greater Water Policy 'Engagement,' Incremental Changes

By Laura Beaven, 4/23/18

EPA water chief David Ross is looking for ways to replicate in other rulemakings the type of engagement the agency used with states to discuss changes to the Obama-era Clean Water Act (CWA) jurisdiction rule, while stressing the need for incremental progress with water policies rather than trying to accomplish everything at once.

Speaking at the National Water Policy Fly-In April 17 in Washington, D.C., Ross outlined his priorities as assistant administrator of the Office of Water, and said his overarching goal is to be proactive instead of reactive. The fly-in was sponsored by the National Association of Clean Water Agencies, the Water Environment Federation, the Water Research Foundation and WateReuse.

One example of how Ross wants to change the way EPA does business is to change the process of consultation with state and local governments and the regulated community into one of "engagement," he said, pointing to the process used with the jurisdiction rule. In that case, EPA invited nine states to each bring three representatives, including state agriculture directors, for two days of talks with the agency, he said.

"We got really close to the vision I have for engagement," Ross said, adding that the challenge now is figuring out "how do I replicate that to other rulemakings."

In terms of other areas of focus, Ross said "aging infrastructure is priority 1, 2 and 3" and is part of Administrator Scott Pruitt's focus on "back to basics."

"Infrastructure at a high level is what I was focused on coming in," with a goal of making "incremental improvements on an annual basis," Ross said.

Using a baseball analogy, Ross said he prefers to "take the safe singles" rather than take bigger risks that may not work.

One aspect of aging infrastructure that has received great attention from Pruitt is the need to replace lead drinking water service lines, something that could be addressed in the agency's upcoming proposal to revise the Safe Drinking Water Act lead and copper rule (LCR).

Recommendations from the agency's National Drinking Water Advisory Council (NDWAC) in 2015 on how to change the LCR included a call for drinking water utilities to conduct full lead service line replacements (LSLRs), rather than partial replacements.

But legal and financial questions over how to accomplish this remain unanswered, and drinking water utilities recently urged EPA to focus on "financially prudent" ways to reduce human health risks when revising the LCR, noting that it may be impossible to include all of NDWAC's recommendation in the proposed rule.

Ross said EPA is "working hard to balance the competing needs" within the LCR revisions and that "you'll see some action this year."

During a panel discussion after Ross' speech, Peter Grevatt, director of the Office of Ground Water and Drinking Water, said Pruitt is very focused on LSLR and noted the administrator's recent visit to Cincinnati to meet with local water utilities and tour two LSLR construction sites.

Grevatt said he suggested the April 16 Cincinnati trip, in part because the city is proactively working to remove its lead pipes rather than doing so because of elevated levels of lead in its drinking water.

Lead Programs

In an April 16 EPA press release, Cathy Bailey, director of the Greater Cincinnati Water Works, said Pruitt's "visit gave us a chance to explain our enhanced lead program that includes education, outreach and removal of lead service lines. Our program wasn't mandated by regulations, but implemented because it is the right thing to do for our community, and we believe it can serve as a model across the country."

Grevatt echoed the agency's emphasis on helping utilities find a way to conduct LSLRs. "It's not just that we'll order you to do that," he said.

Ross also suggested that the Water Infrastructure Finance and Innovation Act (WIFIA) program could provide funding for LSLRs. EPA is prioritizing projects that reduce lead for its next round of WIFIA loans.

Another area Ross highlighted as a priority is nutrient pollution. "I want to aggressively go after it, but holistically," he said, adding that EPA has previously "missed the opportunity to engage with state agriculture directors" on ways to prevent nutrient runoff.

Ross said he wants EPA research to be focused on how to solve the problem. Later, during a question-and-answer session, he said that to date much of the agency's research has been focused on measuring nutrients downstream but he wants it to tackle the question of "how do you get source reduction?"

A water utility representative from Bowling Green, OH, asked Ross if there is any way to leverage WIFIA funds for agriculture projects.

Ross, after consulting with Office of Wastewater Management Director Andrew Sawyers, said, yes. "WIFIA is a very flexible program," Ross said. If a bunch of rural communities wanted to get together and develop a WIFIA proposal, they could, he said.

"Farmers are willing to do the work" to reduce nutrient runoff, especially if they can see the results, Ross said.

Ross also said he wants to "take a long hard look at trading," saying that it "hasn't been utilized enough" and that he likes the idea of utilizing nature to treat agricultural runoff.

Water Trading

During a second question-and-answer period, other EPA water officials reiterated Ross' interest in trading.

John Goodin, acting director of the Office of Wetlands, Oceans and Watersheds, said Ross is particularly interested in figuring out how to remove current hindrances to water quality trading.

And Sawyers said there are "some real opportunities around watershed permitting," adding that some states are looking how to enhance or retool their trading programs.

While water quality trading programs can be developed to address any number of pollutants, most have focused on nutrients. Nutrient credit trading programs are designed to allow a point source to purchase pollutant reduction credits from another point source or a nonpoint source in the same watershed with the intent of meeting the discharge limits established in a Clean Water Act discharge permit

The Government Accountability Office last year found that states with the greatest number of nutrient water quality trades are those with discharge limits dictated by a regulatory cleanup plan, and that without such a driver, trading is unlikely to occur. -- Lara Beaven (lbeaven@iwpnews.com)

The Daily Caller

SOURCES: Most Of What EPA's Leaker Told Dems About Scott Pruitt Is 'False'

By Michael Bastasch, 4/23/18

A former Environmental Protection Agency (EPA) official likely behind negative media stories about Administrator Scott Pruitt doesn't have all his facts straight, according to sources familiar with EPA's inner-workings.

Former Trump campaign official Kevin Chmielewski, who's also former EPA deputy chief of staff operations, gave congressional Democrats a list of accusations against Pruitt, detailing the administrator's alleged "wasteful spending" and "disregard for ethical and legal requirements."

Chmielewski is the likely source for media reports surrounding Pruitt's spending habits and alleged ethical lapses. Chmielewski was allegedly removed from his position at EPA for challenging Pruitt, but that hasn't been confirmed, reports said.

But many of Chmielewski's claims have been called into question by two sources familiar with EPA's inner-workings. One source told The Daily Caller News Foundation of Chmielewski's claims that "more than 60 percent is false, the other 40 percent is information he distorted."

In one instance Chmielewski alleged "a $30,000 contract with private Italian security personnel entered into by Mr. [Pasquele] Nino Perrotta," ahead of Pruitt's attendance of a G7 summit in Italy.

However, two sources familiar with Pruitt's security said that never happened, adding Perrotta, the special agent in charge of Pruitt's security detail, would have had no authority to enter into such a contract on his own.

The "special agent in charge has no authority to make purchase agreements or authorize people to make purchases," one source told TheDCNF. Perrotta would need approval from higher-ups in the Office of Criminal Enforcement and Forensic Training, the source said.

Perrotta did communicate with contacts in Italy but only to get an idea of what sort of security would be typical for a U.S. official of Pruitt's stature, not to negotiate a five-figure security contract, a second source said.

Before joining EPA in 2004, Perrotta joined the Secret Service in 1995. Before that, Perrotta served as an Army intelligence officer for three years and did tours in Italy, Bulgaria and Romania.

Like his boss, Perrotta's become the focus of intense media scrutiny, including a New York Times article that referred to the special agent as Pruitt's "sheriff." NYT's April 12 article, published the same day as Democrats' letter, repeated many of Chmielewski's accusations.

"Perrotta, has clashed — at least once physically — with top EPA officials who challenged Mr. Pruitt's spending, and has steered at least one EPA security contract to a business associate," current and former officials told NYT.

Likewise, "at least one security-related contract was awarded to an individual who works at Mr. Perrotta's private security firm, and he believes that other contracts may also have been awarded to friends or associates of Mr. Perrotta's," Chmielewski told Democrats.

It's true EPA hired Edwin Steinmetz to conduct a security sweep of Pruitt's office in 2017, costing the agency $3,000. Steinmetz is listed on the management team of Perrotta's security firm he operates on the side named Sequoia Security Group.

"It was an emergency; they needed it right away," Steinmetz told NYT. "I dropped everything and took care of it." None of the money Steinmetz was paid went to Sequoia Security Group, and there's no evidence Perrotta played a role in any other security contracts.

Both DCNF sources confirmed Steinmetz's security sweep but contested NYT's characterization Perrotta "steered" the contract toward them. EPA hadn't conducted a security sweep in years and asked Perrotta for a recommendation, the sources said.

EPA contracting officials took the ball from there, the source said. Steinmetz got the $3,000 job through an official agency process, both sources said.

"Very few people are qualified in that specific field and EPA had a hard time finding a vendor," one source said.

Perrotta got permission from EPA to operate a side business in 2013, during the Obama administration. As for "physically" clashing with an EPA official, as NYT alleged, that never happened, one source told TheDCNF.

"Things got so heated that a scuffle broke out during a meeting last summer of the agency's top security and administrative staff" where "Perrotta traded expletives with Mario Caraballo, who until recently served as the deputy

associate administrator of the homeland security office, and that the two men had to be physically separated," NYT reported.

The discussion between Caraballo and Perrotta got heated, but no physical altercation broke out, a source, who spoke with officials present at the meeting, said. Caraballo has since been removed from his position at EPA.

The Washington Examiner

https://www.washingtonexaminer.com/policy/energy/epas-scott-pruitt-says-burning-wood-is-renewable-energy

EPA's Scott Pruitt says burning wood is renewable energy

By Josh Siegel 4/23/18

The Environmental Protection Agency will begin treating energy created by burning trees as renewable, the same as wind and solar.

Biomass from burning wood to produce electricity will be considered carbon-neutral, the EPA announced Monday.

"Today's announcement grants America's foresters much-needed certainty and clarity with respect to the carbon neutrality of forest biomass," Administrator Scott Pruitt said Monday after meeting with forest industry representatives during a visit to a school in Georgia. "Managed forests improve air and water quality, while creating valuable jobs and thousands of products that improve our daily lives. This is environmental stewardship in action."

The recent spending bill passed by Congress had directed the EPA, Energy Department and Agriculture Department to "reflect the carbon-neutrality of forest bioenergy and recognize biomass as a renewable energy source."

Georgia and other large timber states had lobbied the EPA to consider biomass carbon-neutral when the states were facing limits on carbon emissions from power plants required by the Obama administration's Clean Power Plan, one of its key climate change initiatives. Pruitt has begun a process for repealing and replacing the Clean Power Plan, which was never implemented because of court challenges.

The EPA says it will consider biomass as carbon neutral when devising regulatory actions on energy production from power plants, such as a potentially revised, more modest Clean Power Plan.

"The use of biomass from managed forests can bolster domestic energy production, provide jobs to rural communities, and promote environmental stewardship by improving soil and water quality, reducing wildfire risk, and helping to ensure our forests continue to remove carbon from the atmosphere," the EPA said in a policy document explaining the move.

Despite Pruitt's action, EPA's science advisers haven't come to a consensus on whether biomass is carbon-neutral. Many scientists say that while biomass is a renewable resource, it is not carbon-neutral because burning wood for energy releases large amounts of carbon all at once, faster than what is absorbed by newly planted forests.

The EPA's policy statement contends that U.S. forests absorb more carbon from the air than burning wood releases. In 2015, forests offset about 11.2 percent of gross U.S. greenhouse gas emissions, the agency says.
The EPA said it will continue to enforce current air pollution regulations against power generation from biomass as it normally would, not treating it as carbon-neutral.

"This statement of agency policy is not a scientific determination and does not revise or amend any scientific determinations that EPA has previously made," the EPA document says. "Although this policy announcement does not itself alter sources' obligations with regard to [greenhouse gases] and CO2 in any particular regulatory program, the

agency is committed to addressing regulatory uncertainty about how it treats biogenic CO2 emissions in forthcoming actions under various EPA programs."

Reuters

https://www.reuters.com/article/us-usa-trump-pompeo/senate-committee-paves-way-for-pompeo-to-become-top-u-s-diplomat-idUSKBN1HU26X

Senate committee paves way for Pompeo to become top U.S. diplomat

By Patricia Zengerle, 4/23/18

A U.S. Senate committee approved the nomination of President Donald Trump's choice for secretary of state, Mike Pompeo, on Monday after a Republican senator who had been opposed threw his support behind the CIA director in the face of party pressure.

The Senate Foreign Relations Committee approved the nomination on a party-line vote, with all 11 Republicans backing him, nine Democrats opposed and one Democrat, Chris Coons, voting "present" because one Republican was at a funeral out of town.

Majority Leader Mitch McConnell said there were enough votes in the full Senate to confirm Pompeo this week. That would allow Pompeo to attend a NATO summit on Friday.

Pompeo became one of Trump's closest advisers during his 15 months as CIA director. He most recently has been deeply involved in preparations for Trump's summit with North Korean leader Kim Jong Un, including meeting with him three weeks ago.

While many Democrats consider Pompeo too hawkish and worry about past harsh statements on homosexuality and Islam, he has the support of at least three Democratic senators not on the committee who are running for re-election in states Trump won easily in 2016. That all but assures Pompeo will be confirmed.

"I do not believe Director Pompeo is someone who will always prioritize diplomacy over conflict, particularly in the context of the aggressive foreign policy voices growing around him," said Senator Robert Menendez, the top Democrat on the Foreign Relations Committee, citing Pompeo's past openness to regime change in North Korea and Iran.

No Republican besides Senator Rand Paul, who changed his vote on Monday, had announced opposition.

Paul's late switch meant Pompeo avoided the embarrassment of being the first nominee for secretary of state to fail to secure the committee's endorsement since it began considering them in the late 19th century.

That would have weakened Pompeo's reputation internationally and cast a cloud over Trump's push to overhaul his national security team after firing Secretary of State Rex Tillerson and replacing his national security adviser, H.R. McMaster, with John Bolton, also known as a hawk.

The White House and Republican Party had thrown their weight behind the nomination, with unceasing attacks on Democrats for opposing Trump's pick.

Paul had opposed Pompeo for weeks, holding a news conference to announce his opposition to him, as well as Trump's pick to replace him at the CIA, Deputy CIA Director Gina Haspel.

Haspel, whose Senate confirmation hearing is next month, also faces a tough confirmation fight. Democrats, and some Republicans, are concerned about her links to the CIA's past use of "harsh interrogation techniques," widely seen as torture.

Paul has repeatedly threatened opposition on policy positions staked out by Trump, before changing his mind at the last minute. Trump recently predicted he would come around again on Pompeo, calling Paul "a good man" who has "never let us down."

The Wall Street Journal

https://www.wsj.com/articles/van-strikes-pedestrians-in-toronto-1524508659

Driver Plows Van Into Toronto Pedestrians, Kills 10

By Vipal Monga and Jacquie McNish, 4/24/18

A man in his mid-20s plowed a rented van into people walking along a busy Toronto thoroughfare on Monday, killing 10 and injuring 15, and rattled one of North America's safest major cities.

Police said they arrested the driver, Alek Minassian, 25 years old, of Ontario. Authorities said Monday evening that they were still trying to determine his motive.

"We cannot come to any firm conclusions at this stage," said Canada's Public Safety Minister Ralph Goodale. But he said there was "no national security connection" to the attack, based on the evidence police have seen so far.

Toronto Chief of Police Mark Saunders said the attack "looks intentional."

The casualties occurred on one of the city's first warm spring days, along Toronto's main artery, Yonge Street. Mass killings have been much rarer in Canada than in the U.S. and Europe, and many said they were stunned.

"I'm at a loss for words. I can't believe that this has happened here. Things like this don't happen in Canada," said, Melissa Phillips, a nurse who was walking her dog Monday evening just steps away from where pedestrians were hit earlier.

The van jumped up onto the sidewalk around 1:30 p.m. Monday, hitting pedestrians as it headed south for about a mile. Police said 26 minutes lapsed between the first 911 call and the driver's arrest.

The area where the incident occurred is home to people of many ethnic backgrounds, said John Filion, a city councilor representing the area where the incident took place, but is predominantly home to immigrants from Iran, Iraq, Korea and elsewhere in Asia. Businesses in the area include banks, pensions, and government buildings, as well as retail shops.

"This is the kind of community where you rarely even encounter angry people, let alone something like this," said Mr. Filion. "It's a such a shock."

Toronto resident Reza Bahramian said he was out enjoying the nice weather when he saw a van "cut everything." He and some other neighbors started chasing after the van and yelling for it to stop. They saw about four people get hit.

He said he helped one woman who was struck, with CPR, for about half-hour before paramedics arrived. "Blood flowed on the sidewalk," he said, referring to the numerous injuries of people who were hit.

Another witness said in an interview he saw two responders trying to give CPR to two people lying in the street, but eventually the responders covered their bodies with tarps.

Witness Alex Shaker told CTV news that the van was moving at high speed along the sidewalk, striking everything in its way.

"People just with a stroller, with their baby, everything was flying down one by one. And he was going really fast," Mr. Shaker told the network.

The CP24 channel aired witnesses' videos that showed a black-clad man by the white van appearing to point something at a police officer before he drops it and is forced to the ground and handcuffed.

In Canada, mass-casualty events are relatively rare, but when they happen, they loom large: The country reeled after 14 women were killed by gunman at the Universite du Montreal's Ecole Polytechnique in 1989, and again in 2016 after four people were killed in a shooting in La Loche, Saskatchewan.

On Monday afternoon, over a mile of Yonge Street was cordoned off with yellow police tape and the area was swarming with cars from both the Toronto police and the Ontario provincial police. Police were interviewing passersby and asking if they had witnessed the incident.

"I ask everyone to await the results of the police investigation and avoid speculation," Toronto Mayor John Tory said.

"It was with great sadness that I heard about the tragic and senseless attack that took place in Toronto," Canadian Prime Minister Justin Trudeau said in a statement Monday night. He said officials were monitoring events closely, and would work with law-enforcement agencies across the country to ensure Canadians' security.

"As of now, #ISIS channels are not promoting the #Toronto vehicular attack, which contains staples of ISIS-inspired events," said Rita Katz, executive director at SITE Intel Group, which monitors jihadist activity online, on Twitter. ISIS channels typically share images and statements celebrating jihadist attacks on the encrypted messaging app Telegram, and the terror group has previously used vehicles in attacks on the streets of major cities such as London and New York.

Attacks involving either a van or truck striking pedestrians have also unfolded in New York City and some of Europe's urban centers.

Sayfullo Saipov, a 29-year-old Uzbek man, was charged with killing eight people and injuring 12 others last October after driving a rented truck down a crowded Manhattan bike path. Law-enforcement officials say the deadly drive had been planned for weeks and was done in the name of Islamic State. Mr. Saipov has pleaded not guilty to the charges.

In Europe over the past two years, 86 people were killed after a truck drove through crowds watching Bastille Day fireworks in Nice, France; 12 people died after a rejected Tunisian asylum seeker rammed a stolen truck into a busy Christmas market in Berlin; and in Barcelona, 13 died and over 100 were injured after a van mowed down pedestrians on city's most famous central thoroughfare, Las Ramblas.

Politico

https://www.politico.com/story/2018/04/23/ronny-jackson-veterans-affairs-nomination-hearing-546408

Ronny Jackson's VA nomination on the rocks

By Burgess Everett and Elana Schor, 4/23/18

Rear Adm. Ronny Jackson's nomination to be Veterans Affairs secretary may be in trouble, according to senators and aides in both parties.

Republicans are considering postponing his confirmation hearing this week as senators pore over potentially new negative information that committee members have received, according to GOP sources familiar with the matter. And Senate Democrats are digging into his record after being made aware of potential new problems with the nomination.

On Monday evening, committee Democrats huddled in the Capitol office of Sen. Jon Tester of Montana, the top committee Democrat, to plot strategy.

"There's a need for very exacting and close scrutiny and vetting," said Sen. Richard Blumenthal (D-Conn.) after the meeting. "And some questions that need to be answered. I'm not going to comment on any of the specifics, except to say we're going to be doing very close and careful scrutiny."

Republicans and Democrats alike have been talking over the weekend, and in person on Monday, about the potential for allegations to derail Jackson's nomination, senators said. But the nature of discussions now going on about the material is "conversational," said Sen. Thom Tillis (R-N.C.).

Tillis suggested that the Jackson confirmation hearing scheduled for Wednesday may be "pushed back pending a review of some of this stuff that, like I said, I've only heard on a conversational basis. I think that's where we'll spend our time this week."

Jackson is President Donald Trump's physician at the White House and is already facing major questions from Republicans over his lack of experience managing an agency as large as the VA. If he faces additional problems, his nomination could be derailed entirely.

"I would like to hear what he has to say about that. I'm not sure anybody can run the VA. It's so big," said Senate Majority Whip John Cornyn (R-Texas). "But I'm willing to give him the benefit of the doubt and listen to him and hear what he has in mind."

Axios was first to report that new information about Jackson's "professional conduct" was taken to Tester earlier this month.

Democrats declined to comment on the severity of the allegations that have been presented to the committee about Jackson.

"We're going to vet him. The Trump administration doesn't do a particularly good job," said Sen. Sherrod Brown (D-Ohio), another committee member. "That's all I'm going to say."

Spokespeople for the committee did not comment on whether Jackson's hearing has been postponed. But a Republican working on the nomination said it was unlikely the hearing would take place pending review of the new information, though that source cautioned that few have seen the documents rattling the nomination.

"You have to be concerned about any nomination" in a closely divided Senate, the Republican said.

Republicans currently hold just 51 seats and Sen. John McCain (R-Ariz.) is recovering from cancer treatment, leaving them no margin for error if Democrats unify to oppose the nomination.

Subject: Morning Energy: Trump wildfire tweets renew spending fight — Several API staffers head for exit — City goes to court over PFAS

By Kelsey Tamborrino | 08/08/2018 05:38 AM EDT

With help from Annie Snider and Eric Wolff

MAKING WAVES: In attempting to blame California's devastating wildfires on environmental laws and Democratic Gov. Jerry Brown, President Donald Trump may have upped the stakes for one of the many spending fights Congress will have to resolve this fall. No serious expert has endorsed the president's view that allowing some water to follow its natural course to the Pacific Ocean has complicated efforts to battle the blaze, and the president offered more measured comments late Tuesday night. But Trump's earlier series of tweets this week echoed arguments that agricultural interests have been making for years in long-running wars over how the thirsty state's scant supplies get used.

In Congress, California Republicans are trying to block the state from diverting less water to central and southern California farms and cities to preserve more for endangered fish, a plan that has won support from local green groups like the San Francisco chapter of the Sierra Club. The State Water Resources Control Board, whose members were appointed by Brown, is set to vote this month on the plan, and while agricultural interests and their allies are largely powerless to stop him in Sacramento they have had better luck in Washington. GOP Rep. Jeff Denham, whose Central California district would feel some of the deepest cuts under the state's plan, successfully attached an amendment to the House Interior-EPA appropriations bill to block federal funding related to implementation of the plan.

The policy rider faces an uphill battle as appropriators attempt to conference the House measure with the Senate's companion bill, H.R. 6147 (115), which contains no such language. Sen. Dianne Feinstein , the California Democrat who was key to a 2016 California drought deal, hasn't taken a public position on the issue, but has historically opposed legislative efforts to override California law. And the provision is sure to draw the ire of Northern California Democrats who have called Denham's provision a water grab.

Denham hosted Interior Secretary Ryan Zinke at the New Melones Dam late last month, and shortly thereafter the Interior Department formally weighed in with comments opposing the state's plan, saying it would "essentially elevate the Project's fish and wildlife purposes over the Project's irrigation and domestic purposes contrary to the prioritization scheme carefully established by Congress."

Don't forget: Zinke's No. 2, David Bernhardt, was previously the long-time lobbyist for the powerhouse Westlands Water District, battling to send more water to the district's massive farms.

That's not all: The president presented a subdued response to the California wildfires during remarks Tuesday night, where he told reporters he was "monitoring the situation very close," adding that his administration "is in constant contact with everything going out in the state and with the local authorities and with the state authorities." Trump applauded the firefighters and first responders and said his administration would hold meetings about the wildfires, "because there are reasons and there are things you can do to mitigate what's happening," per a pool report.

SEVERAL API STAFFERS HEAD FOR EXIT: The oil and gas industry's top trade association is losing several staffers after hiring a new chief executive , according to sources and social media posts. At least six officials at the American Petroleum Institute, including one of its top lobbyists, have left in recent months, an association spokesman confirmed to Pro's Ben Lefebvre and Marianne LeVine. API's former senior director of federal affairs, Khary Cauthen, is among those who've exited. Cauthen is now vice president of federal affairs at LNG supplier Cheniere, according to a Cheniere spokesperson. Additional senior officials at API are expected to leave in the coming weeks, sources said. Read more here.

DINNER GUESTS: Trump dined last night with business executives at the White House, including Continental Resources CEO Harold Hamm, according to a pool report. The dinner follows news this week that Hamm's company gave $25,000 in May to the legal defense fund created for Trump aides caught up in special counsel Robert Mueller's Russia investigation.

VOTERS SELECT MICHIGAN GOV. CONTENDERS: Come November, Democrat Gretchen Whitmer will face off against Republican state Attorney General Bill Schuette for Gov. Rick Snyder's term-limited seat amid the still-unresolved drinking water crisis in Flint and PFAS contamination elsewhere. Whitmer won the Democratic nomination Tuesday, turning back a primary challenge from progressive outsider candidate Abdul El-Sayed. Schuette, who leads the state's investigation into the Flint water crisis, also handily won his race. Read the recap of last night's primary winners and losers here.

Detroit-area voters faced power outages in at least 14 polling sites due to thunderstorms that struck the area Monday night, electric and gas company DTE Energy said Tuesday morning. The outages caused some poll workers to rely on flashlights and small generators to keep things running for voters, according to tweets sent by Rashida Tlaib, a Democratic candidate in the 13th District. Power was eventually restored to all 14 polling places by around 4:30 p.m., the electric company said.

CITY GOES TO COURT OVER PFAS: The toxic nonstick chemicals known as PFAS that have been popping up in water supplies across the country will be the focus of a lawsuit sought by the New York city of Newburgh. The city filed a federal lawsuit Monday over the contamination in its own water supply in the U.S. District Court of the Southern District of New York. The suit, the city said, seeks to require 23 defendants to clean up the watershed contamination and pay for the supply of clean water needed until the contamination is gone. The defendants range from those who have manufactured or sold the chemicals to those who owned and operated the Stewart Air National Guard Base and Stewart International Airport, where the contamination originated. The lawsuit alleges the defendants' use of the "aqueous film forming foam" resulted in the spread of 12 different types of PFAS chemicals within Washington Lake, the city's primary water supply.

EDF FILES 'SECRET SCIENCE' FOIA SUIT: The Environmental Defense Fund is suing EPA over its failure to release documents requested under the Freedom of Information Act pertaining to EPA's proposed "secret science" rule to ban the use of studies that don't publicly disclose all their data. Earthjustice is representing EDF in the lawsuit, which was filed Tuesday in the District Court for the Southern District of New York. The suit comes as a slate of experts at Harvard University also submitted a comment letter on the transparency rule Tuesday, ahead of the Aug. 16 comment deadline.

SECRET KEEPERS: The Trump administration won't have to turn over documents to a law firm related to its legal arguments for the decision to shrink national monuments, U.S. District Judge David Nye said Monday. The law firm, Advocates for the West, sued for 12 documents withheld from a public records request related to the move to downsize the Bears Ears and Grand-Staircase Escalante national monuments, The Associated Press reports . Instead the federal judge said the records are protected presidential communications. The Advocates for the West's lawyer told the AP the group hasn't decided whether to appeal the decision to the 9th U.S. Circuit Court of Appeals, but said the decision "shows how difficult it is to force sunlight on a government that flourishes in secrecy."

PRIVATE PRACTICE: Tesla CEO Elon Musk took to Twitter on Tuesday to say he's considering taking the electric car company private, jolting the company's stock. The tweet came after a Financial Times report that said Saudi Arabia's sovereign wealth fund has acquired an undisclosed stake of between 3 percent and 5 percent of Tesla's shares this year. In a vague tweet, Musk said he was considering taking the company private at $420 a share and already has secured funding.

Shortly after, the company posted an email Musk sent to staff explaining the potential move. Musk wrote that the intention is not to merge SpaceX and Tesla, but to instead emulate SpaceX's structure. Tesla shares were at about $342 in morning trading, Pro's Patrick Temple-West reports, but shortly after 2 p.m., trading was halted on the Nasdaq market at $367.09, up 7 percent from the start of the day. When trading resumed, Tesla shares bid higher to close at $379.44.

HAPPY BIRTHDAY, RFS: The Renewable Fuel Standard turns 13 today, making it old enough to have its bar or bat mitzvah. Ethanol producers are filled with naches over the program's expansion of domestic biofuel production, but they want presents. What they'd really like is a Clean Air Act waiver allowing year-round sales of E15, something Trump promised Iowans last week was "very close" (though acting EPA Administrator Andrew Wheeler was skeptical). "President Trump vowed to protect the engine of economic growth that has delivered for 13 years," Kyle Gilley, a spokesman for ethanol producer POET, said in a statement. "It is time to allow year-round E15 access for America's drivers."

BLM SEEKS COMMENT ON ALASKA PROSPECT: The Bureau of Land Management announced Tuesday it is taking comment until Sept. 6 on scoping for an environmental impact statement for the Willow oil and gas prospect within the Bear Tooth Unit of Alaska's National Petroleum Reserve. ConocoPhillips Alaska initiated discussions with the agency regarding the potential development of the prospect, BLM said, which is located within federal leases held by ConocoPhillips.

The proposed project includes the construction of a central processing facility, roadways, an infrastructure pad, drill pads with up to 50 wells on each, an airstrip, pipelines, and a gravel mine on the BLM-managed lands within the reserve, which makes up 23 million acres. Already environmentalists are targeting the project's potential adverse effects. "It will scar the land, harm wildlife and worsen climate change," said Kristen Monsell, senior attorney at the Center for Biological Diversity, in a statement.

POWER BACK FOR MOST: The Puerto Rico Electric Power Authority said this week that just 25 customers — or .002 percent — remain without electricity in the aftermath of Hurricane Maria, which first hit the island 11 months ago. That number is out of the close to 1.4 million customers who initially lost power from the hurricane.

CLIMATE SUMMIT IN SIGHTS: The Peoples Climate Movement will host a press conference in San Francisco today announcing its "Rise for Climate, Jobs and Justice" day of action on Sept. 8 — one week before the Global Climate Action Summit takes place in the city. Today's press conference will involve a street mural drawn in real-time by artists using materials from areas affected by the California wildfires.

MAIL CALL! NUCLEAR REACTIONS: Four senators are expressing concern over a draft proposed rule to decommission nuclear power plants. In a letter to Nuclear Regulatory Commission Chairwoman Kristine Svinicki, the lawmakers question the rule's changes to environmental considerations and financial protection requirements, among other issues, and write that the proposal would make it easier for nuclear power plants to be exempt from safety, security and emergency planning regulations. The letter was signed by Sens. Ed Markey , Bernie Sanders, Kirsten Gillibrand and Kamala Harris.

QUICK HITS

Trump wildfire tweets spark bewilderment about California water Back

By Annie Snider, Carla Marinucci and Jeremy B. White | 08/06/2018 03:10 PM EDT

OAKLAND, Calif. — Californians are stunned at President Donald's Trump's latest tweets on the state's catastrophic wildfires — and his insistence that the state is burning because leaders are letting too much fresh water flow into the Pacific Ocean.

Trump tweeted Monday that California "Governor Jerry Brown must allow the Free Flow of the vast amounts of water coming from the North and foolishly being diverted into the Pacific Ocean. Can be used for fires, farming and everything else. Think of California with plenty of Water - Nice! Fast Federal govt. approvals."

That tweet — on the heels of a Sunday tweet that referenced California's "bad environmental laws" as a cause of the state's current raging wildfires — drew an immediate reaction from veteran California GOP strategist Rob Stutzman, who responded via Twitter: "This is nuts" and also "low water IQ." Stutzman has advised former Gov. Arnold Schwarzenegger and a host of national and state GOP candidates.

Trump's comments may be referencing an unrelated dispute between Brown's administration and California Republicans over how much of the state's water can be diverted to Southern California farms and cities and how much must be allowed to flow naturally to benefit endangered and threatened fish species.

Wildfires around California have killed nine people, but firefighters have not raised concerns about the available water supplies.

"The notion that somehow more water would be mitigating or better in fighting these fires is just mind-boggling," Stutzman told POLITICO on Monday. "I don't watch 'Fox & Friends,' but it would seem that someone has put the idea in his head. It doesn't even show an elementary understanding of water policy."

Fox & Friends had aired a segment about the California fires nearly five hours before Trump's Monday tweet but didn't discuss water issues as part of the segment.

Stutzman called the president's recent tweets on California fires and water policy "frightening," saying that "water has nothing to do with why these places are tinder boxes. It's very exasperating. ... It's a statement from the president that shows no understanding of hydrology."

He said he would advise Brown, a Democrat, to "not take the bait" and react to such uninformed views.

Indeed, Evan Westrup, the spokesman for Brown, told POLITICO that "this does not merit a response." But he also added via email: "It's a sad state of affairs when journalism is reduced to chasing the uninformed, unsupervised tweets of the president."

Some Democrats seized on the latest tweet. Rhys Williams, spokesman for Democratic gubernatorial candidate Gavin Newsom, tweeted: "Has anybody seen the baby's pacifier? He dropped it again."

In a purely political sense, Trump's tweets reflected his alignment with California Republicans who have long complained that the state unfairly prioritizes environmental uses for water over the state's sprawling agricultural industry. Putting "fish over farms" is a popular formulation that has been invoked by Trump allies from California's agricultural heartland, such as Reps. Devin Nunes and Kevin McCarthy.

"Forests should be managed properly and water should be allowed for farmers to grow food to feed people," Nunes wrote on Twitter in response to Trump's Sunday tweet, cheering the president "for bringing much needed attention to our flawed environmental policies!"

Trump has courted the Republican-leaning Farm Bureau heavily. California's water wars are a huge issue for the group. Trump addressed the annual Farm Bureau convention in January, becoming the first president in more than two decades to do so. He also raised the issue during a campaign stop in Fresno in 2016.

But experts who make their living studying California's water system reacted for the second consecutive day with a communal groan of exasperation. Peter Gleick of the Pacific Institute, one of the state's foremost experts on how the state manages its water, issued a tweet calling Trump's latest missive "nuts" after labeling the president's initial tweet "gobbledygook bullsh--."

In an email to POLITICO, Gleick noted that the water that flows from California's rivers into the ocean is what remains after cities and farms take their gulp — and that those flows are critical to shoring up ecosystems that, in some parts of the state, are teetering on the brink of collapse.

"Trump's tweets last night and today show a profound misunderstanding about water, fires, California environmental policy, and of course, climate change," Gleick said, adding that the "idea that somehow state water policies are leading to a shortage of water for fighting the fires is too stupid to rebut."

Stutzman said that even more potentially damaging is that the president's Twitter pronouncement is "even somewhat offensive, given that he's trying to make a point on the backs of these fires."

He noted the president on Twitter to date has shown "no sympathy" and expressed no personal concern for the 18 active and raging blazes around the state, which have to date been responsible for the destruction of more than 1,000 homes and billions of dollars in damage.

Ironically, Stutzman said, Trump has stepped on what could have been his own positive message to California — that the White House "has been quick to approve funds and the emergency declarations have come without any complications."

In July, the State Water Resources Control Board proposed major changes to the state's water allocations, preserving more for ailing fish populations. The changes are slated for a vote later this month. That announcement drew the ire of the state's agricultural groups, and state Republicans have turned to their allies in Congress, who have voted to block federal funding related to the allocation plan.

API sees staff departures as new chief settles in Back

By Ben Lefebvre and Marianne LeVine | 08/07/2018 06:04 PM EDT

The American Petroleum Institute, the oil and gas industry's top trade association, is losing several staffers as its new chief executive settles in, according to sources and social media.

At least six API officials, including one of its top lobbyists, have left in recent months, an association spokesman confirmed. Additional senior officials are expected to leave in the coming weeks, according to two other sources familiar with the moves.

The departures come as Mike Sommers, a former chief of staff to then-House Speaker John Boehner, formally takes over API from former president and chief executive Jack Gerard. The industry is negotiating a host of issues with Congress and the White House, including a new offshore drilling plan, renewable fuel standards and steel tariffs.

API's former senior director of federal affairs Khary Cauthen has left to become vice president of federal affairs at LNG supplier Cheniere, according to a Cheniere spokesperson. Former API policy adviser Heidi Keller joined oil company BP as associate director in July, according to her LinkedIn account. Former API Senior Director for External Mobilization Deryck Spooner joined e-cigarette company JUUL Labs, according to a JUUL spokesman. Tyra Metoyer, who worked in API's Houston office, also decamped for JUUL in July, according to her LinkedIn profile.

Former Chief Financial Officer John Robertson left in June, according his LinkedIn page. Vice President of Global Industry Services Lisa Salley has also left the association, the API spokesperson confirmed. Their current activities are unknown.

The former API staffers did not immediately reply to requests for comment sent via social media.

Business executives come back to Trump a year after Charlottesville Back

By Andrew Restuccia, Christopher Cadelago and Stephanie Murray | 08/07/2018 01:52 PM EDT

Business executives who distanced themselves from President Donald Trump a year ago in the wake of the deadly clashes in Charlottesville are back to finding common cause with the administration.

The guest list for a Tuesday night dinner at the president's Bedminster, New Jersey, country club includes 15 top executives of some of the country's largest companies. Of the guests, one publicly resigned from a Trump outside advisory council after the president's refusal to condemn white supremacists and neo-Nazis. And two others were reportedly close to stepping down from another advisory council before Trump abruptly dissolved the councils himself amid the backlash.

The dinner offers Trump a high-profile opportunity to show his critics that at least some in the business community have set aside their previous criticism of him.

"They feel that they can associate with [Trump] now because his policies have been such an amazing success," said Stephen Moore, an economic adviser to Trump during the 2016 presidential campaign.

Moore added that he was surprised the president, infamous for blocking those he believes have betrayed him, invited some executives back into the fold: "I don't understand why President Trump would invite anyone who ran for the high grass when there was the first signs of trouble."

One of the attendees slated to attend Tuesday's dinner, Johnson & Johnson CEO Alex Gorsky, released a statement last year criticizing Trump and announcing his decision to step down from Trump's advisory council on manufacturing.

Though Gorsky had initially insisted he would remain on the council, he changed his mind after Trump gave a press conference at Trump Tower in which he drew an equivalence between white supremacists and the protesters who rallied in Charlottesville against their racist views. "[T]he president's remarks yesterday — equating those who are motivated by race-based hate with those who stand up against hatred — were unacceptable," Gorsky said in the statement at the time. A Johnson & Johnson spokesperson did not immediately respond to a request for comment about why Gorsky decided to attend the Bedminster dinner.

At least two other attendees - PepsiCo CEO Indra Nooyi and Ernst & Young CEO Mark Weinberger - were reportedly weighing stepping down from a separate outside policy advisory group before the president announced that he was disbanding the councils.

Several Trump loyalists are also among the invitees to the dinner, including Continental Resources CEO Harold Hamm, Red Apple Group CEO John Catsimatidis and LeFrak CEO Richard LeFrak. Hamm, a vocal defender of Trump who has advised him on energy policy, donated $25,000 in May to a legal defense fund created for the benefit of White House aides.

Another attendee, FedEx CEO Fred Smith, also has close ties to Trump, even though he has criticized Trump's trade policies. Smith was among the business executives who attended a "Pledge to America's Workers" event last month at the White House, where he received repeated shoutouts from Trump.

Boeing CEO Dennis Muilenburg, who will also attend the dinner, has also courted Trump since he took office and regularly speaks with the president.

Though Nooyi was among the executives who were angry about Trump's remarks about Charlottesville, she also has close ties to the White House. Ivanka Trump, Trump's daughter and adviser, called Nooyi a "mentor" to her in a tweet Tuesday morning amid news that Nooyi would step down as Pepsi's CEO.

International Paper CEO Mark Sutton, another of the participants scheduled to attend Tuesday's dinner, condemned the violence that took place in Charlottesville in a statement at the time, but said he was remaining on Trump's manufacturing council.

Other attendees scheduled to attend Tuesday's dinner include Fiat Chrysler CEO Michael Manley, Mastercard CEO Ajaypal Banga, Boston Beer Company chairman Jim Koch, Honeywell CEO Darius Adamczyk, Newsmax CEO Christopher Ruddy and DocuSign chairman Keith Krach.

The dinner comes during Trump's working vacation in Bedminster, which White House spokesman Hogan Gidley said Monday is taking place while the "White House undergoes needed renovations to the Oval Office and other areas in the West Wing."

White House aides have organized several meetings with the president throughout the week.

Trump allies back fund for aides' legal defense in Mueller probe Back

By Kyle Cheney and Lorraine Woellert | 08/06/2018 01:54 PM EDT

A legal defense fund created for the benefit of White House aides has largely relied on contributions from a handful of President Donald Trump's longtime friends and political allies in the first five months of its existence.

Phillip Ruffin, a billionaire casino mogul who has worked with Trump and accompanied him to Moscow for the Miss Universe Pageant in 2013, contributed $50,000 in April, the documents show. Continental Resources, an oil shale company whose CEO, Harold Hamm, has advised Trump on policy, kicked in $25,000 in May.

The largest donation in the most recent quarter came from Geoffrey Palmer, a Los Angeles developer who has been a large political contributor of Trump's. He contributed $100,000 in late June.

The contributions are being collected by the Patriot Legal Expense Fund Trust, a vehicle established by Trump allies in February and managed by former New York GOP Congresswoman Nan Hayworth. It is designed to pay for legal fees for Trump aides who are roped into special counsel Robert Mueller's investigation of Russian interference in the 2016 presidential election. Aides to former President Bill Clinton had a similar arrangement for congressional and special counsel probes during his administration.

The only money raised in the fund's first quarter, which ended March 31, came from a Virginia-based consulting firm called ProActive Communications, which chipped in $22,000. The firm is owned by Mark Serrano, a onetime consultant to Trump's presidential campaign who is also the spokesman for the legal defense fund.

In all, the fund raised about $200,000 from February to the end of June. It released its required first- and second-quarter paperwork Monday, after watchdog groups filed complaints with the IRS that the fund had missed a July filing deadline.

"I expected to see millions of dollars raised already," said Craig Holman, a lobbyist with the nonprofit Public Citizen, which filed a complaint with the IRS. "Clearly, there has not yet been a comprehensive effort to raise funds and support the legal costs of administration officials."

Clinton's first fund, established in 1994 to help pay for his personal legal defense amid inquiries into a land deal and a sexual harassment lawsuit, raised more than $608,000 in the first six months of its existence. The Trump defense fund was designed to pay for his aides' expenses, not for the president's own legal fees.

The Republican National Committee also has been paying legal fees for Trump family members and others under investigation for activities related to the 2016 campaign.

Hayworth did not respond to requests for comment. A lawyer for the fund referred questions to Serrano, who also did not respond.

The Trump team's fund does not accept donations from lobbyists, and anyone giving at least $200 over a calendar year must have their donations disclosed.

Ocasio-Cortez and Sanders work to elect first Muslim governor Back

By Daniel Strauss | 08/04/2018 06:42 AM EDT

Bernie Sanders and Alexandria Ocasio-Cortez are joining forces to elect an underdog but potentially history-making candidate on the ballot in Michigan next week: Abdul El-Sayed, a 33-year-old physician who would be the nation's first Muslim governor.

Sanders is spending the final weekend of the race in the state, and Ocasio-Cortez was there last week to campaign with El-Sayed ahead of Tuesday's Democratic primary. He also has a constellation of hard-left groups in his corner, including MoveOn.org, Justice Democrats and Our Revolution, the offshoot of Sanders' failed presidential campaign.

After a July lull in primary season, the race in Michigan represents the first opportunity for insurgent liberals to shove Democrats leftward since Ocasio-Cortez's upset victory over Rep. Joe Crowley (D-N.Y.) six weeks ago. Tuesday is also the first real test of the burgeoning alliance between Sanders and Ocasio-Cortez, who have also campaigned for two congressional candidates on the ballot next week in Kansas.

El-Sayed, a first-time candidate who's trailed in public polls, has emerged as a threat to the front-runner, former state Sen. Gretchen Whitmer. Whitmer is a favorite of most elected Democrats as well as organized labor and women's groups such as EMILY's List, which backs Democratic women who support abortion rights.

Every public poll of the primary has shown Whitmer leading El-Sayed and entrepreneur Shri Thanedar, a self-funder who has blanketed the airwaves with television ads but hasn't caught fire. But with Sanders parachuting into Michigan this weekend, El-Sayed backers and Sanders allies see a parallel in recent history.

"Bernie was written off" going into the 2016 presidential primary in Michigan, said Democratic strategist Julian Mulvey, whose firm worked for Sanders on that campaign. "I think Nate Silver predicted that Hillary Clinton had a 99 percent chance of winning in Michigan, and Bernie was able to pull it out. So the best thing you can do is have Bernie going in there to help try to close."

Attorney General Bill Schuette is the favorite to win the Republican primary and has been endorsed by President Donald Trump. Schuette has worked to distance himself from unpopular term-limited Gov. Rick Snyder, a Republican. The state is seen as a prime pickup opportunity for Democrats.

According to a Democrat close to her campaign, Whitmer's most recent internal polling showed her with a 16-point lead in the primary. She has raised more money than El-Sayed, and she has more institutional support: In addition to local politicians, unions and EMILY's List, Whitmer was just endorsed by Sen. Kirsten Gillibrand (D-N.Y.).

But El-Sayed, a former executive director of the Detroit Health Department and a public-health expert, has built a significant support base by presenting himself as a Sanders-aligned progressive alternative to the more mainstream Whitmer. Some of the same outside groups that backed Sanders in 2016 are behind El-Sayed, as are Rep. Ro Khanna (D-Calif.) and grass-roots favorites like Ocasio-Cortez and activist Michael Moore. El-Sayed has also received donations from Ben Affleck and received praise from the hosts of the liberal podcast Pod Save America.

Sanders endorsed the candidate only this week, even though El-Sayed had embraced the Vermont senator and many of his core issues, like a $15 minimum wage, single-payer health care and tuition-free college for families making less than $150,000 a year. Sanders is planning to appear at two El-Sayed rallies on Sunday, in Detroit and Ypsilanti.

"Abdul has run a campaign — win or lose — that speaks explicitly to the policies that Bernie talked about during the 2016 campaign and continues to talk about in the Senate," said Ari Rabin-Havt, a senior adviser to Sanders. "Abdul lines up so perfectly on these values that the endorsement is a testament to running a campaign based on that."

El-Sayed hasn't shied from his religion in the campaign, even as he's had to swat away rumors that he's a George Soros plant sympathetic to the Muslim Brotherhood. He's happily described the immigrant story of his father moving to the United States from Egypt and spending time with his stepmother, whose family history in Michigan goes back to before the Civil War.

But foremost, El-Sayed and his liberal supporters are betting that campaigning on a Sanders-style platform isn't just good politics in a primary: They're trying to prove that a candidate can tout these issues and win one of the three states that Trump flipped in 2016.

"Michigan is ground zero for the debate over how you win back power from Trump and Trumpism," said Ben Wikler, the Washington director of MoveOn.org, which is backing El-Sayed. "And Abdul El-Sayed is the living avatar of the idea that to defeat Trump you don't move right."

In addition to El-Sayed, Sanders and Ocasio-Cortez are backing two congressional candidates on the ballot Tuesday in Kansas. The two New York natives traveled last month to the state to stump with two candidates: Brent Welder, a former Sanders campaign staffer running for a battleground seat in the Kansas City suburbs, and James Thompson, a repeat, liberal challenger for a more solidly Republican seat.

Welder is running in a crowded, six-candidate Democratic primary for the right to take on Rep. Kevin Yoder (R-Kan.) in a district Clinton narrowly won in 2016. But in a sign that Republicans see Welder's ties to Sanders as a liability, a conservative group began running last-minute ads on Friday that appear designed to boost Welder in the Democratic primary, meddling that Welder's opponents decried, blaming Yoder and the GOP.

Back in Michigan, while El-Sayed is rallying with Sanders, Whitmer will be campaigning with prominent Michigan Democratic politicians, including Detroit Mayor Mike Duggan and Rep. Brenda Lawrence.

Whitmer's surrogates and supporters remain bullish about her chances but also are familiar with their state's history of upsets in gubernatorial races. Democrat Jennifer Granholm wasn't the front-runner when she ran for governor in 2002.

"There's polling data, but primaries are tough to poll," said former Gov. Jim Blanchard, a Whitmer supporter, adding that he still expects Whitmer to win.

EMILY's List President Stephanie Schriock painted the primary as an ultimately constructive argument about how to win a general election fight in a battleground state. The differences between Whitmer and El-Sayed, Schriock said, pale in comparison to the contrast between either of them and Schuette, the front-runner in the Republican primary.

"The values all these Democrats share is the same," Schriock said. "What we're having is a very active debate on how to get there. I'll take that. That's what we're talking about there. You've got Schuette on the other side, who wants to tear it all down."

El-Sayed echoed that sentiment on Friday, promising that Democrats will come together, despite the intraparty battle playing out in the final days before the primary.

"Four days out, things can get heated," El-Sayed tweeted Friday. "I admire [Whitmer and] the vigorous debate we share. While I deeply disagree on health care [and] corporate money in politics, I admire her work [and] commitment to serve. We will walk in lockstep, whoever wins, to a blue wave in November."

Chaotic day for Tesla shares amid Musk's tweeting Back

By Patrick Temple-West | 08/07/2018 05:59 PM EDT

Trading in shares of electric vehicle maker Tesla Inc. was halted today after founder and CEO Elon Musk said on Twitter that his company could be taken private.

Musk stunned the stock market with a message from his personal Twitter account: "Am considering taking Tesla private at $420. Funding secured."

Tesla shares were at about $342 in morning trading. Shortly after 2 p.m., trading was halted on the Nasdaq market at $367.09, up 7 percent from the start of the day. When trading resumed, Tesla shares bid higher to close at $379.44.

Tesla's shares have been attacked by short-sellers this year, and Musk has taunted them on Twitter before.

"It is possible that he wants to hurt short sellers of Tesla now [and] he has been very vocal against them recently." analysts for Morningstar wrote today.

WHAT'S NEXT: In a blog posting on Tesla's website, Musk said no final decision has been made and he did not elaborate about funding for the deal.

Subject: Morning Energy: Pruitt's watershed moment — 'Secret science' policy coming — Blankenship slipping

By Kelsey Tamborrino | 04/24/2018 05:42 AM EDT

With help from Emily Holden

PRUITT'S WATERSHED MOMENT: EPA Administrator Scott Pruitt is approaching his two separate House committee hearings this week with sagging support on the hill. The make-or-break moment is approaching as once-stalwart backers begin to express concern about the controversies that have swirled in recent weeks. Republican Sen. Jim Inhofe (Okla.) — perhaps Pruitt's staunchest ally in Congress — told Pro's Anthony Adragna he thinks it's "appropriate to have a hearing in so far as any accusation having to do with his office is concerned," and he cited a report in The New York Times detailing a sweetheart deal Pruitt received on an Oklahoma City home previously owned by a lobbyist.

Sen. Shelley Moore Capito (R-W.Va.) also thought Thursday's hearings before the House Energy and Commerce and Appropriations committees would prove pivotal for Pruitt's long-term future in the administration. "It's really important," Capito said. "He's going to have to answer some tough questions. I'm sure they'll be put to him by both sides and we'll see what his response is."

And Sen. John Boozman joined his two Republican colleagues in supporting hearings by the Environment and Public Works Committee. Meanwhile, sources told Bloomberg that administration officials privately cautioned lawmakers and other conservative allies to pump the brakes on their defenses of Pruitt.

Publicly, however, the White House stands firm in its commitment to Pruitt. Press secretary Sarah Huckabee Sanders told reporters the administration is "continuing to review a number of the reports" about Pruitt, but noted the EPA chief "has done a good job of implementing the president's policies," particularly on deregulation and energy dominance. White House legislative affairs director Marc Short was more direct earlier Monday: "I think Scott Pruitt is doing a great job and we look forward to keeping him there as EPA administrator," he told MSNBC.

More to come? Earlier Monday, five senior congressional Democrats asked House Oversight Chairman Trey Gowdy to obtain further documents and hold hearings after obtaining new records they say raise "troubling" new questions about Pruitt's security expenditures. EPW ranking member Tom Carper told Anthony he had a good conversation with Gowdy regarding Pruitt, but said there was no formal bipartisan agreement to work together on an investigation. "I just gave him plenty of encouragement that he's doing the right thing," Carper said. Read more.

WELCOME TO TUESDAY! I'm your host Kelsey Tamborrino. Congrats to the Nuclear Energy Institute's Robert Powers, who was first to correctly guess Mary Walker was the first woman to receive the Medal of Honor. For today: Who is the last former senator to appear on a U.S. postage stamp? Send your tips, energy gossip and comments to ktamborrino@politico.com, or follow us on Twitter @kelseytam, @Morning_Energy and @POLITICOPro.

POLITICO's Ben White is bringing Morning Money to the Milken Institute Global Conference to provide coverage of the day's events and evening happenings. The newsletter will run April 29 - May 2. **Sign up to keep up with your daily conference coverage.**

BLINDED WITH SCIENCE: EPA's Pruitt is expected to unveil his new science policy that restricts the agency from relying on research that doesn't make public all its available data, a source briefed on the announcement tells Pro's Emily Holden. The proposed rule, which the agency submitted to the White House for review last week, will mirror legislation from House Science Chairman Lamar Smith (R-Texas).

Pruitt argues the change will bolster transparency, but scientists and health advocates say it is an effort to constrain rulemaking. The rollout has been delayed as agency officials tried to determine how to treat industry research used to evaluate the safety of pesticides and toxic chemicals, as Pro's Annie Snider reported last week. While academic studies often can't disclose data that includes personal health records, corporations can't reveal proprietary information either.

SCIENTISTS REACT: Close to 1,000 scientists signed onto a letter to Pruitt Monday, calling on the administrator to reverse course on his plans to revise how the agency considers outside research. "EPA can only adequately protect our air and water and keep us safe from harmful chemicals if it takes full advantage of the wealth of scientific research that is available to the agency," write the scientists, including some former EPA career staffers. Read it here.

A BLANK SLIP: GOP establishment attacks on former coal baron Don Blankenship seem to be taking hold, POLITICO's Alex Isenstadt reports via new polling. With the West Virginia Senate primary a mere two weeks away, a poll out Monday found Blankenship falling behind his more mainstream rivals, GOP Rep. Evan Jenkins and state Attorney General Patrick Morrisey. The poll found Morrisey leading with 24 percent, followed by Jenkins with 20 percent, and Blankenship trailing with 12 percent.

National Republicans have scrambled to intervene in the race, concerned that a Blankenship primary win would destroy their prospects of defeating Democratic Sen. Joe Manchin in November. Blankenship, who spent a year in jail following the deadly 2010 explosion at his Upper Big Branch Mine, has poured nearly $2 million of his own money into a slash-and-burn style campaign savaging Jenkins and Morrisey as pawns of the establishment, Alex writes. Blankenship has also used the Senate run as a path to clear his name. So far, much of his campaign has been geared toward portraying himself as the casualty of the Obama-era Justice Department, which he says was bent on locking him up.

The new survey, which was conducted April 17-April 19 and has a margin of error of 4.9 percentage points, precedes a GOP debate today, and another that will be hosted by Fox News next week for a nationally televised audience. Read more.

SPECIAL ELECTION TODAY: Arizona voters will decide today who will pick up the seat left vacant by Rep. Trent Franks' departure in the state's 8th District. While neither candidate highlights specific environmental issues on her campaign website, Republican Debbie Lesko and Democrat Hiral Tipirneni have markedly different takes on climate change. Tipirneni's site says she believes "climate change is real and that we need to reduce carbon emissions." Meanwhile, Lesko said during a debate earlier this year that "certainly not the majority" of climate change is human-caused. "I think it just goes through cycles and it has to do a lot with the sun. So no, I'm not a global warming proponent," she said.

RULES TO MEET ON COLUMBIA RIVER BILL: The House Rules Committee will meet at 5 p.m. to formulate a rule on H.R. 3144 (115), which would void the environmental impact statement process for altering the hydropower system along the Columbia and Snake rivers. Earlier this month , the 9th Circuit Court of Appeals sided with the state of Oregon, the Nez Perce tribe and conservation groups, ruling that dam operations on the Columbia and Snake rivers must forgo hydropower production during key times of the year to protect

endangered salmon. An environmental impact statement for the system has been the subject of congressional fights, with Rep. Cathy McMorris Rodgers filing the legislation to void that process.

COAL ASH HEARING TODAY: EPA holds a public hearing today on its proposal to roll back the Obama-era regulation for the cleanup and disposal of coal ash. The hearing will begin at 9 a.m. in Arlington, Va., where there will be three sessions: 9 a.m. until noon; another beginning at 1 p.m. and ending at 4 p.m.; and a final session beginning at 5 p.m. and ending at 8 p.m.

PROMISES, PROMISES: Senate spending leaders vowed to restore chamber-wide debate on amendments to individual appropriations bills, Pro's Sarah Ferris and Kaitlyn Burton report. It's a risky move, ME readers may recall, considering how Democrats blocked a largely noncontroversial Energy and Water bill in 2016 because of a proposed amendment on Iran, and in 2015, House Republicans' Interior-Environment bill was tripped up by an unrelated rider on the Confederate flag. But Senate Appropriations Chairman Richard Shelby and his Democratic counterpart Patrick Leahy told committee members in a closed-door meeting Monday that leadership has agreed to allow amendments on the Senate floor for every individual spending bill. And the two have met with Majority Leader Mitch McConnell and Minority Leader Chuck Schumer in recent days about opening up the floor for debate on spending bills.

JUDGE: ENBRIDGE PIPELINE SHOULD STICK TO PLAN : An administrative law judge recommended on Monday that Minnesota regulators approve Enbridge Energy's proposal for replacing its Line 3 crude oil pipeline. But the court stipulated that the pipeline should follow the existing route, not the company's preferred route, which would carry Canadian tar sands crude from Alberta across areas in the Mississippi River, the Associated Press reports. Administrative Law Judge Ann O'Reilly's recommendation to the Public Utilities Commission sets up further disputes, "because the existing line crosses two Ojibwe reservations where tribal governments have made it clear that they won't consent and want the old line removed altogether." Read more.

A METHANE TO THE MADNESS: The comment period on the Bureau of Land Management's proposal to reverse the Methane Waste Prevention Rule ended Monday, drawing thousands of far-reaching comments. The left-leaning Center for Western Priorities analyzed a random sample of 2,000 comments, it said, finding 99.8 percent of them were opposed to the proposal. The Independent Petroleum Association of America and Western Energy Alliance meanwhile submitted joint comments applauding the move. "We were pleased to see workable changes are being considered to the rule that more accurately represent the scope of power and authority given to the BLM for regulating this type of activity," IPAA's Dan Naatz said in a statement. And, E2, an affiliate of the Natural Resources Defense Council, sent a letter to Interior Secretary Ryan Zinke on Monday, expressing its opposition to BLM's proposal. Close to 400 businesses signed onto that letter, which calls BLM's proposal "a net negative for the American public." Read it here.

MAIL CALL! IN HONOR OF NATIONAL PARKS WEEK: League of Conservation Voters organized 122 groups — including the American Civil Liberties Union and the Human Rights Campaign — in a letter to members of Congress opposing the administration's moves on public lands. National monuments "have helped make our public lands more inclusive," the letter states, before calling on lawmakers to "reject any legislation that would limit the president's authority under the Antiquities Act or codify any unlawful rollbacks of existing national monuments." Read it here.

FOR YOUR RADAR: The House will vote to overhaul the 1988 Stafford Act this week, Pro's Budget & Appropriations team reports. The three-decade-old bill is the main piece of legislation overseeing federal disaster-relief efforts, with proposed tweaks that include new incentives to build "smarter and stronger to better withstand disasters in the future," according to GOP Majority Leader Kevin McCarthy's office. That could equate to big changes on how states spend disaster relief money.

ICYMI: ZINKE DRAWS OLIVER'S IRE: The Interior secretary got the full treatment from HBO host John Oliver on "Last Week Tonight" on Sunday. Oliver hit Zinke for referring to himself as a geologist and said he

"has a real flair for creative license." Of course, Zinke is not the first to draw scrutiny from the HBO host. A judge recently dismissed a defamation lawsuit brought by coal magnate Bob Murray against Oliver, who referred to Murray as a "geriatric Dr. Evil." Watch the Zinke video here.

STATE NEWS — CUOMO INTRODUCES PLASTIC BAG BILL: New York Gov. Andrew Cuomo introduced a bill Monday to ban the use of plastic bags throughout the state, Pro New York's Danielle Muoio reports. The legislation — a long-sought promise from Cuomo — would give the state Department of Environmental Conservation jurisdiction over all matters concerning plastic bags and recycling, but comes with caveats that left some environmental advocates saying it isn't far-reaching enough. Read more.

QUICK HITS

— Trump administration official says it's a "top priority" to improve American weather forecasting model, The Washington Post.

Stories from POLITICO Pro

White House reiterates support for Pruitt Back

By Anthony Adragna | 04/23/2018 02:30 PM EDT

The White House says it is still standing behind EPA's Scott Pruitt, voicing support for the embattled administrator two days after it was revealed that a Washington lobbyist whose wife rented a condo to him personally lobbied Pruitt despite weeks of denying they had held any meetings.

"We're reviewing some of those allegations, however Administrator Pruitt has done a good job of implementing the president's policies, particularly on deregulation," press secretary Sarah Huckabee Sanders said at the White House briefing.

She added the administration continues its look into Pruitt's conduct, including his lavish spending, first-class travel arrangements, pay raises for political appointees and use of security personnel. White House budget director Mick Mulvaney told a congressional subcommittee last week he'd investigate the EPA chief's spending $43,000 on a privacy booth for his office.

Pruitt is scheduled to testify at two House hearings on Thursday.

What's next: Sanders said the White House is "monitoring" additional reports about Pruitt.

White House stands behind Pruitt despite new lobbying disclosure Back

By Anthony Adragna | 04/23/2018 01:54 PM EDT

The White House said Monday it still stands behind EPA Administrator Scott Pruitt, praising him for enacting President Donald Trump's environmental and energy policies even as it looked into reports of ethical lapses.

It was the first statement from the White House since POLITICO first reported that despite his denials, Pruitt had met with a lobbyist whose wife rented the Environmental Protection Agency chief his $50-per-night condo. A disclosure form filled late Friday said J. Steven Hart had lobbied the EPA, although both the agency and the lobbyist contend the meeting, held last July, did not constitute formal lobbying.

"We're reviewing some of those allegations. H however, Administrator Pruitt has done a good job of implementing the president's policies, particularly on deregulation," press secretary Sarah Huckabee Sanders said at the White House briefing.

The White House has been looking into Pruitt's lavish spending on first-class travel arrangements, pay raises for political appointees and use of security personnel. Budget director Mick Mulvaney told a congressional subcommittee last week he'd investigate the EPA chief's spending of $43,000 on a privacy booth for his office.

That's on top of several ongoing probes by the EPA's own watchdog and three by congressional committees, including the House Committee on Oversight and Government Reform.

Pruitt is scheduled to testify at two House hearings on Thursday.

Sanders' comments come as five senior congressional Democrats asked House Oversight Chairman Trey Gowdy (R-S.C.) to seek new documents and hold hearings regarding "troubling" new questions about Pruitt's security expenditures.

According to nonpublic documents cited in the Democrats' letter, Pruitt's office was not cleared for classified communications as of March 2017. EPA previously said Pruitt's need to handle such information justified the installation of the privacy booth. The Government Accountability Office concluded last week the agency violated federal law by not informing Congress of the purchase.

The letter also alleges that a security sweep of Pruitt's office — the contract for which went to a business partner of Pruitt's security chief, Pasquale "Nino" Perrotta — went outside federal contracting norms without proper pre-approval.

"Given the latest developments and these new documents, we believe these and related matters are ripe for additional document requests to EPA and that Administrator Pruitt should testify about all of these matters immediately," the lawmakers wrote. Sens. Tom Carper of Delaware and Sheldon Whitehouse of Rhode Island and Reps. Elijah Cummings of Maryland and Gerry Connolly and Don Beyer, both of Virginia, signed the letter.

Pruitt support in Senate erodes as GOP lawmakers seek hearings Back

By Anthony Adragna | 04/23/2018 08:32 PM EDT

Scott Pruitt's wall of GOP support developed some new cracks on Monday, with three key Senate defenders calling for hearings into the embattled EPA administrator's recent controversies.

The three, including staunch Pruitt ally Sen. Jim Inhofe (R-Okla), all said they supported hearings by the Senate Environment and Public Works Committee to look into the former Oklahoma attorney general's actions.

"I think that a couple of us on the committee think it's appropriate to have a hearing in so far as any accusation having to do with his office is concerned," Inhofe told POLITICO.

Inhofe said he was troubled by a report over the weekend in The New York Times detailing a sweetheart deal Pruitt received on an Oklahoma City home previously owned by a lobbyist while serving in a state government. The Oklahoma Republican declined to discuss which allegations he found disturbing, but said "there are some things in there that I'd like to check out and see."

Joining his call for a Senate hearing were two other senior GOP members of the EPW panel, Sens. Shelley Moore Capito (W.Va.) and John Boozman (Ark.).

"Most people have concerns about some of the allegations," Boozman said. "At some point he'll be before the committee and we'll dig deeper and see exactly what's going on."

EPW Chairman John Barrasso (R-Wyo.) told reporters he expected Pruitt would come to testify at some point, but he stopped short of providing a specific timeframe or stating his intention to call a hearing.

To date, four House Republicans have called on Pruitt to resign, along with scores of elected Democrats. And Sen. Susan Collins (R-Maine), has said Pruitt was "the wrong person" to lead the agency based on his policies.

Pruitt has drawn criticism about his ethics and lavish spending in recent months. Three Congressional committees, the White House and EPA's inspector general are all probing his behavior, ranging from his security expenses, high pay raises for aides, first-class travel and meetings with a coal group.

The House Oversight Committee has requested interviews with five senior agency aides and the White House said it would formally investigate Pruitt's expenses after the Government Accountability Office last week found EPA broke the law by failing to notify Congress about a $43,000 privacy booth Pruitt had built in his office.

Pruitt will go to the Hill on Thursday to testify before a House Energy and Commerce subcommittee in the morning and at a House Appropriations subpanel in the afternoon. Those appearances will mark his first time before Congress since the recent allegations broke.

Both Inhofe and Capito said they thought those House hearings would prove pivotal for Pruitt's long-term future in the administration.

"It's really important," Capito said. "He's going to have to answer some tough questions. I'm sure they'll be put to him by both sides and we'll see what his response is."

Meanwhile, EPW ranking member Tom Carper (D-Del.) said he had a good conversation with House Oversight Chairman Trey Gowdy (R-S.C.) regarding Pruitt, but he said there was no formal bipartisan agreement to work together on an investigation.

"I just gave him plenty of encouragement that he's doing the right thing," he said.

But the mounting public criticism from Republicans suggests GOP lawmakers' patience in defending the EPA chief's behavior is waning.

"Some of the things that he's done and that he's been alleged to do are just indefensible," Sen. John Kennedy (R-La.) said. "You just can't put lipstick on those pigs. You can't."

EPA emails show industry worries slowed new science policy Back

By Annie Snider | 04/19/2018 05:01 PM EDT

EPA's rollout of a controversial new transparency policy that would severely restrict the scientific research the agency can rely on when drafting new regulations has been slowed down by political officials' fears that it could have major unintended consequences for chemical makers, according to newly released EPA documents.

The issue of scientific transparency has been high on the agenda of House Science Chairman Lamar Smith (R-Texas), who has found strong support from EPA Administrator Scott Pruitt — much to the consternation of public health advocates and green groups, who view the effort as backdoor attack on the agency's ability to enact environmental regulations.

Since Pruitt announced plans for the new policy last month, researchers and public health proponents have raised alarms that it could restrict the agency's ability to consider a broad swath of data about the effects of pollution on human health. But documents released under the Freedom of Information Act show that top EPA officials are more worried the new restrictions would prevent the agency from considering industry studies that frequently support their efforts to justify less stringent regulations.

Emails between EPA officials obtained by the Union of Concerned Scientists show that Nancy Beck, the top political official in the agency's chemicals office who came to the agency after serving as a key expert for the chemical industry's lead lobbying group, voiced major concerns after she received a draft of the not-yet-released policy on Jan. 31.

The new scientific transparency directive is expected to require that the raw data for all studies EPA relies on be publicly available, and that the studies be peer-reviewed. But Beck said these requirements would exclude a great deal of industry data about pesticides and toxic chemicals that her office considers when determining whether a substance is safe or must be restricted.

It costs companies "millions of dollars to do these studies," Beck wrote in an email to Richard Yamada, the political official in EPA's office of research and development who is spearheading work on the new scientific policy and is also a former staffer for the House Science Committee chairman.

"These data will be extremely valuable, extremely high quality, and NOT published," Beck wrote. "The directive needs to be revised."

Moreover, much of this data, Beck noted, is considered proprietary by companies. It is dubbed confidential business information, and even though EPA can consider it as part of its regulatory review, the data cannot legally be made public.

Yamada replied to thank Beck for the heads up. "Yes, thanks this is helpful - didn't know about the intricacies of CBI," he wrote. "We will need to thread this one real tight!"

The term "confidential business information" primarily applies to industry information. That data is separate from the personal medical information that public health researchers worry could block consideration of their work.

Yogin Kothari, a lobbyist for the Union of Concerned Scientists, said the emails show the Trump administration's EPA has been "trying to stack the deck in favor of the industries they're supposed to be regulating."

"They want to potentially create exemptions for industry, but if you look at this entire set of documents ... you will see that there's not a single consideration for the impacts on public health data, on long-term health studies, on studies that EPA does after public health disasters like the BP oil spill," he said.

EPA spokeswoman Liz Bowman emphasized the policy is not yet finalized.

"These discussions are part of the deliberative process; the policy is still being developed. It's important to understand; however, that any standards for protecting [confidential business information] would be the same for all stakeholders," she said in a statement.

The emails indicate Pruitt wanted the new science policy rolled out at the end of February, and teased his plans in an interview with conservative outlet The Daily Caller in mid-March. But the agency has yet to finalize the policy.

The transparency directive has its origins in legislation introduced by Smith during the Obama administration, that had the backing of a number of industry groups, including the American Chemistry Council. The House Science Committee chairman frequently charged that the Obama EPA used "secret science" to justify "costly new regulations."

Although versions of the measure were approved by the House multiple times, the Senate never took it up. CBO estimated that one version of Smith's legislation would cost EPA $250 million a year, at least in the initial years, and a leaked staff response to questions from the budget office said a later version would be even more costly, would endanger confidential medical and business information, and "would prevent EPA from using the best available science."

But Smith found an ally in Pruitt. The emails indicate that Smith met with Pruitt in early January and show that Pruitt's staff quickly began working on a directive to "internally implement" the legislation.

Industry's backing for the new scientific approach began to waiver under the Trump administration, though. When a top American Chemistry Council scientist testified before Smith's committee in February 2017, she emphasized the need to protect industry information if the transparency initiative moved forward.

"One of the things that we do need to take into consideration as making that data publicly available is that there are adequate protections for confidential business information to ensure that we keep innovation and competitiveness available for the marketplace," Kimberly White told the committee.

Industry has historically claimed that a wide range of information about chemicals, ranging from the processes by which they are produced, to the locations of manufacturing plants, to their very identities, must be kept confidential in order to keep competitors from learning trade secrets. Environmental and public health advocates argue that industry claims this exemption in many cases where it's not necessary and that it often keeps important health and safety information from public view.

The issue was a key point of debate when Congress considered a major overhaul of the nation's primary chemical safety law passed 2016 and has reemerged as Pruitt's EPA sets about implementing the law.

Asked for comment on EPA's new effort to implement the scientific transparency approach internally, American Chemistry Council spokesman Scott Openshaw said the group looks forward to reviewing the directive once it's finalized.

"It is critical that any final directive properly protect confidential business information and competitive intelligence," he said in a statement.

The internal emails show that EPA political staff were particularly attuned to this concern. In a Feb. 23 email to colleagues, Beck forwarded language from a 2005 White House document that laid out narrow exemptions from its requirement that all "important scientific information" disseminated by the federal government go through peer review.

"[Y]ou may need to tweak but hopefully there is something helpful here that can be borrowed/adopted," she wrote.

Richard Denison, lead senior scientist for the Environmental Defense Fund, said that EPA's access to industry data is indeed important to its ability to review the safety of new chemicals and pesticides, but said the internal EPA communications show that Pruitt's EPA wants to "have their cake and eat it too" with the new directive.

"They're trying to force peer review studies done by academic scientists to disclose every last detail, while at the same time allowing industry studies to be kept private or aspects of those to still be kept private," he said.

He pointed out that the concerns Beck raised about the burden the new policy would place on industry are the very same ones that the CBO report said the policy would place on EPA.

Poll: Coal baron Blankenship fading in W.Va. Senate primary Back

By Alex Isenstadt | 04/23/2018 07:26 PM EDT

WHEELING, W.Va. — A new poll out Monday evening shows recently imprisoned coal baron and Senate hopeful Don Blankenship fading in the Republican primary, amid an avalanche of establishment attacks aimed at stopping him from winning the nomination.

With the primary two weeks away, the survey shows Blankenship, who spent a year in jail following the deadly 2010 explosion at his Upper Big Branch Mine, falling far behind his more mainstream rivals, GOP Rep. Evan Jenkins and state Attorney General Patrick Morrisey. The poll found Morrisey leading with 24 percent, followed by Jenkins with 20 percent, and Blankenship trailing with 12 percent. Thirty-nine percent were undecided.

The survey, which was conducted April 17-19 and has a margin of error of 4.9 percentage points, came as Blankenship squared off against his rivals in a 90-minute debate held at Wheeling Jesuit University. The candidates spent much of the evening aligning themselves with President Donald Trump, and beating up on Democratic Sen. Joe Manchin.

They will also meet on Tuesday, and again next week for a nationally televised debate hosted by Fox News.

The survey of 411 primary voters was commissioned by GOPAC, an organization that promotes state Republican legislators, and was conducted by National Research Inc., a polling firm that worked on Trump's 2016 campaign. Neither has taken sides in the primary.

National Republicans have scrambled to intervene in the contest, fearing that a Blankenship primary win would destroy their prospects of unseating Manchin. The 68-year-old former coal executive has spent nearly $2 million of his own to fund a slash-and-burn style campaign savaging Jenkins and Morrisey as establishment pawns.

He has also sought to clear his name. Much of Blankenship's campaign has been geared toward portraying himself as the casualty of an Obama Justice Department bent on locking him up.

Fearful that Blankenship was gaining traction, Mountain Families PAC, a super PAC overseen by strategists close to Senate Majority Leader Mitch McConnell's political operation, swung back — airing around $700,000 worth of TV ads in recent days accusing Blankenship of contaminating drinking water.

The effort to defeat Blankenship has gone further. Earlier this month, Trump flew to West Virginia to hold an event aimed at selling his tax reform legislation. The president was seated next to Jenkins and Morrisey, a clear attempt to promote their candidacies over Blankenship, who was not in attendance.

For national Republicans, the move was not without risk. Last year, a McConnell-aligned super PAC spent millions to stop Alabama Senate candidate Roy Moore from winning the nomination, only to see it backfire. Moore used it to cast himself as the victim of the establishment, and went on to win the primary before losing the general election in a stunning upset.

Blankenship is taking a similar approach. With the contest hurtling into the final stretch, he has begun airing commercials calling McConnell a "swamp creature."

And during a news conference on Monday morning, Blankenship pledged not to support McConnell as Senate GOP leader if he's elected.

"He needs to understand that if I'm there I will not vote for him for majority leader, and so the rest of the senators should understand that they should not put him up if they need my vote," he told reporters.

The candidates largely avoided attacking each other at Monday's debate, perhaps because three lesser-known contenders were also included onstage, a setup that limited the amount of speaking time.

Blankenship used the debate to further his argument against the establishment. He called the 2010 mine explosion "heart-wrenching," and called it "one of the worst days of my life."

But he blamed the disaster on the government, saying it had taken steps to limit the amount of airflow available to the miners.

During his closing remarks, Blankenship referred to Washington as the "district of corruption," and argued that politicians there often tried to make themselves look like they were fighting over ideals when they were merely posturing.

"When I go to D.C.," he said, "it won't be a fake fight, it will be a real fight."

With candidates and outside groups crowding the TV airwaves, much of the firepower is being directed at Jenkins, a second-term congressman who in 2014 defeated longtime Democratic Rep. Nick Rahall. All told, around $1.2 million is expected to be spent against Jenkins, according to a media buyer.

Among those spending heavily against Jenkins is Duty and Country, an outside Democratic group with offices in Washington. To date the group has spent around $380,000 on TV, the vast majority of it against Jenkins.

At Monday's debate, Jenkins argued that Democrats were trying to "meddle" in the primary. He said their attacks on him was proof that the opposing party viewed him as the biggest threat to Manchin.

The Democratic effort, he added, was unprecedented in West Virginia politics.

"They're scared to death of Evan Jenkins on the ballot in November because they know Evan Jenkins can beat Joe Manchin," the congressman said.

Court chooses salmon over hydropower in Columbia River fight Back

By Annie Snider | 04/02/2018 02:34 PM EDT

The 9th Circuit Court of Appeals has sided with the state of Oregon, the Nez Perce tribe and nearly a dozen conservation groups, ruling that hotly contested dam operations on the Columbia and Snake Rivers must forgo hydropower production during key times of the year in order to protect endangered salmon.

The three-judge panel upheld a lower court's decision requiring that water be spilled over the top of dams along the Columbia River System, including the powerhouse Grand Coulee dam, the largest power station in the U.S., during periods when young salmon and steelhead migrate to the ocean. The hydropower turbines pose a threat to the fish.

The Justice Department, representing the National Marine Fisheries Service, Army Corps of Engineers and Bureau of Reclamation, had argued that requiring such operations would cause electricity rates to spike and could threaten the reliability of the electrical grid.

The ruling stems from a years-long battle over the nearly 100-year-old hydropower system along the Columbia and Snake rivers. Conservation groups and tribes with treaty fishing rights want the system altered and operated to benefit wildlife, including calling for the removal of four dams along the Snake River. As part of that litigation, the federal agencies are also working on an environmental impact statement for the system that has been the subject of congressional fights, with Rep. Cathy McMorris Rodgers (R-Wash.) filing a measure (H.R. 3144) to void that process, and Democratic lawmakers coming out in opposition.

WHAT'S NEXT: Unless they successfully appeal the decision, the federal agencies will need to release water over the top of dams beginning this spring. The ongoing environmental impact statement process will continue.

Senate spending leaders vow to open up floor debate for amendments Back

By Sarah Ferris and Kaitlyn Burton | 04/23/2018 06:20 PM EDT

Senate Appropriations Chairman Richard Shelby is vowing to restore chamber-wide debate on amendments to individual appropriations bills to help end Congress' stop-and-go funding cycle.

Shelby (R-Ala.), along with his Democratic counterpart Sen. Patrick Leahy, of Vermont, told committee members in a closed-door meeting today that leadership has agreed to allow amendments on the Senate floor for every individual spending bill.

"There is perhaps unanimity, but certainly strong consensus that if the appropriations process is going to work we're going to be casting votes on amendments and we stay here and we vote," Sen. Jerry Moran (R-Kan.) told reporters exiting the meeting, which was the committee's first bipartisan sit-down of fiscal 2019

"I think it's the single best way to restore the Senate the way the Senate's supposed to work. The full Senate gets a chance to offer a variety of amendments, and if you don't like it, you can vote against it," Sen. Lamar Alexander (R-Tenn.) added.

Shelby and Leahy have met with Majority Leader Mitch McConnell and Minority Leader Chuck Schumer in recent days about opening up the floor for debate on spending bills.

When asked if both leaders were on board, Shelby added: "They tell us they are, and I like to believe them." Leahy added: "We both talked with both of them. I think they both understand. The Senate can't go on like this."

It's a risky gambit, particularly in an election year. Contentious amendments have held up bills in both chambers in recent years.

Back in 2016, Senate Democrats blocked a largely noncontroversial Energy and Water bill because of a proposed amendment on Iran. In 2015, the House GOP's Interior-Environment bill was tripped up by an unrelated rider on the Confederate flag.

The number of amendments on Senate spending bills has dropped dramatically in the last two decades, as the chambers considers fewer and fewer individual bills.

Pruitt foes buy ad time during Trump's favorite TV shows

Kevin Bogardus, E&E News reporter

Published: Wednesday, March 28, 2018

Environmentalists launched an ad campaign in an attempt to oust U.S. EPA Adminsitrator Scott Pruitt from office. NationalSierraClub/YouTube

Environmental groups are taking their campaign to force U.S. EPA Administrator Scott Pruitt from office to a new domain: President Trump's television screen.

Ten green organizations have banded together to a launch a new effort aimed at removing Pruitt. The "Boot Pruitt" campaign begins today with the Sierra Club running television ads on what are considered Trump's favorite morning shows, Fox News' "Fox & Friends" and MSNBC's "Morning Joe."

The ad highlights Pruitt's critical comments of Trump during the 2016 campaign — calling Trump an "empty vessel" when it comes to the Constitution and rule of law — as well as the EPA chief's penchant for first-class travel. The ads will air today, tomorrow and Friday.

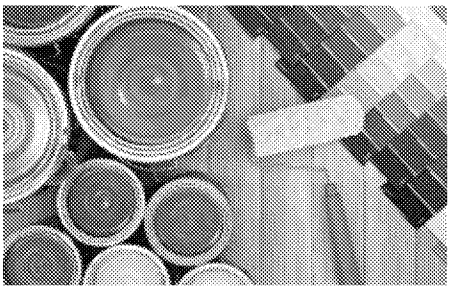
Canada draft assessment: DGEBA and novalac epoxy resins are safe

Substances associated with adverse effects on spleen and skin

28 March 2018 / Canada, Environmental Protection Act, Risk assessment, Sensitisers



A Canadian government assessment has provisionally concluded that four epoxy resins used in paints, coatings and plastics are not harmful to humans or the environment.

The substances are three diglycidyl ethers of bisphenol A (DGEBA; BADGE) epoxy resins (Cas nos 25036-25-3, 25068-38-6 and 25085-99-8) and a novolac epoxy resin (Cas no 28064-14-4).

They are all polymers, used as intermediates in the manufacture of other substances. This is in petroleum production processes to prevent corrosion and build-up, and:

- plating agents;
- adhesives and sealants in grout;
- flooring; concrete; and
- lubricants and lubricants additives.

DGEBA epoxy resins are made by polymerisation of the monomers bisphenol A and epichlorohydrin, via DGEBA.

Novolac epoxy resins are made by the same process to form novalac, followed by epoxidation using epichlorohydrin.

Both types of resin contain highly reactive epoxy groups, associated with potential adverse effects on the spleen, as well as skin sensitisation. The draft risk assessment identities these effects as the "critical" ones for characterising the risk to human health.

The authors say that consumers could be exposed to residual DGEBA as a result of migration into food from food packaging materials containing DGEBA epoxy resins. But even using a "worst-case scenario" the daily intake would be low, corresponding to a low overall risk of harm to human health.

The assessment concludes that none of the substances meet any of the criteria set out in section 64 of the Canadian Environmental Protection Act (Cepa).

Next steps

The government prioritised the substances in a previous round of screening under its Chemicals Management Plan. Assessments conducted under the plan do not normally include consideration of occupational exposure.

The government has initiated a 60-day public consultation on the draft screening assessment, meaning interested parties have until 23 May to submit comments.

Survey on REACH restriction for PFASs extended

29 March 2018 / Europe, PFCs, REACH

A survey launched to help develop a restriction proposal under REACH on PFASs (C4-C7) and other fluorinated substances, has been extended by a month.

The survey, carried out by the Ökopol Institute for Ecology and Politics for Germany's environment agency (UBA), was due to end this month, but following a number of requests the deadline has been pushed back to 15 April.

The UBA is collecting information on the manufacture and use of short-chain PFASs with the aim of identifying risks to the environment and/or human health that should be restricted under REACH.

In a paper published in late February in *Environmental Sciences Europe*, Stephan Brendel from the UBA and others looked at short-chain perfluoroalkyl acids with a particular eye on environmental concerns and the need for a regulatory strategy under REACH.

They concluded that "due to an increasing use of short-chain PFASs, an effective regulation is urgently needed. The concerns do not match the 'classical' concerns as defined under REACH, but are not of minor concern."

Data collection

Included in the agency's data collection is the availability of alternatives to the use of fluorinated compounds and the socio-economic impacts of any restriction.

The short-chain PFASs under scrutiny are those with chain lengths <7 perfluorinated carbon atoms. They include:

- per- and polyfluorinated carboxylic acids (PFCAs);
- fluorotelomer alcohols (FTOHs);
- fluorotelomer iodides (FTIs);

- fluorotelomer acrylates (FTAs) and fluorotelomer methyl acrylates (FMAs); and
- per- and polyfluorinated sulfonic acids (PFSAs).

Polymeric substances that are generated out of these building blocks are also within the UBA's scope.

Survey

The objective of the Ökopol survey is to increase information on:

- manufactured and imported amounts of the respective substance groups;
- manufactured and imported amounts of their potential alternatives;
- the type of uses the substances are applied to; and
- the economic effects that are linked to their use.

Ökopol says it is vital that survey respondents provide information on all the use cases they know of. This will, it says, help "avoid unintended consequences for market actors when a regulatory measure is implemented".

UK starts work on post-Brexit chemicals registration system

29 March 2018 / Substance registration, United Kingdom

The UK government has started work on the delivery of new IT capability, to enable the registration and regulation of chemical substances placed on the national market.

In a written answer to a question posed by an MP in mid-March, Junior environment minister Therese Coffey said that so far, the Department of the Environment, Food and Rural Affairs (Defra) has spent £330,000 on the "Alpha development phase" of the IT system for the registration of chemical substances.

She added that "no expenditure has been incurred to date on developing IT capability for the regulation of chemical substances as the initial phases of the project are focused on registration."

At the end of January the UK's Secretary of State for the Environment authorised spending of £5.8m (€6.64m) for the system.

The chemicals IT platform is one of six "planned EU Exit readiness activities" being carried out by Defra, for which it has asked £16m in advance of the EU Withdrawal Bill receiving royal assent – when the Queen formally agrees to make the bill into an Act of Parliament (law).

In related news, a Chemical Watch survey has found that just 12 months to go before Britain is expected to leave the EU, a third of UK-based companies are actively organising or planning to move some of their operations out of the country because of the regulatory uncertainty.

Chemical Watch is holding its second workshop on post-Brexit options for UK chemicals law in London on 17 April.

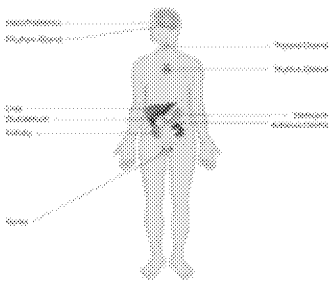
Commission comes under fire for 'patronising' approach to EDCs in EU

NGOs, scientists participate in public hearing on health impact

29 March 2018 / EDCs, Europe



The European Commission, the EU's executive arm, faced fresh criticism from the European Parliament's environment committee (Envi) and NGOs at a public hearing about its handling of endocrine disrupting chemicals (EDCs).

At one point in the 22 March proceedings, Envi vice-chair Pavel Poc told Commission representatives "I would really appreciate if your approach to this was not so self-righteous and patronising".

The hearing was organised jointly by Envi and the Petitions Committee (Peti). Speakers included experts from EU and national regulatory agencies and representatives of academia and NGOs.

It was organised in response to what the Parliament called "a high number" of petitions from citizens expressing concern over EDCs.

Threat of censure

During the hearing Mr Poc referred to an attempted motion of censure MEPs aimed at the Commission as far back as 2016 for its delay in publishing scientific criteria on EDCs. That motion had lapsed after several key MEPs withdrew their support for it but, Mr Poc warned, the outcome of a similar motion now might be different.

He said the next time the issue is debated the Commission should consider whether it has done everything it could and "should have in mind this one simple fact": MEPs could support the motion of censure.

In October last year Parliament vetoed the Commission's criteria proposal and asked it to come up with a new proposal "without delay", after MEPs argued the Commission had exceeded its mandate.

Two months later, in December, the EU's Standing Committee on Plants, Animals, Food and Feed (SCoPAFF) adopted revised EDC criteria in December. The proposal is currently undergoing scrutiny by the Council of Ministers and the European Parliament.

NGO push

During the debate Natacha Cingotti from the Health and Environment Alliance (HEAL) called for a "coherent EU strategy" on EDCs addressing a diverse range of product groups, such as cosmetics, toys and food contact materials.

Action is "long overdue" and member states such as Denmark, France and Belgium would take individual measures if the Commission fails to act decisively, she added.

ClientEarth's Alice Bernard said the EU is obliged to control EDCs under the 7th Environment Action Plan. She called for more resources to facilitate effective controls.

However, Peter Korytar, policy officer at the Commission's environment directorate, said EDCs are not "unattended" in EU legislation. They are included in all chemicals regulations, he said, with specific provisions in some.

He said the Commission will publish a report "in a few weeks" in which it will set priorities for future work on the substances.

Scientists urge no delay

Scientists at the hearing said decisions should not be deferred on the basis that further research is needed, as enough tools are available to regulators.

Alberto Mantovani, a professor from the Italian Health Institute, suggested as the way forward a "mode-of-action driven approach" to support risk assessment and risk reduction. MoA refers to cellular changes, rather than molecular.

Daniel Dietrich, from the University of Konstanz in Germany, said natural and synthetic EDCs should be considered together – as the former also cause adverse effects. He gave the examples of sugar and yellow mustard. "It is a matter of dose and risk," he added.

Olwenn Martin from Brunel University in London disagreed, saying that while individuals can control their sugar intake, they must depend on policy makers to control chemical substances. She also urged wider free dissemination of more data on EDCs.

Sweden advocates developing microplastic restrictions at EU level

29 March 2018 / Microplastics, Sweden

A Swedish investigation into whether further national restrictions on microplastics in cosmetics and other chemical products are needed concluded that such action would be better carried out at EU level in the first instance.

Sweden's chemical agency Kemi, which carried out the research, says "the work being done at EU level on restriction proposals could result in reliable decision material and clear and harmonised rules and regulations which would also be cost-effective".

The investigation follows the Swedish government's decision in February to ban microplastics with a cleansing, exfoliating or polishing effect in rinse-off cosmetics products.

With the ban already planned, the government asked Kemi in 2017 to look at the occurrence of microplastics in certain cosmetics products that are not covered by the prohibition.

The agency says its assessment is based on "striking a balance between environmental concerns and the consequences of a national restriction.

"Our assessment has also taken account of the uncertain level of knowledge we have about microplastics."

Defining microplastics as solid plastic particles smaller than 5mm in any dimension and insoluble in water, Kemi identified polymers and waxes that might be microplastics in both cosmetics and chemical products. However, it says it does not have "sufficient material at present to assess with certainty which polymers ought to be designated as microplastics ..." It is therefore difficult, it says, to identify existing alternatives or replacements that can be developed.

Kemi estimates that between 0.2 and 4.4 tonnes of microplastics per year are emitted to the water environment from cosmetics products that are sold in Sweden.

Agency intentions

In the report Kemi says it plans to:

- participate in the development of restriction proposals on intentionally added microplastics in products at EU-level;

- act to encourage the EU Commission to consider the possibilities of introducing requirements on registration and evaluation in REACH for polymers;
- act to encourage voluntary measures to be taken in the sectors responsible for detergents and cosmetics;
- participate in work on microplastics standardisation;
- work to improve knowledge of microplastics in products through its ongoing mapping of hazardous substances; and
- act to improve coordination and dissemination of knowledge about plastic nanoparticles through the Swedish National Platform for Nanosafety.

The agency says it is committed to promoting greater knowledge on the part of researchers, public authorities and companies, especially regarding occurrence and properties of the smallest types that are used in products.

It also plans to speak with relevant industries to this end and to encourage the replacement of microplastics on a voluntary basis, such as in the cosmetics sector.

Sweden proposed the broadening of its ban on microbeads in rinse-off cosmetics to all products that release them last year.

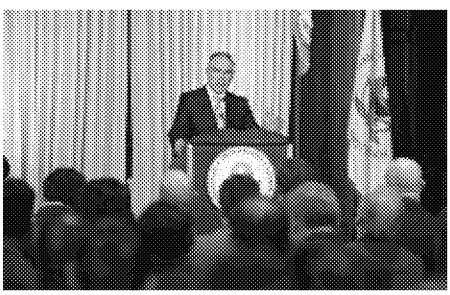
US EPA to unveil 'secret science' details in coming weeks

Public consultation to be sought for transparency dialogue

29 March 2018 / TSCA, United States



The US EPA is preparing to make a formal announcement and solicit public feedback on its forthcoming 'secret science' policy changes within the next month.

Last week, news surfaced that the EPA was planning to unveil a new policy that would block it from using studies that are not publicly available as the basis for its regulatory decisions.

NGOs immediately raised the alarm that this change could "radically limit" the types of science used to develop public health and environmental protective policies.

The EPA press office has not responded to multiple requests for further details on what this change will include. But a source close to the issue told Chemical Watch this week that a more formal rollout will come in the next few weeks.

The initiative will entail a process for gathering ideas and information from interested stakeholders to begin a dialogue around the way the agency assesses science, according to the source. The goal will be to ensure that there is increased transparency in how the EPA evaluates the science underlying its regulatory decisions.

It was not immediately clear if this would take the form of a formal rulemaking or not.

Initial reports had indicated that the EPA's science policy would "mirror" the HONEST Act – a bill passed by the House a year ago, but which has not gained traction in the Senate. That bill calls for the science used by the agency to be "transparent and reproducible".

But Chemical Watch has been told that while the stalled legislation and the EPA's evaluation of how it looks at scientific studies are rooted in similar concerns, the latter may not be exactly in line with the former.

Nevertheless, concern at the new approach continues to swirl. Earlier this week former EPA administrator Gina McCarthy and former acting assistant administrator Janet McCabe wrote in the *New York Times* that the public should "[not] be fooled by this talk of transparency".

"[Administrator Pruitt, pictured] and some conservative members of Congress are setting up a nonexistent problem in order to prevent the EPA from using the best available science," they said.

Automotive groups defend lead-acid batteries in California

Stakeholders call for SCP programme to focus on "greatest impact" products

29 March 2018 / Metals, United States

The automotive industry is pushing back on California's interest in evaluating lead-acid batteries under the Safer Consumer Products (SCP) programme.

Lead-acid batteries are one of seven product categories named in the Department of Toxic Substance Control's 2018-2020 draft priority products work plan. These represent the candidates from which the DTSC may select 'priority products'. Once a product-chemical combination is designated, manufacturers must either undertake an alternatives analysis or phase out the substance's use.

The most frequent form of lead-acid batteries are 12-volt car batteries. The work plan additionally names, among others, 'small, sealed forms', including those used in consumer electronics, and batteries used for mobility, such as in scooters, golf carts and forklifts.

And while the products may contain three SCP candidate chemicals – lead, arsenic and sulfuric acid – industry groups are protesting their inclusion in the draft plan.

The Alliance of Automobile Manufacturers – a coalition including major manufacturers like Mitsubishi, Volkswagen, General Motors and Volvo – said the product has "minimal potential for exposure" when in use.

And while there have been issues with the recycling of these batteries in the past (see box), it said, the "targeting of the entire automotive battery supply chain for the past mistakes of an individual 'bad actor' does not represent a science-based, data-driven approach to remedy any outstanding concerns associated with the product".

If the primary concerns exists with recycling and manufacture, it added, "these can be better addressed via other regulatory mechanisms".

Mema, the Motor & Equipment Manufacturers Association, which represents more than 1,000 companies who manufacture motor vehicle systems and component parts, said that lead-acid batteries do not meet the two primary criteria for a priority product listing. Namely, that there is:

- potential exposure to the chemical in the product; and
- potential that exposures contribute to or cause significant or widespread adverse impacts.

A priority product listing, it said "should be reserved for products that have the greatest impact on benefiting human health or the environment, provides the SCP programme the best chance of success, and is a legitimate use of DTC's resources and the resources of the industry that manufactures the product."

The Green Chemistry Alliance – a broad coalition incorporating more than a dozen major trade groups – cited lead acid batteries as an example where the work plan would conflict with state or federal regulatory programmes. "Every aspect of the product life-cycle is already highly regulated at both the state and federal levels," said the group.

"The department should [not] attempt to conflict with, duplicate the activities of other regulatory agencies or supersede the regulatory authority of other agencies – whether or not they've taken action to date on particular aspects of the full life cycle of products and chemicals."

Safer alternatives?

But ZincFive – a manufacturer of nickel-zinc based energy storage products – said that lead has been successfully removed from such applications as paint and gasoline, and that "viable, lead-free alternatives are now available in the form of lithium-ion and nickel-zinc batteries".

"California DTSC has the opportunity to make the monumental lead poisoning clean-up in Vernon the last of its kind and to make the lives of all Californians safer through designation of lead-acid batteries as a priority product," said the company.

However, the Battery Council International – a lead battery trade group – countered that these are "new and unproven battery technologies with known significant environmental and public safety risks, and unknown long-term impacts".

Exide Technologies

The inclusion of lead-acid batteries in the work plan follows a highly publicised toxic cleanup at Exide Technologies. The facility's activities – which included recycling scrap from spent lead-acid batteries – resulted in widespread lead contamination impacting as many as 10,000 properties.

In 2016, California Governor Jerry Brown cited Exide when he directed the DTSC to evaluate lead-acid batteries.

The work plan says the department has begun research on exposures and hazards associated with lead-acid batteries, and will continue that work. It held a public workshop on 6 November last year to begin this process.

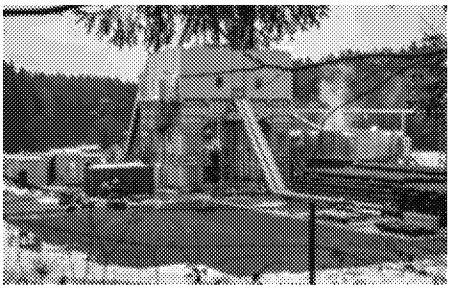
EU committee: knowledge of oil, gas health risks 'very poor'

Call for open access database

29 March 2018 / Accidents, emergency response & poison centres, Data, Europe, Halocarbons, Mining & minerals, Risk assessment



The quality of scientific assessment of possible public health risks posed by the EU's onshore oil and gas exploration and extraction activities is "very poor", according to the European Commission's Scientific Committee on Health, Environmental and Emerging Risks (Scheer).

The committee estimates that over 1,300 different chemicals may be emitted to the environment from onshore oil and gas activities. These include biocides, scale and corrosion inhibitors, oxygen scavengers, surfactants and various hydrocarbons.

The Commission asked Scheer to assess the public health risks and to identify the main knowledge gaps. The committee found that most studies are from the US, with evidence pointing towards possible health effects. It expressed its "surprise at the very poor scientific assessment of the possible effects of these activities in the EU".

Although the probability of chemicals being released to the environment is relatively low under normal operation, there is a high risk of accidental spillages. The physico-chemical properties and environmental behaviour of the chemicals involved in oil and gas exploration differ widely. Some are transported in the air while others pollute water systems.

Included in the 1,300 chemicals are reproductive and developmental toxicants and carcinogens. The committee suggests that "the risk of some cancers and of adverse birth outcomes may be increased in populations living around onshore oil and gas exploration and exploitation sites". Yet the evidence is "weak to moderate".

Scheer found "insufficient" quantitative information on exposure pathways and levels. It also identified a need for more data from environmental monitoring and human biomonitoring. "With the existing information on exposure and hazard, it is currently not possible to perform a thorough risk characterisation of human health risk associated with oil and gas exploration and exploitation," it concluded.

The committee says it would like to see an open access, EU database of all chemicals involved in oil and gas activities. To characterise the hazardous properties of individual chemicals, it recommends using a weight-of-evidence approach with *in vivo* and *in vitro* data, as well as Qsar and read-across.

Human health risk will result from exposure to a mixture of chemicals, says the committee. The exact mixture composition and exposure concentration will vary over time and from site to site.

Walmart aligns disclosure policy with Californian law

Retailer finds state's Cleaning Product Right to Know Act enough for suppliers to comply

29 March 2018 / Cleaning products, Confidentiality & right-to-know, Labelling, North America, Personal care, Retail, United States, Voluntary action

An update to US retailer Walmart's ingredient disclosure policy means that product suppliers can now comply with it, by adhering to California's list of chemicals of concern.

In 2013, the company informed its suppliers that it wanted online disclosure of products containing substances on its list of priority chemicals by 2015 and on labels by 2018. Walmart's priority chemicals are compiled from 22 regulatory lists.

However, they can now use California's list of chemicals, which will be required under the state's Cleaning Product Right to Know Act, to check which substances need to be included on their product labels. Walmart has made the change to lessen the burden for suppliers, which would otherwise have to comply with two lists when California's requirements are implemented.

California's labelling requirements enter into force in 2021, while Walmart's have been in force since January.

Walmart's director of sustainability communications, Micah Ragland, told Chemical Watch: "In seeking closer alignment with California's [Act], our aim is to help enhance efficiencies for our suppliers and increase transparency and ingredient disclosures for our customers."

Work with HCPA

According to a three page statement, recently released by Jim Jones, at trade body the Household and Commercial Products Association (HCPA), his organisation worked with Walmart to "better align the company's ingredient transparency requirements with California's new law".

Commenting on suppliers having to adhere to both lists from 2021, Mr Jones, who was the former assistant administrator for chemical safety at the EPA, said that the "differences would make it challenging to comply".

In essence, he added, Walmart will expect suppliers to meet a more ambitious schedule than California, but "the substances of compliance will be the same".

The main difference between California's and Walmart's lists is that the retailer includes Minnesota's chemicals of concern that fall under the state's Toxic Free Kids Act. California's list contains around 3,200 substances, while Walmart's exceeds 4,000.

"This may appear to be a small win, but if you are a company that sells in California (almost all our members) and Walmart (almost all our members), even small differences in requirements can lead to extraordinary costs and time-consuming compliance," he said.

Mr Jones told Chemical Watch that the HCPA is reaching out to a large number of retailers, which are putting in place or have chemicals safety policies, including Target.

"The aim is to create greater dialogue so that they understand what suppliers can and can't do and how long it takes for them to do certain things, like the length of time it is possible to make a label change for example."

Products covered

Walmart's disclosure requirement covers "chemical-based" consumables products, sold through Walmart US and Sam's Club US stores. Departments and product categories covered are:

Walmart departments:	Sam's Club categories:
Health and beauty aids	Health and beauty aids
Household paper	Tabletop and bags
Pets and supplies	Pet supplies
Household chemicals	Laundry and home care
Cosmetics and skincare	Baby care
Infant consumable hardlines	Paper goods
	Janitor supplies

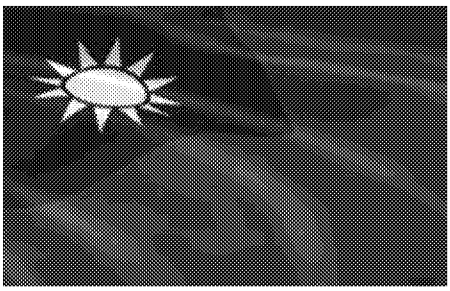
Taiwan's draft Pecs list and registration changes expected April

TCSCA revisions also moving forward

29 March 2018 / New substances, Priority substances, Substance registration, Taiwan, TCSCA



Taiwan's Toxic and Chemical Substances Bureau says the publication of the long-awaited draft revisions to its registration process for new and existing chemical substances, together with a draft list of more than 100 priority existing chemicals (Pecs) is likely in April.

In an interview with Chemical Watch, Hsieh Yen-ju, director-general of the EPA's Toxic and Chemical Substances Bureau, said his agency recently submitted both documents to the office of EPA Minister Lee Ying-yuan.

Speaking on 26 March Mr Hsieh acknowledged that "industry concerns" had delayed the draft documents past their expected date of end of February. But the advance notice of 60 days of public comment on the changes should happen sometime in April, he said.

Draft revision of TCSCA under review

Mr Hsieh also said that a draft bill to revise the Toxic Chemical and Substances Control Act (TCSCA), which would be renamed the Toxic and Chemical Substances of Concern Control Act, is now being reviewed by the Social Welfare, Health and Environmental Protection Affairs Committee of the Legislative Yuan, Taiwan's parliament.

The Executive Yuan, Taiwan's Cabinet, had listed the draft package of changes as a "priority bill" for passage in the current legislative session, which will end in late June, Mr Hsieh said.

Swedish nano-platform launches new website

29 March 2018 / Nanomaterials, Sweden

The Swedish National Platform for Nanosafety – SweNanoSafe – has published a website aimed at improving communication and the exchange of knowledge on the safety of nanomaterials.

It is targeted at regulators, scientists, industry, NGOs, and others interested in the safety of nanomaterials.

In Swedish with some information in English, the SweNanoSafe website offers basic information and research on how nanomaterials are regulated in various areas, such as chemicals, cosmetics and the work environment.

Safety aspects of the substances concern their whole life cycle – synthesis, development, production, use and management of waste.

The site includes:

- a knowledge bank;
- Q&As;
- a calendar; and
- links to other sources of information mainly in Sweden and Europe.

It is part of the Swedish Toxicology Sciences Research Centre (Swetox) commission from the Swedish government to create a national platform for nanosafety.

Sweden has been proactive in setting controls on nanomaterials. A rule requiring companies in the country to notify data on nanomaterials in chemical products to the national chemicals agency's product register entered into force on 1 January this year. Companies have until 28 February 2019 to comply.

On a European level, in June last year Echa launched its EU observatory for nanomaterials (Euon), a public website aimed at increasing transparency of information on nanomaterials on the EU market.

It came after the Commission opted not to create an EU nano register, given delays in the introduction of new REACH information requirements for nanomaterials.

The impact of the website "will be minimal", the Dutch National Institute for Public Health and the Environment (RIVM) said in December.

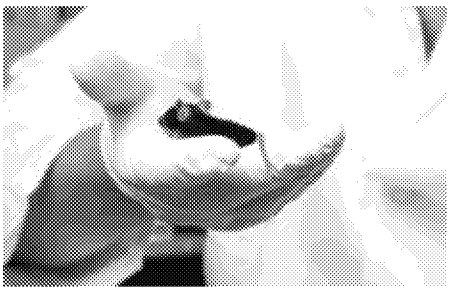
Global ban on animal testing hard to achieve, industry says

China could be biggest hurdle

29 March 2018 / Europe, Personal care, Test methods



The EU's call to establish a global ban on animal testing for cosmetics will prove challenging, say cosmetics industry groups.

Particular barriers, they say, include the lack of acceptance of alternative test methods internationally and getting countries that do not implement bans to reconsider their current approaches.

Last month, the European Parliament's Environment Committee (Envi) voted to advocate for a worldwide ban on animal testing for cosmetics by 2023.

It proposed drafting an international convention against the testing of animals for cosmetics within the UN framework, and called for it to be included on the agenda of the next UN General Assembly meeting.

But a Cosmetics Europe spokesperson told Chemical Watch, that despite efforts from the cosmetics industry, alternative replacement test methods have not yet been developed or accepted for all toxicological endpoints.

The EU testing and marketing ban, that entered into force in March 2013, covers all endpoints, irrespective of whether a full set of alternatives methods is available to replace corresponding animal studies.

The trade body said this has "severely limited" industry's ability to introduce new ingredients, use existing ones for new uses and respond to new questions regarding their safety.

The spokesperson added that amendments to Envi's proposal, calling for resources to be allocated for fast development, validation and introduction of alternative testing methods to replace key toxicological endpoints were "extremely important".

It was equally important that these alternative methods "received international regulatory acceptance for use in safety assessment of cosmetic ingredients and products", they added.

Developing alternatives

The US does not have a formal requirement for animal testing of cosmetic products, but the Food and Drug Administration (FDA) does require companies to test across a range of toxicological endpoints in order to prove safety.

According to the FDA's website, animal testing by manufacturers, seeking to market new products, may be used to establish product safety. "In some cases, after considering available alternatives, companies may determine that animal testing is necessary to assure the safety of a product or ingredient," it says.

Francine Lamoriello, executive vice president of global strategies for the Personal Care Products Council (PCPC), told Chemical Watch, the cosmetics industry has invested "hundreds of millions of dollars over the past several decades to develop scientifically valid alternative safety testing methods".

She added that the PCPC encouraged FDA approval of alternatives to animal testing "as part of its principles for federal cosmetics regulatory modernisation" and was committed to "the development of additional alternative testing methodologies".

China challenge

The push for a global ban is being proposed because around 80% of the world's countries still allow animal testing and the marketing of cosmetics tested on animals. China is one country with a major cosmetics market that does not implement a ban, instead requiring products to be animal tested before being allowed on the market.

Janet Winter, CEO of the US consultancy, International Cosmetics and Regulatory Specialists, told Chemical Watch that China's mandatory animal testing requirement for imported cosmetics, was likely to be the "biggest challenge" for a global ban.

She said that industry was working with the Chinese government to eliminate their animal testing requirements and hoped that as China is a member of the World Trade Organization (WTO), a resolution put before the UN would create "additional pressure" to rescind them.

"This is another step forward, serving to increase visibility on the issue. Industry will continue to pursue the abolition of animal testing at every opportunity, and the UN message will serve as a part of that," she said.

US-based NGO, the Institute for In Vitro Sciences (IIVS), is working with China's National Institute for Food and Drug Control (NIFDC) to improve use of non-animal tests in China.

Erin Hill of IIVS told Chemical Watch, there are "many efforts" needed in order for the Chinese government to come in line with international standards - such as acceptance of data from the OECD test guideline methods.

She said: "It may be a big leap for them to pass a ban on animal testing."

A March plenary session, at which the resolution on the ban was due to be voted on, was delayed. A European Parliament spokesperson said it will now take place in either April or May.

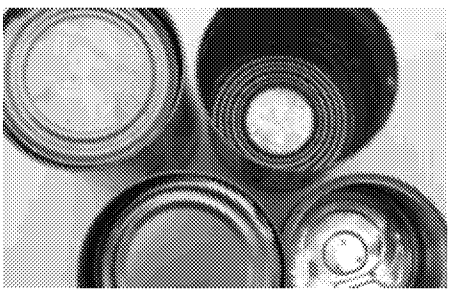
NGO urges EU phase-out of hazardous chemical groups

Report highlights BPA substitution with 'potentially harmful' BPS

29 March 2018 / Alternatives assessment & substitution, Bisphenols, Europe, Food & drink, REACH



UK-based NGO CHEM Trust has called on EU regulators to "phase out" the use of groups of similar chemicals to prevent substitution of one hazardous substance with a related one that has similar properties.

In separate letters addressed to Echa, the European Food Safety Authority (Efsa), and the European Commission's Health Commissioner, the NGO says "the only exception to this should be if industry has good data showing the chemical they wish to use does not have the same properties as those of the chemical being restricted".

The letters coincide with the publication of a report which highlights the common industry practice of substituting bisphenol A (BPA) with bisphenol S (BPS), both of which, Echa's risk assessment committee has said, may have similar toxicological profiles.

BPA is already on the REACH candidate list of SVHCs on three counts. Not only is it toxic to reproduction, but it also has endocrine-disrupting properties which cause probable serious effects to human health and the environment.

It is used in thermal paper till receipts – although that is facing a restriction from 2020 – as well as polycarbonate water bottles and food can linings.

Echa has started investigating BPS by asking industry for more safety data rather than regulating its use, CHEM Trust says.

Additionally, "as far as CHEM Trust is aware Efsa – responsible for assessing chemicals in food packaging – has not reexamined the toxicity of BPS or other bisphenols" the NGO says.

Report findings

According to the report – *From BPA to BPZ: a toxic soup? How companies switch from a known hazardous chemical to one with similar properties, and how regulators could stop them* – most companies selling BPS are "claiming that it has no hazards".

The report shows that people and the environment are "not being properly protected from hazardous chemicals as businesses are moving from one problem chemical in a group to another," Michael Warhurst, CHEM Trust executive director said.

"We need EU regulators to phase out groups of chemicals of concern, rather than slowly restricting one chemical at a time. We cannot continue to gamble with people's health like this."

The report is published a year after CHEM Trust's *No Brainer* study, which reviewed the evidence that a number of chemicals, including BPA and BPS, might harm brain development in children.

Recommendations

The report lists five recommendations:

- regulators should regulate groups of related chemicals, rather than take a substance by substance approach: this needs to be used in REACH and regulations such as laws on chemicals in food contact materials. Echa should also investigate the effectiveness of industry's self-classification of chemicals, and whether this is being done in accordance with the legal requirements;
- manufacturers must improve their own assessment of the safety of chemicals: it is "not acceptable", CHEM Trust says, to claim that a chemical like BPS has no hazards, when a very similar chemical is known to have substantial hazards, including endocrine disruption;
- downstream users of chemicals should not replace one "problem chemical" with another similar chemical from the same group;
- workers should ask whether they are being exposed to BPA or other bisphenols, and ask employers to move to safer non-bisphenol alternatives; and
- consumers should ask retailers whether products such as plastic bottles, till receipts and food cans are bisphenol-free, and should ensure that children do not play with till receipts.

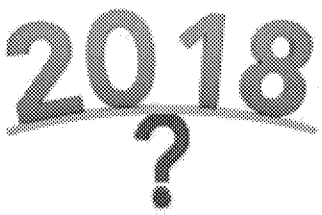
Companies likely to miss REACH 2018 'fast-track check' deadline

High number of 'exceptional case' inquiries for late test results

29 March 2018 / Data, Europe, REACH, Substance registration



An expected surge in the number of companies submitting REACH 2018 dossiers by the end of March – so as to secure a completeness check outcome on their dossiers in 21 days – does not seem likely, Echa says.

The agency had previously warned the outcome of such checks on dossiers submitted after 31 March may not arrive until August.

With two months to go until the registration deadline, Echa has received 18,037 dossiers covering 7,452 substances – 4,975 of which have not been registered before.

Overall, the agency said in comments to Chemical Watch, this is 10% behind the current 2018 deadline dossier estimations for this point in time. However, it added, the expectation has always been of a large peak in submissions during the last weeks before the deadline "so it is difficult to draw conclusions at this point".

For the 2018 deadline, 3,236 companies have filed dossiers – 544 companies are new registrants.

'Exceptional' cases

Submission inquiry and data-sharing dispute activity remains "very high", Echa said, "which is a sign that submissions are in general late".

Additionally, requests for letters of access "remain quite high" as do the number of expressions of interest received for the Directors Contact Group (DCG) solutions. This is particularly the case on the late availability of test results – "which also reflects that industry is late with the preparations and therefore submissions will arrive in the last weeks before the deadline", Echa said.

Those prospective registrants expecting late test results on their substances must secure lab testing contracts dated before 31 March in order to be considered as an "exceptional case", and to potentially be permitted to submit their dossiers after the 31 May deadline – if Echa consents.

The agency has now received around 160 expressions of interest for DCG solutions – almost all for the issue on late availability of test results. "Given the large interest we have updated the DCG webpages to make more transparent the kind of documentation that companies need to provide to apply for the DCG cases," Echa said. "It does look like this will continue to increase in the coming weeks."

Extra support

The agency has decided to open REACH-IT 24 hours a day, seven days a week, including bank holidays and weekends, so industry can continue to submit. Full Echa support is available during business hours, it said, adding it "constantly" monitors the situation.

It will run a REACH 2018 Q&A session on 19 April with a panel of experts responding to queries.

Echa says it is "ready to support" companies with all the "different difficulties" they may encounter including:

- late test results;
- issues with lead registrants and substance information exchange fora (Siefs);
- suppliers not registering; and
- data-sharing disputes.

"It is now important that companies start to submit their dossiers as soon as they are ready," the agency said. "It is also important that companies do not rush to correct their dossiers if they fail the first completeness check, but continue to focus on submitting the remainder of their dossiers.

"They get ample time to address the failure. What is important is to submit before the deadline. The dossier can validly be completed after the deadline, within the time given by Echa to address the failures."

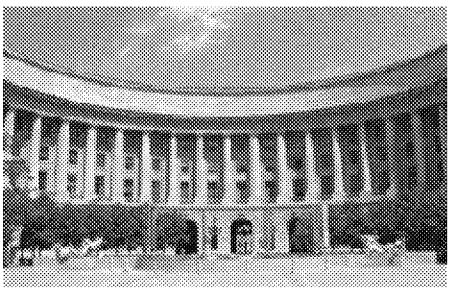
NGO scientists may reject appointment to US EPA chemical advisory panel

'Secret science' policy gives new SACC appointees pause

29 March 2018 / TSCA, United States



A recent announcement that the US EPA will be expanding the membership of its Science Advisory Committee on Chemicals (SACC) has been met with concern from members of the NGO community selected to serve on it.

The SACC – which is tasked with providing expert advice on scientific matters under TSCA – was formed in the waning days of the Obama administration. Last August, the agency signalled plans to expand it.

On 23 March, the agency announced 11 new members. These include three representing NGOs, four from industry, and four from academia or governmental organisations.

But at least one of newly chosen NGO representatives has refused to participate. And Chemical Watch has learned that all three may back out over concerns that the panel may be forced to work with limited scientific data.

Michael Wilson, national director for occupational and environmental health at the BlueGreenAlliance, "notified EPA that he was unable to accept the appointment", a spokesman for the organisation told Chemical Watch.

Ruthann Rudel, director of research at the Silent Spring Institute, is debating whether to take the position she was offered.

"I haven't decided what I'm going to do yet about my appointment," she told Chemical Watch. "I'm collecting some advice and information."

And Jennifer McPartland, senior scientist at the Environmental Defense Fund, said she had not responded to an invitation to join the panel and was surprised to see her name on the list of new appointees.

"News of [EPA Administrator Scott] Pruitt's proposal to limit the science the agency can consider has given me pause," she said in an email. She is still debating whether to accept her appointment.

Dr McPartland's concern around the EPA's so-called "secret science" policy is shared among many in the NGO community.

The new transparency initiative, signalled by Mr Pruitt in an interview with a conservative news publication last week, could bar the agency from using studies that are not publicly available to underpin regulatory decisions.

NGOs said this could result in suppressing crucial data needed to take action on hazardous chemicals under TSCA.

Science Advisory Committee on Chemicals

Formation of the SACC was required by the Lautenberg Act, to provide "independent advice and expert consultation" on the scientific and technical aspects of implementing the new TSCA. Its first 18 members were named in January last year.

The American Chemistry Council criticised the picks, of which less than a quarter were industry representatives.

Following leadership changes to the agency under President Trump, and "after further consideration of the objectives and scope of SACC activities", the EPA said it would expand the committee.

The additional members "will increase the balance of scientific perspectives and add experts with experience in labour, public interest, animal protection, and chemical manufacturing and processing to the committee," the EPA said in its announcement.

Four of the 11 new members represent industry directly, including two of the four candidates backed by the ACC. And appointee Michael Holsapple joined the Michigan State University faculty after a long career with Dow Chemical.

The eleven new appointees are:

- Charles Barton, global manager of toxicology and risk assessment at the Valspar Corporation;
- Steven Bennett, vice president for scientific affairs at the Household and Commercial Products Association (HCPA);
- Sheri Blystone, director of regulatory affairs and product safety at SNF Holding Company;
- Susan Dempsey, risk assessor and toxicologist for the Nebraska Department of Health and Human Services;
- Thomas Hartung, a toxicology professor at Johns Hopkins University;
- Michael Holsapple, professor in the Department of Food Science and Human Nutrition at Michigan State University;
- Mark Johnson, director of toxicology at the US Army Public Health Center;
- Sidney Marlborough, senior environmental toxicologist at Noble Energy;
- Jennifer McPartland, senior scientist at the Environmental Defense Fund (EDF);
- Ruthann Rudel, director of research at the Silent Spring Institute; and
- Michael Wilson, national director for occupational and environmental health at the BlueGreenAlliance.

Chemical Makers Worry Steep New EPA Fees Could Stifle Innovation

Posted: Mar 28, 2018, 7:29 AM EDT

By Adam Allington

Chemical manufacturers are concerned that hefty new EPA fees to support premarket reviews could stifle innovation and pose a barrier to bringing new chemicals to market.

A proposal would empower EPA to collect increased fees from chemical manufacturers and processors starting Oct. 1. The fees will allow the EPA to offset about $20 million in annual costs for implementing certain sections of the revised Toxic Substances Control Act.

EPA Administrator Scott Pruitt, in a February news release announcing the statement, said the proposed fee changes would ensure that the agency has "sufficient resources to review chemicals for safety with the highest scientific standards."

But chemical makers worry the fees could discourage innovation, particularly for developing new chemicals.

"Notifications for new chemicals in TSCA usually don't have a market yet, so many companies won't be able to afford the fees EPA is talking about," said Martha Marrapese, a partner with Wiley Rein, a Washington-based law firm specializing in chemical regulation.

"There will be a significant impact on innovation if they don't keep fees as low as possible," Marrapese told Bloomberg Environment. "If it costs thousands of dollars in fees, and EPA can't review applications in timely way...companies won't register their chemical here, they'll go somewhere else to do it."

Sticker Shock

The original TSCA capped fees for premanufacture notices (PMN) at $100 for small businesses and $2,500 for larger companies generating about $1.1 million annually. According to both industry and regulatory experts, there was general acknowledgment that the old levels—set three decades ago and never adjusted for inflation—needed to be substantially increased.

The new numbers on the table propose charging companies $16,000 for each premanufacture notice, new use notice, or microbial commercial activity notice.

"It is a sticker shock—to go from $2,500 to $16,000 for each PMN," said Rose Passarella, a senior scientific regulatory manager for Intertek, a Washington-based consultancy.

Another area of concern is the $4,700 the EPA is now proposing to evaluate requests for exemptions such as low-volume or test marketing exemptions.

"We have a number of serious concerns regarding the proposal," said Robert Helminiak, vice president of legal and government relations for the Society of Chemical Manufacturers and Affiliates, who's members include companies like Janssen Pharmaceuticals and BASF.

With exemptions, the EPA is applying substantial fees in an activity that has not historically had any assessment at all, and does not account for the market disruption it would cause, Helminiak said.

"EPA should not assess fees for processing these applications," he told Bloomberg Environment. "EPA should instead include the costs of reviewing exemption applications in the aggregate overhead costs of administering TSCA."

The Dow Chemical Co., PPG Industries Inc., and other companies contacted by Bloomberg Environment elected to defer comments about the new fees to their primary trade organization, the American Chemistry Council. That organization opted to withhold specific comments on the proposed fee structure until the end of the public comment period on April 27, according to an ACC spokesman.

PRIA Comparisons Not Accurate

The EPA already charges industry fees for pesticide registrations. But Marrapese of Wiley Rein said there are differences between the fees being discussed under TSCA and the ones collected under the Pesticide Registration Improvement Act of 2007 (PRIA).

"Pesticides are typically subject to a proprietary license, so companies are willing to invest more to pay for registrations," Marrapese said.

Marrapese notes that a substantial amount of scientific data and information are required to support the registration of a pesticide. These data can be very costly to create, which is why Congress included provisions in PRIA that provide certain rights to the data submitter. TSCA however, contains no provisions for data compensation.

"Under TSCA, once a new chemical goes onto the inventory, anyone can make it," she said.

High Enough?

EPA estimates the annual costs of carrying out testing on new and existing chemicals to be $80.2 million.

The agency also plans to collect fees to recover a portion of costs incurred it incurred from conducting chemical risk evaluations that manufacturers requested. The EPA expects the fee amount will range between $1.3 and $2.6 million per chemical.

But some said the proposed fees are not high enough—especially considering the greater scrutiny the new law requires the EPA to give new chemicals.

"Historically, the great majority of PMNs received by EPA never go on to be commercialized," said Richard Denison, lead senior scientist at the nonprofit Environmental Defense Fund.

According to EPA statistics, Denison said that of 40,000 PMNs reviewed over several decades, only about 14,000 went on to be commercialized, of which, only 5,300—or 13 percent—were subject to any kind of regulation or withdrawn by the submitter.

"This means that the great majority of PMNs were submitted with no meaningful intent by their manufacturers to commercialize them," he told Bloomberg Environment.

"This is not about innovation. In most cases, the decision not to commercialize a chemical had nothing to do with EPA's decision about it—meaning, almost two-thirds of the time, EPA had to waste public resources reviewing new chemicals that companies had no intent to commercialize," Denison said.

Focus on Exemptions

EPA officials have previously agreed with broad concern that higher fees for new chemical reviews "could create an economic barrier to innovation."

Because of that, the agency proposed a two-tier fee structure under which small businesses would pay about 80 percent less. But the definition of "small business" could change, based on criteria such as annual sales.

"More than ever, I expect you'll start to see a growing premium on TSCA exemptions," said Tom Berger, a partner with law firm Keller & Heckman LLP.

Companies could attempt to "consolidate exemptions" for things like test market R&D, or exemptions for low production volume chemicals, Berger said. "I think companies are going to start putting a lot more money into R&D, trying to get as much exemption as they possibly can," before they decide to file with EPA.

Chemical makers could soften some of the sticker shock by filing more consolidated premanufacture notices, Berger said during a March 14 webinar on fees that Keller & Heckman held.

In some cases, companies can consolidate up to six new, similar chemicals on an individual PMN, the EPA's proposed fee rule said, and he urged companies to contact the agency to make sure their chemicals meet the law's criteria for consolidation.

Sticker Shock' on Proposed EPA Fees • German Efficiency • Raw Feelings About Raw Data

Posted: Mar 28, 2018, 6:46 AM EDT

By Chuck McCutcheon

The EPA wants to start collecting more fees from chemical manufacturers and processors to help pay for implementing parts of the recently revised toxic-chemicals law.

Those companies aren't buying the idea.

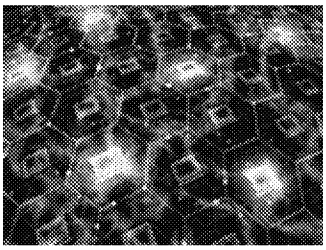
EPA Administrator Scott Pruitt said the proposal to collect "user fees" will help ensure the agency can review chemicals for safety "with the highest scientific standards," Adam Allington explains in a story being published today.

But chemical makers worry that the fees—which would be hiked from $2,500 to $16,000 in some cases—amount to "sticker shock" and could discourage innovation. Many companies won't be able to afford them, they say.

GERMANY'S BUILDINGS: Germany is trying hard to reduce greenhouse gas emissions over the next few years. But its new coalition government is looking too much at efficiency standards for new construction and not existing buildings, housing specialists tell Jabeen Bhatti in a story published today.

German cities are chock-full of older housing, ranging from prewar walk-ups to postwar reconstructed buildings. While coveted for their aesthetic appeal, many buildings still rely on antiquated heating methods and need energy-efficient renovations. Twenty percent of the country's total greenhouse gas emissions come from the nation's building sector, and 70 percent of housing stock doesn't meet current energy standards. Less than 1 percent of the needed renovations for carbon dioxide reduction have taken place.

Pruitt's Open Data Plan Could Limit Usable Research, Critics Say



EPA head Scott Pruitt's plan to ban the agency from using private or confidential data in making policy decisions would eliminate most of the scientific literature the agency reviews, scientists told Bloomberg Environment.

Washington to Be First State to Ban Firefighting Foam Chemical

Washington will be the first state to ban certain toxic chemicals in firefighting foams linked to a range of health problems when Gov. Jay Inslee (D) signs the ban into law late March 27.

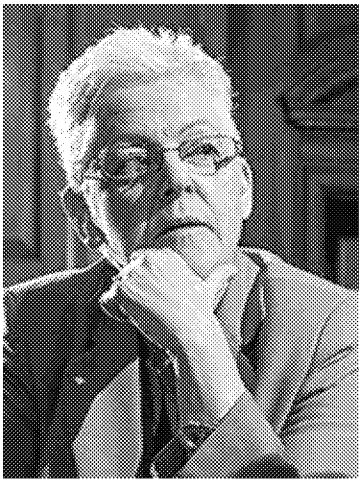
McCarthy, McCabe blast Pruitt's attack on 'secret science'

Maxine Joselow, E&E News

Published: Tuesday, March 27, 2018

Two former U.S. EPA officials under President Obama blasted Administrator Scott Pruitt's attack on "secret science" in a *New York Times* op-ed yesterday.



Former U.S. EPA Administrator Gina McCarthy. U.S. EPA/Flickr

Former EPA Administrator Gina McCarthy and Janet McCabe, who was acting assistant administrator of the agency's Office of Air and Radiation, sought to defend the agency's use of scientific studies when crafting regulations.

In a closed-door meeting at the Heritage Foundation earlier this month, Pruitt announced plans to restrict EPA's use of science in rulemakings (Climatewire, March 16).

European biocides authorities agree how EDC criteria will work in practice

Papers finally adopted, criteria implemented in June

27 March 2018 / Biocides, EDCs, Europe

EU authorities have decided how the criteria for identifying endocrine disrupting chemicals will be realised in the approval processes for biocidal substances and products.

This month's meeting of the biocides competent authorities (CAs) adopted two papers after months of discussion. The endocrine disruptor criteria for biocides will begin to take effect in less than three months, on 7 June.

The criteria should have little effect on substances with an assessment report submitted before 1 September 2013. These still fall under the rules of the biocidal products Directive (BPD).

But substances with an assessment report submitted after 1 September 2013 – when the biocidal products Regulation (BPR) entered into effect – will no longer be approved, if the new criteria identify them as endocrine disrupting.

The final paper on biocidal products introduces a controversial provision: the criteria will be applied to both biocidal active and non-active substances (co-formulants) in pending product authorisation applications. This rule was met with criticism from industry, legal experts and Echa, last year.

Guidance

Both the substance and product approval processes will depend greatly on the data requirements for assessing endocrine disrupting properties. Echa and the European Food Safety Authority (Efsa) are currently developing a guidance paper that will determine these. A draft of the paper was met with mixed reactions earlier this year.

Echa and Efsa's main biocides and pesticides working groups will be consulted, before publication of the final version. The biocides competent authorities and the Standing Committee on Plants, Animals, Food and Feed will also discuss it.

But Echa told the biocides CAs at this month's meeting that it is "on track" to publish the final guidance in time for June.

More detail on this story, and copies of the two CA meeting papers, are available on CW+BiocidesHub.

EU ombudsman tells Commission to share cosmetics nano information

Official sides with NGO on catalogue notifications access

27 March 2018 / Cosmetic products Regulation, Data, Europe, Nanomaterials, Personal care

The EU Ombudsman has found the European Commission guilty of maladministration over its handling of a public access request to information pertaining to the cosmetics nano inventory.

Ombudsman Emily O'Reilly has recommended that the Commission grants NGO ClientEarth access to notifications made by cosmetics manufacturers, following a complaint made a month after the inventory was published in June last year.

Specifically, she says, the EU executive should provide them with the list of all Article 16 notifications uploaded to the cosmetic products notification portal (CPNP), redacting only those parts that are covered by an exception to access provided by law.

The Commision should also ask the NGO if it wants a sample of Article 13 notifications, she added. It has until 15 June to send its opinion on the matter.

Catalogue delay

Under the cosmetics products Regulation, the Commission had been legally required to publish a catalogue, containing the details of nanomaterials present in cosmetic products by January 2014. But this was delayed by more than three years. The EU executive put it down to poor quality notifications and the need to liaise with member states and stakeholders to jointly improve the submitted data prior to publication.

In 2016 ClientEarth asked for access to the information sent by cosmetic companies to the Commission and to the draft catalogue.

In her recommendation – published this month – the Ombudsman says she was "not convinced" by the Commission's argument, at the time of the 2016 request, that the catalogue was not completed and there were only draft internal versions. It was "neither citizen friendly, nor in line with the EU public access rules", she adds.

Some of the notifications "could in fact have been extracted from the Commission's database", Ms O'Reilly says.

Although the final version of the catalogue was not published when ClientEarth originally requested access, the Ombudsman says, the Commission "failed to consult the complainant as to whether it would want access to any of the existing draft versions. This constituted maladministration."

'Useless' catalogue

Despite the long delay to publication, ClientEarth says the catalogue still does not let people identify which cosmetics contain potentially harmful nanomaterials, or assess the threat they may pose to human health.

ClientEarth lawyer Alice Bernard says consumers need to be informed so that they can "decide for themselves" whether to use products containing them.

"Sadly, the nanomaterial catalogue finally published by the Commission is useless for consumers, since it does not identify which products contain the nanomaterials. This is not in line with the cosmetics Regulation," she says.

Notifications

ClientEarth had asked for public access to information under Article 16(10)(a) of the cosmetics Regulation or, if such a catalogue did not yet exist, to notifications under Article 13(1) for cosmetics including nanomaterials, as well as the information notified under Article 16(3).

- Article 16(10)(a) says that by 11 January 2014, the Commission had to make the inventory publicly available;
- Article 13(1) requires details, such as the category of cosmetic product and name; and
- under Article 16(3) cosmetics products containing nanomaterials shall be notified to the Commission, six months prior to being placed on the market, except where they have already been placed on the market before 11 January 2013. It also sets out a series of information requirements.

Pruitt's Open Data Plan Could Limit Usable Research, Critics Say

Posted: Mar 27, 2018, 7:21 AM EDT

By Jennifer Lu *and* Sylvia Carignan

EPA head Scott Pruitt's plan to ban the agency from using private or confidential data in making policy decisions would eliminate most of the scientific literature the agency reviews, scientists told Bloomberg Environment.

Pruitt told the Daily Caller March 19 about his intentions for allowing only "open data" in drafting regulations and said the Environmental Protection Agency could only consider studies that make their data available for public scrutiny. Further, EPA-funded studies would have to make all of their data public.

Researchers are concerned that the policy could have far-reaching effects for how the agency regulates drinking water, air quality, and chemicals including pesticides and herbicides. Supporters of the idea, however, say the public has a right to view the information used to craft rules that affect them.

The EPA estimated in 2017 that a similar requirement for open data would limit usable studies by 95 percent.

"That will essentially lead to excluding massive bodies of evidence," Jonathan Samet, a former chair of the EPA's Clean Air Scientific Advisory Committee, told Bloomberg Environment.

Pruitt's policy is similar to language in a 2017 bill (H.R.1430) introduced by Rep. Lamar Smith (R-Texas) barring the EPA from basing certain actions on anything but studies that are publicly available and substantially reproducible.

The actions include risk, exposure, or hazard assessments, air quality science documents, standards, chemical limits, waste regulations, cost-benefit reviews, and guidance.

Right to See Data

Smith believes the public has a right to see data that EPA uses to justify its regulations, Thea McDonald, a spokesperson for the House Science, Space, and Technology Committee, told Bloomberg Environment in an emailed statement March 26. Smith is the committee's chairman.

"The public, including scientists, should have the opportunity to evaluate the agency's data and independently determine whether the data supports the EPA's conclusions," Smith said in the statement. It's unclear how much of Smith's bill will be part of Pruitt's policy. The EPA didn't respond to Bloomberg Environment's emailed requests for comment.

The EPA told the Congressional Budget Office in 2017 that the provisions in Smith's bill would "strongly discourage" industry and academic researchers from working with the agency, because the EPA couldn't guarantee to protect intellectual property, trade secrets like chemical formulas, or personally identifiable information in health studies.

"It's all part of the removal of science and scientists from the decision-making process," Samet said. "We're moving away from evidence-based regulations, which is what EPA does, which is what EPA should do, which is what EPA was set up to do."

Confidential Information

There's an ongoing debate in the research world about the merits of confidentiality versus the need for reproducible results, Tony Cox, a member of the EPA's Science Advisory Board and chairman of the Clean Air Scientific Advisory Committee.

Pruitt's plans align with scientific journals' increasing desire to promote transparency with data and to make more models and analyses readily available, Cox told Bloomberg Environment in an email.

Transparency "is an important part of the process of creating sound and trustworthy science," he said.

The EPA's Office of Pesticides Programs recently relaunched an attempt to obtain data on a Columbia University public health study on the effects of the insecticide chlorpyrifos on children exposed in utero. The EPA, under the Obama

administration, justified banning the chemical in part on the study, which linked levels of the pesticide in umbilical cord blood with neurodevelopmental delays in childhood.

Chlorpyrifos manufacturer Dow AgroSciences criticized the Columbia study on grounds that the EPA didn't have access to the raw data.

Institutional Review Boards

The ability to reproduce a study's results is important, but the relevant methods and techniques are what need to be shared, not patient personal data, or trade secrets and intellectual property, Gretchen Goldman, research director at the Union of Concerned Scientists' Center for Science and Democracy, told Bloomberg Environment.

Research institutions, such as universities and military facilities, have institutional review boards, which protect sensitive information by requiring researchers to sign ethics agreements before reviewing data.

The boards review researchers' intent to view or use sensitive data, and ensure researchers have gone through training about the appropriate uses of human studies data and how to secure it.

Boards also want to ensure ethical guidelines are followed in how test animals or people are exposed to harms and that personally identifying information will not be released, Goldman said.

Foundational Fine Particulates

Rallying cries against "secret science" can be traced back two decades to when fine particulate matter was included in the list of EPA-regulated air pollutants in 1997, Samet said.

Fine particulate matter—microscopic particles 2.5 microns in diameter or smaller—is emitted by a range of sources, including motor vehicles, power plants, and factories.

The agency had based its particulate-matter standards on two landmark studies, the Harvard Six Cities study and the American Cancer Society study.

Both contained "pivotal evidence" showing that people living in cities with higher levels of air pollution were at higher risk of dying, said Samet, the dean of the Colorado School of Public Health.

"At the time, there was a lot of discussion generated by industry stakeholders where if this data was so important, the data should be public," Samet said.

Peer Review

Those who decry "secret science" don't understand or don't acknowledge that the two studies were peer-reviewed and the raw data was reanalyzed by an independent research group, C. Arden Pope III, a co-author on the Harvard Six Cities study, told Bloomberg Environment.

That independent research group, the Health Effects Institute, gets funding from government agencies, including the EPA, and the automotive industry.

Health Effects Institute researchers found similar relationships between living in more polluted areas and a higher risk of death, Daniel Greenbaum, president of HEI, told Bloomberg Environment.

Findings from the two original studies became the bedrock for how the agency justifies its air regulations, from the Clean Power Plan to rules reducing mercury and toxic air emissions from power plants.

If you look at the cost-benefit analyses the EPA has done, most of them point to fine particulate matter exposure as the single largest contributor to the number of avoidable deaths, Greenbaum said. "And that is primarily calculated using the American Cancer Society and the Harvard Six Cities results."

"For those that don't want to reduce their pollution, one of the strategies they use is to criticize the science itself," Pope said. "I think that's pretty obvious to anyone that watches what's going on."

Greenbaum also warned that limiting what kind of science can be used to set regulations would "cut both ways."

While particulate-matter studies point toward lowering the threshold to protect public health, studies on nitrogen dioxide—emitted by cars and factories, eventually forming ozone—suggest no additional health benefits at lower nitrogen dioxide standards, Greenbaum said.

If Smith's bill had been passed, the "Honest Act would say those studies aren't available," and regulated industries wouldn't receive relief, Greenbaum said.

Furor Over EPA 'Open Data'

Posted: Mar 27, 2018, 6:41 AM EDT

By Chuck McCutcheon

Scott Pruitt wants to ban the EPA from using private or confidential data in making policy decisions. Scientists have a problem with that: They say it gets rid of much of the literature the agency reviews.

Pruitt, the EPA's administrator, has discussed allowing only "open data" in drafting regulations and said the agency should only consider studies that make information available for public scrutiny, Jennifer Lu and Sylvia Carignan write in a story being published today. The idea's backers say people have a right to view the information used to craft rules that affect them.

But the EPA estimated in 2017 that a similar requirement for open data would limit usable studies by 95 percent.

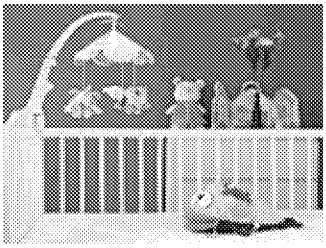
"That will essentially lead to excluding massive bodies of evidence," says Jonathan Samet, a former chair of the EPA's Clean Air Scientific Advisory Committee.

CALIFORNIA RETALIATION? As the Trump administration begins dismantling Barack Obama's ambitious auto efficiency regulations, California is said to be poised to retaliate by doing something that automakers have feared: de-coupling the state's rules with those set in Washington.

The state intends to revoke its so-called "deemed to comply" provision, two people familiar with the matter told Bloomberg News. The obscure-but-important state rule declares that carmakers that satisfy the EPA's tailpipe greenhouse gas standards automatically fulfill California's rules, too.

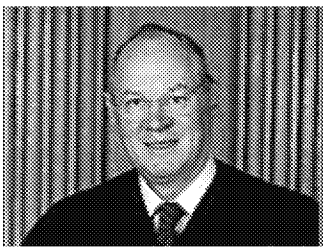
The dispute comes as an American Lung Association survey released today finds 70 percent of voters say EPA should keep its greenhouse gas standards for model years 2022-2025 at their current stringency.

Israel Limits Phthalates in Baby Changing Products After Expose



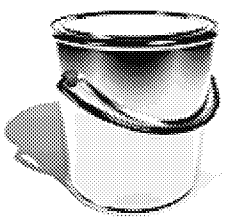
Israel is fast-tracking a strict limit on baby mattresses, changing mats, and other products found to contain high levels of endocrine-disrupting chemicals after a regulatory glitch allowed their sale.

Kennedy Recused After Late-Discovered Conflict From 1985 Case



Justice Anthony M. Kennedy will sit out of an environmental case to be argued in April because he heard an earlier iteration of the case while he was sitting on the U.S. Court of Appeals for the Ninth Circuit 33 years ago.

Brazil Begins Enforcing Old Law Limiting Lead Levels in Paint



A now-enforceable Brazilian law that limits lead in childrens' and household paints to 0.06 percent only will affect small, non-lab-tested paint producers, an association representing major producers said.

EDF Signals New Chemical-Specific Path To Target EPA SNURs Under TSCA

The Environmental Defense Fund (EDF) is warning that a draft EPA rule allowing a new use of an existing chemical is "legally vulnerable," suggesting a new chemical-specific path for environmentalists to challenge EPA's approval of new chemical uses under the revised Toxic Substances Control Act (TSCA).

Pruitt's Bid To End 'Secret Science' Faces Legal, Implementation Hurdles

Administrator Scott Pruitt's pending plan to apply a sweeping new data transparency requirement at EPA is expected to face legal and implementation controversies likely as soon as it is released, agency watchers say, including potential violations of medical privacy protections, trade secret information and other data that form the basis for air quality standards, pesticide and chemical approvals and other rules.

EPA Seeks An Extra 90 Days To Propose TSCA Lead Dust Rule Update

EPA is formally asking a federal appellate court to clarify when it made final its Dec, 27 order requiring the agency to propose -- within 90 days -- an update to its lead dust hazard standard for residential buildings and to grant an additional 90 days to comply with the order, though environmentalists indicate they oppose the request.

California DTSC Faces Debate Over Reach Of Review For PFAS In Carpets

Industry and environmentalists are battling over which per- and polyfluoroalkyl substances (PFAS) California's toxics department should assess in its proposal to list carpets and rugs containing the substances as a "priority product" under its green chemistry program, a decision that could drive how strictly the products are regulated.

EPA Adds 11 Members To TSCA Advisory Panel For Increased 'Balance'

EPA has boosted the size of its new panel dedicated to advising the agency on chemical science and management issues, adding 11 new members to the now 29-member panel.

EPA Gets Budget Reprieve In FY18 But Some Query Whether It Will Last

EPA appears to have largely escaped Trump administration plans to cut its budget by 31 percent in fiscal year 2018 after lawmakers unveiled a spending bill for the remainder of the year that funds the agency at essentially FY17 levels while also increasing funding for key infrastructure programs.

Judges want more info from EPA on chemical rule delays

Amanda Reilly, E&E News reporter

Published: Monday, March 26, 2018

Federal judges sought additional details Friday from U.S. EPA in a lawsuit challenging the agency's delay in Obama-era chemical safety rules.

The three-judge panel of the U.S. District Court for the District of Columbia Circuit asked EPA to provide instances where any federal agencies have changed the effective or compliance dates for a regulation based on administrative reconsideration of that rule.

EPA is to provide a "comprehensive list of examples" by April 3.

"If a comprehensive list would be excessively burdensome to produce, EPA shall explain why that is so and shall produce as many examples as practicable," the judges ordered around 5 p.m. Friday.

EU withdrawal guidelines exclude UK role in Echa

26 March 2018 / United Kingdom

In guidelines adopted last week on the UK's withdrawal from the EU, the European Council has repeated its stance that Britain will play no role in EU agencies, such as Echa, once it leaves the trade bloc in one year's time.

The Council also "further reiterates" that the Union "will preserve its autonomy as regards its decision making, which excludes participation of the United Kingdom as a third-country in [its] institutions and in the decision making of [its] bodies, offices and agencies".

There can be no "cherry picking", it adds, through participation in the single market based on a sector-by-sector approach. This "would undermine the integrity and proper functioning of the single market".

And the role of the EU's Court of Justice will also be "fully respected", it says.

The wording will unsettle British prime minister Theresa May who, earlier this month, said the UK government is to seek "associate membership" of Echa and other European agencies as part of the EU withdrawal negotiations.

Also this month, Cefic and the UK chemicals industry broadly welcomed a conditional agreement on the transition period after the country leaves the Union.

Negotiations between the EU and the UK continue, with a deal expected to be finalised at the European Council summit this October.

European Commission consults on two draft cosmetics nano opinions

26 March 2018 / Europe, Nanomaterials, Personal care

The European Commission's Scientific Committee on Consumer Safety has opened consultations on two draft opinions on nanomaterials in cosmetics. They are for:

- styrene/acrylates copolymer (nano) and sodium styrene/acrylates copolymer (nano) when used in leave-on cosmetics products with a maximum concentration limit of 0.06%; and
- colloidal silver (nano) when used in cosmetics, including toothpastes and skin care products, with a maximum concentration limit of 1%.

In both of SCCS's preliminary opinions, the committee was not able to decide on the safety of the materials due to insufficient data.

The consultation periods will close on 11 and 15 May respectively.

Danish Consumer Council says SVHC app is a success

'High hopes' that EU-wide app will put pressure on companies

27 March 2018 / Confidentiality & right-to-know, Denmark, Europe, Retail, SVHCs

The Danish Consumer Council said its Tjek Kemien app, which helps consumers identify substances of very high concern (SVHCs) in products, has been a success, despite a decrease in usage.

At Chemical Watch's Global Business Summit, held in Amsterdam earlier this month, Jakob Zeuthen, head of environment policy at the Danish Chamber of Commerce, said the number of scans made through the app had fallen.

But Claus Jørgensen, senior project manager at the council, told Chemical Watch: "It's been a success in the way that business knows the app and consumers are more aware of their right to know, but it's not a success if you want increasing numbers of scans every year."

The app allows consumers to scan a product barcode and automatically send an Article 33 request to the manufacturer or retailer, asking if the product contains SVHCs. Under Article 33 of REACH, suppliers are legally obliged to provide the information, free of charge, within 45 days.

Statistics from the two major Danish supermarkets - Coop and Dansk Supermarched - show the number of requests they received from Tjek Kemien dropped from 88 in 2016 to 16 in 2017.

But Mr Jørgensen said these figures do not reflect the total number of scans made in the supermarkets. This is because some would have been answered immediately through the app's database of product information or been sent directly to the manufacturer.

The app was used to make 14,000 scans last year and more than 120,000 times since its launch in 2014. It was used 832 times in January this year.

'High hopes'

Mr Jørgensen said the council had stopped promoting Tjek Kemien in order to focus on the AskREACH project, which will launch an EU-wide app next year. It is one of 20 partnership organisations involved in the initiative, led by the German Environment Agency (UBA).

Tjek Kemien will be discontinued when the EU-wide app launches and existing users will be redirected towards the new app through a system update.

He said there were "high hopes" that it would be popular with consumers and encourage companies to be prepared for Article 33 requests.

"On a larger scale we'll have greater success than we do here in Denmark, because [it] is such a little market. Our goal in the campaign is to get many millions of scans to put pressure on the companies," he said.

Another reason for the decline in use of the Tjek Kemien app is the 45-day period to receive information from manufacturers, which Mr Jørgensen said was off-putting for consumers.

He said: "If you see a big TV in the sale and you find out you have to wait 45 days to get an answer about SVHCs, you might not wait. The 45 days is a barrier."

AskREACH is encouraging companies to add product information to its database, so requests can be processed immediately without waiting for a response from the manufacturer.

The council is in the process of getting permission from companies in its Tjek Kemien database to be added to that of AskREACH.

Mr Jørgensen said this could be used as a "marketing tool" for companies which do not use SVHCs in their products.

The EPA Cleans Up Its Science

Now Congress Should Act To Lock In Place Data Transparency
Steve Milloy
March 26, 2018
https://on.wsj.com/2IV9LeH

The Environmental Protection Agency will no longer rely on "secret" scientific data to justify regulations, Administrator Scott Pruitt announced last week. EPA regulators and agency-funded researchers have become accustomed to producing unaccountable, dodgy science to advance a political agenda.

The saga began in the early 1990s, when the EPA sought to regulate fine particulate matter known as PM2.5—dust and soot smaller than 2.5 microns in diameter. PM2.5 was not known to cause death, but by 1994 EPA-supported scientists had developed two lines of research purporting to show that it did. When the studies were run past the EPA's Clean Air Science Advisory Committee, it balked. It believed the studies relied on dubious statistical analysis and asked for the underlying data. The EPA ignored the request.

As the EPA prepared to issue its proposal for PM2.5 regulation in 1996, Congress stepped in. Rep. Thomas Bliley, chairman of the House Commerce Committee, sent a sharply written letter to Administrator Carol Browner asking for the data underlying studies. Ms. Browner delegated the response to a subordinate, who told Mr. Bliley the EPA saw "no useful purpose" in obtaining the data. Congress responded by inserting a provision in a 1998 bill requiring that data used to support federal regulation must be made available to the public via the Freedom of Information Act. But it was hastily written, and a federal appellate court held the law unenforceable in 2003.

The controversy went dormant until 2011, when a newly Republican Congress took exception to the Obama EPA's anticoal rules, which relied on the same PM2.5 studies. Again the EPA was defiant. Administrator Gina McCarthy refused requests for the data sets and defied a congressional subpoena.

Bills to resolve the problem died in the Senate. Democrats argued that requiring data for study replication is a threat to intellectual property and an invasion of medical privacy. In fact, the legislation would protect property by requiring a confidentiality agreement, and no personal medical data or information would have been released.

This sort of data is already routinely made public for research use. In 2012 I was desperate for a way around the Obama EPA's secrecy on the PM2.5 issue, I found out in 2012 that I could get California death-certificate data in electronic form. The state's Health Department calls this sort of data "Death Public Use Files." They are scrubbed of all personal identifying and private medical information. Some of my colleagues used this data to prepare a 2017 study, which found PM2.5 was not associated with death.

The best part is that if you don't believe the result, you can get the same data for yourself from California and run your own analysis. Then we'll compare, contrast and debate. That's how science is supposed to work.

It would be better if Congress would pass a law requiring data transparency. A future administrator may backslide on the steps Mr. Pruitt is taking. In the meantime, we have science in the sunshine.

Pesticide Studies Won E.P.A.'s Trust, Until Trump's Team Scorned 'Secret Science'

Backed by agrochemical companies, the current administration and Congress are moving to curb the role of human health studies in regulation.

Aug. 24, 2018

A strawberry field in California's Salinas Valley, where a yearslong study, funded in part by the Environmental Protection Agency, has linked pesticides to ailments in children of farm workers.Carlos Chavarría for The New York Times

SALINAS, Calif. — José Camacho once worked the fields here in the Salinas Valley, known as "the Salad Bowl of the World" for its abundance of lettuce and vegetables. His wife still does.

But back in 2000, Mr. Camacho, who is 63, got an unusual phone call. He was asked if he wanted to work for a new project studying the effects of pesticides on the children of farm workers.

"This seemed really crazy," he recalled saying at the time, since he barely spoke English. "A research study?"

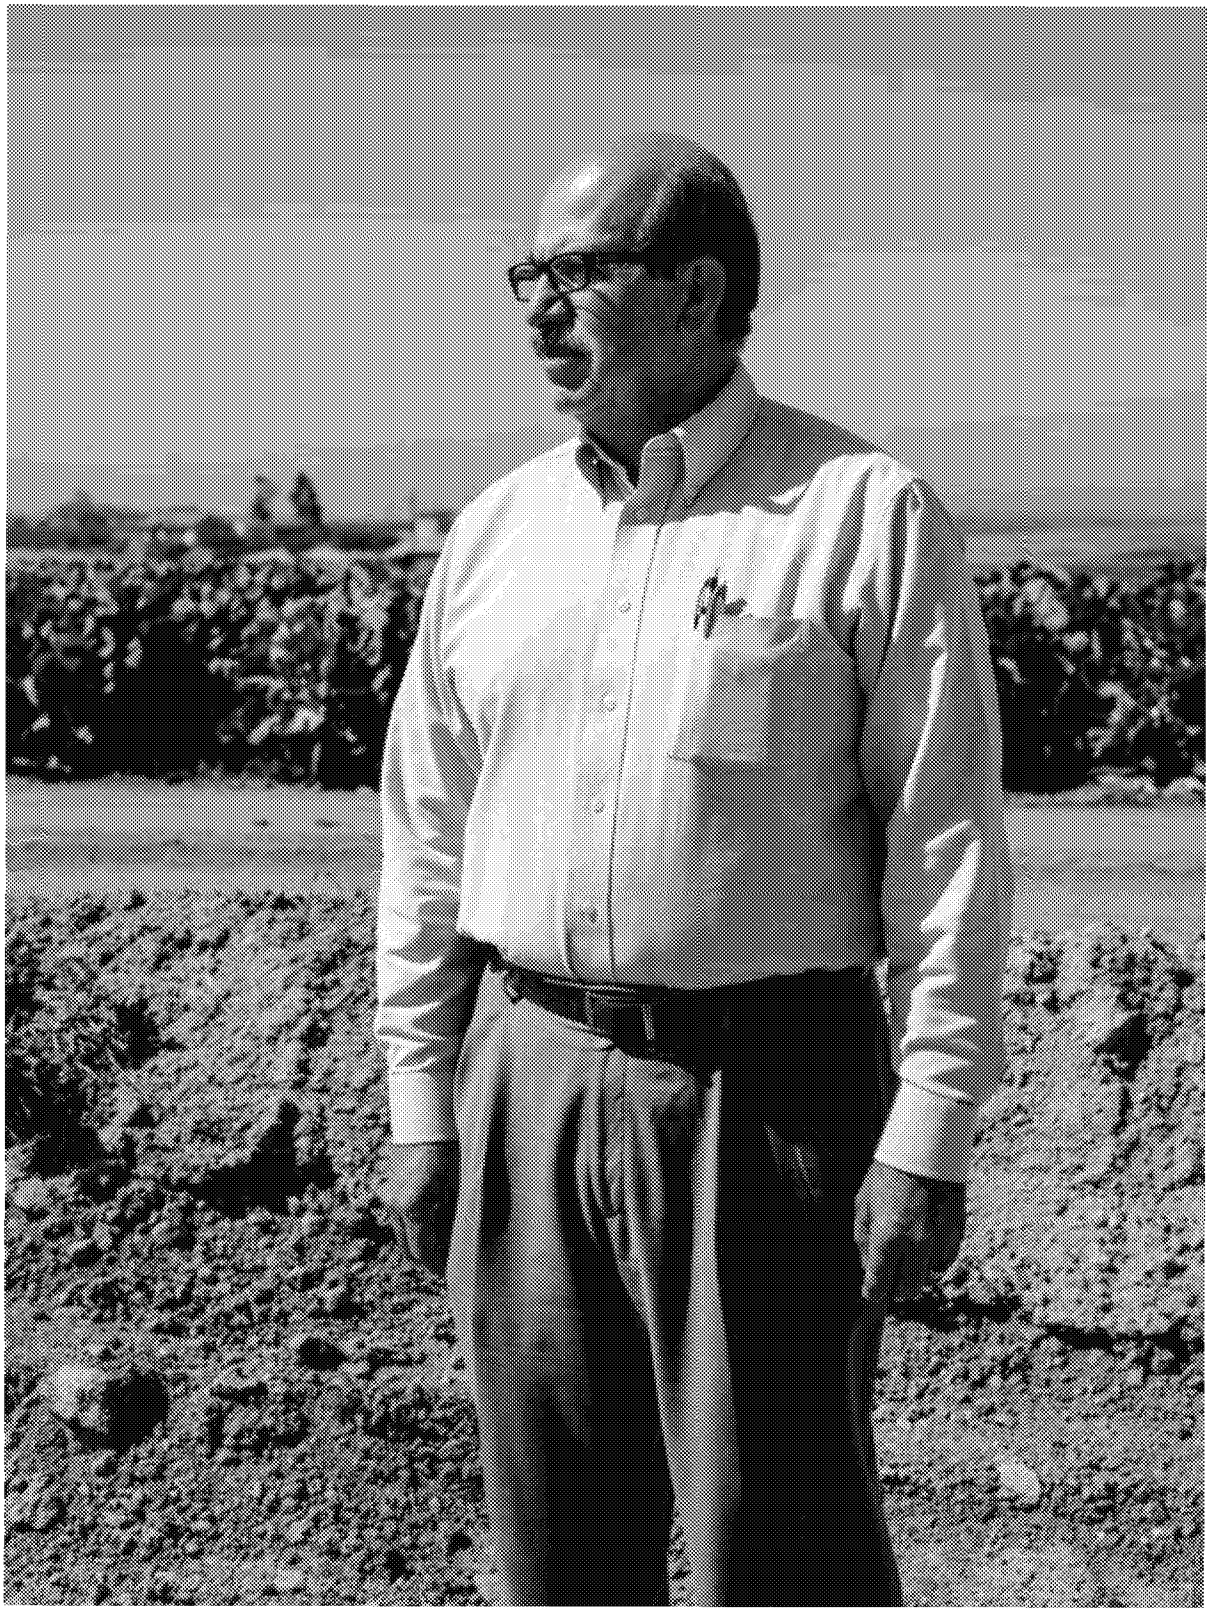
The project, run by scientists from the University of California, Berkeley, and funded in part by the Environmental Protection Agency, is still going all these years later. Known as Chamacos, Spanish for "children," it has linked pesticides sprayed on fruit and vegetable crops with respiratory complications, developmental disorders and lower I.Q.s among children of farm workers. State and federal regulators have cited its findings to help justify proposed restrictions on everything from insecticides to flame-retardant chemicals.

But the Trump administration wants to restrict how human studies like Chamacos are used in rule-making. A government proposal this year, called Strengthening Transparency in Regulatory Science, could stop them from being used to justify regulating pesticides, lead and pollutants like soot, and undermine foundational research behind national air-quality rules. The E.P.A., which has funded these kinds of studies, is now labeling many of them "secret science."

Studying disease trends in specific groups of people — a branch of medicine known as epidemiology — started to gain currency at the E.P.A. in recent years. These studies can be difficult because they require adjusting for all the various substances people are exposed to beyond pesticides. But researchers had amassed years of data from a wave of compelling chemical studies begun in the 1990s, giving regulators a new body of research to incorporate into their decision-making.

Under the Obama administration, the E.P.A., which had long favored tests on rats and other laboratory animals in its pesticide regulation, began considering epidemiological studies more seriously. The agency leaned on this type of research in proposing to ban an insecticide called chlorpyrifos in late 2016, and has been repeatedly prodded to take action on the chemical by federal courts.

But weeks after Donald J. Trump was elected president, CropLife America, the main agrochemical trade group, petitioned the E.P.A. to "halt regulatory decisions that are highly influenced and/or determined by the results of epidemiological studies" unless universities were forced to share more of their data.



José Camacho was asked in 2000 to participate in the study, which tracks families as they go about their normal lives. Such research was embraced by the E.P.A. during the Obama administration.Carlos Chavarría for The New York Times

Industry leaders aggressively challenged such studies in high-level meetings and emails with E.P.A. leaders, according to thousands of pages of documents obtained through Freedom of Information Act requests. One trade group invited a top E.P.A. official to meet with its Washington lobbyist last year, complaining that "carefully controlled" animal studies were giving way to "conclusions reflected in epidemiological papers."

Gary W. Van Sickle, executive director of the California Specialty Crops Council, wrote to the agency last September that "there have been serious flaws with E.P.A.'s conclusion to use these data."

The council, representing growers of crops as diverse as carrots, garlic, pears and peppers, cited "inappropriate use of the epidemiology."

The E.P.A., whose new leadership is seeded with industry veterans, has responded. In a mid-July assessment of atrazine, a widely used weed killer long banned in Europe, the agency reviewed and dismissed 12 recent epidemiological studies linking the herbicide to such ailments as childhood leukemia and Parkinson's disease. It echoed the conclusions of research funded by Syngenta, atrazine's manufacturer, finding the chemical unlikely to cause cancer.

Before scandals forced Scott Pruitt out last month as head of the E.P.A., he proposed the transparency regulation. It would ban many epidemiological studies, and other outside research, unless more data behind the studies was made public. In doing so, he revived a strategy advanced for years by congressional Republicans and corporate interests like tobacco companies.

"The era of secret science at E.P.A. is coming to an end," Mr. Pruitt proclaimed at the time. The agency's new acting administrator, Andrew R. Wheeler, says he's moving forward with the proposal, as the agency re-evaluates a class of widely used insecticides, called organophosphates, that have been the subject of numerous epidemiological studies like Chamacos.

Nancy B. Beck, a chemical industry veteran who is the E.P.A.'s deputy assistant administrator, said there was no attempt to thwart epidemiology, adding that the agency was committed to "the best available science in the most transparent manner."

But academics and state health officials say universities are being pressured to release data that would ultimately divulge the identities of study

participants, a strategy once used by tobacco companies seeking to undermine research on the dangers of smoking. While participant data is shared with regulators in drug trials, academics fear that the E.P.A.'s proposal would additionally require divulging confidential personal information, potentially violating privacy regulations for federally funded research.

Ana Lilia Sanchez, a farm worker and the mother of a participant in the Salinas Valley study, said her family took precautions to avoid pesticide contamination.Carlos Chavarría for The New York Times

"It is a naked attempt to use a false claim that something nefarious is going on with these studies in an effort to allow industry to challenge conclusions that are not in their favor," said James Kelly, a manager of environmental surveillance at the Minnesota Department of Health.

A Wave of Studies, an Uneasy Industry

An advertisement in a Nebraska student newspaper was looking for people who wanted to "earn extra money." Thirty-six college student volunteers and others from the community who responded were paid $460 to drink gelatin capsules filled with the pesticide chlorpyrifos, at up to 300 times levels the E.P.A. considered safe, without a full discussion of the risks.

Sponsored by Dow Chemical, this study, conducted in 1998, was one of the last of its kind. That year, the E.P.A. banned the use of studies exposing people to pesticides, and it continues to severely restrict them.

Epidemiology, which has been used to examine everything from the effects of climate change to childhood obesity, offered a way to continue studying disease trends, amid new legal requirements to examine how pesticides particularly affect infants and children. And it could do so by tracking people during their normal lives instead of treating them as if they were lab rats. Chamacos and other studies began almost immediately, although it took decades to collect sufficient data and study how participants changed over time.

One study by Columbia University researchers linked an insecticide to developmental delays in toddlers. Another, by scientists at the University of California, Los Angeles, connected pesticides to Parkinson's disease. Academics at the University of Rochester found that pesticides lower sperm counts in men, while researchers from the Harvard School of Public Health found lower fertility in women.

By 2015, there was a growing body of research, often funded in part by the E.P.A. The agency decided that year to consult epidemiology more seriously in its evaluation of glyphosate, the world's most popular weed killer and the active ingredient in Monsanto's Roundup.

"This is a watershed event in our Program, and one which I feel particularly proud to be a part (go epi!!)," Carol Christensen, then an E.P.A. epidemiologist, wrote in a 2015 email to a colleague — using "epi" as shorthand for epidemiology. "In the 35 year history of our program, this will be the FIRST time epi studies are actively considered in the decision making."

Yet even then, there was friction over what to make of studies aiming to determine whether glyphosate causes cancer.

One E.P.A. division, the Office of Research and Development, closely examined epidemiological research and came to believe either that glyphosate was likely to cause cancer or that there was at least some evidence suggesting a problem. But another division, the Office of Pesticide Programs, was dismissive of epidemiological studies and determined that glyphosate was not a carcinogen, a view that prevailed at

the E.P.A., according to interviews, emails and an internal memo obtained by The New York Times. Those involved in the agency's debates on epidemiology spoke on the condition of anonymity because the discussions weren't public.

Monsanto said in a statement that "we cannot speak to the internal E.P.A. discussions" but emphasized the agency's ultimate finding that glyphosate was not likely to cause cancer.

The cancer question received renewed attention this month when a California jury awarded $289 million to a groundskeeper who alleged that the chemical had sickened him. In his closing argument, the plaintiff's attorney, R. Brent Wisner, called epidemiology one of "the three pillars of cancer science" that the case relied on.

At the E.P.A., the debate swung in favor of epidemiology. While such studies are often complex and can be of varying quality, the agency was reluctant in the past to give them as much weight as lab experiments on animals. But by the Obama administration's final months, the agency moved for the first time to ban a pesticide largely because of epidemiological research.

The pesticide, chlorpyrifos, was the same one ingested years earlier by unwitting Nebraskans. It is applied to crops like apples, oranges and strawberries to combat insects like spider mites and sap-sucking bugs.

In California alone, chlorpyrifos was sprayed on 640,000 acres in 2016, according to state data. And research from Salinas, and the Chamacos study, became a central element in the E.P.A.'s recommendation.

"There is a breadth of information available on the potential adverse neurodevelopmental effects in infants and children as a result of prenatal exposure to chlorpyrifos," the agency concluded in 2016, also citing epidemiological research from Columbia University and the Icahn School of Medicine at Mount Sinai.

The pesticide industry's reaction was loud and intense.

Monsanto, in emails with the E.P.A., was dismissive of critical epidemiological research related to Roundup, writing that "such studies are well known to be prone to a number of biases."

A Trump administration proposal would prevent the E.P.A. from using many epidemiological studies, like the one in Salinas, unless more data behind them was made public.Carlos Chavarría for The New York Times

Dow Chemical said in reports submitted to the E.P.A. that "the evidence from these studies is insufficient" and called chlorpyrifos a "proven first-line of defense" against new pest outbreaks.

A month after taking over the E.P.A., Mr. Pruitt acted. He disregarded agency scientists and rejected the proposed chlorpyrifos ban, later calling for "a new day, a new future, for a common-sense approach to environmental protection."

View From the Field

Ana Lilia Sanchez, 50, has worked in the fields in Salinas more than half her life, and one of her daughters has been a Chamacos study participant.

Ms. Sanchez has learned to watch for drifting droplets or the whir of a helicopter spraying overhead.

"Sometimes when we feel it, or we hear it, we start talking about it," she said recently, sitting with her 5-month-old granddaughter at her home on a Salinas cul-de-sac. "Why wouldn't they tell us, you know, to get out of

here, to not come today?" she asked. "Women, they cover themselves, but men are working in short sleeves, so they are more exposed."

Insecticides like chlorpyrifos are organophosphates, from the same chemical family as nerve agents like sarin and Novichok, the Russian-developed compound linked to recent attacks in Britain. While the safety of insecticides is extensively tested, long-term health impacts, or even how far pesticides drift, are the subject of continuing disagreement.

Ms. Sanchez showers after work, before touching her granddaughter.

"I also put my clothes aside," she said. "We separate the clothes we use when we're working, both my husband and I, and wash them separately so they're not contaminated."

While some human studies examine potential harm from pesticide residue found on fruits and vegetables, the Chamacos project is more personal, following hundreds of children in the heart of where American food is grown. California has the nation's largest agricultural industry and uses more than 200 million pounds of pesticides annually.

Brenda Eskenazi, the director of the Salinas Valley project, said that "well-controlled epidemiologic studies" were essential for understanding "how things affect human health."Carlos Chavarría for The New York Times

For locals, pesticides are part of life. "It's a big difference from when I was working," Mr. Camacho said, while standing in a strawberry field framed on three sides by distant hills. Men and women were bent over nearby, pulling weeds. "My supervisor would say: 'That's not dangerous. Just keep working.' There was no information."

Chamacos is built on an unsettling premise: What happens to children of pregnant mothers certain to have pesticides in their bloodstreams? The E.P.A. and other government agencies have spent millions of dollars funding Chamacos.

Half the Chamacos children have been tracked since before birth. Researchers have collected 350,000 samples of blood, urine, breast milk and even household dust and spent nearly two decades studying maturing children. They perform neurodevelopmental and physical assessments and study factors like diet and school performance. After nearly two decades, the study's data appears in more than 160 academic papers.

During a visit to the Chamacos office in Salinas, Brenda Eskenazi, the director of the project and a professor of epidemiology at Berkeley, was testing out brain monitoring equipment, wearing what looked like a black swim cap strewn with knobs and wiring. She has long been fascinated with cognitive development, going back to when she saw a Woodstock reveler — one having a bad acid trip — dive into pavement.

"Why did he do that?" Ms. Eskenazi remembers wondering at the time. "What was he thinking? What's going on in that brain?"

"Any science is imperfect," she said, but stressed that "well-controlled epidemiologic studies" were essential for understanding "how things affect human health." She added, "Otherwise you're just making huge assumptions that a rodent is the same as a human."

A Bitter Debate

The day after Mr. Pruitt made his March 2017 decision to reject a ban on chlorpyrifos, he hosted top executives from one of the nation's largest farming and pesticide trade organizations for a closed-door conversation.

Near the top of the meeting agenda was "Epidemiology Study Policy" in the aftermath of the "chlorpyrifos matter," according to internal records.

McKinnon Elementary School in Salinas. The pesticide industry contends that epidemiological studies are prone to biases and not as reliable as testing on lab animals.Carlos Chavarría for The New York Times

"There are no guideposts, if you will, for what is a legitimate, useful epidemiology study and what is not," Jay Vroom, CropLife America's president, said in an interview, explaining what he had told agency officials at this and other meetings.

In a subsequent letter to the E.P.A., a CropLife America lobbyist said the agency was relying on a "shortsighted approach," and the group submitted formal proposals to curb the embrace of epidemiology the E.P.A. undertook under the Obama administration.

Mr. Pruitt responded with his proposal, made this past spring, to ban epidemiological and other studies that did not make study details public, including at least some information on study participants.

Academics have resisted previous requests to review their data, notably at Columbia University. In a 2016 letter to the agency, a university official wrote that it could not provide "extensive individual level data to E.P.A. in a way that ensures the confidentiality" of "our research subjects."

David Michaels, an epidemiologist at George Washington University's School of Public Health and head of the Occupational Safety and Health Administration during the Obama administration, said Mr. Pruitt's plan was not about transparency but about discrediting studies that made pesticides look bad.

"The underlying justification for this 'transparency' proposal is a caricature of how science really works," Mr. Michaels said at a recent hearing. "The cynical approach proposed by E.P.A. can be best described as 'weaponized transparency.'"

It is no coincidence, he said, that the term "secret science" was also used in the 1970s when the tobacco industry was trying to forestall critical research about smoking.

Researchers have had wins. This month, a federal appeals court ordered the E.P.A. to ban chlorpyrifos, citing findings from human studies. The Trump administration is mulling whether to appeal.

But epidemiologists are unsettled. In mid-July, after nearly two decades of work on Chamacos, the E.P.A. emailed Ms. Eskenazi requesting "the original data" from her research, citing "uncertainty around neurodevelopmental effects associated" with pesticides she has studied. The agency made a similar request to Columbia.

Ms. Eskenazi, worried about her study participants' privacy, alerted university lawyers. She is now concerned that the E.P.A. may try to undermine her study's repeated findings that some pesticides may be harming children.

"I knew this was going to come sooner or later," she said. "And here it is."

Danny Hakim reported from Salinas, and Eric Lipton from Washington.

Subject: Strengthening Transparency in Regulatory Science
Attachments: Strenthening Transparency in Regulatory Science 04-24-2018.pdf

FYI—Please see attached.

Today, the Administrator signed the proposed rule "Strengthening Transparency in Regulatory Science."
I thought everyone would be interested in reading the document themselves, rather than just relying on other interpretations.

In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

Please let me know if you have questions.

Executive Summary

The American Chemistry Council (ACC) is pleased to provide the following comments on the Environmental Protection Agency's (EPA) proposed rule, Strengthening Transparency in Regulatory Science (Strengthening Transparency), published in the Federal Register on April 30, 2018.[1] ACC and its members are directly impacted by the science-based regulatory actions of EPA under a myriad of federal environmental statutes. As such, ACC has a keen interest in EPA's adoption and implementation of a proposal as important as this one, which will reach across the breadth of the Agency's authority.

In the following comments, ACC offers its support for the proposed rule; responds to a number of questions posed by EPA in its preamble; and provides a number of specific recommendations regarding how the proposed rule can be improved and strengthened. Specifically, ACC suggests the following:

- Implementation of the rule would benefit from policy and/or guidance regarding the weight to be accorded the science informing significant regulatory decisions
- EPA should provide better historical context and applicability to the proposed rule
- EPA has not in all circumstances properly identified from where its authority is derived under the various federal environmental statutes cited in the proposed rule
- The regulation should apply to Executive Order 12866 significant regulatory actions at the proposal stage
- Key regulatory definitions and regulatory text require greater clarity
- Clarifications to the preamble are needed
- Implementation of the rule should be statute specific
- The proposed rule should apply to enforcement and permit proceedings
- EPA should incorporate stronger data and model access requirements into its Cooperative Agreements and Grants while complying with privacy and confidentiality requirements and laws
- The rule should apply to all EPA programs, including its IRIS program
- Methodologies and technologies providing protected access to confidential and sensitive data should be employed

[1] 83 FR 18768 (April 30, 2018).

- The rule should generally apply prospectively to EPA decision making
- Bias should not be presumed
- EPA should work with entities where scientific data are not publicly available in a manner sufficient for independent evaluation

I. Introduction and Background

ACC strongly supports EPA's demonstrated commitment in this proposal to build upon the principles underlying the Administrative Procedure Act (APA), Executive Orders 12866, 13777, and 13783, and guidance of Office of Management and Budget (OMB). In addition, ACC supports the proposal's expansion of the 2013 "Increasing Access to the Results of Federally Funded Scientific Research" memorandum directing federal agencies and offices to develop and submit plans to the White House Office of Science and Technology (OSTP) that ensure peer-reviewed publications and digital scientific data resulting from federally-funded scientific research are accessible to the public, the scientific community, and industry—to the extent practicable.

The OSTP directive required each agency to develop a public access plan that maximizes access to federally-funded "digitally formatted scientific data"[2] while also protecting confidentiality, personal privacy, confidential business information (CBI), intellectual property rights, and U.S. competitiveness.[3] In 2016, EPA issued its Plan to Increase Access to Results of EPA-funded Scientific Research in response to the OSTP directive.[4] Importantly, EPA's Strengthening Transparency proposal appears to extend such commitments beyond the government-funded requirement of the OSTP directive to "dose response data and models underlying pivotal regulatory science regardless of the source of funding or identity of the party conducting the regulatory science."[5]

ACC believes that EPA's proposal correctly codifies an important good governance principle—that government agencies should be as transparent as possible, within the bounds of the law, about scientific information relied upon and the justifications for the significant regulatory decisions they make.

---

[2] As defined in OMB circular 110 as "the digital recorded factual material commonly accepted in the scientific community as necessary to validate research findings, including data sets used to support scholarly publications. . ." It is a definition consistent with that of "research data" in the regulatory text of EPA's proposal.

[3] More than 20 federal agencies have developed and implemented Data Access Plans, including EPA, the National Institutes of Health (NIH), the Center for Disease Control (CDC), and the Food and Drug Administration (FDA).

[4] Plan to Increase Access to Results of EPA-Funded Scientific Research (USEPA, November 29, 2016) https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf

[5] ACC suggests improvements to EPA's terminology in the preamble that are described later in these comments in sections VI and VII.

The Agency's focus on dose-response data and models appropriately reflects the evolution of toxicology from a largely observational science to a discipline that applies advanced scientific techniques and knowledge. Research programs within academia, government, and private sector labs have greatly improved our ability to investigate and understand the underlying biological mechanisms, modes of action, and dose responses of toxicants. We can now evaluate biological events leading to toxicity and consider how (in a dose-response manner) these biological events relate to potential risks to human health. This was not possible 10-to-20 years ago. This improvement should directly translate to the application of transparent weight-of-the-evidence approaches to the assessment of human relevance; the development of points of departure; and the derivation of protective human health equivalent dosages that minimize the use of uncertainty factors and variability. A goal has been to apply this knowledge to improve the scientific basis of government regulatory policies and industry product stewardship.

For environmental concerns, exposure-response is the more appropriate relationship to evaluate because most of the environmental test guidelines require quantifying concentrations in media external to the organism for use as the exposure metric. Toxicity information and—when available—knowledge of mechanisms, are integrated with exposure-response models for risk-based environmental safety decision making.

Despite significant scientific progress in the understanding of mechanisms of action (MOA) and adverse outcome pathways (AOP), the movement away from default precautionary assumptions has been slow to occur, particularly in certain EPA programs. Significant investments by government, academia, and the private sector into toxicological research are counteracted by the failure to move away from default assumptions toward science-based decisions.

ACC encourages EPA to implement best available scientific procedures under this rulemaking. The Agency should move away from the outdated linear concept of how biology operates toward biologically-based mechanisms, i.e., mode of action (MOA) and adverse outcome pathways (AOP) for both cancer and non-cancer effects, that clearly establish the threshold nature of toxicological endpoints for derivation of points of departure for establishing regulatory values and making regulatory decisions.[6] [7]

In the following discussion, ACC offers its comments to help clarify and strengthen the proposed rule.

---

[6] Critics of this proposed policy appear to overlook the fact that the call to evaluate different dose response models is entirely consistent with the Agency's Cancer Guidelines, which have been in place since 2005. See Guidelines for Carcinogen Risk Assessment https://www.epa.gov/sites/production/files/2013-09/documents/cancer_guidelines_final_3-25-05.pdf

[7] https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3038594/

II. Implementation of the Rule Would Benefit from Policy and/or Guidance Regarding Weight Accorded the Science Informing Significant Regulatory Decisions

As EPA has noted, the proposed rule is consistent with and builds upon the EPA policies implemented by previous administrations. Implementation would be aided by a policy statement or guidance that indicates greater weight will be given to studies using validated test methods and procedures, models, and approaches when and where those data are based on publicly accessible data, and transparent computer algorithms.

Other scientifically relevant and reliable studies and data should not be eliminated from consideration, but rather, accorded less weight when integrating evidence from multiple studies within and across different lines of evidence. Any guidance and other relevant documents developed to assist EPA staff to comply with this rule should include specific examples and/or case studies, perhaps drawing from recent EPA rulemakings, to demonstrate what constitutes regulatory science that is material to EPA's significant regulatory decisions.

III. EPA Should Provide Better Historical Context and Applicability to the Proposed Rule

EPA is proposing to add this rule to 40 C.F.R. 30, contained in Chapter 1, Subchapter B, dedicated to "Grants and Other Federal Assistance," without explaining how or why this rule fits within this subchapter, thereby creating potential confusion regarding its applicability. The potential for confusion was enhanced by the fact that EPA's public website currently contains information regarding the content that was formerly within 40 C.F.R. 30 but was repealed on December 19, 2014, i.e., general terms and conditions applicable to grant recipient and sub-recipients.[8] In addition, a number of questions on which EPA seeks comment relate solely to EPA cooperative agreements and grants or access to EPA-funded data.

In contrast, Section 30.3 of the proposed regulatory text state that "the provisions of this section apply to dose-response data and models underlying pivotal regulatory science regardless of who funded or conducted the underlying data, models, or other regulatory science." Stakeholders would benefit greatly from EPA providing clarification regarding the applicability of Subchapter B and whether and to what extent this rule applies to government-funded and/or beyond government-funded scientific research. We believe the broader approach is warranted.

[8] https://www.epa.gov/grants/epa-general-terms-and-conditions-applicable-40-cfr-part-30-and-31-recipients-effective and see, 79 Fed. Reg. 244 at 76054 (Dec. 19, 2014).

IV. EPA Authority under Federal Environmental Statutes

The provisions cited by EPA under the Clean Air Act (CAA), the Clean Water Act (CWA), the Safe Drinking Water Act (SDWA), the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and the Emergency Planning and Community Right-To-Know Act (EPCRA) in support of its authority to develop and implement its proposed rule all provide broad regulatory authority to promulgate regulations "as are necessary to carry out [the Administrator's] functions" under the statute. The citation to the Resource Conservation and Recovery Act (RCRA) speaks to Labor Standards in the issuance of grants, and does not appear applicable to this rulemaking authority. EPA cites Section 25(a)(1) of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), which does provide the Agency with broad authority to "prescribe regulations to carry out the provisions of this subchapter [FIFRA]." It should be noted, however, that the statutory language is a bit different from the other cited statutes and does not read as "as are necessary to carry out....". In addition, FIFRA Section 136r(a) does not relate to rulemaking and instead provides the Agency broad authority to undertake research necessary to carry out the purposes of FIFRA. As such, EPA may mistakenly have included Section 136r(a) to support the proposal as cited on 83 Fed. Reg. 18769. EPA's reference to section 10 under the Toxic Substances Control Act (TSCA) also does not appear on-point. ACC believes EPA's authority to implement this rule is derived from TSCA Section 26(h), which speaks directly to scientific information and standards to which the Agency must adhere in the administration of its work under TSCA Sections 4, 5, and 6.

V. The Regulation Should Apply to E.O. 12866 Significant Regulatory Actions at the Proposal Stage

A. Definitions in E.O. 12866 Are Well-Established, Understood, and Applied.

The proposed rule would apply to significant regulatory actions as defined by E.O. 12866 at Section 3(f) as:

> (f) ''Significant regulatory action'' means any regulatory action that is likely to result in a rule that may:
>
> > (1) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;
> > (2) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;
> > (3) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
> > (4) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in this Executive order.

This definition has been applied by the Executive Branch since the Clinton Administration promulgated E.O. 12866 in 1993. Its meaning is well-established with more than twenty-

five years of use. The underlying principles, however, precede its adoption. For example, the E.O. carried over the threshold of an annual $100 million effect on the economy that had been in place since 1978. This (3)(f)(1) threshold for economically significant regulatory actions is the same threshold that requires cost-benefit review for proposed and final regulations considered by OIRA.

A significant benefit of using the E.O. 12866 definition in the final rule is that EPA can easily apply it, against substantial practice and precedent, in a reliable, consistent, and predictable manner. This reduces the burden on the agency, and importantly, provides greater predictability to stakeholders and the public so they can understand to which agency actions the regulation will apply.

B. Conformity with E.O. 12866 Definitions Promotes Efficient OIRA Review.

Similarly, the process by which significant regulatory actions are identified under E.O. 12866 is also well-established. Here, with respect to application of the proposed rule, EPA would retain primary responsibility to identify the significant regulatory actions to which the rule should apply. OIRA would assess EPA's identification against the criteria set out in E.O. 12866. Neither EPA nor OIRA would be charged with applying a new or unfamiliar definition, nor a new process for review.

C. The Range of Agency Actions to Which the Rule Will Apply Should Not be Narrowed.

The significant regulatory elements of E.O. 12866 already require OIRA review and have for the past 25 years of established practice. The proposed rule respects that principle, and indeed, leverages it for maximum efficiency.

EPA specifically invites comment on whether a narrower definition might be appropriate, such as final regulations that are determined to be "major" under the Congressional Review Act, or "economically significant" under E.O. 12866. Either of these approaches would lose the efficiency and predictability benefits of using the E.O. 12866 definition—and would increase work for both EPA and OIRA. Further, many significant and precedential agency actions do not meet the "economically significant" threshold. For example, many federal agencies administer environmental, health and safety requirements for workers, consumer products, and environmental media—air, water, soil. It should never be the case that EPA, or EPA and other agencies, establish and/or enforce conflicting and irreconcilable health values for the same compound; require the use of different personal protective equipment; or simultaneously prohibit and permit use or discharge of a particular compound. The same rigorous scientific standards, best available science and weight-of-the-evidence approaches should be applied across programs and media to protect human health and the environment. Adoption of the E.O. 12866 definition of significant regulatory action helps avoid inconsistent regulatory decisions by federal agencies that might interfere with policies designed to protect human health and the environment, unfairly burden businesses, and impede the protection of human health and the environment.

D. The Final Rule Should Apply to Significant Guidance Documents.

OMB's Final Bulletin for Agency Good Guidance Practices defines a "significant guidance document" as a guidance document disseminated to regulated entities or the general public that may reasonably be anticipated to:

> (i) Lead to an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or state, local, or tribal governments or communities;
> (ii) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;
> (iii) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or
> (iv) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in EO 12866, as further amended.

EPA already maintains and publishes a list of significant guidance documents that meet the OMB definition.[9] [10] Applying the rule to EPA's significant guidance allows for greater parity and consistency with respect to the application of scientific principles in regulatory and guidance contexts. It ensures that the same quality and rigor will underpin decision making. It also helps ensure that EPA will apply the same principles to both regulatory requirements and implementing guidance, which provides greater certainty to the regulated community and the public.

VI. Key Regulatory Definitions and Regulatory Text Require Greater Clarity

EPA's terminology and regulatory definitions should be more concise and applied consistently to achieve greater clarity regarding the meaning and proposed application of the rule. For example, proposed section 30.2 refers to "**pivotal** regulatory science as the studies or analyses that **drive** the requirements and/or quantitative analysis of EPA final significant regulatory decisions." [Emphasis added]. This definition is distinguished from "regulatory science," defined as "scientific information, including assessments, models, criteria documents, and regulatory impact analyses, that provide the basis for EPA final significant regulatory decisions." These two definitions can be interpreted as simultaneously referencing something identical as well as one being a subset of the other. Therefore, the definitions are vague and need clarification.

---

[9] See https://www.epa.gov/laws-regulations/significant-guidance-documents

[10] Notably, EPA's list of significant guidance documents include guidance that applies directly to the regulated community, such as the agency's *2017 Guidance To Assist Interested Persons in Developing and Submitting Draft Risk Evaluations Under the Toxic Substances Control Act* (EPA-HQ-OPPT-2017-0341-0002) and *Interpretive Guidance for the Real Estate Community on the Requirements for Disclosure of Information Concerning Lead-Based Paint in Housing, Part I* (EPA-HQ-OPPT-2007-0765-0001).

Assuming the intent is to define and distinguish the subset of scientific studies and analyses that form the scientific foundation for EPA's regulatory decisions from the larger universe of *all* the scientific information reviewed and considered by the agency, a more precise word than "pivotal" would be "material." In other words, those scientific studies and analyses that are material to its regulatory decision must be or be made publicly available in a manner sufficient for independent validation.

The regulatory text in 30.4 and 30.5 should be clarified. Section 30.4 appears to apply to EPA's use of studies (or other regulatory science) relied upon when EPA takes *any* final agency action (emphasis added). In those instances, EPA should make all such studies available to the public to the "extent practicable." Section 30.5 refers specifically to the requirements that apply when "EPA uses dose response data and models underlying "pivotal" (which ACC believes is more aptly expressed as "material") regulatory science." ACC interprets this to mean that in these specific circumstances, the dose response data and models must be "publicly available in a manner sufficient for independent validation," which EPA defines as in a manner "consistent with law, protects privacy, confidentiality, confidential business information, and is sensitive to national and homeland security." Information considered "publicly available in a manner sufficient for independent validation" when it includes the information "necessary for the public to understand, assess, and replicate findings." As noted above, for environmental safety, exposure-response is the more appropriate relationship to evaluate because most of the environmental test guidelines require quantifying concentrations in media external to the organism for use as the exposure metric. EPA should provide greater clarity regarding what it intends to do in circumstances where raw data cannot be made publicly available.

EPA should include a discussion in the final rule regarding how it proposes to address exposure assessments and risk characterization data and models in the future extensions of related rules on Transparency in Regulatory Science.

Section 30.7 appears to be missing one or more words in the header to the section. It states: "What role does independent peer review in this section?" ACC believes the missing word is likely "have," but EPA should clarify and correct this section in the final rule.

EPA uses the word "justify" frequently throughout the various sections of proposed regulatory text when referencing the use of regulatory science to make its decisions. For example, section 30.7 states: "EPA shall conduct independent peer review on all *pivotal regulatory science* used to justify *regulatory decisions.*" ACC suggests that there are more precise words that EPA should use to link "pivotal regulatory science" with "regulatory decisions," such as "underpin" or constitute the "foundation" of the "scientific basis" of its regulatory decisions.

ACC has offered some additional, specific language suggestions in a redline version of the proposed regulatory text that is included in these comments in Appendix A.

VII. Clarifications to the Preamble are Needed

A. Definition of "Pivotal Regulatory Science" is needed.

The definition in the proposed regulatory text and may lead to confusion among stakeholders. We recommend consistency between the preamble and the regulatory text and that EPA clarify its terminology.

Importantly, in footnote three on page 18769 of the preamble, EPA states:

> EPA has the authority to establish policies governing its reliance on science in the administration of its regulatory functions. Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use [of] non-public data in support of its regulatory actions. *See Coalition of Battery Recyclers Ass'n v. EPA,* 604 F.3d 613, 623 (D.C. Cir. 2010); *American Trucking Ass'n v. EPA,* 283 F.3d 355, 372 (D.C. Cir.2002). EPA is proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions.

ACC believes that this footnote should be clarified to be consistent with the regulatory text that provides that there are exemptions to this policy outlined in sections 30.5 and 30.9. EPA's preamble should not be at odds with the regulatory text.

Invariably there will be circumstances where underlying data no longer exist for studies and/or models that are high quality and reliable. For example, most organizations have data retention policies that have resulted in the disposal of underlying data. Furthermore, Good Laboratory Practices (GLP) regulations include defined periods of time to retain data and study records.[11] EPA should address how it will continue to use those studies and models in light of these policies.

B. Assertions about proposal not "directly regulating entities outside of federal government" and not having "substantial direct effects" on the states.

On page 18769 under section A, EPA states that the proposed regulation does not "directly regulate any entity outside the federal government" and on page 18772, EPA states under section E that "this action imposes no enforceable duty on any state, local or tribal governments or the private sector." Under Section F, EPA asserts that this action does not have federalism implications and will not have "substantial direct effects on the states." ACC is not certain that these statements are accurate. Consider, for example, the establishment of water quality standards (WQS).

[11] 40 C.F.R. 160.

Under Section 303(c) of the CWA, states and authorized tribes must develop WQS and submit them to EPA for its approval or disapproval. To help them develop the standards, EPA provides scientific guidance through its "Section 304(a) National Criteria Recommendations," which specify quantitative concentrations/level and qualitative measures of pollutants that, if not exceeded, generally will ensure acceptable water quality. In developing these recommendations, EPA evaluates acceptable water quality. When developing these recommendations, EPA evaluates available scientific data on a pollutant's effects on public health and welfare, aquatic life, and recreation. EPA recommends that states and tribes consider the Agency's water quality criteria when developing their WQS, though states and tribes may also consider other scientific criteria that differ from EPA's recommendations.

While EPA's national water quality criteria recommendations are not regulations and do not impose binding requirements, they do serve as the scientific basis for the development of water quality standards and WQS are the foundation of a number of CWA programs. As EPA states in its Water Quality Standards Handbook, these standards "establish the baseline used for measuring the success of the CWA programs, so adequate protection of aquatic life and wildlife, recreational uses, and sources of drinking water, for example, depends on developing and adopting well-crafted WQS."[12]

C. Publications should be cited.

ACC suggests that EPA revise its statement that the proposed rule "takes into consideration the policies or recommendations of third-party organizations who [sic] advocated for open science." The recommendations referenced by EPA actually emanate from a survey of the members of three professional organizations whose memberships represent repositories of knowledge and experience in regulatory assessment.[13] As such, reference 10 in EPA's proposal should also be revised to cite the publication, Expert Opinion on Regulatory Risk Assessment, A Survey by the Center for Media and Public Affairs (CMPA) and Center for Health and Risk Communication (CHRC) at George Mason University" (December 6, 2013).[14]

D. Definition of "reproducibility" is needed.

EPA uses the term "reproducibility" in the preamble, but never defines the term and does not include the term in the definitions in the proposed regulatory text. It is unclear what constitutes a reproducible versus non-reproducible finding. It is important to consider that there are different types of reproducibility, such as methods reproducibility, results reproducibility, and reproducibility of conclusions.

For example, OMB's Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by Federal Agencies defines "capable of being substantially reproduced" as "independent reanalysis of the original or supporting data using the same methods would generate similar analytical results, subject to an acceptable degree of imprecision." [15] However, the inability to reproduce research studies can be related to issues of study design, variability or differences in biological test systems, data integrity, data analyses, and in some cases, scientific misconduct. As Carl Sagan stated, "extraordinary claims require extraordinary evidence." Accordingly, new or novel findings that purport to indicate effects that have little or no biological basis, based on the weight of the evidence coupled to first principles of relevant scientific disciplines, should be subjected to suitable reproducibility requirements, which could include causal analytics.

E. Definition of "publicly available" is needed.

EPA does not define what it means by its use of the term, "publicly available." There is more than one definition of the term currently in use by federal agencies.[16] EPA should clarify the level of access and disclosure to the public that is intended. If it intends to determine this on a case-by-case basis, that also should be made clear.

F. Greater clarity on data refinement issues is needed.

Another important aspect relevant to "public availability" is the level of data refinement EPA will require. The National Academies of Science, Engineering, and Medicine (NAS) held a workshop in 2016 to discuss obstacles for sharing data.[17] The NAS defined several key terms to ensure clarity at the workshop. EPA should consider adopting a similar lexicon to increase the clarity of its regulation. (See Table 1 in Appendix B). In addition, the NAS Report suggests a "cleaned dataset" would be acceptable to use for all routine analyses and verification. (See Table 2 in Appendix B). EPA should establish clear standards on the acceptability of "*cleaned datasets*." This will help to standardize data reporting and formatting. It will also prevent over- and under-reporting.

VIII. Implementation of the Rule Should be Statute-Specific
