Further, few of the statutory provisions cited in the proposal actually support EPA's ability to pick and choose among valid scientific information, studies, and techniques in its formation of environmental standards and modeling. None authorizesfba precluding consideration of probative, relevant studies.

In fact, no federal environmental statute so much as suggests that EPA can ignore the "latest" or "best" or "appropriately designed and conducted" scientific studies whenever the underlying data are not public.

By limiting EPA's access to the latest, best available, and generally accepted science, the proposed rule would violate the very federal laws that EPA is required to uphold.

For example, the Safe Drinking Water Act – which, among other things, serves to protect children from lead poisoning – mandates that EPA develop rules based on "the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices."

Besides the Safe Drinking Water Act, the proposal violates specific provisions of the Clean Water and Air Acts, CERCLA, TSCA, and EPCRA, at the very least.

Disturbingly, the proposed rule's only exception to the exclusion of studies for which underlying data are not publically available is wholly at the EPA Administrator's discretion. The rule would allow the Administrator – without standardized, objective, or even science-based criteria – to determine on a case-by-case basis that compliance is "impracticable" where making data publically available is "not feasible."

Clearly, such an insular, open-ended exemption "process" is ready-made for arbitrariness, if not misuse and abuse.

Independent Scientific Organizations Do Not Support the Proposal

The strongest indicator that the proposal is flawed as a matter of science is the overwhelmingly negative reception it has received from the scientific community.

In fact, we are not aware of a single major independent scientific organization that has expressed support for the proposal.

The American Association for the Advancement of Science stated, "[t]his proposal appears to be an attempt to remove valid and relevant scientific evidence from the rule-making process."[1]

The editors of the several prestigious journals, including Science, Nature, and the Proceedings of the National Academy of Sciences, issued a joint statement in response to the proposal in which they stated, "[e]xcluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes."[2]

Incredibly, EPA's own scientific advisors – the Scientific Advisory Board – were not consulted by the Agency on the rule. (SAB members became aware of the rule only when it was announced by then-Administrator Pruitt announced at a press event).

---

[1] American Association for the Advancement of Science. AAAS Statement on EPA Administrator's Plan to Disallow Use of Scientific Evidence in Decision-Making. (April 20, 2018).
[2] Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel, and Deborah Sweet. Joint Statement on EPA Proposed Rule and Public Availability of Data. Science. (April 30, 2018).

The SAB subsequently wrote to the then-Administrator observing that the proposed rule deals with "a number of scientific issues that would benefit from expert advice and comment from the SAB."[3]

The advisory group's letter urged the Agency to "request, receive, and review" scientific advice from the SAB before moving further ahead with the proposed rule.

The Proposal Should Be Withdrawn And EPA Should Consult With Scientific Organizations On Agency Science Needs

The State of New York believes that the proposal is vague, ill-supported, and deeply flawed; it broadly and squarely conflicts with core EPA statutory duties, and is directly contrary to federal law.

Coupled with the Administrator's directive prohibiting EPA grant recipients from serving on scientific advisory panels, the proposal appears to reflect a deliberate effort to undermine well-founded Agency scientific practices – which is particularly egregious given EPA's critical mission and its responsibilities to the residents of New York and other states across our nation.

In May, the New York Attorney General, joined by seven other Attorneys General, wrote to then-Administrator Pruitt, expressing strong opposition to the proposed rule and calling for it to be withdrawn.

Today, the State of New York renews our call to withdraw the proposed rule to Acting Administrator Wheeler.

After withdrawing the proposed rule, if the Acting Administrator is genuinely interested in the "transparency" of science at EPA, he should familiarize himself with the many ongoing efforts within EPA, the federal government, and the scientific community itself to promote transparency and data sharing. He should then work with independent scientific organizations – such as the National Academy of Sciences – to both support and build on these efforts.

On behalf of Attorney General Underwood, I thank you for your time and attention, and for providing me an opportunity to speak on this important matter.

Testimony of
Molly Rauch, MPH
Public Health Policy Director
Moms Clean Air Force
on
July 17, 2018
for
Censored Science Hearing
Docket Identification No. [EPA-HQ-EPA-HQ-OA-2018-0259]
at
EPA Headquarters
William Jefferson Clinton East Building, Main Floor
Room 1153
1201 Constitution Avenue NW., Washington, DC 20460
Public Hearing Testimony

Hello, my name is Molly Rauch and I am Public Health Policy Director with Moms Clean Air Force. Thank you for this opportunity to offer comment. On behalf of more than one million members of Moms Clean Air Force, I am here today to strongly oppose the administration's attempts to censor the science used in public health decision making.

This intentionally misleading proposal is being sold by EPA leadership as an effort to increase "transparency." But the facts suggest that the real motivation is simply to sweep under the rug the scientific evidence disfavored by polluting companies. The proposal would prevent EPA from using studies that are based on personal medical data, thereby eliminating some of the most important long-term epidemiological studies investigating the impacts of pollution on public health. Hundreds of scientists have spoken out against this proposal.

Indeed, this flimsy proposal was designed without adequate input from the scientific community, according to members of EPA's own Scientific Advisory Board. It was rushed through the regulatory process, and was originally proposed with a gallingly short public comment period, suggesting an intention of casting less light on the rulemaking process, not more. For a proposal that posits a sweeping change in the health-based rulemaking that is the foundation of the EPA, it was quite the sleight of hand.

As a public health expert who has been closely following EPA's rulemaking process for more than a decade, it is evident that this proposal is a cynical ploy to bolster polluting industries that don't like the results of longitudinal research.

Who does this benefit? Who really benefits from this charade? Not the families everywhere who want to breathe clean air and drink clean water. Not frontline communities dealing with multiple pollution exposures from many industrial sources. Not the millions of children with asthma across the country whose disease can be worsened by small changes in air quality day to day. Not the elderly, and those with underlying health problems, whose likelihood of being admitted to the hospital, of having a stroke, of having a heart attack, of dying – could depend on the levels of particulate pollution in the air. It does not benefit these people.

I have a master's in Public Health. One of the most valuable things I learned in graduate school was how to evaluate the reliability of epidemiological studies. We learned the importance of considering many different criteria. Whether the raw data was available to me was never grounds for automatically discounting the credibility of research. The idea that an entire library of studies would be rejected, based simply on that one external criteria, represents a crude approach, to put it kindly.

We also learned about the ironclad importance of treating study subjects ethically and with respect. All research on humans must be approved by an Institutional Review Board, which prioritizes the privacy and consent of the study subject. There are laws about this. When study subjects are disrespected, terrible things can happen. There's a reason that we had to learn about the Tuskegee study of untreated syphilis in African American men. We cannot go back to a time when the study subject is a mere pawn in someone else's game. Treating study subjects ethically requires protecting their privacy.

Finally, we studied the tactics of polluting industries, and their shameful legacy of attempting to undermine science. Whether it was the tobacco industry or the lead industry, we learned about the deliberate, expensive, decades-long campaigns to protect corporate profits – and meanwhile, people were literally dying as a result. This is

an old story. We've heard it before. Today, we are hearing that story again. Public health professionals are trained to recognize this story, and call it out.

This proposal is an excuse to hamstring researchers, weaken public health protections, and pad the profits of polluting industries.

As a public health professional, as a mother, and on behalf of Moms Clean Air Force and our more than one million members, I strongly urge the EPA to stop this radical proposal – for the health and safety of all Americans.

The Medical Society Consortium
ON CLIMATE & HEALTH

Respected EPA panelists and fellow citizens. My name is Mona Sarfaty. I am a physician trained in family medicine and public health; I practiced primary care medicine and taught medical and public health students in three different academic medical centers over a 35-year period. Today, I direct a program in Climate and Health at George Mason University in Fairfax, Virginia. I also direct a Consortium of physician societies called the Medical Society Consortium for Climate and Health whose 550,000 members are more than half the doctors in the U.S. The Consortium seeks to inform the public and policymakers about the health harms of climate change and the health benefits of climate solutions. I am submitting the formal comment of the Consortium in written form in a separate document.

The Environmental Protection Agency (EPA) is proposing to change the rules that dictate what evidence must be considered as the basis for protecting the public's health. As a physician who spent a summer in Southern California during college and didn't see Mount Wilson looming in front of me for the entire first week I spent there because of the smog, I am incredulous. I remember well the pain in my chest when attempting to play tennis on those smoggy days.

This was the early 70's at a time when a Republican president was creating the EPA. Now, 50 years hence, tremendous evidence has accumulated that validates my symptoms and the negative effect that unhealthy air has on people who must breath it. After that summer, as a practicing physician, I took care of people with asthma and chronic lung disease who were at greater risk on bad air days. So it is shocking to me that the EPA would propose putting aside huge amounts of thoroughly reviewed evidence on the causal connections between air pollution and poor health claiming that the basis for the conclusions were "secret".

Today, I lead a Consortium comprised of the country's largest medical societies whose doctor members are highly concerned about the health harms of climate change. The similarities between the current EPA willingness to disregard established science about the connection between carbon dioxide and global warming and the willingness to disregard solid evidence about the impact of air pollution on health are glaring. Despite overlapping evidence from every country in the world and the entire U.S. climate-science enterprise, the EPA leadership does not accept or recognize reality.

To all of us whose lives are dedicated to helping people get and stay healthy, there is a "secret" lurking in the science of air pollution and global warming. It is not what we have long known about how burning fossil fuels creates waste products that damage and inflame our lungs. This has been validated by voluminous overlapping research studies. The secret is not that carbon emissions from burning fossil fuels are warming our climate, exacerbating the health harms of air pollution, and causing other dangers to our health--from heatwaves, wildfires, pollen production, and storms. The secret is hiding in plain sight: fighting air pollution is the greatest public health opportunity of our time. Reducing polluting fumes and emissions from fossil fuels will rapidly improve our health and fight climate change.

When an EPA's not-so-secret agenda is to promote fossil fuels, two things follow: 1) the fact that fossil fuels are the major contributor to both air pollution and global warming must be undermined or denied; and, 2) the research that documents this reality and how it harms our health must be attacked. It's not hard to see that the approach is to mislead people by wrapping these attacks in rhetoric that is alternatively scary ("secret science") and high-minded ("transparency"). We are told that the rationale for the new proposed "strengthening transparency standard" is that individual medical records included in research were "secret". In fact, like all medical records, they were confidential; and they remain so.

The record shows that this same argument of "secrecy" against scientific studies has been used by polluting industries going back many years. Currently, we have

a President who thinks only of less regulation. A President and an EPA that fail to regulate responsibly and ignore key research studies put our health and our climate in danger.

Health providers know that facts may be scary when our health is threatened. But we also know that denying or ignoring facts blinds us to discovering and acting on the best ways to heal medical problems and protect our health. We can't let that happen. The EPA must live up to its charge and work to face facts and protect our environment and our health. With this proposed regulation, its leadership is pointing it in the opposite direction.

Arthur N. Marin, Executive Director

Testimony of Northeast States for Coordinated Air Use Management
On Notice of Proposed Rule: Strengthening Transparency in Regulatory Science
[EPA–HQ–OA–2018–0259]
July 17, 2018
Washington, D.C.

My name is Paul Miller, and I am the Deputy Director of the Northeast States for Coordinated Air Use Management (NESCAUM). NESCAUM is the regional association of air pollution control agencies representing Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont.

I offer today NESCAUM's comments on EPA's Proposed Rule "*Strengthening Transparency in Regulatory Science*." These comments reflect the majority view of NESCAUM members, and individual members may hold some views different from the NESCAUM states' majority consensus.

We present this testimony today out of our concern that should this proposal lead EPA to not fully consider the best available science in rulemakings, it will endanger public health and the environment.

The EPA invokes "strengthening transparency" as a primary driver for this proposal, but fails to describe how a perceived lack of transparency has hampered past rulemakings. It provides no examples of where "EPA has not previously implemented these policies and guidance in a robust and consistent manner" nor what are the specific "agency culture and practices regarding data access" that require changing. The Agency also provides no cost analysis of the proposal.

Without additional clarity from EPA, we are having difficulty identifying the problem EPA seeks to address. Therefore, for the following reasons, we request that EPA withdraw this Proposed Rule.

First the proposal is too vague as written to provide the public with a meaningful opportunity to comment.

The Proposed Rule lacks credible specificity and is overly vague in its terms and scope. Under the Administrative Procedures Act (APA), EPA is required to articulate the specifics of its proposed rulemakings in a manner that provides a valid opportunity for public comment.

In this proposal, however, EPA solicits comment across a long list of topic areas, but fails to provide the Agency's own "sufficient detail and rationale" [APA § 553(b)(3)] on the solicited comment areas. We are left in the position of speculating on EPA's views and on those of other commenters that would presumably shape EPA's final rule. It is well settled law that this approach fails to provide adequate notice for informed public comment.

Second, EPA must describe how the proposed text in sections 30.5, 30.7, and 30.9 affect current practice.

Sections 30.5 and 30.7 of the Proposed Rule respectively say: "the Agency shall ensure that dose response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation," and "EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions[.]" EPA does not describe its approaches for "independent validation" and "independent review."

Furthermore, the Proposed Rule in section 30.5 also includes qualifying language that "The agency shall make all reasonable efforts to explore methodologies, technologies, and institutional arrangements for making such data available before it concludes that doing so in a manner consistent with law and protection of privacy, confidentiality, national and homeland security is not possible." EPA provides no examples of where and how, in the agency's view, past rulemakings specifically failed to make these efforts, and how EPA would change past practice in this context.

Adding to the vagueness of sections 30.5 and 30.7, section 30.9 would provide the Administrator with broad authority to exempt regulatory decisions from the proposed disclosure provisions "on a case-by case basis if he or she determines that compliance is impracticable." The Proposed Rule fails to provide specific criteria for determining when "compliance is impracticable." Lacking clear guidelines for transparent decision-making, the Administrator's discretion would appear to be unbounded in application and potentially based on haphazard non-transparent rationales.

Third, EPA has provided no meaningful cost estimate for the Proposed Rule.

The costs are likely quite significant, however, based on a Congressional Budget Office (CBO) cost estimate of a similar legislative proposal in Congress.[11] From that analysis, costs could range between a few million dollars to more than one hundred million dollars per year. In addition to lack of cost information, EPA offers no accounting of foregone benefits should a broad application of this proposal limit the use of the best available science in setting public health standards and preventing adverse health outcomes.

In conclusion, EPA's proposal has far-reaching consequences on the future use of science by the agency. These consequences, however significant they may be, are indeterminate in light of the proposal's vagueness. The proposal fails to clearly articulate the problem EPA seeks to address, the specific Proposed Rule requirements, and its costs and benefits. These are well understood and basic elements that federal agencies must include to ensure informed public comment. Given that these elements are completely missing from this proposal, EPA should withdraw it.

Thank you.

Testimony of Peter Lurie, MD, MPH

President

Center for Science in the Public Interest

U.S. Environmental Protection Agency Public Hearing on the Proposed Rule Titled

"Strengthening Transparency in Regulatory Science"

July 17, 2018

My name is Dr. Peter Lurie and I am the president of CSPI, the Center for Science in the Public Interest. CSPI is an independent science-based health advocacy organization with over 500,000 members. We accept no Industry or government donations and carry no advertising in our *Nutrition Action Healthletter*. Prior to joining CSPI, I served at the Food and Drug Administration as Associate Commissioner for Public Health Strategy and Analysis, where for several years I led the agency's Transparency Initiative. Over the course of my career, I have authored numerous academic articles on transparency.[1]

CSPI is a firm advocate of scientific transparency. Our Integrity in Science Project investigated, exposed, and sought to reduce corporate influence on science and science-based public policy for many years. More recently, CSPI led a call for the National Library of Medicine to be more transparent in publishing conflict of interest disclosures. But EPA's proposed rule is *not* about transparency or strengthening science. Instead, it is a wolf of pro-industry bias hiding in the sheep's clothing of transparency in science. The proposal should be withdrawn.

Transparency is not about restricting the use of sound science as this proposal would do; it is about communicating openly and clearly about the action taken, the strengths and limitations of the science used, and making that science and interpretation as available to the public as possible. Certainly,

[1] A partial list of my published articles relating to transparency is appended to this testimony.

the more transparent a government agency can be about the nature and limitations of the data underlying a decision, the better. But the failure to meet some abruptly and arbitrarily elevated standard for disclosure cannot and should not be grounds for the summary exclusion of data that were rigorously gathered and reported.

The surest tests of any scientific transparency policy are: 1) whether it was itself developed transparently, and 2) whether it promotes transparent, rigorous, science-based decision-making in an even-handed manner. The proposal fails on both counts.

First, this proposal violates fundamental tenets of transparent rulemaking. EPA apparently failed to consult with relevant stakeholders such as scientific, research, or health professional associations, did not consult with other federal agencies, and did not even make the proposed rule available to its own Scientific Advisory Board for review.[2] In addition, the proposal lacks critical citations and documentation or even an adequate justification for why it was proposed. Rather than furnishing the evidentiary support required for administrative action, the agency has merely adopted a legislative initiative[3] that failed to pass despite support from the energy, chemical, manufacturing, and other key industries. That legislation was proposed by Rep. Lamar Smith (R-TX), Chair of the House of Representatives Committee

[2] EPA Science Advisory Board. Memorandum: Preparations for Chartered Science Advisory Board (SAB) Discussions of Proposed Rule: Strengthening Transparency in Regulatory Science RIN (2080-AA14). [3] H.R.1430 - HONEST Act. https://www.congress.gov/bill/115th-congress/house-bill/1430.

on Science, Space, and Technology, who questions the science behind climate change[4] and the relationship between air pollution and mortality.[5]

Moreover, despite its professed fealty to cost effectiveness in rulemaking, the proposed rule provides no cost-effectiveness analysis whatsoever. It simply asserts blithely that "EPA believes the benefits of this proposed rule justify the costs." But the rule would be costly indeed: analyses of an earlier version of Rep. Smith's legislation from the nonpartisan Congressional Budget Office predicted costs of $250 million per year over the next few years.[6]

But even more important, the proposal will not meet its purported scientific goals and will instead undermine the scientific basis for decision-making by the agency. Since its inception, EPA has developed rules with demonstrable efficacy in protecting the public by relying in large part upon the kinds of data that EPA would now preclude from consideration. Some of EPA's greatest public health accomplishments, such as eliminating lead in gasoline and classifying secondhand smoke as a cause of cancer (which led to banning smoking from indoor public places), were based on the kinds of data that would be discarded under the proposal. Such data are widely used in rulemaking proceedings by other U.S. government agencies and around the world. It is particularly troubling that the proposal also opens the door to a reconsideration of past rules, which would be utterly inappropriate under prevailing principles of administrative law.

[6] Congressional Budget Office. Cost Estimate, H.R. 1030 Secret Science Reform Act of 2015, As ordered reported by the House Committee on Science, Space, and Technology on March 3, 2015, March 11, 2015. https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf.

In fact, the proposal would have an effect opposite to its claimed purpose; it would suppress important and relevant science conducted in large part by the best minds in academia and government, thereby unduly restricting the evidence available to EPA and potentially favoring data developed by industry. Most academic epidemiologic studies rely on aggregated data and other means to protect the privacy of their human subjects. In other cases, researchers conducting the studies may be prevented from making the underlying data publicly available for legal, practical, or ethical reasons.

The pro-industry orientation of the proposal is revealed once more in its assault on the linearity assumption in the dose/concentration-response function. (This approach assumes that there is no safe threshold at the population level for most chemical pollutants.) This assault runs counter to the advice provided to EPA by the National Research Council, which stated, "The committee recommends that cancer and noncancer responses be assumed to be linear as a default."[7] In another departure from its claimed commitment to transparency, EPA provides no scientific citations for its claim of "growing empirical evidence of non-linearity in the concentration-response function for specific pollutants and health effects." But what is most telling about the discussion of linearity is its inclusion in the proposed rule in the first place; there is simply no need to raise it in a proposed rule supposedly about transparency.

A legitimate approach to strengthening transparency in regulatory science would heed the advice provided by the National Academies to use the best and most current science to support and revise default assumptions, make implicit defaults explicit, and provide clear standards for the level of

[7] National Research Council. Science and Decisions: Advancing Risk Assessment. Washington, D.C.: National Academies Press; 2009, p. 180.

evidence needed to depart from default assumptions,[8] taking into account data-sharing guidelines already developed by NIH.[9]

Let me close with the question with which EPA should have started: What is the problem that this proposed rule seeks to fix? Where is the study for which the lack of access to raw data resulted in misinterpretation or in the promulgation of an inappropriate regulatory standard? To the contrary, the record is replete with studies that formed the basis of health- and life-saving regulations that would now be precluded from use and that might even provide a basis for the revocation of rules enacted in the distant past.

July 17, 2018

I am Roy Gamse, formerly EPA Deputy Assistant Administrator, reading the comments of John Bachmann. He served EPA for 33 years and was the Associate Director for Science/Policy and New Programs for the Office of Air Quality Planning and Standards in Research Triangle Park, NC.

Comments of John Bachmann

I appreciate the opportunity to provide these comments on the proposed rulemaking "Strengthening Transparency in Regulatory Science" on behalf of the Environmental Protection Network (EPN). EPN will submit detailed written comments on the proposal later.

This proposal would *not* strengthen transparency of regulations. Instead it would preclude the assessment and use of the best scientific information available, as required by all major statutes administered by EPA. The process by which it was developed, the misuse of references that ultimately do not support its arguments, and the lack of specifics on what EPA actually intends to do are an embarrassment to the Agency. The new acting Administrator should withdraw it from consideration as soon as possible.

- EPA's Proposal is a Solution in Search of a Problem

  - The proposal asserts that it is dealing with a "replication crisis," but does not cite a single instance where a study used by EPA for any type of major rule was shown to be flawed due to a lack of access to the underlying data. In fact, EPA and industry funded an independent reanalysis of the two air pollution studies that were criticized for not releasing confidential health information to the public, and both were successfully *reproduced* with results published in 2000. Moreover, their key findings have been *replicated* dozens of times since then by other investigators using different health and air quality data.

  - The proposal to exclude important peer reviewed studies is wholly inconsistent with scientific practice and EPA's past use of science in

regulatory decisions. Where studies with novel results appear, EPA's assessments have noted limitations, and in some cases supported reanalyses. EPA's science/policy related assessments are themselves peer reviewed by SAB or CASAC to further ensure study evaluations consider all of the relevant scientific literature.

- As noted by an SAB workgroup, EPA's proposal downplays valid concerns about the risks of providing access to the confidential information of subjects in epidemiology studies. The SAB group noted:
  - Some of the largest and/or most useful health effects data sets cannot be made fully public, because certain personal information on age, sex, health and location could be used to identify the participants, or because of agreements made with study participants in advance.
  - EPA failed to mention various ways to assess the validity of prior epidemiology studies without access to data, nor that the rule might preclude continued use of studies published many years ago.

- The proposal includes a provision for the Administrator to waive this requirement. No clear decision criteria are provided to allow EPA scientists and stakeholders to understand when and how such waivers might be granted. It thus appears that this requirement could be applied in an arbitrary and capricious manner that does not reflect sound science judgment.

- Critical decisions like these must be made on the basis of science, not politics. Otherwise highly relevant studies for which data cannot be publicly shared, even if published in the best peer reviewed journals and replicated, may be judged to be inherently untrustworthy.

- The rushed and mostly secret process EPA followed in developing this proposal displays a complete disinterest in transparency in public policy, much less in science. In developing this proposal, EPA leadership:
  - Did not provide a role for its own career scientific and science/policy experts in crafting the proposal or in assessing its potential impacts,
  - Never included the rule in its regulatory agenda,
  - Did not notify or consult with the SAB, much less request a review of the draft proposal as required by law,

- Did not solicit the advice of the National Academy of Sciences on provisions that would change dose-response models used in risk assessment from those previously recommended by the NAS,
- Did not ask for a review to solicit the views of other Federal Agencies that conduct research and/or use health effects science in developing policies and regulations.
- Finally, the Agency originally allowed only a 30-day comment period on this remarkable, unvetted departure from decades of past practice in the assessment and use of science.

- In suggesting the potential costs of the rule would be minimal, EPA ignored the costs -
  - to researchers, who would have to pay to set up and maintain data sharing for their previously published studies to be considered,
  - to EPA for conducting the multiple reanalyses required in section 30.6 of the rule,
  - and to public health, for the disbenefits of undermining existing regulations.

  Having done no assessment, EPA has no basis for its claim that the benefits of the rule would exceed costs.

- Scientists and scientific publications that EPA cites as evidence of support for this rule have rejected the proposal's preemption of existing studies based on availability of raw data.

  - John Ioannidis reacted strongly to the proposal in an editorial, noting that "If the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim."
  - Editors of four major scientific journals, whose policies EPA cited as support, jointly stated that "It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them...Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes."

- EPA should immediately withdraw this flawed proposal from consideration. Given the fatal flaw of establishing an unnecessary regulation for science assessment that would elevate transparency over any other criterion, we are unable to offer any suggestions for improving it.

Testimony of the

American Petroleum Institute

Public Hearing on the

Proposed Rule: Strengthening Transparency in Regulatory Science

[April 30, 2018; 83 Fed. Reg. 18,768; Docket ID: EPA–HQ–OA–2018–0259]

July 17, 2018

Thank you for the opportunity to provide public comment today. My name is Ted Steichen a Senior Policy Advisor at the American Petroleum Institute (API).

API is the only national trade association representing all facets of the oil and natural gas industry, which supports 10.3 million U.S. jobs and nearly 8 percent of the U.S. economy. Our 620 corporate members - from large integrated oil and gas companies to small independent companies - comprise all segments of the industry. API member companies are producers, refiners, suppliers, retailers, pipeline operators and marine transporters as well as service and supply companies providing much of the nation's energy. Science used when developing policy and regulations impacts all aspects of API member business.

The members of API are dedicated to continuous efforts to improve the compatibility of their operations with the environment while economically developing energy resources and supplying high quality products and services to consumers. Our members recognize their responsibility to work with the public, the government, and others to develop and to use natural resources in an environmentally sound manner while protecting the health and safety of our employees and the public.

API supports the use of sound science as a critical component in public policy. To the extent possible, and consistent with the protection of other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections, data and analysis used in establishing and evaluating environmental, health, welfare and economic impacts should be transparent and reproducible and available as early as possible in the rulemaking process. Transparency and reproducibility should also apply to underlying data and information, such as environmental and economic impact data and models that are utilized to predict costs, benefits, market impacts and/or environmental effects of specific regulatory interventions.

API members are aware there are some obstacles to full transparency and reproducibility and are committed to working with other stakeholders to develop practices that maximize science transparency while preserving existing confidentiality strictures.

As EPA goes about this rulemaking API suggests that regulatory decisions based on science should rely upon the following principles:

- Openness in science and related findings underpinning laws, regulations, standards and guidance documents.
  - This is especially true for government-funded research and science but should include all policy-relevant studies.

- Reproducibility of research and associated findings, including fully-annotated data, methodologies, model inputs, code and other critical information that support the conclusions of research. All of these should be available to the public.

- Inclusion of clear requirements to ensure that the data underlying decision-making are publicly available in a manner sufficient for independent validation, as much as practicable.
  - Privacy concerns are important, but advances in encryption technology and blinding of data make it possible to enhance transparency while ensuring privacy as necessary to comply with the law.

- Inclusion of clear requirements and a well-documented process are critical to ensure that the data underlying decision-making are publicly available in a manner sufficient for independent validation to the degree practicable.

- Protection for confidential business information (CBI) used in regulatory processes and support agency actions.
  - This protection for CBI may need to be maintained even for certain data that are submitted to EPA to inform rulemakings.
  - Protections for proprietary information or CBI should not be weakened, though results of agency analyses of this information could potentially be made available. Any such available results should be transparent regarding the agency's selection of key data, and the interpretation of that key data.

- Explicitly addressing and highlighting uncertainties in data, models and analyses when utilizing those studies in decision-making.
  - This is particularly important when models are used to quantify benefits of an action at levels at or below existing standards or background concentrations of a regulated substance.

- Broad application of these principles to information used to inform policy decisions, including scientific, economic and environmental impact data and models that are designed

to predict health and environment impacts, costs, benefits, and/or market impacts of specific regulatory interventions on complex economic or environmental systems.

- Engaging stakeholders, as early as possible, in the decision-making process to ensure application of data transparency principles for studies to be included and to address how studies that have not been reproduced or that are non-reproducible will be considered in the process.
  - For studies that are high quality and are regarded by the regulatory agency as the best available data for regulatory use though proprietary, identify the recourse for stakeholders regarding CBI, privacy concerns or other transparency issues, to ensure that regulatory decisions are indeed based on sound science.

- Application of these principles, as early as possible, in the pre-rule stage as technical support documents are prepared.

In closing, as described above, API supports the use of sound, transparent science in public policymaking and we plan to submit written comments to the docket.

Strengthening Transparency in Regulatory Science

Docket ID No. EPA-HQ-OA-2018-0259

From: Luke Michaelson, PhD RN

July 17, 2018

From the perspective of a nurse, the proposed rule titled **Strengthening Transparency in Regulatory Science** will harm the public and will implement unachievable transparency guidelines within population health research areas. For example, epidemiological studies correlating illness and air quality may require personal identifiable information and confidentiality agreements. The **Strengthening Transparency in Regulatory Science** regulation seeks to only use studies which allow public access to all data. Since those confidential raw data cannot be publicized, that research will not be used to develop future health guidelines.

In fact, if the **Strengthening Transparency in Regulatory Science** rule is implemented, the result will be less science influencing future health policy. Such a result will harm the American population, especially those more vulnerable to environmental hazards, such as children and the elderly. The scientific community already supports Transparency and Openness Standards which are able to accommodate research using strict confidentiality and private guidelines [1]. This proposed federal guideline is redundant and does impart a fiscal and labor burden on an agency President Trump has previously targeted for a 23 percent decrease in its budget. Furthermore, the EPA has lost hundreds of employees [2] and therefore, the agency will not be able to support the validation of even "approved research data" within a timely manner.

Prior to the proposed guideline, **Strengthening Transparency in Regulatory Science**, the scientific community has proactively contributed research directly helping the health of the American public. In 1955, the Air Pollution Control Act was the first federal legislation related to air pollution, and authorized funds for air quality research. In 1963, the Clean Air Act authorized the US Public Health Service to conduct research on how to control air pollution. Air quality legislation, culminating in amendments to the Clean Air Act in 1990, has produced an estimated $59-140 billion in health savings [3]. Furthermore, prior research associated the following pollutants with poor health outcomes; higher carbon monoxide and ozone levels correlated with lower birth weights and poor intrauterine growth; for every 10$\mu g/m^3$ increase in PM_{10} levels, respiratory related infant deaths increased by 16%, and children living in communities with the highest levels of $\leq PM_{2.5}$ particulate matter were approximately 5 times more likely to have abnormal lung function when compared to their peers with the lowest $\leq PM_{2.5}$ levels [3].

Good science and research help the American public. The **Strengthening Transparency in Regulatory Science** guideline ignores the documented public health successes from prior research. This guideline will immediately harm the American communities and reverse health gains we have made. I suggest this guideline not be implemented.

Public Hearing on the proposed rule "Strengthening Transparency in Regulatory Science" **Docket Number: EPA-HQ-OA-2018-0259**

Comments:

The only transparency in this rule is the clear political wrench being proposed.

This wrench is designed, in industry's favor, to dismantle the EPA's ability to function in its mission.
Retroactively, no less.

The proposed rule would hand the EPA administrator this wrench to wield at whim.

Wow.

Wrong.
Withdraw it!

Over →

Submitted by a member of the public who trusts the established scientific practices.

Let the polluters try to hide behind 'transparency'.

Testimony of
Victoria Rachmaninoff, Moms Clean Air Force Intern
on
July 17, 2018
for
Censored Science Hearing
Docket Identification No. [EPA-HQ-EPA-HQ-OA-2018-0259]
at
EPA Headquarters
William Jefferson Clinton East Building, Main Floor
Room 1153
1201 Constitution Avenue NW., Washington, DC 20460
Public Hearing Testimony

Hello, my name is Victoria Rachmaninoff and I am from Winnetka, Illinois. I want to start by saying thank you for this opportunity to offer comment. I am deeply concerned about Acting Administrator Andrew Wheeler's attempts to censor science in the name of transparency and am here today to speak out against this proposed rule.

My mother grew up in a house of smokers. From infancy, her lungs were filled with the second-hand smoke of my grandmother, and later her older sister. While driving, the windows were kept shut no matter how many cigarettes were lit. Their home was no different. All throughout her life, until she herself started smoking, my mother breathed in the cigarette smoke of others, as studies showing the links between cigarettes and cancer were suppressed by the tobacco industry.

We now know that cigarettes can lead to more than just cancer; they also severely increase your risk of heart disease and stroke. My mother is 58 and I am thankful that she is still healthy. Her mother quit smoking at 68. This was not by choice. Just ten years older than my mother is now, she suffered from a massive brain hemorrhage. Her stroke left her paralyzed and nearly took her life.

In the early 1990s, when I was born, the tobacco industry tried to do something similar to what is being proposed now. In reaction to well respected, sound science, they created their own guidelines for "transparency" to discredit research showing the damaging impacts of second hand smoke. If they had gotten their way, my generation, a whole other generation, may have grown up inhaling second-hand smoke, just like my mother.

As early as the 1940s, the tobacco industry knew that cigarette smoking could cause cancer. While actively hiding this research, and producing cigarettes veiled as "safe," millions of Americans endowed this industry with misplaced trust. It took over 50 years to undo the detrimental effects of the tobacco industry's scientific cover-up. Countless people have died, and more will continue to die as a result. Now is not the time to let this injustice repeat itself.

Like cigarettes, pollution from smokestacks and tailpipes cause serious health problems and can even lead to death. Just as we have finally accepted the health impacts of cigarettes, it is time to accept that there are real, and consequential health impacts from pollution— and start dealing with them. Those industries want to avoid accountability for the harm they cause by throwing out the scientific evidence.

But while this ruling is being done under the guise of "transparency," there is nothing secret about the science EPA uses to protect us. The EPA already makes available the scientific studies it relies on to make decisions. But many of those studies depend on the use private medical data that cannot and should not be made public. This rule is an excuse to discount these studies so they can weaken public health protections.

Today, I work for Moms Clean Air Force. I fight each day with over 1,000,000 parents and people dedicated to protecting children's health. Before, I spent four years working with elementary and preschool children, in the field of education. The students I worked with all came from low-income families. And when I think about who will suffer most from this ruling, it is children like them. At the age of four, six, and ten their vulnerable lungs and bodies are highly susceptible to the effects of air pollution. And because of their income, they are more likely to live near dangerous sources of pollution.

This proposal means that many studies on young people, people of color, and low-income communities - groups who suffer disproportionately from pollution - would be excluded from EPA consideration. Making the data public could identify the participating individuals. And simply redacting information is not enough. The information required to be made public still would allow with simple decoding for the identification of participants. Perhaps even worse, excluding this important data from consideration could further exacerbate negative environmental impacts on these and other vulnerable communities.

The EPA has used transparent and sound science for decades. My family, the families I work with at Moms Clean Air Force, and millions of Americans are counting on the EPA to continue using this science, without putting our privacy at risk. I strongly urge the EPA to stop this radical proposal - for the health and safety of all Americans. Thank you very much.

Public Hearing - Strengthening Transparency in Regulatory Science
Afternoon Session - Final List of Speakers | July 17, 2018
1201 Constitution Ave. NW | WJC East Building, Room 1153

Assigned Speaker No.	First Name	Last Name	Organization
1	Pamela	Miller	Alaska Community Action on Toxics
2	Elizabeth Ann Glass	Geltman	CUNY School of Public Health
3	Patricia	Koman	University of Michigan
4	Alexis	Andiman	Earthjustice
5	Alexis	Andiman	on the behalf of Devon Hall, Rural Empowerment Association for Community
6	Sarah	Kogel-Smucker	Office of the Attorney General for the District of Columbia
7	John	Doherty	Independent Toxicologist
8	Trisha	Sheehan	Moms Clean Air Force
9	James	Duffy	Clean Air Task Force
10	Erika	Rosen	George Washington University
11	Gretchen	Goldman	Union of Concerned Scientists
12	Maggie	Flaherty	League of Conservation Voters
13	Adam M.	Finkel	University of Michigan School of Public Health
14	Augusta	Wilson	Climate Science Legal Defense Fund
15	David	Coursen	Environmental Protection Network
16	Abigail	Omojola	Breast Cancer Prevention Partners
17	Alan	Lockwood	Physicians for Social Responsibility
18	Elizabeth	Woolford	National Parks Conservation Association
19	Paul	Allwood	Minnesota Department of Health
20	John	Stine	Minnesota Pollution Control Agency
21	Virginia	Ruiz	Farmworker Justice
22	Karen	Mongoven	National Association of Clean Air Agencies

Morning All,

You already have a copy of Ms. Goldman's testimony; she submitted it prior to the hearing. But I forgot to include in the packets sent yesterday.

Please let me know if you have any questions.

Thank you.

Subject: Public Comment - July 17 Hearing (1 file)

Good afternoon,

Attached is a condensed (zipped) public comments folder that includes scanned copies of oral testimonies submitted, scanned copies of written comments submitted to the docket box, final speaker, attendee and press lists, scanned copies of the original check-in/sign-in sheets.

Please note that I plan to follow up with the court reporters to see if they received any copies (while at the hearing) that were not provided to us (or that we are missing).

Please let me know if you have any questions or concerns.

Thank you and have a great day.

Attachments: EPA transparency comment.doc; EPA transparency in regulatory science ATTACHMENT to COMMENTS.pdf; DUNN EPA Science Transparency submission(1).pdf

Hi Dale,

Tom wanted me to get your opinion on the case below. We've been allowing substitutions for registrants but everyone we've allowed wasn't already speaking themselves.

In the case below, John Dunn wants Steve Milloy from Junk Science, who is already registered to speak at the 12-4 session, to replace him at the 12-4pm session.

In my opinion, John Dunn's registration should be cancelled and Steve Milloy not given another 5 minutes to speak. Tom suggests we allow Steve to represent John, but make it clear that he needs to be presenting John's comments.

What would you prefer we do?

Subject: Re: U.S. Environmental Protection Agency (US EPA) public hearing on the proposed rule, "Strengthening Transparency in Regulatory Science,"

Ms. Breeden,

I talked to Tom in the Science Advisor's office a few weeks ago after the hearing was announced and I was assured that since I could not make the trip from Texas for in person testimony, I could have a substitute, who is Steve Milloy. Mr. Milloy is familiar with my work and has the submission and will make the in person verbal 5 minute presentation during the afternoon session that I signed up for.

I have submitted my comments and attachments for materials on my submission to the docket previously and Mr. Milloy has agreed to take my 5 minutes. I signed up for the afternoon segment.

My comments and submissions for the docket are attached above FYI, please inform me if there is a problem.

Thanks for your courtesy and consideration.

Subject: U.S. Environmental Protection Agency (US EPA) public hearing on the proposed rule, "Strengthening Transparency in Regulatory Science,"

Good morning,

You are registered to speak at the U.S. Environmental Protection Agency (US EPA) public hearing on the proposed rule, **"Strengthening Transparency in Regulatory Science," on July 17, 2018, at the EPA, William Jefferson Clinton (WJC) East Building, 1201 Constitution Avenue NW, in Washington, DC 20460, Room 1153.**

The hearing will begin at 8:00 a.m. (EST) and continue until 8:00 p.m. (EST) or one hour after the last registered speaker has spoken, whichever is earlier. Oral testimonies will be heard in 3 session increments: 8am to 12pm, 12pm to 4pm and 4pm to 8pm.

When you arrive please enter the William Jefferson Clinton (WJC) East Building on Constitution Avenue NW. Please be prepared to show a valid picture identification to enter. Room 1153 is located near the 1201 Constitution Avenue NW entrance.

A registration table will be located outside of room 1153. You will be assigned a speaker number based on when you check-in (i.e., on a first-come, first-served basis). Check-in for each session will begin one hour before the start of that session.

Each session will begin with opening remarks from an EPA official. The speakers for the session will be placed in order and testimonies will be given until everyone registered for that session has spoken. Oral testimony will be limited to 5

minutes for each commenter. A timer will be used to indicate when the 5 minutes are completed. Due to time constraints, slides and videos will not be permitted during testimony. Lunch, dinner and session breaks have not been scheduled. If you need to enter or leave the room during the hearing, we ask that you do so quietly.

The EPA encourages commenters to provide a copy of your oral testimony and any other materials electronically to Docket ID No. EPA-HQ-OA-2018-0259 at https://www.regulations.gov, or in hard copy form at the hearing.

Please forward any additional questions, comments, or concerns to staff_osa@epa.gov.

Carl R. Darnall Army Medical Center, Fort Hood, Texas.

Table of contents of elements of the submission

The Submitter's opinions are personal and not attributable to the US Army or Department of Defense.

This submitter has witnessed US EPA misconduct for a period of 3 decades on a scale that is stunning, or alarming, going back to the EPA decision to ban DDT in the early 1970s, resulting in the deaths of millions in the 3rd world, and a particularly horrific impact on children.

More recently in addition to serial misconduct with regards to toxicology and epidemiology research the EPA has compounded its scientific methodology misconduct with a systematic violation of domestic and international ethical and moral/legal norms in regards to human experimentation—promoting and funding, approving human experiments that resulted in uninformed subjects being involved in experiments at 10 domestic and 6 foreign medical research institutions where they were intentionally observed while inhaling small particle contaminated air while being observed for adverse effects. These experiments carried out by prominent Medical Schools, is in spite of US EPA public pronouncements and testimony before congress that small particles are toxic, lethal (Hundreds of thousands of deaths annually) and carcinogenic.

US domestic law prohibits human experiments that might harm and international medical ethical standards for human experiments prohibit human experiments with no exceptions except exigencies of great need if the researchers act as subjects. Any other human experiments with a risk of harm are prohibited, and no consent will remove that proscription.

In the past 3 decades US EPA air quality research has been an abomination, relying on junk toxicology/epidemiology and the precautionary principle. The submitter has actively tried to expose the misconduct.

The proposal by the US EPA, discussed here to force EPA scientific transparency and scientific integrity is salutary and significant in all its elements, and the submitter is grateful for the change from the formerly fraudulent toxicology and epidemiology of the EPA to impose a new form of integrity.

I will detail in this submission the nature of the EPA sponsored research fraud, the methods and data manipulation and management that have resulted in EPA fraud on the public about air quality health effects, toxicological claims in other areas of EPA responsibility and the EPA full blown commitment to the hoax of CO2 levels as a cause of catastrophic warming. In these three areas of EPA research and policy making it is easy to identify the frauds on the public that are supported by a well-paid band of hired researchers and an in house gang of committed environmental true believers. The result is a fraud and research and policy conduct that is so badly informed and poorly researched and developed that it includes systematic commission of civil and even criminal acts to further an EPA agenda of aggressive environmental regulations that have created tremendous economic burdens for no good reason other than a fanatic environmental ideological agenda.

I will elaborate with specific references and documents in the submission below—elaborate on the irresponsible and flagrantly unscientific research funded and promoted by the USEPA on all matters of toxicology and epidemiology and my admonition to any reader is that if we do not stop this junk science for politics and ideology, we will follow the path of fools for a cause—the path of true believers that is paved with confirmation biases and fallacious science and policy making that violates the law and cheats the taxpayer in two ways, scaremongering, and regulatory burdens that steal resources and assets for regulatory compliance that diminishes better use of those resources in the public and private sectors. My promise to the reader is I will show you how and how much the EPA disrespects and abuses the rules and methods of science.

1. Other commentaries I agree with highlighted

The Washington Post
By Robert Hahn
May 10, 2018

https://www.washingtonpost.com/opinions/many-mocked-this-scott-pruitt-proposal-they-should-have-read-it-first/2018/05/10/31baba9a-53c2-11e8-abd8-265bd07a9859_story.html?noredirect=on&utm_term=.f7bcbc0a1887

Robert Hahn is a visiting professor at Oxford University's Smith School of Enterprise and the Environment and a non-resident senior fellow at the Brookings Institution. He recently served as a commissioner on the U.S. Commission on Evidence-Based Policymaking.

When Environmental Protection Agency Administrator Scott Pruitt proposed a rule last month to improve transparency in science used to make policy decisions, he was roundly criticized by interest groups and academics. Several researchers asserted that the policy would be used to undermine a litany of existing environmental protections. Former Obama administration EPA officials co-wrote a New York Times op-ed in which they said the proposal "would undermine the nation's scientific credibility." The Economist derided the policy as "swamp science."

But there is a lot to cheer about in the rule that opponents have missed. A careful reading suggests it could promote precisely the kind of evidence-based policy most scientists and the public should support.

Critics typically argue that the proposed regulation would suppress research that contains confidential medical records and therefore scientists could not share underlying data publicly for privacy reasons. Such restrictions, these critics say, would have excluded landmark research, such as Harvard University's "Six Cities" study, which suggested that reducing fine particles in the air would dramatically improve human health and helped lead to more stringent regulation of fine particles in the United States.

...

But it appears that few defenders or opponents of the proposal have actually read the proposed EPA regulation, which is only seven pages long. Both sides distort the regulatory text.

Here's what the rule would actually do about the question of confidentiality of Personal Health Information under HIPAA or any other rule.

First, it would require the EPA to identify studies that are used in making regulatory decisions.

Second, it would encourage studies to be made publicly available "to the extent practicable."

Third, it would define "publicly available" by listing examples of information that could be used for validation, such as underlying data, models, computer code and protocols.

Fourth, the proposal recognizes not all data can be openly accessible in the public domain and that restricted access to some data may be necessary.

Fifth, it would direct the EPA to work with third parties, including universities and private firms, to make information available to the extent reasonable.

Sixth, it would encourage the use of efforts to de-identify data sets to create public-use data files that would simultaneously help protect privacy and promote transparency.

Seventh, the proposal outlines an exemption process when compliance is "impracticable." Finally, it would direct the EPA to clearly state and document assumptions made in regulatory analyses.

(It is this submitter's position that the privacy/confidentiality issues raised by EPA sponsored researchers are intended to be a distraction—there is nothing that prevents a release of the data used in the EPA studies of the 90s, and since, because data can be collected without identifiers that penetrate to reveal Personal Health Information or the identity of individuals. Most of the EPA Sponsored studies on small particle effects are death studies—there is nothing that is sacred and confidential about a death certificate. The Studies the on ozone effects can easily be done to redact personal health information.) Here's what the EPA's new proposed rule wouldn't do: nullify existing environmental regulations, disregard existing research, violate confidentiality protections, jeopardize privacy or undermine the peer-review process.

Taking steps to increase access to data, with strong privacy protections, is how society will continue to make scientific and economic progress and ensure that evidence in rule-making is sound. The EPA's proposed rule follows principles laid out in 2017 by the bipartisan Commission on Evidence-Based Policymaking — humility, transparency, privacy, capacity and rigor — and moves us toward providing greater access to scientific data while protecting individual privacy.

Instead of throwing stones, the scientific community should come together to offer practical suggestions to make the rule better. For example, the rule should recognize the incentives for scientists to produce new research. . . .

Done right, this could improve government policy not only in the United States but also around the world.
It's still hard to tell how this rule will affect EPA decisions, but one thing is clear: The rule will make the evidence by which we make policy decisions more transparent. The policy might not be perfect, but its benefits will likely far outweigh its costs.

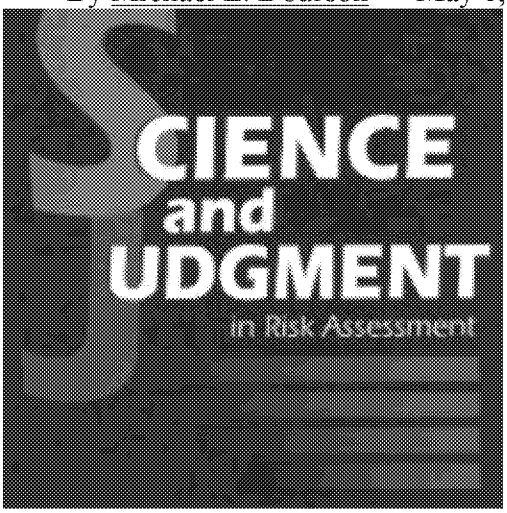
Comment by the submitter—this is blowing smoke and making excuses for the "secret science" that has dominated EPA activities for decades—there is no privacy or confidentiality problem with gathering data on deaths in studies that do not depend on personal data or release that personal data. Death Certificates with accompanying information do not violate confidentiality or privacy rules and can be used to assess the validity of the studies submitted—period.

Michael Dourson is a prominent toxicologist in the private sector. Here, again below I provide bold highlighting for his essay on the matter of the transparency proposal:

From A Risk-Assessment Perspective, EPA Getting Rid Of 'Secret Science' Makes Sense

•

By Michael L. Dourson — May 8, 2018 Washington Examiner



Science and Judgment in Risk Assessment - the "Blue Book"

Environmental Protection Agency Administrator Scott Pruitt's recent announcement that EPA will not use "secret science" — that is science for which the underlying data is not available — is challenging. Whereas EPA is routinely in receipt of unpublished toxicity studies for chemicals designed for commerce, not all important scientific findings are publishable. Nor do scientific journals generally have sufficient space to include all data.

Much has been made in recent weeks of this new EPA policy, including an op-ed opposing it by former EPA Administrator Gina McCarthy and former acting Assistant Administrator Janet McCabe.

The media coverage has focused attention on how science is considered acceptable and useful in EPA's rulemaking. But missing from this is the perspective of risk scientists charged with protecting public health. In the case of EPA, it is often not enough for any one positive study to be published in a peer-reviewed journal. Such work often needs replication because a positive finding occurs, on average, in one out of every 20 studies due to chance.

If a study cannot be replicated, then it at least needs to make sense within the pattern of available data. For pesticides regulated by EPA, these data are often from hundreds of studies done according to federal guidelines.

Studies that are not replicated or that do not make sense in an overall pattern are still considered, however. Risk scientists will often contact the authors to obtain additional information in order to conduct their own analysis, a common practice within EPA.

When such data are forthcoming, without the need to break confidentiality or disclose confidential business information, independent analyses can be conducted and the public health is better served. But when such information is withheld by the authors, government risk scientists are often left with a dilemma.

For example, imagine that a series of studies come out on a single human group that is exposed to a commonly used insecticide, and they show an unexpected effect at extremely low exposures. This finding

has not been replicated and clashes with multiple animal and human studies that point to danger only at much higher exposures.

In this case, EPA scientists would ask the authors for the underlying data to confirm this unexpected low-dose effect. But let's say they can't get it. EPA is then left with neither confirmatory studies, nor information that makes sense in light of other studies, nor the ability to conduct its own analysis. Understandably, Pruitt has chosen a policy of not using such studies.

There is one sense in which McCarthy and McCabe are spot on. The judgment over which epidemiology and/or toxicology data to use for risk or safety assessment purposes should be left to risk scientists. But from my perspective as a risk scientist, Pruitt's decision is still correct. The public's interest is best served when science is replicable and consistent with other information. When studies cannot be replicated or are inconsistent with other information, access to their underlying data is vital to independent analysis. When the underlying data are not provided to a risk scientist, it is difficult to use this study to make a credible risk judgment, much less national rulemaking.

In short, the public is often worried about chemical exposure, as they should be when such exposure exceeds a safety level. But the public's interest is best served by trusting in experts dedicated to public health protection, not by withholding scientific data from independent analysis.

Michael L. Dourson, PhD, DABT, FATS, FSRA, is prominent and accomplished toxicologist.

2. Choices in Risk Assessment--Report for the DOE 1994 by Steve Milloy

Steve Milloy, the founder and main writer for JunkScience.com for 20 plus years wrote a major research Monograph on Toxicological Policy issues as a contractor for the US Department of Energy in the early 90s. He exposed the federal agency science and policy misconduct in a major report "Choices in Risk Assessment" completed in 1994 on EPA 'science policy' and 'default assumptions.'

What is science policy? From "Choices in Risk Assessment", below are 10 common science policy issues and default assumptions used in EPA risk assessment.

Click here for a PDF of "Choices in Risk Assessment." It is more than 200 pages that explain why the EPA has lost its way, had lost its way in the early 90s because of ideologically energized environmental nonsense science.

Following the end of the Cold War, the Department of Energy (DOE) faced clean-up costs for its nuclear weapons sites amounting to hundreds of billions of dollars. The high costs would largely have been incurred because of EPA standards that essentially would have required the former weapons sites be returned to "Garden of Eden" status.

At the time, the DOE took the EPA standards so seriously that it was actually developing essentially a giant vacuum cleaner to suck-up the top layer of sand at the Nevada Test Site (approximately 5,400 square miles in size), decontaminate it and replace the sand.

Overwhelmed by the magnitude of the clean-ups, the Bush administration DOE commissioned Milloy in 1992 to lead an investigation into whether EPA clean-up standards were based on science or politics. Milloy's team of science and policy experts (called the Regulatory Information Analysis Project) compiled a report titled, "Choices in Risk Assessment: The Role of Science Policy in the Environmental Risk Management Process."

Completed in the fall of 1994, the report concluded that environmental policy was largely based on politics, not science. But when the report was completed and circulated for review within the Clinton administration-run DOE, the report was flagged as politically incorrect and Milloy was ordered by Clinton appointee Carol Henry (a former EPA staffer) to keep the report secret.

Sacrificing his business relationship with the Clinton DOE, Milloy disobeyed the order and released the report, which was subsequently featured in a Wall Street Journal editorial.

The attention that "Choices in Risk Assessment" garnered coincided with the Republican takeover of 104th Congress and congressional focus on regulatory reform, vaulting Milloy into the regulatory reform debate about to take place on Capitol Hill. Milloy testified before the U.S. Senate about risk assessment in the context of DOE clean-up on March 6, 1995. The DOE never wound up spending hundreds of billions of dollars to clean up its weapons sites. No word on what ever happened to the giant NTS vacuum cleaner.

Dunn comment:

The DOE report by Milloy

CHOICES IN RISK ASSESSMENT: THE ROLE OF SCIENCE POLICY IN THE

ENVIRONMENTAL RISK MANAGEMENT PROCESS

Prepared for Sandia National Laboratories

Sponsored by the U.S. Department of Energy

Office of Environmental Management and Office of Environment, Safety and Health (1994)

There are more than 200 pages, so I provide some pertinent sections emphasized by Milloy that pertain to scientific issues that hit on the big issues.

This is the link to the document:

https://junkscience.com/wp-content/uploads/2018/05/Choices-In-Risk-Asscssment-v-01-01Interior-With-Cover.pdf

Below is the table of contents, that will give one a sense of the magnitude of the report.

Hereunder I also feature sections of the summary and conclusions of the report—that are stunning. Consider—this is a report written by one man, essentially, a biostatistician and lawyer, and it exposes the problem of risk management in a politically charged atmosphere—the scaremonger environment of the US federal agencies committed to the environmental cause. Misconduct of the federal agencies and their paid researchers in matters of toxicology/epidemiology/risk management.

My question would be—why didn't this author get a National Award for exposing scientific malfeasance and scaremongering in Federal Agencies in the early 1990s? Well the answer is found in an analysis of what has gone on since—Deep State, totalitarian, junk science fraud that promotes the precautionary principle approach in all matters of public health research and science, the agenda of leftist environmentalist fanatics.

The proposal for scientific integrity and transparency is long overdue and the damage done by ideologues in the federal agencies will require a major overhaul in methods and internal review processes.

Much of the damage could have been avoided, had Milloy's report been respectfully considered and used as a guide for federal agency risk management. Instead it was suppressed and ignored by the Clinton Administration environmental fanatics.

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

Many risks to human health and the environment are "unprovable."

Some risks to human health and the environment are provable. Provable risks can be measured or observed directly and include actuarial risks such as those associated with highway or air travel accidents. In contrast, other risks—such as those associated with low-doses of radiation or exposure

to chemicals in the environment—are often too small to be measured or observed directly with existing scientific methods and available resources. Additionally, specific health and environmental effects are often difficult to attribute to specific causes because other competing causes cannot be excluded with reasonable certainty. Such risks are unprovable. However, the fact that a risk is unprovable does not mean that it does not exist. Provable risks can be calculated, whereas unprovable risks can only be estimated through the risk assessment process. Although unprovable risks may be estimated and expressed in probabilistic terms, they are at best educated guesses and do not constitute knowledge or uncontroverted fact. In other words, the ability to produce a numerical estimate of an unprovable risk does not mean that the risk is proven.

Science policy issues are unavoidable in, and science policy decisions are essential to, the regulatory risk assessment process.

Risks are unprovable because of significant gaps and uncertainties in scientific knowledge, data, and method. When risk assessment is used to estimate unprovable risks, these gaps and uncertainties become science policy issues. Both risk assessors and risk managers make science policy decisions in order to bridge the gaps and uncertainties. Thus, science policy decisions enable the estimation of unprovable risks.

. . .

CHOICES IN RISK ASSESSMENT

The existence and extent of science policy in risk assessment are rarely fully and fairly disclosed.

. . .

The lack of disclosure causes risk assessment results to be communicated essentially as fact. Such communication is misleading. Lack of full and fair disclosure of the role of science policy in risk assessment is not the fault of regulators alone. Media communication of risk information tends to omit discussions of science policy because such discussions: (1) do not fit into sound bites; (2) tend to detract from the sensationalism of the risk information; or (3) are not simple to communicate, and subtleties are lost.

Science policy decisions are responsible for regulatory programs and regulatory impacts that are justified on the basis of risk assessment

. . .

CONCLUSIONS AND RECOMMENDATIONS

As in the risk assessment process, science policy and other assumptions play a significant role in the estimation of benefits and costs associated with regulatory programs.

When risks can only be estimated, the benefits of regulatory programs to reduce those risks also can only be estimated, are not verifiable, and depend on science policy-based assumptions. Similarly, cost assessments often depend on assumptions, are uncertain, and cannot constitute uncontroverted fact. An important distinction between estimates of costs and benefits is in the certainty of their existence. Because it is not possible to prove with certainty the existence of unprovable risks, the existence of benefits from regulatory

programs also cannot be proven. In contrast, while there is uncertainty involved in cost assessments, such uncertainty is associated with the magnitude of the estimated costs, not their existence.

Science policy decisions can be made so as to result in desired regulatory outcomes.

The case studies of fluoride in drinking water, asbestos in consumer products, unleaded gasoline, and used oil are examples of decisions where science policy-based assumptions help to justify desired regulatory outcomes.

- In the case of fluoride in drinking water, the weight-of-evidence science policy decision that fluoride was not carcinogenic in humans supported the continued fluoridation of water, a highly valued and desirable public health measure. This science policy decision also helped maintain the credibility of the Public Health Service, which has been promoting the use of fluoride since the 1940s.

- In the case of asbestos in consumer products, the science policy decision to consider only the estimated cancer risk from asbestos brake products and not to consider the potentially offsetting safety risk from the use of non-asbestos brake product substitutes helped justify EPA's decision to promulgate a ban on commercial uses of asbestos.

- In the case of unleaded gasoline, the science policy decision that mechanisms of carcinogenicity varied between rodents and humans provided the basis for concluding that unleaded gasoline is not carcinogenic to humans. This science policy decision helped maintain the credibility of EPA's program to remove lead from gasoline.

- In the case of used oil, the science policy decision that used oil is not a hazardous waste facilitates used oil recycling. Labeling of used oil as a hazardous waste would have resulted in a burdensome cradle-to-grave regulatory scheme for used oil that might have undermined recycling efforts and increased pollution from illegal or improper disposal of used oil.

CHOICES IN RISK ASSESSMENT

For the foreseeable future, science policy will remain the key to all regulatory programs that rely on quantitative risk assessment.

. . .

Recommendations

Policy makers, risk managers, the media, and the public should be made aware of the role of science policy in risk assessment and subsequent risk management decisions.

Although risk assessors are likely to be aware of science policy issues and decisions, the same cannot be said for policy makers, risk managers, the media, and the public. Risk assessors often fail to emphasize the existence and extent of science policy in risk assessment. Where the role of science policy is not explicitly explained, risk estimates may be erroneously communicated to policy makers, risk managers, the media, and the public as uncontroverted fact. Because these groups are unaware of the role of science policy, they often fail to inquire about its impact on risk assessment. Either failure may result in regulatory decisions that are made on an uninformed basis to an uninformed, misled, or unnecessarily alarmed public. Risk assessors

should ensure that such miscommunication does not occur. Policy makers, risk managers, and the media should inquire about the existence and extent of science policy.

The federal government should institute a mandatory training and continuing education program on regulatory risk assessment and risk management for policy makers, risk managers, risk assessors, and their staffs.

Communication of risk assessment results should emphasize the role of science policy.

Because risk assessments for unprovable risks are educated guesses, risk assessment results should never intentionally or inadvertently be presented as fact. Full disclosure of the role of science policy should accompany risk estimates wherever presented, including Federal Register notices, executive summaries of regulatory documents, press releases, and other public and media communications. Disclosure is ineffective if it is inaccessible, comprehensive, explicit, and understandable. Disclosure should attempt to address the following questions:

- **Is the risk of concern provable, and can it be calculated? If the risk is unprovable, is it because the risk is too small to be detected with current scientific methods or because competing risk factors cannot be sufficiently distinguished?**

- **If the risk is unprovable, or provable but incalculable, what are the gaps and uncertainties in scientific knowledge and data that preclude the calculation of risk?**

- **What science policy decisions have been made to bridge these gaps and uncertainties? For unprovable risks, what science policy decisions have been made that concern the existence of the risk?**

- **Could alternative science policy decisions have been considered? What would the impacts have been on the risk assessment of these alternative decisions?**

- **What are the implications for regulation of the science policy decisions made as well as the alternatives? Do alternative science policy decisions reduce or eliminate the basis for regulation? Does consideration of substitution risks or lifecycle risks affect the basis for regulation?**

Answers to these questions will facilitate understanding of the likelihood that a risk exists and its potential magnitude. Improved understanding will enable: (1) policy makers and risk managers to decide on a more fully informed basis whether and what resources should be expended to address the risk; and (2) the public and media to debate the issue on a more fully informed basis.

Risk assessment guidelines may help provide a framework for the use of science policy in risk assessment, but only if such guidelines are flexible and complied with in good faith.

Risk assessment guidelines can provide a framework within which regulators can make science policy decisions. Such a framework would provide the regulated community and the public with the "rules" for science policy decisions in regulatory risk assessment. . . . With respect to potential judicial review, although it will be difficult for a court to rule on the scientific merits of an agency science policy judgment, a court can rule whether that judgment has been explained adequately. Ultimately, the merits of the judgment will be evaluated, and the agency's credibility will be weighed in the court of public opinion as well as by the scientific community.

Precedent has been established, and agencies should be encouraged to give meaningful consideration to alternatives to the default assumptions used in risk assessment

Only when policy makers, risk managers, the public, and the media fully understand the role of science policy decisions in risk assessment can the "real" issue in environmental and public health protection be debated. We must determine what society is willing to pay to reduce or avoid risks to human health and the environment which have been identified and estimated using science policy rather than science alone. These risks may or may not actually exist. If they do exist, they are likely to be relatively small or indistinguishable from other risks. If risks are too small or indistinguishable, it likely will not be possible to know whether regulation produced any benefit. The open debate of the value and priority of regulating these types of risks will enable, but not guarantee, policy and regulatory decisions to be made on a fully informed basis.

3. Commentary on proposed new, more stringent EPA ambient air standards for 2006.

Submitted for consideration in the comment period to end April 17, 2006.

April 13, 2006

John Dale Dunn MD JD

Brownwood, Texas violations of epidemiological and toxicology scientific rules are a scandal that cannot be ignored. The Dockery 1993, Pope 1995, and Samet 2000 studies (see endnotes) and other studies of health effects of air pollution relied on by the EPA, all showed that large studies with adequate power could not demonstrate relative risk of any significance. The studies all showed effects less than ten percent, rather than the statistically and scientifically required 200 to 300 percent effect. It is astounding the EPA has the gall to announce an air pollution crisis and propose more stringent air quality standards when none of the studies the EPA relies on show and proof of health effects.

The EPA is obligated to educate the public on the clear evidence that air pollution may have aesthetic and cultural import, but that there is no air pollution health "crisis." The EPA and its sponsored and supported health effects researchers are now just raising their voice in this debate instead of trying to use science. The EPA air pollution health effects science is an emperor with no clothes, as discussed below.

This commentary challenges the EPA to show one study that proves that one person has died due to air pollution in America in this past 20 years. People die for various reasons, suddenly and not so suddenly, as will be discussed below. That reality eludes the work of numbers crunchers who slave at desks over death certificate information like Pope and Dockery. One doesn't die from an exposure to air pollution, one dies from failed medical therapy, arrhythmias caused by long term coronary disease, stroke, pulmonary embolism, which are not caused by air pollution. The Asthma problem is an increasing problem not related to air pollution, since the rate of asthma is increasing with decreasing air pollution. The deaths from asthma will be discussed below and have nothing to do with air pollution, it is a socioeconomic phenomenon. It is time to retire the air pollution health effects studies of crude death tallies and it's time for the EPA to stand down from this repeated use of crisis talk and aggressive pursuit of pure air—a religious campaign disguised as science in the public interest.

As a last and compelling consideration, this author is familiar with death in America. As an emergency physician, much more familiar with what kills people than economists and public health officials who don't know which is the business end of a ventilator and live in the world of death certificates and mortality data. People die for many reasons and under many circumstances in America, but air pollution doesn't kill them, even the worst levels of outdoor air pollution one might imagine in America don't create a toxic level, which reveals the other major flaw in the EPA crisis rhetoric, junk science toxicology that completely disregards any effort to define toxin or toxicity. That subject will also be dealt with herein below.

The scientific epidemiological and toxicological criticisms of the EPA health effects studies and policy making are:

1. The Dockery 1993 and Pope 1995 studies did not show valid evidence of death effects, since they showed a death effects relative risk below 1.1, a negligible relative risk that is 10 percent of the minimal relative risk all epidemiologists consider necessary for proof of causation. A 200% or 300% change in death effect is the lower limit. Some epidemiologists require relative risk of 4 or a 400% effect when evaluating poorly controlled cohort studies.

2. This relative risk problem cannot be overcome by EPA and health effects researchers emphasizing the misleading use of the term statistical significance, which is not a proof test, but a statistical reliability test. One can be statistically confident and reliable but absolutely wrong.

3. The EPA and its health effects researchers have consistently and persistently ignored the lack of proof of health effects in these studies, and have made public announcements and allowed media reports to proclaim that thousands are dying in America due to air pollution when the studies do not show any proof of death effect at all. Lying for justice or an environmental ideal does not make the lie any less dishonest.

4. The health effects research used by the EPA has consistently ignored the basic rules for toxicology and the well-known phenomenon of threshold for toxicity. Only at the EPA does straight line toxicology have any status, mostly because it avoids serious science. Main stream toxicology science is still committed to the idea of threshold of effect and the old saying—the dose makes the toxin. The EPA scientists in house know the truth, but again politics and a commitment to a policy/environmental ideal results in lies.

5. Under no valid scientific analysis retro or prospectively, can the EPA use the methodologies or the results of the Pope, Dockery, McDonnell, or Lipfert (see endnotes) studies to justify one more burdensome air pollution regulation, but there is strong evidence for rescinding the last round of Air Quality Standards.

6. The EPA has a mandate to act only on the basis of acceptable scientific evidence of health effects, and is obligated to abandon the precautionary principle approach to regulatory policy, a pathetic substitute for legitimate science and clearly a principle founded in politics, not science.

7. The EPA could never convince a Federal Court, operating under Federal Rules of Evidence 702 and the court dicta for expert and scientific testimony that the EPA air pollution health effects science is valid proof of anything. The Pope, Dockery and Lipfert or Samet studies cannot be massaged or misrepresented enough to create any proof of air pollution health effects. The studies show trends within an insignificant range and "associations," that are not evidence of proof of health effects.

8. Precautionary principles that are used by the EPA as stand-alone policy justification are nothing more than a dressed up version of anxiety, cannot pass muster for admissible scientific evidence in a Federal Court and ignore the reality of risk/benefit analysis.

9. Based on the information reviewed in this critique, the EPA must revisit old rigs, forgo new, more onerous and expensive regulatory interventions, and the EPA must suspend its rulemaking in air pollution until it can find valid and reliable science on health effects.

Toxic air pollution existed in the past, and still may occasionally occur in some places on the planet as a local phenomenon, as particulate and other noxious air pollution in industrial areas, from various sources. Certainly air in big cities, Pittsburg, Los Angeles, Houston, New York was fouled in the past by air pollutants and even when not toxic, was smelly and visible, but trends in air pollution in the past 30 years as reported and confirmed by the EPA, have all been positive, attributable to changes in industrial processes, regulatory efforts and cleaner petroleum and coal consumption. Any study or discussion of air pollution is focused on a moving, improving problem. However the public thinks the air is worse than ever and there is an air pollution health effects crisis, and that is the fault of the EPA, its favorite researchers, and the mass media, who love to scare the public, since EPA budgets and environmental organization budgets depend on the anxiety of the public.

The death and illness rates during smog and air pollution catastrophe periods in the past were affected by less effective medical management and heavier cigarette smoking but also significantly higher air pollution than exists anywhere in the United States today, for many reasons. Deaths from acute respiratory failure in the past were more common and less preventable, but that is an independent factor related to medical advances and not due to air pollution itself. Airway diseases, the main effect of any air pollution, were less treatable before the 1970s. Pulmonary Medicine has changed dramatically for the better since 1970. Many airway diseases were more dangerous in the past and medical therapies frequently failed to control disease and death. Medical expertise in respiratory illness and cardiovascular disease is changed, but Pope and Dockery still yearn for the good old days of killer air because it scares the public. Their research ignores the trends of the last 20 years and below I will discuss a conscious deception in the second half of the Pope research from NCI data. In addition the EPA air pollution researchers continue to ignore the weakness of their findings, hoping to keep alive the "deadly air" panic talk alive.

People die for lots of reasons in America, but not due to air pollution. Air pollution health effects researchers know that, but act as though nothing has changed. The EPA should carefully reevaluate the number of deaths that researchers claim are due to air pollution in the last 20 years, but the EPA has a conflict of interest. No air pollution crisis might mean reduced EPA funding. No air pollution crisis might mean no funding for the researchers and their support organizations.

The air pollution health effects studies are based on weak epidemiologic relationships and trends carelessly described without definition as "associations," or "trends." Well ice cream consumption and drowning or boating accidents are associated by season, but ice cream eating doesn't cause water accidents. Associations are not proof, they are observations of phenomena--clusters of events that may or may not mean something. Epidemiologists know these things and should be careful when describing data associations and trends within insignificant ranges like less than relative risk of 2, so that the reader or reporter won't mislead the public or a politician. However, the definitions are not forthcoming from the scientists and researchers because saying that there is no crisis of air pollution means no publications for air pollution researchers, no

invitations to swell events, no funding, no chance to pursue a political agenda and change the world, making your mother proud.

The uncertainties of the air pollution health effects studies, the weak relative risks and the methodological problems of the most influential of the health effects studies are so noticeable and remarkable that during this comment period the EPA should reassess what has gone wrong in air pollution health effects research. The EPA should assess how these weak studies have affected EPA policy and rule making. The EPA doesn't have the right to panic the public and political leaders with deceptive junk science in the service of religious and fanatic environmentalism.

DISCUSSION OF THE STATISTICAL AND METHODOLOGIC PROBLEMS OF THE SAMET, POPE, AND DOCKERY HEALTH EFFECT DEATH STUDIES.

Author's comments are in bold. Studies referenced are underlined and the cite is in the endnotes by name and year. Sorry to disappoint those who want numbered endnotes—not a formal paper.

J. Samet (Samet 2000) published in the New England Journal of Medicine, a study modeled after the studies of Pope (1995) and Dockery (1993). He compiled and studied deaths in twenty American cities over a period of years, and compared them with air pollution monitor reports for those cities.

Samet in this 2000 paper asserts the following:

--"the relative rate of death from all causes was 0.51 percent increase for each increase in the PM 10 (10 micron size particulates) of 10 micrograms per cubic meter." This effect is not proof of anything, and Dr. Samet knows it. Less than a 1-% death effect is a nonsense result in a big cohort study.

--"the relative rate of death from cardiovascular and respiratory diseases rises 0.68 percent for each increase of 10 micrograms per cubic meter" Trends of less than 1% inside of a meaningless range of relative risk less than 1.05? A serious epidemiologist would snicker?

--"we also analyzed the effects of levels of carbon monoxide, sulfur dioxide, and nitrogen dioxide in a fashion similar to that of the analysis of pm 10 levels. After adjustment for pm 10 and ozone levels we found little evidence that these pollutants had a significant effect on the relative rate of death." Hold it, hold it, Samet says that he can't find an effect, even itsy bitsy effects from ozone precursor and carbon monoxide, something the other EPA favorite researchers say are killing thousands? Samet is not helping the EPA here. What about those dastardly pollutants? We scientists and particularly toxicologists are smiling to see Samet make a fool of himself and by adoption of this weak and deceptive epidemiology, the EPA doesn't look too good either. This is the kind of research the EPA has been using in air pollution regulatory policy now for years.

--"We did not find an effect of ozone levels on the overall rate of death from all causes or from cardiovascular and respiratory causes during the full year periods. Ozone levels were positively associated with mortality rates during the summer months when ozone levels were highest, although the 95 percent posterior interval extended into the range indicating no effect of ozone levels on mortality." Might this non-Johns Hopkins man who owns no jacket with arm patches translate for the benighted—Samet says even ozone doesn't have a death effect in his study. Score so far on this paper—rational skeptics for people in search of truth 3, EPA and Samet 0.

--"We found no evidence that key socioeconomic factors such as low socioeconomic status affect the association between PM10 and the risk of death in linear regression models." Some might be surprised to know that Samet works at a School of Public Health and all Public Health research for the last 20 years has shown clearly that there is a socioeconomic effect that produces premature deaths. Skeptics now 4 and running away, EPA and Samet still 0. Socioeconomic noise cancels out air pollution effects; that's the way the epidemiologists put it.

--"Our analysis also did not address the extent to which life is shortened in association with daily exposure to the various pollutants." Well golly Dr. Samet, everyone dies, how can you talk about death effects if you don't measure whether deaths are premature? Skeptics 5, Samet and EPA still 0.

Additional comments by this author:

1. The rate of death changes in Samet's studies are less than 1%, which is epidemiologically meaningless and shows no respect for the relative risk of 2 (100%) or more, that all cohort studies have to show in order to be able to assert effect. Little effects, even in studies with good confidence intervals and lots of power, are still empty studies, make work exercises. Samet's study was a nothing, yet it got published in the New England Journal, so one must wonder about political and environmentalist agendas up in Boston. I suppose they are neutral on the environment and always demand valid research in support of political agendas. I suppose.

2. The study fails to age/sex adjust for the important analysis—premature death. How did Samet get published? Samet is asserting proof of effect at less than one two hundredth of what is required in epidemiology. Then he says he didn't bother with measuring whether air pollution caused premature deaths. This research is about acute death affects? At non-toxic pollution levels? There is no plausible biologic science to support the idea that non-toxic air pollution kills people. Samet is beyond redemption. He's in scientific denial, or he works for the EPA agenda and he will be funded until he is old and gray.

3. Low relative risks, below 1.2, are the results in Samet's studies and all the other EPA health effects studies. One study goes above 1.2, the Dockery 1993 smaller study at 1.26, since recalculated by Enstrom in his article, Enstrom 2005 to 1.13. Such weak and minimal findings are unacceptable for publication, much less serious EPA policy making. The EPA and the studies misuse the term statistical significance, trends or association if they mean proof. There is no proof in any of these studies of an air pollution health effect. These studies prove nothing in the relative risk ranges of less than 1.3, particularly in cohort studies of death certificates that are subject to serious confounding.

4. The failure by Samet to find any effect, even these minimal effects, from other air pollutants like nitrous and sulfur oxides (ozone precursors), ozone, and carbon monoxide should give the EPA cause to wonder about any further attempts to impose new ambient air standards. The EPA has noticeably ignored Samet conclusions about these pollutants, why?

5. Samet's assertion that socio economics do not effect death rates is a an extraordinarily faulty conclusion for a public health researcher, since his study only looked at average area incomes for the twenty cities; and there is a vast body of public health research that shows that socioeconomics independently are a significant factor in life expectancy. (Wong 2002, Fitzpatrick 2001, Lantz 1998).

6. Socioeconomics is a factor and would nullify the signal from air pollution effect, and could even be a cofactor in another way by causing poor indoor air quality from substandard housing and a higher rate of

smoking along with a higher rate of underreported smoking. For example the poor have outdoor jobs where they can smoke more, and culturally they may be much heavier smokers with more inhaling, a potential confounder. Such confounding might explain the Ohio and West Virginia data from Pope 1995. That's why relative risk has to be set high, to avoid the effect of confounders not seen or understood.

The Samet article includes cautionary notes on the limitations of the study's methodology. His caveats are applicable to the all the previously mentioned Pope and Dockery, favorite EPA studies on air pollution health effects:

1. "For the pollutants measured on an hourly basis we calculated the 24-hour average." Toxicologists cringe at that one.

2. "If the pollutants were measured at multiple locations in a metropolitan area, we averaged the data." Remember the basic principles of toxicology, if you're downwind from an air pollutant you're safe, how can he say these things with a straight face. You have to know the patient and the toxin and the dose to know anything much about the science. Population studies are very crude at non-toxic levels of exposure.

3. "Since the Environmental Protection Agency requires levels of PM 10 to be measured only every six days, data for ozone and other pollutants were generally more available on more days." Good grief, this is a sham, a toxicology study with exposures every so often in sub toxic ranges.

4. "We analyzed the effect of the day on which the pollution data were obtained (the current day, the day before, or two days before) on the association with mortality rates. The overall effect did not vary with the lag interval selected. We report data for a one day lag between pollution variables and mortality." This is the place where Dr. Samet shows he doesn't know anything about death. You could be sick to death in a hospital and I can keep you alive indefinitely until the family gives up—where do those cases fit in Dr. Samet's arbitrary lag time of one day? What about people who die in a bed at a nursing home and haven't been outside in two years? These public health wonks and economists who hate dirty air do research as if a death certificate signed by the local GP is a piece of reliable data on the health effects of air pollution. They are in dreamland.

Then Samet says they found a temporal-causal relationship -- astounding! He didn't find a causal relationship, but he can find a temporal relationship. Did he dredge and dredge until he found something to point at? What's he talking about? Who's to know when the blips in the data are differences of less than 1%? That's not about cause of death, that's about political agendas and a polemic dressed up as science that causes public anxiety.

The good Doctor continues.

5. "Data on levels of PM 2.5 (small particulates) are not yet available nationally, since a monitoring network for particles in this size range is currently being implemented." This writer believes that Dr. Samet is working the agenda for the "annuity." Small particulates are an annuity for the EPA and air pollution researchers because, along with ozone, dust will never go away. Those air pollution demons assure EPA power into the distant future and more regs and anxiety. Dust is bad. Dust is always going to be there. It's the perfect air pollutant for the EPA.

Samet and others in the air pollution junk science club just use the PM 10-micron data that is measured every six days as a surrogate for PM 2.5. The supportive press and academic colleagues forgive such a lapse since they are working on the agreed upon agenda.

6. "Our analyses also did not address the extent to which life is shortened in association with daily exposure to the various pollutants."

Extraordinary. If the endpoint is a death effect, then the study must analyze premature death in mortal man and assess acute events as a measure of effect and endpoint for acute and/or chronic disease. To determine premature death effect, age and sex adjusted death rates are the accepted methodology, but Samet is just doing death rates and he gets published in the New England Journal of Medicine? Politics and the right agenda trump science and peer review?

7. "The finding that the association between PM 10 levels and the risk of death was strongest for cardiovascular and respiratory causes of death is consistent with the hypothesis that persons made frail by advanced heart and lung disease are more susceptible to the adverse effects of air pollution."

Again they didn't show that at all, they showed less than a 1% effect on death rates. I thought these people were dying of air pollution caused illness, not acute effects of air pollution, which at current levels couldn't kill a canary. What gives? What gives is that Dr. Samet is clueless because he's a numbers cruncher for the EPA in cahoots with his friends in the spic and span air society. I know why people die and it isn't from air in America, or even from Air America. Air pollution comes in many forms but we are obligated to live with toxicology science, not anxiety. Living organisms don't die for the thought of a smoggy day or from a bad smell. Dr. Samet and his cottage clack of air pollution hand wringers should go to a hospital and see how and why people die before they do these desk analyses of death certificates.

Despite these caveats the Samet research group asserts in the conclusion of their paper:

"Our analyses provide evidence that particulate air pollution continues to have an adverse effect on the public's health and strengthen the rationale for limiting levels of respirable particles in outdoor air." Samet says nothing about the significance of their research showing no death effect from ozone, carbon monoxide, sulfur and nitrous oxides. That would certainly disrupt current EPA policy, and he avoids an admission that the relative risks and death rate changes he found do not reach epidemiologic significance.

This study by Samet is sham epidemiology/science, junk science with lipstick, and the deception and "newspeak" harkens back to junk science in the service of the King or the current tyrant. Pope, Dockery and Samet are the officials/magicians/astrologers/conjurers in the EPA court, providing the EPA regent with needed "expertise" to justify the latest edict.

Briefly we will discuss below Dr. Samet's mentors, the EPA's favorite air pollution haters, Drs Dockery and Pope, who work together and change places on the authors lists of their papers.

The Six City and Pope Studies?

Dockery (1993) and Pope (1995) did studies that were the model for the Samet study discussed above. The studies did do better than Samet, in that they measured relative risk of premature death by studying death rate with age sex adjusting. Both Dockery and Pope were unable to show significant relative risk of health effect. The Pope and Dockery studies were used in the mid 1990s to justify EPA Director Browner's "emergency" new ambient air quality standards on ozone and other pollutants. The resulting cost was

estimated by the Center for Study of American Business at Washington University, St. Louis, at more than 100 billion. The Browner action was taken unilaterally, in spite of protests from many agencies within the government and without the approval or support of EPA internal experts. This action was taken without proof of a health effect, since Pope and Dockery never showed an acceptable relative risk. They were limited again to Samet's "associations" and trends within meaningless ranges below a relative risk of 1.3.

There is a greater relative risk of whole milk causing lung cancer than the relative risk that the EPA has shown for air pollution. One might say that's because of some confounder—well duuuh, that's why relative risk has to be above a threshold of 2 and some say 3, so confounders don't make the epidemiologist look confounded. Samet, Pope, Dockery don't care, they're on a roll and have the support of the environmentalist zealots, and the EPA (whoops, that's redundant). Call public relations, the research shows air pollution is killing thousands. It causes CANCER.

This paper points out that the EPA and the researchers are cheatin', and Dr. K. Popper, famous philosopher of science favorably cited by the Supreme Court in the Daubert decision, says that science must be more serious and reliable than politics. Popper asserts that science must be based on proofs that are reliable. Popper even talks about what the air pollution research by Pope, Dockery and Samet and the spic and span society is—Popper says some "science" is so bad it can't be falsified. How does one falsify something that means nothing? Associations at the edge of or in the midst of nothingness is what Pope's and the other health effects studies assert should be the basis for society wide regulatory regimes. Breathtaking—no pun intended.

The EPA says that air pollution kills thousands, because air pollution kills thousands. That is a tautalogy, a common tool for junk scientists. IT IS BECAUSE IT IS. I write here to tell the EPA that their anxious pursuit of clean air is more about politics and power and anger with modern industrial society that is already cleaning up the air, more about the religion of environmentalism. That's why the crisis, without the deaths or the science is a political or a polemic tool, not science. Not nice to fool with science that way, particularly when there is a Federal mandate that the EPA insist on scientific integrity for policy making. The EPA should not be in the business of ginning up false crises and scaring mothers that their kids are going to suffer from the air just so that the bureaucracy will thrive at the Federal and State level.

The EPA cannot claim to be unaware of the failure to prove health effects by the insignificant level of relative risk in the Pope and Dockery studies. These are the most basic of epidemiologic rules. And no subsequent studies have rehabilitated the failures of the Pope and Dockery studies. Samet, as described above, just repeated the same mistakes and came to up with the same lack of proof of health effect, unjustified conclusions and excessive and activist recommendations.

The barriers to a good study on health effects of air pollution for Dockery and Pope were the same as for Samet,

1. mobile populations,

2. unreliable, non-continuous and fixed monitor information,

3. no monitor information on some pollutants all the time (2.5 micron particles for example) or part of the time (10 micron and others),

4. an attempt to assess long term chronic health effects of air pollution by death studies, an acute phenomenon,

5. death certificates and raw death data used without autopsies,

6. inside air quality ignored for populations living indoors, particularly during old age, advanced medical illness, and terminal illness,

7. But most of all, no biological plausibility because the deaths are in the setting of non-toxic levels of air pollution (the inane straight line effect toxicology of the EPA cannot continue to get a pass—it is advocacy at the expense of science).

The EPA in assessing the air pollution effects studies must revive Bradford-Hill Criteria for toxicology.

The Bradford Hill (BH) criteria for toxicology are elementary, and establish biological plausibility for toxin effects. They require the toxicologist to establish plausibility, dose effect, reproducibility, time relationship, and a pattern of predictable and observable effects. Sounds like good science, but that's only part of it. Karl Popper was referenced above as the guru of the philosophy of science, and master or curator of scientific principles. The Popper legacy of science rules are referred to reverently in the Supreme Court opinion in the Daubert v. Merrill Dow Case [509 U.S. 579 (1993)] on admissibility of scientific testimony. Falsifiability is the key. To be true science one must submit to the test of being proven wrong. Pope and Dockery study results can't be falsified because they don't even allow a legitimate assertion of proof. They are tools in the game of politics, not in the game of toxicology. The EPA is required by common sense and federal statute to apply the BH criteria in air pollution studies, and all other toxicology work, but instead this wildly deceptive use of small changes within insignificant ranges of effect is souped-up to become the reason the EPA must act, now, immediately, to save lives. The EPA is saving itself, but the air pollution regulations are not saving any lives because the research would show the lives lost with valid epidemiology, and it doesn't.

The only reason that the EPA can create a crisis from the Pope or Dockery studies if it holds its nose and just projects to the whole population of the United States, then relative risk of less than 5% becomes thousands of deaths, even though it fails to show proof of one death caused by the toxicity of air pollution. Not one death.

If the biological plausibility of air pollution causing disease and death consistent with the BH criteria was established or could be established, then EPA and air pollution health effects researchers like Pope, Dockery and Samet could rest with their laurels. If air really were a killer or a toxin, we wouldn't see these weak cohort studies from the EPA with itsy-bitsy relative risks, and the argument would be over.

The EPA is not the national agency or institute for the arts, culture, pleasantness and good smells, it has a serious public health responsibility and a federal mandate to find toxins with legitimate science, promulgate appropriate solutions for the public benefit and then assess the effectiveness of what it has done. None of those steps are being taken in the air pollution policy making of the EPA.

The air pollution health effects studies in America will never be able to show the required relative risk of 2 or 3. What was the EPA role in such deception?

The idea that seems to control the EPA policy making on air pollution in the past 15 years is--ignore methodology and statistical problems, science be damned, move on to the grand program of air purification.

Find the ultimate terrible pollutant that will never go away, even with all our regulations. That is why small particulates are so promising for the EPA, enough so that these health effects studies talk about small particulates without measuring them, or measuring them in only one part of the study and not everywhere. The project of demonizing small particulates is reflected in the Samet study. He makes strong assertions with extraordinarily weak evidence, but he goes to the meetings, he knows what the EPA is concerned about. With EPA leading and frequently funding the crusade—science and truth casualties are acceptable. Small particulates are the worst crisis in the history of air pollution, they might cause CANCER.

I grew up and still live on a farm. I consider dust a reality that cannot be regulated away, just like ozone is part of the Smoky Mountains. There is a form of air pollution that is now being generated by the EPA in its ozone and small particulates crisis project—it is composed of dust, water, methane, and biological particulates.

Joseph Shumpeter said that the first casualty of a commitment to an ideal is the truth. The second casualty, this author asserts, is the unwary taxpayer and public that depends on responsible government. Solzhenitsyn said "The simple step of a courageous individual is not to take part in the lie. One word of truth outweighs the world." The EPA has become a slave to the lie of junk science in health effects research because the agency is devoted to its own importance and the importance of its religious and political agendas. EPA dredges up and makes icons of the precautionary principle, the small numbers/large projections lie, small trends within meaningless relative risks in populations studies, the refusal to recognize basic toxicology concepts. The EPA is a rogue agency in need of a stand down and close internal inspection with regards to bad policy making on the basis of bad science.

The Killer Smog

In The New England Journal of Medicine, Dr. C. Arden Pope, clean air activist, and one of the EPA's all time favorite air pollution health effects researchers, describes killer air in Belgium in 1930, Pennsylvania in 1948, and London in 1952 -- and uses those incidents as examples of why he thinks there is good reason to pay attention to a study in that issue of the Journal that claims to show a causal relationship between non-toxic air pollution and children's pulmonary functions. Again the study he is supportive of shows no epidemiological proof, just "associations," which are nothing more than statistical cluster puffs in population studies subject, as pointed out above, to bias and confounders. But the key is the study includes two important things for environmentalist zealots, children, and air pollution. Most importantly this study, like all the air pollution health effect studies, is working in insignificant causation ranges of effects so Pope and the EPA can talk about little bitsy trends and associations and urge that something be done before children die on playgrounds. They talk of these numbers exercises like they foretell an apocalypse. Gather the elderly and children and go seek shelter from the air, says Dr. Pope, an economist who got in the air pollution health effects business because he hated the air in Utah—imagine if he had lived in New Jersey. Dr. Pope advises---Stop breathing, if you must.

People do not go out into the streets of America, choke and die. The days of the people of London and Pittsburgh wearing dark clothes to mask the effect of soot and smoke are gone. The public health hanky battalion wants Americans to think air is killing their children and old folks, but in America ambient air pollution did not kill anyone, last week, last year, or in the last ten years. The panicky talk has to stop and the EPA must stop being the sponsor of the lie. The medical journals have to put their scientist hats back on and stop wringing their hands about nonsense environmental crises. The EPA is so busy these days frightening people about their rat studies and the imagined effects of so many things. Hardly enough time in

the day to pursue air pollution, except the EPA has lots of staff and lots of money and much energy and religious devotion to the cause.

EPA Policy and Regulation Activity

Fredrick Bastiat is known for his "law of unintended consequences," best exemplified as the analysis of the Paris shopkeeper's broken window. Bastiat made a common sense observation that when government or individuals choose to spend money or act, it produces desired and undesired effects, always making a ripple within the society and economy.

Let us propose to the EPA that if asthma deaths are predominately in young adult black males in America because of poor compliance (McFadden 1997), due to cost and availability of asthma treatment for disadvantaged adult black males or some other socio-economic or political problem, the EPA would be foolish to work on parsing senseless air quality regulations in preference to better asthma health care. The EPA would not be a party to such nonsense, would it, to relieve the anxiety of anxious environmentalists or satisfy the EPA staff's need for power and control?

There are no free regulatory actions. Every choice has multiple consequences, and government interventions have effects unforeseen. The EPA takes taxpayer dollars for every jot and tittle, every phone call, every new grand idea of every zealous bureaucrat. Every dollar spent for the EPA's ideal of pure air comes from somewhere and is taken from somewhere else.

The EPA is charged with responsible health effects research and policy making. The questions raised in the mid 1990s and now are the same:

1. If relative risk is a well known measure of cause and effect in epidemiology, why does the EPA allow relative risk below acceptable levels of proof to influence policy making?

2. Considering that EPA regulatory activity is tremendous burden to the economy, and the air regulations have a cost effect measured in billions per year taken from the taxpayer. If socioeconomic factors are an undeniable influence on quality of life and life expectancy, then can weak and unacceptable health effects epidemiology as described above, be excused for some abstract ideal of pure air?

3. Can studies that measure acute events in any way be considered studies of cumulative health effects? Are these death studies that Pope and the other air pollution researchers insist on basically flawed and deceptive. The answer is yes.

4. If some of the studies can't eliminate confounders, does the EPA have the authority to impose an onerous regulatory regime on the American society on the theory that cleaner air is a worthwhile, even if it doesn't have any effect on health?

Enstrom Particulate Air pollution Health Effects Study of 50,000 elderly Californians. 2005

Dr. James Enstrom, in the attached article found in appendix A, studied deaths in elderly Californians in 25 counties. He found that the relationship between fine particulates and mortality was very weak during the 1973-2002, particularly after 1982. He also reviewed the cohort studies on health effects of fine particulates and mortality by Pope, Dockery, McDonnell, and Lipfert, and found that their results were fairly similar to his, with the weakest health effects being present during the most recent years.

Enstrom finds:

1. The relative risks, age and sex adjusted and homogenized, are close to 1.00 in his and the other death studies (Pope, Dockery, McDonnell, Lipfert) he reviews in Table 10—there is no proof of health effect shown from particulate air pollution in his or the other studies.

2. Pope's year 2000 16 year follow up to the earlier (Pope 1995) study of the same cohort (Pope 2002) shows a declining cumulative risk from 1.07 to 1.04, first half to second That means to all but the innumerate that the relative risk in the second decade is well below 1.04. Hello Dr. Pope, Helloooo EPA.

3. Enstrom points out there are substantial geographic variation between the California populations of his study and Pope's Ohio, Kentucky and West Virginia data. The potential for confounders should be considered. I know something about that, and people in those states aren't the same as people in Enstrom's study. They might live different lives from their fellow citizens in Lala land. That's what homogenizing and sampling in epidemiology is all about. Without the data from those three states, Pope's studies would be more epidemiologically insignificant than they are, if that were possible. So much for avoiding cherry picking and the admonition to chip off the edges of the data to norm a cohort analysis.

The important points of the Enstrom study: .

1. Deaths and air pollution relative risks were assessed for 25 California counties, a cohort of 50,000 elderly Californians, and 39,000 dead before the end of the study in 2002. The relative risks were measured with proper confidence and homogeneity.

2. Relative risk found was extremely small and insignificant, 1.04 in the first part of the study (1973-1982), then relative risk of death from air pollution disappeared altogether in the second part of the study (1983-2002). Which will it be EPA, a crisis or salvation from killer air.

3. For the entire period the relative risk was 1.01 Pulleeez, 1-% risk? That's a relative risk of 1.01. I am closer than that to being rich and good looking, like Michael Jordan. The results would have to be 2.00 to be proof of any health effect, 1.00 is no effect.)

4. This Enstrom study, like all the other studies that the EPA uses to analyze health effects, and supposedly to study small particulate effects, is limited by the lack of PM 2.5 micron monitors before 1979 and only limited monitors after.

5. No increased death effects of any kind were shown in the counties with higher levels of air pollution, eliminating any dose response effect (a favorite rhetorical tool of the EPA researcher group), that, some of the higher pollution counties had lower relative risks. So is air pollution good for you if you live in California? In this range of relative risk absence of trend is meaningless but Dr. Enstrom does the

prescribed exercise, since the air pollution cabal likes to do trending and associations. The idea of a trend within an insignificance is interesting to consider, for fun, but not for science.)

6. Table 10 in Enstrom's paper shows a comprehensive review of comparable relative risks from large (Pope, Enstrom) and small (Dockery, McDonnell, Lipfert) studies, showing that only the Dockery study published in 1993 in a small cohort shows a relative risk above 1.1 at 1.15. All the other studies show relative risk similar to Enstrom, in the range of 1.07 or less.

7. In table 10 a number of the confidence intervals cross 1.0, the cumulative relative risk of the Pope study for the second half is lost in the failure to separate out the second half, indicating there is a reason to believe that in the second half of his study 1990-98, Pope had a relative risk approaching an insignificant 1.01. I worry, sort of, about Pope hiding this bad trend downward of an already weak relative risk. Could one suppose he has revealed this problem to his friends at the EPA?

Suresh Moolgavkar comments

It would not be practical here to cover all the writings of Suresh Moolgavkar on the epidemiologic and methodology problems he identifies in the EPA air pollution health effects research and policy making, and this writer does not understand some of the subtleties. Dr. M's brain and pen are too capable for an adequate treatment here, by a mere emergency physician. Dr. Moolgavkar's recent in depth review and critique of EPA particulate and air pollution research and policy making is in Appendix B.

Moolgavkar 2005 wrote a commentary on Enstrom's paper for Inhalation Toxicology discussed above (see second part of App. A). He asked the rhetorical question "Can contemporary epidemiological and statistical tools reliably detect miniscule risks, particularly with strong risk factors as potential confounders?" (Dr. Moolgavkar is too kind. He politely avoids exposing the junk science, the obvious, that miniscule risks in a cohort study like the results in the Pope, Dockery and other studies show no health effects at all and talking about trends in those ranges is silly.)

Moolgavkar objects to the methodology of proportional hazards modeling because "it is highly unlikely that proportionality of hazards would hold over the entire period of time covered by these studies." (The long term air pollution health affects studies). He asserts that it can be argued that "the SO 2 effect wipes out the PM signal in joint pollutant models." He does not even address the Samet study showing no SO 2 effect, so even that problem may ignore the more basic one that is so apparent—there is no detectable causal effect between air pollution and death. Dr. M is operating with the assumption that SO2 still is on the top of the list of bad pollutants. No doubt it is more toxic than others, but again, we must repeat the toxicology commandment—the dose makes the toxin. The air pollution health effect studies relied on by the EPA are ridiculously weak and are used as silly substitutes for a lack of laboratory proof that the current air conditions cause disease. The health effects research of Pope Dockery and Samet is just an exercise in the traditional deception of the "data dredge," the tool of crisismongers.

What is the point of quibbling about miniscule, below threshold of proof, differences in a cohort death study, some slavish devotion to arithmetic? I benefit, I suppose from not liking higher math, in this circumstances, that's why I focus on the medicine and the proper analysis of death studies and why people die.

Moolgavkar (2005 See App. B) wrote a lengthy review and criticism of EPA policy in Regulatory Toxicology and Pharmacology that exposes the epidemiologic and toxicological problems of the EPA air pollution health effects research discussed above.

Moolgavkar asserts: "evidence fell far short of supporting a causal association between particle mass concentration and human health." He goes on "the results of observational epidemiology studies can be seriously biased, particularly when estimated risks are small, as is the case with studies of air pollution. The Agency (EPA) has largely ignored these issues." "I conclude that a particle mass standard is not defensible on the basis of a causal association between ambient particle mass and adverse effects on human health."

Although Moolgavkar allows that the EPA may be bending the science in an attempt to pursue the precautionary principle on particulates, the precautionary principle under a mandate of good science in the public interest is not good policy. It is the default position for making concerns, feelings and aesthetics into the basis for regulatory actions that cost society billions for compliance. However no sandal-footed environmentalist gang of enviro-religious concerned citizens can allow the EPA to reject science.

The EPA is prohibited by federal mandate from ignoring science in the pursuit of the precautionary principle. The precautionary principle is anti-science and irrational by definition. Health effects not showed scientifically trumps feeling, concern and governmental overreach. The EPA is mandated by federal law to halt the overreach of the air pollution crisis crusade until it can resuscitate science in the public interest.

Fine Particulate Air Pollution and Total Mortality Among Elderly Californians, 1973–2002

James E. Enstrom

Jonsson Comprehensive Cancer Center, University of California, Los Angeles, California, USA, and

Scientific Integrity Institute, Los Angeles, California, USA

Fine particulate air pollution has been associated with increases in long-term mortality in selected cohort studies, and this association has been influential in the establishment of air quality regulations for fine particles (PM2.5).However, this epidemiologic evidence has been questioned because of methodological issues, conflicting findings, and lack of an accepted causal mechanism. To further evaluate this association, the long-term relation between fine particulate air pollution and total mortality was examined in a cohort of 49,975 elderly Californians, with a mean age of 65 yr as of 1973. These subjects, who resided in 25 California counties, were enrolled in 1959, recontacted in 1972, and followed from 1973 through 2002; 39,846 deaths were identified. Proportional hazards regression models were used to determine their relative risk of death (RR) and 95% confidence interval (CI) during 1973–2002 by county of residence. The models adjusted for age, sex, cigarette smoking, race, education, marital status, body mass index, occupational exposure, exercise, and a dietary factor. For the 35,789 subjects residing in 11 of these counties, county-wide exposure to fine particles was estimated from outdoor ambient concentrations measured during 1979–1983 and RRs were calculated as a function of these PM2.5 levels (mean of 23.4 μg/m 3). For the initial period, 1973–1982, a small positive risk was found: RR was 1.04 (1.01–1.07) for a 10-μg/m 3 increase in PM2.5.For the subsequent period, 1983–2002, this risk was no longer present: RR was 1.00 (0.98–1.02). For the entire follow-up period, RR was 1.01 (0.99–1.03). The RRs varied somewhat among major subgroups defined by sex, age, education level, smoking status, and health status. None of the subgroups that had significantly elevated RRs during 1973–1982 had significantly elevated RRs during 1983–2002. The RRs showed no substantial variation by county of residence during any of the three follow-up periods. Subjects in the two counties with the highest PM2.5 levels (mean of 36.1 μg/m 3) had no greater risk of death than those in the two counties with the lowest PM2.5 levels (mean of 13.1 μg/m 3). These epidemiologic results do not support a current relationship between fine particulate pollution and total mortality in elderly Californians, but they do not rule out a small effect, particularly before 1983.

Table ten is present as originally published in a pdf file of the article. Attached.

Fine Particles and Mortality

Suresh H. Moolgavkar

Fred Hutchinson Cancer Research Center Seattle, Washington, USA

In an interesting paper in a recent issue (vol 17, issue 14)

of the journal, Enstrom examined the association between fine particulate matter (PM) pollution and mortality in a cohort of elderly Californians. The analyses used proportional hazards

regression and after adjusting for age, sex, cigarette smoking, and other potential confounders, Enstrom concluded, "These epidemiologic results do not support a current relationship between

fine particulate pollution and total mortality in elderly Californians, but they do not rule out a small effect, particularly

before 1983." Enstrom's analyses were based on a sub-cohort of individuals enrolled in the first Cancer Prevention

Study (CPS I) conducted by the American Cancer Society (ACS). Enstrom's conclusion is consistent with the conclusions of a cohort study among veterans conducted by Lipfert et al.

(2000), but is at odds with the results from analyses of the second ACS cohort (CPS II) by Pope and others (Pope et al., 1995, 2002; Krewski et al., 2000), which reported statistically

significant associations between fine particulate pollution and mortality.

Every epidemiological study has weaknesses and limitations and, undoubtedly, both proponents and skeptics of the 'fine par-ticles cause death' thesis will find much to criticize in the studies

that do not support their conclusions. These discrepant results raise an important question, however. Can contemporary epidemiological

and statistical tools reliably detect miniscule risks, particularly with strong risk factors as potential confounders? All the cohort studies referred to above use proportional haz-ards modeling for data analyses. But is proportional hazards really the appropriate tool for these analyses? First, it is highly unlikely that proportionality of hazards would hold over the en-tire period of time covered by these studies. Statistical tests for departures from proportionality of hazards have low power. En-strom states that, in his analyses, these tests failed to reject pro-portionality of hazards. However, his finding of a higher relative risk associated with fine particles over the period 1973–1982 is inconsistent with proportionality of hazards over the entire

I have discussed the original CPS II study (Pope et al., 1995)

and reanalyses (Krewski et al., 2000; Pope et al., 2002) in de-tail

elsewhere (Moolgavkar, 2005). I note here, however, that

the reanalysis by Krewski et al. (2000) of the original (Pope

et al., 1995) study (which considered no pollutant other than

PM), showed quite clearly that the pollutant most strongly as-sociated

with mortality was not PM but SO2.In fact, when SO2

was considered along with PM in the model for all-cause mor-tality, the coefficient for sulfates was reduced to less than a third of its original value, that for fine particles was reduced to a sixth of its original value, and both became statistically insignif-icant. It is also of interest to note that consideration of spatial correlations attenuated the PM coefficients to a much greater extent than the coefficients for SO2.Given the much stronger and more robust association of SO2 with mortality in the CPS II reanalyses, I find it surprising that this study continues to be taken as providing strong support for the PM mortality asso-ciation. It can be plausibly argued on biological grounds that SO2 could not be causally associated with mortality. But that still does not explain why SO2 wipes out the PM signal in joint pollutant models. This awkward fact has simply been dismissed as being irrelevant. In a more recent study of the CPS II cohort that doubles the follow-up time and triples the number of deaths, Pope et al (2002) reported significant associations between fine particles and oxides of sulfur with all-cause, cardiovascular and lung cancer mortality. Surprisingly, despite the findings in the Krewski analyses that SO2 was the pollutant most strongly as-sociated with mortality, no joint pollutant analyses were carried

Abstract only

A review and critique of the EPA's rationale for a fine particle standard

Suresh H. Moolgavkar

Sciences International, Inc., King Street Station, 1800 Diagonal Road, Suite 500, Alexandria, VA 22314, USA

Received 18 November 2004

Available online 24 March 2005

Abstract I review the rationale for the Environmental Protection Agency_s 1996 fine particle standard, which was based almost entirely on the epidemiological data with neither support from Toxicology nor understanding of mechanism. While many epidemiological papers available in 1996 reported associations between ambient particles and adverse effects on human health, many others did not and the evidence fell far short of supporting a causal association between particle mass concentration and human health.

The literature appearing after 1996 further complicates the picture. The large studies that have appeared after 1996, such as National Mortality Morbidity and Air Pollution Study, and the reanalyses of the American Cancer Society II study, report risks that are substantially smaller than the risks reported in the 1996 Criteria Document and Staff Paper. Moreover, concerns about confounding by weather, temporal trends and co-pollutants remain unresolved. Other issues having to do with model choice have resurfaced as a result of reanalyses of critical data to address a glitch in a widely used software package for time-series epidemiology studies of air pollution. Finally, contemporary examples show that the results of observational epidemiology studies can be seriously biased, par-ticularly when estimated risks are small, as is the case with studies of air pollution. The Agency has largely ignored these issues. I conclude that a particle mass standard is not defensible on the basis of a causal association between ambient particle mass and adverse effects on human health. Such a standard may be justifiable on the basis of the precautionary principle, however. The Agency could argue that the Science raises concerns about current levels of air pollution, and that reduction of ambient fine par-ticulate matter mass, if it could be achieved without an increase in the level of the ultrafines, could have positive effects on human health. If the Agency justifies a particulate matter mass standard on these grounds then the debate over the form and level of the standard will, for all practical purposes, belong strictly in the Policy arena.

4. Dunn submission on Ozone October 8, 2007

Subject: Comments on Ozone Standards 2007

Submitted via the a-and-r-docket@EPA.gov 10-9-07

Docket ID No. EPA-HQ-OAR-2005-0172

Comments by John Dale Dunn, MD, JD, Civilian Emergency Medicine Faculty, Carl R. Darnall Army Medical Center, Fort Hood, Texas, Policy Advisor, Heartland Institute, Chicago, IL. Member, Board of Scientific and Policy Advisers, American Council on Science and Health, New York, NY.

Corrected and revised final draft submitted 0915 CDT 10-9-07.

1. The EPA ozone science does not justify continued aggressive ozone regulation and a new lower 8-hour standard.

2. The observational air pollution studies and the weak exercise/ozone inhalation studies cited by the EPA show weak associations and relative risk less than 1.5, as well as lab results best described as non adverse. The study evidence cited by the EPA would not be admissible in a Federal Court because it violates basic epidemiology and toxicology scientific rules.

3. The EPA's own Clean Air Scientific Advisory Committee advised in the past that ozone effects research did not show adverse effects and the ozone standard should be left as is.

4. There is no EPA research that shows any benefits from the air quality improvements of the past 20 years. Is it that the EPA doesn't want to report any improvement, for fear it will jeopardize agency funding? Is it evidence that the air pollution wars of the past 20 years were against a PHANTOM MENACE? Are the weak population studies on air pollution weak for a reason--there was no killer air in America?

DISCUSSION

The EPA cited health effects studies are weak on adverse ozone health effects and weak generally on air pollution adverse effects.

The Scientific studies discussed in the proposal document are reviewed below. Although the studies are cited by the EPA to justify the ozone standard, they are not what the EPA commentary says they are. They do not excuse the old standard, or justify the new proposed ozone standards because they are a combination of weak observational studies and no-effect intense exercise/high ozone studies.

Commentary on some of the prominent studies:

1 Dockery DW, Pope CA 3d, Xu X, et. al. An association between air pollution and mortality in six U.S. cities. N Engl J Med 1993;329:1753-9.

Weak observational study that mentions, but does not control confounders. The results are small effects with relative risks of an insignificant magnitude that is proof of nothing.

2 Pope CA, Thun MJ, Namboodiri MM, et.al. Particulate air pollution as a predictor of mortality in a prospective study of U.S. adults. Am J Respir Crit Care Med 1995;151:669-74.

Like the Dockery study above, one of the EPA's most important studies for justifying air pollution regulations. This study is another example of weak epidemiology with weak relative risks and no correction for confounders.

Even after the congress passed a law sponsored by Senator Shelby, requiring Pope and Dockery to produce their data sets, they still dodge and feint, and have not complied. Pope and Dockery are still in the inside clique of EPA favored and sponsored epidemiologists. They continue unhindered and well funded by the EPA and other governmental grant sources friendly to an aggressive regulatory agenda.

3 Hrostman DH Ozone concentration and pulmonary response relationships for 6.6 hour exposures with five hours of moderate exercise to 0.9, 0.10, and 0.12 PPM. American Review of Resp Dis Nov, 1990; 142: 1158-63.

Even heavy exercise with ozone inspired above current limits shows little ozone effect and no disease. The effect shown was mostly subjective respiratory mechanical effect. Ozone makes air heavy and increases its suspended/solute load.

4 Samet JM, Dominici F, Curriero FC, et.al. Fine particulate air pollution and mortality in 20 U.S. cities, 1987-1994. NEJM 2000; 343:1742-9.

Study of cities that claims to know how many days it takes for air pollution to kill someone, then proceeds to find no kill effect from all the air pollution factors, including ozone and ozone precursors, except small particulates, but then admits that the small particle monitor information is not available for the study and that big particles were used as a surrogate. Breathtaking, but published by Dr. Samet's friends in Boston. Incidentally the EPA on its air web site now has announced that large particles are no longer monitored or controlled because they do not cause adverse effects, but the old studies that concluded the dangers of small particles admit they used large particle monitor data as a surrogate for the small particles, since small particle monitors only became available in the late 1990s.

5 Wong JD, Shapiro MF, Boscardin WJ, et. al. Contribution of major diseases to disparities in mortality. N Engl J Med 2002;347:1585-92.

Discussion of confounders in death studies. Apparently has not been read by EPA sponsored and in-house epidemiologists, since the proposal documentation of the EPA makes little mention of he problem of the studies that are relied on—they make assertions without caveats like they were environmental gurus.

6 Fitzpatrick R. Ed. Social status and mortality. Ann Intern Med 2001 134;10:1001-2.

Lantz 1998 Lantz PM, Lepkowski JM et. al. Low income was an independent risk factor for premature death after controlling for health behaviors. JAMA 1998; 279:1703-8.

None of the studies used by the EPA for air pollution regulatory strategies control well for socio-economic status. Some of the studies do nothing more than mention that average income and education were used over large areas. Very similar to the casual use of wide-area, even regional monitors as measures of exposure to pollution.

7 McFadden ER jr., Warren EL. Observations on asthma mortality. Ann Intern Med 1997;127:142-7.

Shows that asthma mortality is in a select group of patients and caused by under-treatment and socioeconomic factors.

8 Mcconnell R, Berhane KT Gilliland F, "Asthma in exercising children exposed to ozone: a cohort study, Lancet 359 (2002) 386-91.

Selective reporting of this study ignored the protective effect of ozone, (yes, protective) in the whole cohort while making much of a minimal evidence of detrimental effects in one group--kids who were in three sports. McConnell is part of the Gauderman group that specializes in studying air in Southern California and always finds detrimental effects, even though many times the methodology and the evidence of risk are questionable and weak.

9 Gauderman WJ, Vora H, McConnell R, et al. Effect of exposure to traffic on lung development from 10 to 18 years of age: a cohort study. Lancet (on line) Jan 26, 2007. www.thelancet.com.

This study by the Southern California group had two major problems--1. Very small pulmonary function differences, less than 5%, which is insignificant, and no real negative trend, since the trend line only existed because of one outlier. There was also a high drop out rate. 2. The study measured differences in groups up to 1500 meters, dividing by 500 meters except for a group within 300 meters. Research shows that air quality from roadways is at background by 300 meters. The air quality on Southern California roadways was reported by H. Zhu in Atmospheric Environment 2002; 36: 4325-35 and in Environmental Science and Technology 2006; 40: 2531-36. Gauderman's group is well sponsored by a division of the California EPA. Imagine their funding stream if they reported no roadway effects?

Studies and analysis ignored by the EPA

The EPA also refuses to recognize the research and analysis that contradicts the EPA air regulation proposals.

Lipfert FW, Perry HM, Miller JP, et.al. The Washington University—EPRI veteran's cohort mortality study: preliminary results. Inhal. Toxicol. 2000, 12 S4:41-73. (Insignificant air pollution health effects.)

Enstrom J. Fine particulate air pollution and total mortality among elderly Californians, 1973-2002. Inhalation Toxicology 2005; 17:803-16. (Very large and long term study shows no air pollution death effect, in fact a counter intuitive protective effect of air pollution in many California cities. This study essentially nullifies the weak studies of Pope and Dockery as well as other death studies that are used by the EPA to push tighter NAAQS)

Moolgavkar S. Let. Fine particles and mortality. Inhalation Toxicology 2006;18:93-4. (Refutes the EPA air pollution project dogma. Discussion of EPA overreach and excessive regulatory zeal.)

Moolgavkar S. A review and critique of the EPA's rationale for a fine particle standard. Reg Tox Pharm 2005; 42:123-44. (Expose' of the EPA's failure to use good science to justify its agenda to make current ambient air pollution appear to be a serious health risk for Americans.)

Schwartz, J. No Way Back: Why Air Pollution Will Continue to Decline, (Washington: American Enterprise Institute, 2003). (Discussion of declining air pollution and improving air quality.)

The situation is so bad that the EPA and its sponsored epidemiologists and public health toxicologists control the literature and the journals. Journal editors now ignore toxicology and relative risk rule breaking. A recent poll by the National Institute for Statistical Science indicates that epidemiology journal editors no longer require data set production, p value calculation adjustments for multiple testing, and compliance with the rule on relative risk. The epidemiology journals have become political commentary on the hot environmental and social issues of the day—a mirror on the mental state of the academy.

Federal Rules of Evidence

The persistent failure of research on ozone and other air pollution observational studies to meet the requirement for relative risk of 2 and the p valued calculations without adjustment for multiple testing are examples of pseudo-science. The measure of scientific integrity, however, goes outside the academic and journal community. The Federal Courts have a stake in reliable evidence and the Federal Trial Court Judge makes the call on admissible scientific evidence.

The Federal Judicial Center's *Reference Manual on Scientific Evidence*, 2nd Edition (2000, West Group), also free on line at http://www.fjc.gov) Chapter on Epidemiology, written by highly esteemed experts, including Leon Gordis, the former Chair of epidemiology at Johns Hopkins School of Public Health deals with various matters of admissibility. The Manual states, at page 384:

> The threshold for concluding that an agent was more likely than not the
>
> cause of an individual's disease is a relative risk greater than 2.0. Recall that a
>
> relative risk of 1.0 means that the agent has no effect on the incidence of disease. When the relative risk reaches 2.0, that implies that the agent is responsible (with certain qualifications noted below) and implies a 50% likelihood that an exposed individual's disease was caused by the agent.
>
> A relative risk greater than 2.0 would permit an inference that an individual plaintiff's disease was more likely than not caused by the implicated agent. Thus, a relative risk of 2.0 would permit an inference that an individual plaintiff's disease was more likely than not caused by the implicated agent.

There are no major studies of ozone health effects relied on by the EPA that show a relative risk 2 or more. In fact there is not, at this time, a way to design a study on ozone that will show evidence of any relative risk, because there is no end point to measure. Ozone is a benign molecule, and doesn't cause death or disease. Exercise studies with excess exposure are a house of scientific cards for any EPA effort to build a toxicology argument against ozone.

The only reason the EPA can use these studies with relative risk of 1.5 or less, and not blush or apologize, is a political climate of panic about the environment and collusion in the academic and journal community collecting around the non-scientific social science concept of the precautionary principle. Discarding the relative risk rule is necessary to the survival of the precautionary principle, since the scientific evidence on ozone and most other pollutants cannot be shown to reach the relative risk of 2.

Expanding the effect of the EPA with "susceptibility."

The EPA also misuses the concept of sensitive or susceptible groups to make any exposure a concern for regulation. Susceptibility allows the EPA extraordinary latitude. There is always someone who is really, really sensitive—therefore the EPA plans to play the sensitive game and will make the society pay, eliminating any target toxin, regardless of the cost of the ablution. The rational regulatory regime does not adopt such a nonsensical approach, but the EPA embraces the concept as an excuse to overdo.

Reviewing the EPA United States air quality map, there are presently very few unsafe air quality areas, but that map will deceptively and dramatically change if the new ozone standard is implemented, along with the nonsense of the susceptibility. It will make no difference whether the standard is 0.06 ppm or .07 ppm, the non-compliance expansion guarantees that the EPA will exist into eternity.

The EPA is no longer in the business of protecting the public health and preserving the environment, the new range of ozone standards is an example of an EPA attempt to redefine what the environment should be and assure itself agency immortality. The EPA wants the world to be a scrubbed down bubble with no dust and no ozone for its own purposes, with no consideration of the rules of scientific integrity or even the mission of the agency to protect the environment and the public. Next the EPA will be regulating nitrogen, which is toxic if found at too high a percentage in the air. Really toxic.

The EPA is consciously and intentionally pushing the limits of scientific concepts of toxicity and epidemiology and cheating on the margins with the help of aggressive and flexible toxicology and epidemiology research. At this point a responsible Federal Judge, properly informed by the Federal Judicial Center Reference Manual on Scientific Evidence, chapters on toxicology and epidemiology, would throw out the "evidence" the EPA is using for this round of ozone standards.

The EPA refuses to study the health effects of the air quality improvements of the past 20 years. Why?

The EPA, like most government agencies or political advocacy groups, lives or dies by the old H.L. Mencken maxim about practical politics, that the public must be frightened, and anxious to be led to safety. False ozone fears and air pollution anxiety prop up the EPA. The EPA and its allies in the environmental movement feed the irrational and uninformed concern that the public has about a declining air quality, in the face of contrary evidence of improving air.

Why is there no research from the EPA that shows a public health benefit from the 20-year improvement in the quality of the air in the United States? Is the health benefit there and not shown or is it possible that the ambient air of 20 years ago, including the ozone levels, was not toxic? Generally even a blind toxicologist can prove a toxic effect by showing that the removal of a toxin caused a benefit. If there are air quality improvements that the EPA documents in its monitor information, then there should be a corresponding improvement in the health of the public.

Los Angeles and Houston air have improved—why no research to show the benefits? Is the EPA a one trick pony—they can only talk panic and crisis and bad air. Good air is not in the lexicon, only bad air and assertions of people dying from bad air? The proof of benefit would be the logical scientific inquiry to show the value of EPA activity and tighter air standards. Where are those studies of benefit?

If there is no real change in life expectancy or quality of life from air quality improvements, what will the EPA do, more importantly what should the country and the society do? Fire the EPA for lying or malpractice? The EPA and its allies in state and local government agencies, and in the non-governmental

environmental advocacy sector would be decimated by reports that there is no crisis in the environment, never was. They would also be, incidentally, unemployed and unemployable as pollution sheriffs.

Air Pollution Trends and Policy

Some places in America will be naturally dusty; some places will have natural background ozone levels that create haze. West Texas exemplifies the first, the Smoky Mountains the second. Trends in air pollution, control of ozone and ozone precursors in the past 30 years have all been positive, yet the EPA does not and will not report any benefit or improvement and continues to aggressively and energetically pursue every opportunity to increase its regulatory empire and authority. The EPA even sponsors and funds non-governmental entities like the American Lung Association and other rabid environmental groups that sue the EPA to push more environmental intrusions. That raises a question about conflicts and influence peddling, and contaminates the very important debate about EPA responsibilities to protect health and preserve the environment and maintain a high level of integrity in its science and research.

The blow back on the latest round of EPA overreach in ramming down the ozone standard is the protest of reasonable people confronting a new regulatory burden based on weak science. Ten years ago the EPA Clean Air Scientific Advisory Committee advised the EPA that ozone could not be shown to produce adverse health effects at the standard then, 0.12 PPM. Even then the CASAC, which is inclined to favor EPA policy proposals as a creature of the agency, was reluctant to support the ozone standard reduction from 0.120 ppm to a lower number. Chairman George Wolff said " although the panel member's opinions differed, none supported the lower end of EPA staff's recommendations, and a majority of members stated a position which included . . . the present standard."

EPA Clean Air Scientific Advisory Committee

The EPA Clean Air Scientific Advisory Committee (CASAC) in the late 1980s pointed out that ozone respiratory effects were not "adverse" health effects, and the CASAC in the 1990s refused to support using the Pope and Dockery studies to justify new NAAQS in 1997, but now the EPA is less scientific or objective in its analyses. The CASAC of today has become an advocacy committee committed to EPA agendas, even advocating more aggressive EPA activity. The CASAC of today has not and cannot be objective about ozone issues, and the current CASAC commentaries are not objective science but advocacy for aggressive environmentalism, now and forever.

There is no explanation for the CASAC conduct of the past few years other than political commitment to the environmental movement and the precautionary principle. In the past the CASAC and other agencies were the only chance that fanatic EPA officials would be brought under control, but now the CASAC has gone to the political side and cannot be trusted to show objectivity. Any argument for more regulation is supported. They represent the politicization of environmental science. CASAC commentary on small particulates last year was over the top.

Only 6 of 21 CASAC members supported the small particulate standards in 1996, the CASAC in 1996 advised in favor of the standard for ozone remaining at 0.120 ppm. Times have changed, the CASAC is now no restraint on junk science, and the CASAC of today is predictably in favor of any new and more stringent standard.

There are many in America who believe that the air quality is worse now than ever. That is because they get no reliable information from the EPA. The EPA is no longer a public agency that protects the public, but a

political propaganda mill, intent on panicking the public and working an environmentalist agenda. Informing the public of the improvements in air quality would reduce public anxiety and EPA and environmental group funding. Environmentalism would suffer a setback as a movement. The EPA is intentionally giving the public incorrect information about the current air quality, creating more anxiety, pollution warnings and claims about deaths.

This proposed new ozone standard is part of the deception, since the day the standard goes into place the American Lung Association, the EPA and the usual environmentalist organizations like Sierra Club will announce a new dirty air crisis. This latest round for ozone standard setting appears to be an effort by an EPA and its allies to reinvigorate their position as protecting the innocent public from killer air. They offer the naïve members of he public the proposal to create a pristine environment, more pristine than even Mother Nature could produce.

Consider, instead the reality as described by an environmental regulation expert:

> The United States has made tremendous progress in reducing air pollution during the last forty years. Air pollution has declined dramatically since the 1960s and 1970s, and virtually the entire nation now meets federal health standards for carbon monoxide (CO), sulfur dioxide (SO2), and nitrogen dioxide (NO2). Many areas of the country still exceed health standards for ground-level ozone ("smog") and airborne particulate matter (PM), but both of these pollutants continue to decline as well. Half of the nation's ozone-monitoring locations exceeded the federal one-hour ozone standard in the early 1980s, but only 13 percent exceeded the standard by the end of 2002. PM measurement methods have changed a number of times during the last forty years, but all trend data show PM levels dropping. Average levels of PM2.5—the form of PM now of greatest regulatory concern—have declined by a third during the last twenty years. (Joel Schwartz, 2003)

A good example of irrational panic mongering is in the September 9, 2004 issue of New England Journal of Medicine, in which C. Arden Pope, an economist cum environmentalist, describes as a companion piece to another children are victims of bad air article, describes killer air in Belgium in 1930, Pennsylvania in 1948, and London in 1952 and proposes those incidents as examples of why he thinks there is good reason to be worried. Pope is always worried, although he can't show me one person in his studies who really died from air pollution. They died as members of the cohort and he counted them as dead from air pollution after he looked at their death certificates. That's not a proper toxicologic analysis, that's an association. People don't die on epidemiologist's desks from associations.

In America ambient air pollution did not kill anyone, last week, last year, or in the last ten years. The crisis of bad air is long past, and the real health effects from air are non existent, but won't go away because the EPA is too big and too influential and too aggressive to go silent.

I agree with the Chairman of the Texas Commission on Environmental Quality, Buddy Garcia, who said in his letter of September 25, 2007 to EPA Administrator Johnson that ozone non-compliance will be the rule rather than the current exception, if the new standard is put in place. Mr. Garcia points out that 0.06 is well

known to the EPA as a background level in many environments—and that such a standard is irrational and cannot be complied with in places like the Gulf Coastal Plain.

Chairman Garcia also points out a little problem that the EPA ignores, that ozone precursors are mostly a product of mobile sources, not point/stationary sources, so the penalties and costs will be imposed on cities and communities for things they can't fix. Why is it that the EPA appears to care little about Mr. Garcia's concerns and his appeals for sensible science and policy making?

Summary

The research used to justify the proposed new ozone standard does not demonstrate results that meet the basic rule for proof of detrimental health effects. In fact the consistent findings of the EPA ozone research is insignificant ambient ozone pollution relative risk and laboratory evidence of fleeting effects if humans or animals are forced to breath high levels of ozone and exercise.

Research studies have shown that low relative risk results and pervasive confounders make it very unlikely that the proposed new ozone rules will have measurable beneficial or protective health effects. The EPA has failed to show the previous reduction in ozone levels has produced any benefits.

The EPA should abandon this precautionary-principle driven and junk science justified new standard, and retreat from continued aggressive tightening of ozone and other air quality standards.

Conclusion and recommendation.

There is no health effects science that justifies the current ozone standard of 0.08 ppm, so I urge the EPA to reset the ozone standard at the more reasonable 0.12 ppm, pending evaluation of the ozone control program for termination. Ozone should go the way of large particles, no longer on the list of EPA targets.

Imagine a government control program that has an end.

Economic and political effects of adoption of the recommendation.

I project that billions of taxpayer dollars and compliance costs could be returned to the citizens as soon as the EPA gives up chasing ozone, a benign component of the natural world.

I also project that a chastened and re-dedicated EPA might,fter the end of the ozone campaign, eschew future goose chases, and focus on serious, non-political, scientific inquiries in the public interest.

5. Dunn Presentation to the Health Risk Assessment Subcommittee of the and Executive Committee of the US EPA Board of Scientific Counselors 2007, 2008

John Dale Dunn MD JD

November 15, 2007 in person Bethesda, Maryland

Committee members and staff,

My name is John Dale Dunn. I am an inactive attorney. I teach emergency medicine at the Carl R. Darnall Army Medical Center, Fort Hood, Texas.

I asked for more time to present in early October, but I will do the best I can with the 3 minutes allotted. Dr. Stan Young from the National Institute for Statistical Science, and Dr. James Enstrom, epidemiologist from UCLA, will follow my presentation on the phone. We are not professionally or financially affiliated, but we share a concern about EPA scientific activity and integrity. In the future we will ask for more time to discuss our concerns with the BOSC.

H.L. Mencken made the prescient observation that the goal of practical politics is to create a hobgoblin, and make the public clamorous to be led to safety.

1. The Federal Judicial Center's Reference Manual on Scientific Evidence, published in 2000, and provided to the committee, was written by experts like Leon Gordis and Bernard Goldstein.

2. The scientific advice and rules provided to judges in the Manual are generally held and well known to the committee.

3. My concern is that EPA research repeatedly violates the Reference Manual rules on observational study relative risk as proof of causation and the rules on toxicology. I think well established and reliable scientific rules should govern EPA research.

4. The Manual insists on Relative Risk of at least 2 for proof of causation in observational studies. The EPA sponsored and funded research repeatedly and flagrantly violates that rule and claims small effects are reliable.

5. The Manual recites the traditional rules of toxicology, including the concept of threshold. The EPA violates those rules by arguing for high-dose toxin experiments on hybrid homogeneous rats and mice, combined with linear modeling as proof of toxicity.

EPA Administrator Browner had the chutzpah to claim that the adoption of ambient air standards proposed in 1995, that were based on Pope and Dockery small effects results, would prevent 20,000 deaths.

The quality of air and the environment is better now, but Americans think the environment is worse due to EPA public relations and research activities.

The BOSC is charged with assuring reliable and credible EPA research and policy making. EPA science should not risk a sensible judge applying the rules and finding EPA research inadmissible. It should be research and that does not panic the public with weak and incredible claims, like those made by Ms. Browner.

The BOSC should prevent the EPA shouting "consensus," intimidating the academic and journal community into breaking the rules and creating unjustified public anxiety.

Respectfully,

John Dale Dunn MD JD

Dunn Comments on ozone standards--2007.

Reference Manual on Scientific Evidence 2nd Ed. (2000)

Submission with this email:

2001 Editorial by Drs. Samet and Burke in American Journal of Public Health defending use of small effects studies.

Amicus brief submitted on behalf of Drs. Wogan, Eaton and 29 other distinguished Scientists criticizing EPA Linear Modeling on dioxin.

DUNN PUBLIC COMMENT SUBMISSION

MEETING OF THE EXECUTIVE COMMITTEE

Board of Scientific Counselors (BOSC) OF THE EPA

JANUARY 24-25, 2008 by phone with written submission emailed.

In the recent months I have provided materials and commentary on scientific integrity issues that fall within the BOSC Mission. The submissions and commentary were to the HHRA meeting and NERL meetings.

I renew for the Executive committee, my concerns about the following:

1. EPA sponsored scientists have repeatedly used relative risk in the negligible range as proof of health effects causation, in spite of epidemiology rules to the contrary, as recited in the Reference Manual on Scientific Evidence, published by the Federal Judicial Center.

2. The same is true of EPA sponsored science on the issue of hi dose rodent toxicology combined with linear modelling with no threshold. Again, I submitted the Reference Manual chapter on toxicology.

3. In addition to the Reference Manual materials, I submitted the brief filed on behalf of the American Council on Science and Health and many distinguished scientists criticizing EPA linear modelling and no threshold toxicology.

I will not resubmit these materials today, since they are already available to the Executive Committee, in addition to submissions by Dr. Stan Young on multiple testing unreliability and Dr. James Enstrom's submissions on his concerns about conduct in the scientific community that stifles inquiry and penalizes legitimate scientists.

The Executive Committee is composed of members much more expert than in the problems of data dredging in small effects science. The EPA is also embarked on a new series of toxicology projects that will increase the chance for problems, the genomic effects toxicology and small effects chemical toxicology research projects that increases the risk of more uncertain and unreliable research in health effects.

I ask the Executive Committee to begin to make more inquiries in these areas, and hold the EPA to a higher standard of reliability. The BOSC represents the interests of the public in assuring EPA science does not just promote interests and agendas of the EPA, but a balanced and reliable effort on behalf of the public interest and deserving of the public's trust.

Thank you for your consideration.

6. Essay by John Dale Dunn for congressional Aides of the Space, Science and Technology Committee of the House, on matter of Science and the Law

10-10-11

Introduction to fallacious and erroneous science and the law.

In addition to reviewing the Reference Manual on Scientific Evidence of the Federal Judicial Center, txt and links in this folder, there are also some excerpts from a book by Peter Huber, PhD and attorney, and Ken Foster PhD on the meaning of the new rules of admissibility for scientific evidence and testimony.

The section of the book excerpted focuses on fallacies in science and the intellectual, epistemological, political, social and psychological aspects of bad science.

First, however, anyone attempting to understand the current state of affairs should read the folder file on Angelo Codevilla, the essay on scientific pretense, along with the farewell speech by Dwight D Eisenhower in 1960 that discussed after the military-industrial complex, the government-research complex and in that section Ike warns of the danger of big government funding research programs and how such developments might corrupt the scientific process, which is not about authority and consensus, but skepticism and humility, the self-questioning that is essential for good science.

After reviewing the essay by Codevilla, one might expand on the problem of oligarchies in the other essay by Angelo Codevilla on the Ruling Class in America, that discusses the problem of elitist oligarchy dominated government tainted by group think and statist agendas. That is critical to the development of science in the service of politics.

Peter Huber, Kenneth Foster *Judging Science* (1997 MIT Press)

The chapters of importance in this book discuss the judicial articulation of what is good science, then essays and discussion on '

Testability and Falsification—Chapter 3

Errors in Science—Chapter 4

Reliability—Chapter 5

Scientific Validity—Chapter 6

That's enough for this folder material and will be summarized with the excerpts from the book including in the materials of the folder.

The materials are valuable, because they include original essays by many of the important figures in the philosophy of science. This summary is by John Dunn, but the original writers are better in their original discussion for more in depth inquiry.

1. Karl Popper is quoted and his teaching on good science is adhered to in the Blackmun Daubert opinion. Popper, a philosopher, emphasizes the importance of the deductive method of development of scientific concept and solutions, which is heavily focused on evidence and testing theories developed for evidence that might falsify the theory. Falsifiable is essential to a good scientific theory, otherwise Popper considers the theory non science. Pp. 35- 55

2. Weinberg proposes a concept of trans-science that is not practically verifiable or it may exceed the sensitivity of the instruments and methodology. Pp 55, 56.

3. An example of trans-science is epidemiology in the range below proof of effect, for example uncertain methodology or Relative Risk of less than 2. P 57.

4. Another concept of trans-science that is rhetorically in widespread use is to prove no risk, to prove the negative. P 58.

5. Reliability and validity are not the same, for example a reproducible and reliable measure may be invalidated because of a poor instrument or methods or bad underlying science. The first error is easier to identify and correct than the second, which looks valid. P 69-71.

6. Confounders produce validity errors and are the reason observational studies require effects of 100 percent—there are many confounders, listed at p 71, migrations or maturation of the study group, attrition, selection, regression to the mean, sequence of effects, experimenter and subject biases and behavior, even simple things like recall bias and overreliance on recall.

7. Confidence interval is another form of measure of reliability of the data, providing a range of accuracy or reliability around a result. P 79, 81. But some say that confidence interval is too loose. One important consideration is that if a confidence interval includes 1.0, there is no basis to argue for an effect. STUDIES RELIED ON BY US EPA THAT INCLUDE 1.0 IN THE CONFIDENCE INTERVAL (CI) ARE NOT RELAIBLE TO SUPPORT AN ASSERTION OF TOXICITY. A CONFIDENCE INTERVAL THAT INCLUDES 1.0 SHOWS A NULL EFFECT.

8. When the signal (results) is in the range of the noise (background natural variability) the reliability of the research is compromised by the signal to noise confusion. In studies with small effects like the US EPA air pollution premature death studies, confirmation bias (also called tunnel vision) energized by intellectual passion and commitment to a political agenda produce studies that do not justify the policies proposed and pursued or the regulatory regimes imposed. P 84.

9. Fallacies and fallacious thinking and research derive from reliance on authority, consensus, acceptance of a vote of those present, obfuscation or cover and selection bias in the service of intellectual passion or ambition, or the "gold effect" which is another form of intellectual passion combined with social

pressure consensus bias. All these biases and prejudices and fallacies of thinking are in contravention to the gold standard for scientific inquiry—skeptical experimentation by researchers who are the most strict judge of the nature and reliability of their research and disciplined in analyzing whether their evidence is proof of a theory. P 85.

10. Intellectual passion and ego of the researcher are sources of bad science and one of the most important conflicts of interest. Ego produces a failure to test one's theory adequately and produces confirmation bias—gathering supportive evidence and rejecting dissent or disagreement and evidence that falsifies the theory in favor. All researchers tend to mythologize themselves and their research, and lack the humility to recognize their own fallibility or see the limits or weakness of their research. Their investment in their career and stature make them rigid and uncritical in their assertions of theory or positing of solutions or answers. P 86

11. Sick science is characterized by:

a. The maximum effect is produced by a phenomenon of barely detectable intensity.

b. Observations are made near the threshold of visibility of the eyes or instruments.

c. There are claims of great accuracy (and significance).

d. Ad hoc excuses are used to nullify any dissent or criticism.

e. The supporters rise and then fall.

12. Another characteristic of sick science is the cargo cult syndrome—pretense of scientific methodology that has no substance. P 89.

13. Another characteristic of sick science is the reports of effects that are considered ominous are in the range of background. E.g. EMG that was proposed to cause terrible carcinogenic effects in the range of the earth's magnetic fields.

14. The pattern of error that goes to policy making, for example ignoring opportunity benefits, fear of introducing new technologies on the precautionary principle, ignoring safety risks associated with a proposed regulatory regime or remedy, ignoring large existing benefits in favor of fear of risk or the precautionary principle, or MOST IMPORTANT, IGNORING THE UNINTENDED CONSEQUENCES OF PROPOSED SOLUTIONS, EITHER IN TERMS OF COMPLIANCE COSTS OR DIRECT AND KNOWN RISKS AND DETRIMENTS.

15. Procrustean data torturing is not different from opportunistic data torturing, and certainly no less pernicious and deceitful. P 99.

16. The seven deadly sins of knowledge or the cognitive illusions that are nefarious;

a. overconfidence

b. magical thinking

c. predictability in hindsight

d. anchoring or tunnel vision

e. ease of deception

f. probability blindness or chance ignorance

g. the game of conjuring of linkages and ignoring the weak links in a chain P 118, 119

17. Reliability refers to the reproducibility of the data. Reliability is measured in terms of sensitivity and specificity. Bayes' theorem measures positive and negative predictive values that are both dependent on sensitivity and specificity. P 113-115.

18. Back to Popper, the soundness of a theory depends on

a. the conclusions must be internally consistent

b. avoid tautological statements that prove nothing but just reference the assertion

c. look for scientific advances in a theory

d. test a theory with experiments

19. The theory must be logically consistent, falsifiable, must assert something new, or novel, and it must be verified by experimental evidence (p 138, 139).

20. There are a fistful of fallacies

a. indirect cause asserted

b. necessary causes are not always sufficient cause

c. temporal or post hoc causation is not real causation

d. ecological fallacy transfers observations about populations to individuals

e. the faggot fallacy piles small and suspect items of proof or evidence and attempts to validate by the bundle or the height of the pile

f. weight of evidence fallacy is similar to e. and relies on the pile

g. bellman's fallacy is another form of the pile fallacy

h. fallacy of risk is the confusion of absolute and relative risk and using one or the other to deceive

i. inappropriate extrapolation is the assumption that one knows the trends and can project

j. new syndrome fallacy is novelty to an extreme

k. insignificant significance—overemphasizing the importance of statically significance in proof of a theory

l. Fallacy of ignoring large effects in small studies because hey fail a statistical significance test.

m. Positive results are fallaciously given more significance

n. Denial of medical mistakes (all these are on P 143)

21. There are good rules for reading and evaluating a paper as a reviewer. P 149-150

22. Feinstein dissects fallacious and alarming medical reports on reserpine causing breast cancer, coffee causing pancreatic cancer, and alcohol and breast cancer. Feinstein reviews how the studies on these reports were flawed. P 156.

It is important to note that the book Judging Science is an exceptional effort by extraordinary authors and this writer cannot do them justice. The books sections are excerpted by necessity.

Buying the book will be the best choice for anyone compelled to learn the intricacies of legal management of scientific evidence and the theories of science that underlie any reasonable discussion of scientific reliability and veracity.

7. An abbreviated story of the effort by John D. Dunn MD JD to expose the misconduct of the US EPA in matters of toxicology and epidemiology.

The Environmental Protection Agency's Particulate Matter Rules: One Physician's Crusade against Cargo Cult Science (JPANDS Spring 2014)

John Dale Dunn, M.D., J.D.

http://www.jpands.org/vol19no1/dunn.pdf

The U.S. Environmental Protection Agency has an annual budget of almost $10 billion, and influence and power far beyond that, with U.S. industry and society always subject to EPA orders, regulations, guidelines, fines, and edicts on environmental compliance.

My effort to expose EPA's bad science and policy making began in the early 1990s, and has culminated in the past 2 years in EPA's admissions, in declarations under penalty of perjury, that inadequate and unreliable, even unethical science underlies EPA regulatory regimes under the Clean Air Act (CAA).

In the infamous Tuskegee syphilis experiment, innocent black Americans suffered the depredations of advanced syphilis as federal public health agents denied them treatment. Now EPA-sponsored studies deliberately expose human subjects to pollutants that the EPA claims to be toxic, lethal, and carcinogenic. The Tuskegee experiment was unnecessary—the effects of advanced syphilis had been known for centuries. The EPA claims it already knows how dangerous fine-particulate air pollution is, but the agency is funding human exposure experiments with what EPA-published air quality standards say are toxic levels of fine-particulate air pollution.

Environmental Law Course

I was a small-town emergency physician and inactive attorney when the dean of sciences at the local Howard Payne University asked me to teach environmental law for the new undergraduate major in environmental science. I obtained the federal and state statute books and put the course on the curriculum to

include adult education for community people interested in compliance issues, as well as the environmental science students.

My study of the economics and politics of environmental regulation led to the conclusion that it involved a **form of cargo cult science** (fake science that looks like science), as described by Nobel Prize winner Richard Feynman,1 that develops when government money is lavishly given to people in the academy to support a political agenda built on a false threat of public harm. EPA's cargo cult science was in the area of epidemiology (population studies) and toxicology (study of poisons and harmful substances). It allowed EPA to beat the panic drum and scare people about killer environmental poisons that were not harming anyone in the ambient environment. This coincided with the growth of the radical environmentalist movement, which I would describe as a cult built on pantheism and a commitment to statist control of society.

One of my guest lecturers, an engineer responsible for compliance for Phillips 66 and an alumnus of Howard Payne, said that EPA would eventually take as much as five percent out of the gross domestic product. His predictions didn't seem so exaggerated when, in the mid-1990s, ozone air standards proposed by EPA Administrator Carol Browner under President Clinton were estimated by economists to cost the economy more than $100 billion. Browner pushed ahead in spite of objections and opposition by EPA's in-house Clean Air Scientific Advisory Committee, and all the Democrat administration-controlled executive agency divisions and offices.

Many aspects of junk science in the public health sector promoted by agencies like EPA are explained by biostatistician and lawyer Steve Milloy in his books *Science Without Sense* (Cato, 1995), *Silencing Science* (with Michael Gough, Cato, 1998), and *Junk Science Judo* (Cato, 2001). Other valuable books on bad science are by Peter Huber: *Galileo's Revenge* (Basic Books, 1991); *Phantom Risk: Scientific Inference and the Law* (MIT Press, 1993); and the most extraordinary study of junk science I have read, *Judging Science: Scientific Knowledge and the Federal Courts* (with Kenneth Foster, MIT Press 1997). The last focuses on the question of science as evidence and how rules of evidence should be used to determine admissibility of scientific testimony and evidence in court proceedings.

"Clean" Air vs. Safe Air: Justifying Regulatory Overreach

The cottage industry of air pollution research is committed to the proposition that air pollution panic is justifiable if it allows regulatory reach by the EPA that would satisfy an aesthetic demand for "clean" air. In my opinion, the research community is distorting the intent of the Clean Air Act (CAA), which should have been named the Safe Air Act since it is impossible to make the air"clean" of pollutants (such as dust, for example). The statutory language of the CAA required the EPA to identify harmful air pollution and mitigate the effects, not make the air "clean."

One of the most prominent EPA-sponsored researchers in air pollution is Jonathan Samet, M.D., chair of epidemiology at Johns Hopkins Bloomberg School of Public Health and chair of the EPA Clean Air Scientific Advisory Committee (CASAC). In a 2000 paper in New England Journal of Medicine, 2 he claimed that fine particles were causing deaths. This claim was based on an inadequately small association of fine particulates and deaths in a study of 20 cities. Small associations are not proof of causation and could easily be a random effect or result from data mining and dredging. By the year 2000 EPA had used its junk science to stack up a well-funded and sponsored pile of papers using the same bad methodology and claims

as the Samet paper, going all the way back to the Pope 3 and Dockery 4 foundational air pollution studies that created the EPA air pollution research and regulation crusade of the 1990s.

Samet and his fellow air pollution researchers, who had become advocates, would mine the data to find a small association and then announce a threat and crisis. In his 2000 paper, 2 however, Samet made an admission that I thought very important: he could not find a toxic effect from the other EPA criteria air pollutants, carbon monoxide, sulfur oxides, ozone, or ozone precursors such as nitrogen oxides and volatile organics. Today, however, Samet campaigns against ozone as if he had never written that paper.

After a two-part science and legal critique that I wrote on Samet's 2000 New England Journal of Medicine 20-city study of effects of air pollution at the website of the American Council on Science and Health, 5,6 James Enstrom, Ph.D., research professor at the University of California at Los Angeles, contacted me and asked for assistance with his efforts to stop California government efforts to create more air pollution regulations that would harm business and industry. I submitted public comments opposing proposed EPA particulate and ozone regulations in 20067 and 2007, 8 with no effect on EPA policy or attitude. EPA continued to make absurd claims that this or that air pollution regulation would save lives.

During that same period, I benefited from the statistics expertise of S. Stanley Young, Ph.D., of the National Institute for Statistical Science in Research Triangle Park, North Carolina.

U.S. EPA Board of Scientific Counselors

In 2007 Enstrom, Young, and I decided to approach EPA's Board of Scientific Counselors (BOSC), an outside independent scientific advisory group that was supposed to monitor and critique EPA science and policy making to encourage research compliance with basic scientific rules. BOSC was composed of members of high professional standing who were in private or state activities, and not EPA employees.

We articulated our positions, based on our areas of concern for BOSC subcommittee meetings in late 2007, and then the executive committee in early 2008. Our pleas and arguments were:

1) Irresponsible and false epidemiology and toxicology by EPA researchers claimed an effect that clearly fell well below any threshold needed to show a toxic effect in observational epidemiological population studies. Evidence for claimed air pollution death effects was inadequate to prove any causation and was asserted without a plausible toxicological mechanism.

2) Studies with multiple inquiries exaggerate the chance of false positives. The EPA was misusing the concept of statistical significance by failing to adjust for the multiple inquiries.

3) The EPA and its sponsored researchers and reviewers ignored studies that disproved their theories and suffered from tunnel vision and confirmation bias. Moreover they persecuted researchers like Enstrom who found results that didn't support the EPA agenda.9

I traveled to Maryland to present my concerns in person to the BOSC subcommittee of the Human Health Risk Assessment Committee, and Enstrom and Young presented by telephone. After waiting through hours of presentations by insider EPA officials and researchers before the scheduled public comment period, each of us was allowed only three minutes. Considering the inhospitable reception we received, it was not surprising we were the only outside commenters. Many lectures of an hour or more had been followed by laudatory comments from other EPA employees and officials present. I also noted that the roster of

committee members was clearly made up of people who had previously, or would in the future, want to be grantees of EPA largesse. It was definitely a home game, with home umpires.

I reviewed the Board of Counselors minutes for the previous five years and found there were no public comments at Board of Counselors meetings in those years. Even highly placed people in private industry, who were severely affected by its regulations, had no taste for criticizing EPA or its sponsored researchers. Favoritism and influence peddling are constant factors in governmental programs. Enstrom, Young, and I decided that appeals to the supposedly independent BOSC were worthless. Nonetheless, we made presentations to another subcommittee and then the BOSC executive committee.

The CARB Toxic Air Machine Project of 2007-2008

The battle was over at EPA, since it was a fixed game, but at the same time there was a battle going on in California led by Enstrom, which heated up in 2008 because of a new set of diesel engine rules focused on fine-particulate air pollution. These regulations were proposed and supported by research sponsored by EPA and the California Air Resources Board (CARB), a subdivision of the California EPA.

In 2005 Enstrom published his results of a robust and current study on the effects of fine-particulate air pollution in California. The study (10) involved 50,000 people in the years 1973-2002. It showed no premature death effect in California from fine- particulate air pollution. Moreover, California's air pollution of the 1950s and 1960s had declined for 30 years. Nonetheless, the increasing rate of asthma was misrepresented as a sign of an air pollution crisis justifying more air pollution regulations for no discernible benefit. Enstrom was also concerned that economic hardships would prove to be important causes of deprivation and decreased human life expectancy, as demonstrated in reliable population studies.11

In 2007, the CARB "solicitation" and review process was set up for a document entitled "Methodology for Estimating Premature Deaths Associated with Long-term Exposure to Fine Airborne Particulate Matter in California." The process included three scientific advisors and six "independent" but paid reviewers well known to, and allies of, CARB. Then CARB staff in May of 2008 released a draft report and proposed regulatory regime, claiming that air pollution caused premature deaths in California. A public comment period began, and the CARB business-as-usual process ran into vigorous critiques 12 submitted by Enstrom and other distinguished public health scientists and engineers in July 2008.

Public criticisms of the CARB draft report included:

1) Panel reviewers were reviewing their own or their close colleagues' air pollution studies.

2) CARB had discarded the Enstrom study and ignored geographic and time trend evidence available in the reviewed research that argued against their conclusions of air pollution death effects in California and the need for more regulations.

3) CARB had failed to adjust for changes in engines and emissions that also made older studies invalid.

4) Basic rules of the sciences of epidemiology and toxicology were violated in the CARB research that made claims based on small associations that were inadequate to claim a premature death effect.

My critique 10, pp 129-135 of the comments document discusses basic principles of scientific evidence that the EPA violates in its overreach. According to the Federal Judicial Center's Reference Manual on Scientific Evidence, 13, 14 which discusses the magnitude of toxic effect required in observational studies that are

used in public health toxicology research, an agent was more likely than not the cause of an individual's disease when the relative risk (RR) is 2.0, that is, a 100 percent increase in the disease or effect (e.g. premature death) in the exposed population. For example, the research on effects of cigarette smoking showed the RR of lung cancer in cigarette smokers is 10.

An RR greater than 2.0 would permit an inference that an individual plaintiff's disease was more likely than not caused by the implicated agent. None of the cited foundational and supportive studies EPA or CARB use to justify air pollution regulatory regimes have the minimum RR of 2 needed to assert evidence in associations of causation.

While epidemiologists study population effects, toxicologists study adverse effects. In the early 1950s, Sir Austin Bradford Hill, British icon of public health research, originated nine criteria referred to by the Federal Judicial Center in the Reference Manual for proving toxicity. Hill's first and most important criterion was evidence of a measurable and significant toxic effect. Other criteria include that the toxic effect proposed has to be plausible, has to make temporal and dosage exposure sense, and should be evaluated to make sure some other factor is not in play.15

EPA has consistently disregarded the Bradford Hill criteria, in particular using small associations that fail the test of adequate evidence of effect. There is no real knowledge of actual exposure of individuals alleged to be affected or dead, and certainly no assurance that outside air quality is the exposure that is appropriate to measure, since people spend the majority of their time indoors. A final and important consideration is that EPA research shows no evidence of a current understanding of a plausible mechanism for fine-particle toxicity or lethality.

CARB staff in October 2008 issued a final report that was the same as the preliminary draft report of May 2008. CARB staff admitted that they didn't show the public scientific critiques to the expert panel or request an expert response to those criticisms of CARB research conclusions or policy proposals.

In December 2008, Enstrom and three other prominent California air pollution experts directly contacted CARB board members to urge rejection of the 2008 report. The four also wrote a public letter to CARB to recommend that CARB reassess the report and delay any decision on air pollution and diesel regulations.16

Enstrom and Young checked the credentials of Hien Tran, lead author of the CARB Report on Fine Particles and Premature Death in California, and found that he had a fake Ph.D., purchased for $1,000 from a drop box, Thornhill University.17 Enstrom and others also pursued another scandal—that CARB executive Mary Nichols knew of the Tran fraud and had not reported it to the CARB Board before Dec 12, 2008, when it voted to approve the Truck and Bus Regulation. Enstrom's research into the enabling legislation for CARB also found that most members of the Scientific Review Panel on Toxic Air Contaminants had served in their positions longer than the specified term of 3 years without following the nomination and appointment process of members required by the 1983 enabling statute. Pacific Legal Foundation filed a lawsuit in June 2009 to force compliance with the nomination and appointment process, resulting in the removal of five of the nine members.

A taxpayers' protest was held with speeches and demonstrations at the State Capitol on Aug 28, 2009, reinforced by the sound of a 220-truck convoy sponsored by the California Dump Truck Owners Association (now the California Construction Trucking Association). The convoy circled the Capitol building and, on

cue, sounded truck horns for one minute. The convoy and the Capitol steps rally on California agency overreach were not covered by the press, but the legislators were there.

Business leaders and industry sectors that use diesel engines raised their voices. Dr.Bill Wattenberg, an engineer and influential talk show host from San Francisco's KGO, railed against CARB. Bloggers and other radio hosts joined in. Bryan Bloom, Lee Brown, and Betty Plowman and other trucking industry people were eloquent in public meetings. Jay McKeenan for the California Independent Oil Marketers Association, representatives of the logging industry organizations, Bill Davis with the Southern California Contractors Association, and Shelly Sullivan of the California Manufacturers and Technology Association, all pressed for a CARB suspension of the new diesel rules and a sensible agency retreat from its aggressive stance. Skip Brown, construction executive, was a steady and important participant as a speaker and writer.

California Assemblyman Roger Niello (R-5th Assembly District) presented a bipartisan letter with 52 signers demanding that CARB suspend the new diesel rules. Senator Robert Dutton (R-31st Senate District) and Assemblyman Dan Logue (R-3rd Assembly District) introduced bills to slow down CARB implementation plans on greenhouse gas and global warming regulations. Gov. Arnold Schwarzenegger weighed in to advocate a suspension of any new fine particulate/diesel regulations until the California economy could recover.

As a result of this 2-year campaign, CARB attempted to repair its damaged reputation for reliable research with a full-day scientific discussion and "cage match" debate on Feb 26, 2010 at the California EPA hearing room in Sacramento.

CARB designated three experts from the original scientific review panel: Daniel Krewski, Ph.D., Michael Jerrett, Ph.D., and Arden Pope, Ph.D., well-credentialed and also longtime friends and beneficiaries of CARB and EPA grants, members of the insider air pollution club with senior status. CARB paid for them to appear just as they had paid for previous research and review work.

Krewski has headed a large group that did a national study.18 A close look at the results showed that they found no air pollution "associations" that would support a claim of human health effects in California, but they ignored their own results, which would argue against their basic premise. During the symposium, Jerrett admitted that he couldn't find an air pollution health effect in California, but a year later he manipulated the data to show a minor association in one of his models19 created by a trick in methodology and geographic gerrymandering that he called "conurbation."20 As noted above, the Pope and Dockery group 3,4 have been prolific and always predictably produced studies with very weak associations that they claim support their position that air pollution kills.

For the opposing public critics, James Enstrom, Ph.D., Fred Lipfert, Ph.D., Robert Phalen, Ph.D., Roger McClellan, D.V.M., Suresh Moolgavkar, M.D., Ph.D, and Tom Hesterberg, Ph.D., M.B.A., appeared. These well-qualified researchers urged no more regulations and no more exaggeration of the science on air pollution health effects.

The webcast is seven hours long. 21 The net effect was that the public commenters exposed the nature of the CARB malfeasance on human health effects science, and demonstrated that the CARB research project was a setup that involved conflicts of interest and a failure to objectively evaluate competing data and evidence on the question of California air quality and its effect on health.

No regulatory relief came from the debate and the proof of CARB malfeasance, and CARB proceeded with the originally planned air pollution regulations.

Washington Politics

The Space Science and Technology Committee of the House of Representatives contacted me in 2010, and I provided information from the CARB wars and the previous challenges of EPA air pollution research claims and policy making. Congress had hearings in the fall of 2010 and through 2011 on EPA air pollution research and regulations. In 2011 and 2012, the House Energy and Commerce Committee also had activities and an interest, and in February 2012 former chairman Rep. Joe Barton (R-Texas) gave a speech outlining the perfidy of the EPA on many aspects of science and policy, as well as legal aspects of EPA misconduct.

Barton condemned:

- EPA's refusal to assess risk and benefit on regulations;
- EPA's burdensome and nonsensical power plant regulations;
- EPA's failure to cooperate with congressional oversight;
- Persistent and flagrant conflicts of interest among EPA researchers and advisers who receive tens of millions of dollars in research grants from the agency while serving as reviewers of EPA research;22
- EPA researchers' refusal to comply with basic rules of public health research in toxicology and epidemiology;
- Inappropriate reliance on the precautionary principle;
- Circumvention of congressional oversight; and
- Grant-giving to non-governmental advocacy groups that then enter into collusive lawsuits and aggressive regulatory requests that promote the agency's agenda and expand its regulatory and political power.

As Barton pointed out, "I believe that the American public and taxpayers should not be paying for an agency that manipulates data and funds researchers in the form of exterior grants, who in turn serve on the internal committees within the EPA to create policy and work in an oversight capacity. This is an incredible conflict of interest to the American public."23

Rep. Barton's dressing-down of EPA and its administrator was a first step in the right direction. But now Rep. Barton and his colleagues need to follow through by implementing real solutions that will stop EPA's regulatory excesses.

EPA and the Admissibility of Scientific Evidence

EPA research on human health effects of air pollution consistently violates the rules of science and is not admissible in a federal court under the rules of Daubert v. Merrell Dow, 509 U.S. 579 (1993). The Daubert majority opinion, written by Justice Harry Blackmun, discarded the old rule of "generally accepted" for scientific testimony and evidence, from the 1923 case of Frye v. United States, 293 F. 1013 (D.C. Cir. 1923) and adopted new, more rigorous tests for admissibility of science testimony and evidence, under Federal

Rules of Evidence (1975), particularly Rule of Evidence 702 on Testimony by Experts. The rule provides that if scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue (Rule 104 test), a witness qualified as an expert by knowledge, skill, experience, training, or education, may testify thereto in the form of an opinion or otherwise.

In his written opinion, Justice Blackmun provided an erudite discussion on the philosophy of science, with a strong dose of the theories of a respected philosopher of science, Karl Popper.

Justice Blackmun's major points were as follows:

1) Trial judges were the gate keepers to assure that reliable science was admitted as evidence.

2) Scientific testimony and other scientific evidence had to be consistent with everyday good scientific practice.

3) The science would be assessed generally as follows:

a. The general acceptance rule of Frye did not survive the new Federal Rules of Evidence.

b. Knowledge is more than subjective belief or unsupported speculation; it must be supported by evidence and proven methods.

c. An expert witness is permitted wide latitude under the federal rules of evidence to offer opinions, including those that are not based on firsthand knowledge or observation.

d. Under Federal Rule of Evidence 104, a federal trial judge must determine the threshold question of whether the evidence is relevant and material to the case and will assist the trier of fact.

Justice Blackmun continued that if the threshold test of Rule 104 is satisfied (3d above), then the judge, in applying the rules of Daubert, must assess the admissibility of the scientific evidence and testimony on the basis of four tests under Federal Rule of Evidence 702 on Testimony of Experts:

1) Whether the theory or technique can be and has been tested;

2) Whether the theory or technique has been subjected to peer review and publication (this test is not dispositive, only additive);

3) Whether the technique or method has a known or potential rate of error; and

4) Acceptance of the theory or technique within a relevant scientific community of scholars.

Professor Michael Fenner of Creighton Law School wrote a helpful, in-depth review of the Daubert opinion. 24 In *Judging Science*, 25 Kenneth Foster and Peter Huber (MIT Press 1995) also review and analyze Daubert, providing much background analysis on the problems of junk science and fallacious science and also on the methods that produce reliable evidence and avoid scientific negligence and misconduct.

The Federal Rules of Evidence provide a means to challenge EPA-sponsored research, claims, conduct, actions, and policy-making. The burden of the challenge to an action, or ruling or fine or penalty, is to prove that the agency was arbitrary and capricious in its analysis of the pertinent science and research on human health effects and detriment. A common-sense understanding of those words entails actions taken without good justification or rationale. The courts have been inclined to be excessively deferential and allow agency

hegemony, even refusing to hear arguments on the arbitrary and capricious standard for agency acceptance of scientific research assertions.

Jurisprudence allows for judicial deference to agency discretion in matters of ambiguous statutory provisions, described by Justice Antonin Scalia in *Whitman v. American Trucking Association*. 26 What the erudite Justice Scalia fails to constrain is the inordinate and inappropriate expansion of the deference allowed EPA in reference to interpretation of ambiguous statutory language to include arbitrary and capricious agency acceptance of what would be arguably inadmissible scientific testimony and evidence.

Judges are, however, and always have been, the ones to decide what's admissible as evidence. Agency discretion under the jurisprudence of the Chevron decision 27 should not allow unreliable scientific evidence into the record under the rules of *Daubert*, whether it's a hearing or a trial. The evidence must be admissible for purposes of proving that the agency is or is not being arbitrary or capricious, which makes the decision on evidentiary admissibility and reliability separate from whatever idea the court might have about agency authority and discretion.

Unreliable scientific evidence is inadmissible and therefore cannot be used to justify agency actions. The admissibility rulings on evidence trump some arcane idea about agency discretion that is all tied up in the jurisprudence on congressional delegation. There is no law that Congress has passed that permits agencies to use and promote junk science.

In the excessive support of congressional delegation to agencies under the statutes, and the general deference for agency discretion under Chevron, Scalia allows EPA research to cheat and avoid a challenge under the "arbitrary and capricious" standard. Justice Scalia just plain ignores the commonly and legally understood meaning of "arbitrary and capricious." Proposing inadmissible scientific evidence and testimony on critical research assertions that are foundations for policy and regulatory action would certainly cross the threshold of "arbitrary and capricious" under the Administrative Procedure Act.

The Role of the Administrative Procedure Act (APA)

The Administrative Procedure Act (APA) allows a successful challenge of agency conduct when that action is arbitrary (without good reason) and capricious (on a whim and without a good reason). Violating scientific rules, like the ones that are clearly outlined in the *Reference Manual on Scientific Evidence* 11, 12 to educate judges on science, would certainly raise the question of irrationality that is the fundamental issue for claiming that an agency has acted in an arbitrary and capricious manner.

The courts have, however, been very lenient with the EPA on the violations of scientific rules and provided many opportunities for agencies to violate the rules of science, so legislative actions may be necessary to force better science and policymaking at EPA. The alternative is to find a judge with integrity and an appellate court that doesn't undermine a judgment of inadmissibility, or will entertain and find valid an appeal to reverse an improper judgment on Daubert admissibility.

Legislative Remedies

In the political sphere, Congress can modify standards of administrative and judicial review to demand good science and a better standard for agency conduct, with more reasonable rules on challenges to EPA actions. This is similar to the rules for challenges to actions by the Occupational Safety and Health Administration, which carry a preponderance-of-evidence burden.

The pertinent legislative act is the Congressional Review Act (CRA), found at 5 U.S.C. 801, which allows Congress to jump in when the agencies are involved in misconduct. CRA was enacted as section 251 of the Contract with America

Advancement Act of 1996, also known as the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). The law allows Congress to review, by means of an expedited legislative process, new federal regulations and, by passage of a joint resolution, to overrule a regulation.

Another legislative effort to bring the pressure to bear on the federal agency and their sponsored researchers is the **Data Quality Act**, which requires agency-sponsored research to hold to good scientific principles or be subject to review and possible modification or recision.

Even without legislation, responsible, competent, and serious legislators can find reasons to question EPA conduct, and lawyers can frame evidentiary challenges so that the courts and administrative hearings will be required to make clear rulings on admissibility of scientific evidence with an accompanying rationale for appellate review.

A bad evidentiary ruling is a reversible error; a good ruling will nurture good science in the courtroom. No lawyer but a pettifogger would admit to arguing for bad science that violates the public trust.

At present EPA, following Samet, 28 asserts the theory of "no threshold" for a toxic effect of air pollution, allowing EPA to pursue any pollutant to the last molecule. This impossible goal allows for unlimited expansion of EPA power. Chemical toxicology still is based on thresholds. **"No threshold" chemical air pollutant toxicology turns the Clean Air Act (42 USC 7401. 1963, amended 1970, 1990) on its head and nullifies and abandons the strategy Congress intended.**

Human Experimentation Scandal

As previously described in this journal, 29 EPA has been sponsoring research in which human subjects are exposed to air pollutants at levels far exceeding those EPA declares to be toxic or lethal. It is illegal, unethical, and immoral to expose experimental subjects to harmful or lethal toxins.30 The Reference Manual on Scientific Evidence, 3rd ed. (2011), [12, p 555] declares that exposing human subjects to toxic substances is "proscribed" by law, and cites case law. The editor of Environmental Health Perspectives (EHP) refused a request by Steve Milloy of JunkScience.com to withdraw a paper based on one such study and conduct an investigation.31

According to information obtained by Milloy from a Freedom of Information Act (FOIA) request, a University of North Carolina research study exposed 42 people to what EPA says are harmful or lethal levels of fine particles, with some receiving 10 times EPA's declared safe level of 35 micrograms per cubic meter of air. The EPA human experiments described were conducted from January 2010 to June 2011, and ended three months before then-EPA Director Lisa Jackson's congressional testimony, during which she still asserted dramatic claims of the lethality of small particulates less than 2.5 microns in diameter (PM2.5), claiming thousands of deaths and hundreds of billions of dollars in economic consequences from the deaths and disabilities caused by fine particles.

There have been no publications of toxic effects as declared by the authors of the paper, other than the one case report of a cardiac arrhythmia described earlier; 29 the researchers failed to report that none of the other

subjects had any adverse effects, despite the obligation of researchers to report results both for and against their hypothesis.

Did EPA risk the deaths of 42 subjects? Or are EPA officials lying in their testimony about the dangers of small-particle air pollution and deliberately misleading Congress and the public?

After filing complaints with EPA officials and the editor of EHP, Milloy and I filed complaints with the North Carolina Board of Medicine and the University of North Carolina (UNC) School of Medicine. The North Carolina medical board found no violation of the Medical Practice Act by the physicians, and no action was taken by the UNC School of Medicine.

A lawsuit was filed in Federal District Court in Arlington, Va., to ask for injunctive relief or a remedy that would stop the human experiments. The Court said it didn't have the authority or jurisdiction to stop the human experiments, but declarations under penalty of perjury obtained from officials of the EPA research team at UNC Chapel Hill School of Medicine were revealing.

Eugene Cascio, M.D., a lead EPA physician in the research team, declared that 10 domestic medical schools and six foreign medical schools were doing human exposure experiments. They included some of the most prominent medical schools in the United States—Rutgers, Rochester, Ohio State, University of Michigan, Michigan State, University of Washington, University of California at Los Angeles, University of Southern California, and Lovelace Clinic affiliated with the University of New Mexico. The foreign medical schools included three in Europe, one in Canada, and two in the UK.32

Two other declarations produced by EPA officials in the lawsuit were critical to understanding EPA misconduct. Martin Case, program administrator, declared that he told the subjects they could die from the exposures, but he did not write that warning in the consents obtained.33 Milloy has obtained the consent forms from UNC and other medical schools involved in the project for human experimentation, and none of programs warned subjects of EPA's position that fine particles were toxic, lethal, and carcinogenic, and that the subjects might suffer the consequences.34

Robert Devlin, Ph.D., senior research official for EPA and part of the UNC team, stated in his declaration under penalty of perjury that the EPA was sponsoring the human experimentation because the results of epidemiological studies are not reliable enough and do not establish a strong enough case for toxicity of air pollution.35

In paragraph 8, Devlin states:

> Controlled human exposure studies conducted by EPA scientists and EPA-funded scientists at multiple U.S. universities fill an information gap that cannot be filled by large population studies. In 1998 the Committee on Research Priorities for Airborne Particulate Matter was established by the National Research Council in response to a request from Congress. The committee was charged with producing four reports over a five- year period which describe a conceptual framework for an integrated national program of particulate-matter research, and identified the most critical research needs linked to key policy-related scientific uncertainties.

The committee states on page 36 of its report:

> Controlled human exposure studies offer the opportunity to study small numbers of human subjects under carefully controlled exposure conditions and gain valuable insights into both the relative deposition of inhaled particles and the resulting health effects. Individuals studied can range from healthy people to individuals with cardiac or respiratory diseases of varying degrees of severity. In all cases, the specific protocols defining the subjects, the exposure conditions, and the evaluation procedures must be reviewed and approved by institutional review boards providing oversight for human experimentation. The exposure atmospheres studied vary, ranging from well-defined, single- component aerosols (such as black carbon or sulfuric acid) to atmospheres produced by recently developed particle concentrators, which concentrate the particles present in ambient air. The concentrations of particles studied are limited by ethical considerations and by concern for the range of concentrations, from the experimental setting to typical ambient concentration, over which findings need to be extrapolated.

Controlled human exposures studies have been conducted for decades on important pollutants such as ozone, particulate matter, nitrogen dioxide (NO2), sulfur dioxide (SO2), VOCs [volatile organic compounds] emitted [in] new homes, and carbon monoxide (CO).

In paragraph 9 of his Declaration, Devlin states: "Controlled human exposure studies assess the biological plausibility of the associations observed in the large-population epidemiological studies."

So we have come full circle. For 20 years I have argued that EPA is involved in corrupted, invalid, unreliable epidemiology. Now, under pressure from a lawsuit for unethical conduct, it admits what we knew already, that epidemiology is being misused as a false portfolio of evidence of air pollution toxicity. The most astounding aspect of this human experiments scandal is the refusal of state boards of medicine, institutional review boards (IRBs), deans of medical schools, and EPA officials to investigate and stop the misconduct. This is in spite of the well-known and remembered Tuskegee and horrific wartime

Nazi/Japanese medical experiments on prisoners.

What we have discovered with EPA misconduct and that of the grantees at numerous medical schools is very sobering. These are not trivial violations of the ethical rules on human experimentation with which the IRBs are familiar. The rule is that one cannot perform harmful human exposure experiments— period. In only a very few circumstances where significant benefit is anticipated could subjects be exposed to harmful substances, after they are informed of the risks.

Conclusion

For 20 years or more EPA has promulgated bad epidemiology and bad toxicology that eventually evolved into research with unethical human exposure experiments. There is no easy way to excuse unethical human experiments to substantiate claims made in congressional hearings, despite lack of evidence, that air pollution or other forms of pollution are toxic and lethal.

If EPA is lying about the toxicity, the regulations fall. If it isn't, a federal agency is committing battery and unethical research that is criminal, unethical, and violates agency rules on human research. Either way, innocent experimental subjects are victimized.

Daubert and the *Reference Manual* guidelines could be used to restore sanity and objectivity to EPA regulatory activities so that they would improve public health policy-making rather than serving a political agenda.

Environmental Protection Agency's Air Pollution Research: Unethical and Illegal?

Steve Milloy, M.H.S., J.D., L.L.M., John Dale Dunn, M.D., J.D (JPANDS Winter 2012)

- www.jpands.org/vol17no4/dunn.pdf

"First, do no harm"is a fundamental precept of medical ethics. So how do U.S. Environmental Protection Agency physicians explain their non-therapeutic experiments in which they exposed health-impaired people to high levels of concentrated diesel exhaust and other air pollutants?

A federal court may soon help clarify this dilemma.

Since at least 2004, EPA physicians have been intentionally exposing human beings to various forms of concentrated airborne particulate matter (PM), including diesel exhaust, at an EPA laboratory at the University of North Carolina School of Medicine (UNC). The diesel exhaust is generated by idling a diesel truck with its exhaust pipe located right under the air intake for the exposure chamber.

The university not only houses the EPA facility, but also provides on a contract basis the mandatory institutional review board (IRB) intended to serve as the last line of defense for human study subjects.

Although these experiments materially violate every law, regulation, and standard developed since World War II for the protection of human subjects, there are two primary violations.1

First, these experiments should never have been approved by UNC or conducted by EPA given the allegedly lethal nature of PM as determined by EPA.

Since 1997, the agency has regulated PM on the basis that it kills people. In 2004, EPA clarified its views of PM's lethality by concluding that any inhalation of PM could result in death within hours of exposure.2 The EPA reiterated this view in its 2009 scientific assessment of PM.3

In July 2011, Dr. Jon Samet, chairman of EPA's Clean Air Scientific Advisory Committee, wrote in the New England Journal of Medicine that there is no safe exposure to PM.4 This view was repeatedly echoed by EPA air chief Gina McCarthy in a February 2012 letter to House Energy and Commerce Chairman Fred Upton (R-Mich.).5

EPA Administrator Lisa Jackson testified before Congress in September 2011: "Particulate matter causes premature death. It doesn't make you sick. It's directly causal to dying sooner than you should. She added,"If we could reduce particulate matter to levels that are healthy we would have an identical impact to finding a cure for cancer."6 Cancer kills about 570,000 in the U.S. annually, according to the American Cancer Society.

In addition to the EPA-determined lethal nature of PM, EPA also says there is strong evidence that PM is carcinogenic.7

These characterizations of PM essentially portray it as one of the most toxic substances known to man—at least according to EPA. Though every poison has a lethal dose, any exposure to PM can kill, and kill quickly (within hours), EPA claims. Although exposure to carcinogens like asbestos, benzene, and vinyl chloride may cause cancers decades after exposure, or after decades of exposure, these risks obviously pale in comparison to that of PM in the view of EPA.

EPA, then, is experimenting on human beings with what it views as one of the most toxic substances known to man for the simple (and illegal) purpose of evaluating what would happen, apparently in an effort to bolster its epidemiological (i.e. statistical) claims.8,9 Worse, many of the study subjects are health-impaired, suffering from metabolic syndrome, asthma, old age, or combinations thereof.

The idea of a government agency deliberately exposing sick people to what it portrays as an extremely toxic substance is shocking. This is, however, only part of the story.

Second, informed consent is the cornerstone of medical practice and human testing protocols. Failure to obtain informed consent, among other misconduct, resulted in the execution of 16 of 23 Nazi doctors at the Nuremberg tribunal. The so-called "Common Rule" has been adopted by American medical researchers, including EPA, as a standard for conducting human experiments, and it prohibits harmful human experiments.10

Although EPA went through the motions of having its study subjects read and sign consent forms, the forms never mentioned that any exposure to PM could result in death within hours of the experiment. Study subjects were instead told, for example, "You may experience some minor degree of airway irritation, cough or shortness of breath or wheezing. These symptoms typically disappear two to four hours after exposure, but may last longer for particularly sensitive people."10

At least hundreds, and possibly thousands of human subjects have been so experimented upon by EPA physicians or EPA- grantee physicians at universities around the country. These experiments continue even as these concerns have been pointed out to EPA in recent months.

Has anyone been harmed? At least one 58-year-old obese woman with a personal and family history of heart problems had her experiment terminated early when she developed atrial fibrillation/flutter. The case was reported, 11 and it was said to be "the first case report of cardiovascular disease after exposure to elevated concentrations of any air pollutant." The rhythm resolved spontaneously about 2 hours after termination of the exposure. The authors concluded: "The resolution of the arrhythmia with termination of the particle exposure further supports a causal relationship between the two."They made this strong inference even while acknowledging evidence of a high frequency of supraventricular ectopy prior to exposure, numerous preexisting risk factors, and the fact that an

electrophysiologic study 6 weeks later revealed a re-entrant circuit, which was ablated. The authors suggested a potential mechanism of "disruption of the normal cardiac autonomic control," without

acknowledging the confounding factor of a potential emotional reaction to being in a setting resembling a gas chamber and being the subject of an exposure to an inhaled air mixture in a lab.

Although EPA physicians attributed the subject's arrhythmia to her PM exposure, they nevertheless did not modify the consent forms for subsequent human test subjects to reflect this risk.

As a result, the American Tradition Institute, a nonprofit public policy group, has filed suit in federal court against the EPA seeking an end to this illegal experimentation (American Tradition Institute Environmental Law Center v. U.S. EPA, Case 1:12- cv-01066-AJT-TCB, U.S. District Court for the Eastern District of Virginia—Alexandria Division).

Complaints have been filed with the North Carolina Medical Board concerning three of the North Carolina-licensed EPA physicians involved in the illegal experimentation. This investigation continues. The University of North Carolina School of Medicine has announced an internal review.

Congress has gotten involved, too. Sen. Jim Inhofe (R-Okla.) has requested that the Senate Environment and Public Works Committee, the committee responsible for overseeing EPA, schedule hearings on the scandal. Spearheaded by Rep. Paul Broun,

M.D. (R-Ga.-10), the House Science Committee has requested that the EPA Office of Inspector General conduct an investigation.

The lawsuit has already produced a notable admission of sorts from an EPA employee. In his declaration,12 EPA Clinical Studies Coordinator Martin W. Case asserted that he verbally informs human subjects in an ongoing trial that, "There is the possibility you may die from this." In addition to the shocking nature of this"warning,"even if it were acceptable to risk the lives of human study subjects for the sake of science—and it's not—such a warning would need to be in writing, according to federal regulations.

It's clear that "first, do no harm" was not a high priority concern of EPA physicians involved in this shocking experimentation. EPA and UNC are now in defensive postures, and the medical community needs to hold them accountable. Given past outrages of medical science, like the Nazi experiments and the Tuskegee syphilis experiments to name just two, what will the medical, political, and legal communities do to stop this ongoing research sponsored by a United States federal agency and funded with taxpayer dollars?

Another possibility is that the EPA does not believe its own testimony to Congress, and that oppressive, costly regulations have been imposed on American industry on the basis of flawed epidemiologic studies, unwarranted extrapolations, and contrived estimates of benefits. The experiments may be designed to find a potential mechanism of harm, like the one suggested in the case report by Ghio et al.11 If so, the very purpose of the experiments is to cause harm to human beings in an effort to justify false testimony.

[Editor's Note: In a letter from the Environmental Protection Agency Office of Inspector General, dated October 22, 2012, Assistant Inspector General for Program Evaluation, Carolyn Copper, indicated the agency "plans to begin an evaluation of the Environmental Protection Agency's (EPA's) Research on Human Subjects...to determine whether EPA: 1) Obtained sufficient approval to expose subjects to specific levels of diesel exhaust emissions or concentrated airborne particles; 2) Obtained adequate informed consent from human study subjects before exposing them to diesel exhaust emissions or concentrated airborne particles; 3) Adequately addressed any adverse events that occurred, including notifying the University of

North Carolina at Chapel Hill's Institutional Review Board (IRB), the Human Studies Review Board, and the Human Subjects Research Review Official, revising consent forms as needed, and providing clinical follow- up in accordance with the approved protocol." 9. 2018 Enstrom reviews and exposes EPA air quality epidemiological misconduct 2017

https://junkscience.com/2018/05/pope-fails-to-find-error-in-enstroms-2017-reanalysis-of-pope-1995-pm2-5-study/

The study below is a reanalysis of earlier studies relied on by the US EPA.

Dr. Enstrom shows that the studies not only show small associations that are proof of nothing, but in some cases reanalyzing the data shows Confidence Intervals that include Relative Risk of 1.0 so the studies failed in every way to show an effect. Dr. Enstrom also provides information on a systematic effort by journals to suppress his expose'.

https://www.ncbi.nlm.nih.gov/pubmed/28473741

Abstract

Background: In 1997 the US Environmental Protection Agency (EPA) established the National Ambient Air Quality Standard (NAAQS) for fine particulate matter ($PM_{2.5}$), largely because of its positive relationship to total mortality in the 1982 American Cancer Society Cancer Prevention Study (CPS II) cohort. Subsequently, EPA has used this relationship as the primary justification for many costly regulations, most recently the Clean Power Plan. An independent analysis of the CPS II data was conducted in order to test the validity of this relationship.

Methods: The original CPS II questionnaire data, including 1982 to 1988 mortality follow-up, were analyzed using Cox proportional hazards regression. Results were obtained for 292 277 participants in 85 counties with 1979-1983 EPA Inhalable Particulate Network $PM_{2.5}$ measurements, as well as for 212 370 participants in the 50 counties used in the original 1995 analysis.

Results: The 1982 to 1988 relative risk (RR) of death from all causes and 95% confidence interval adjusted for age, sex, race, education, and smoking status was 1.023 (0.997-1.049) for a 10 $\mu g/m^3$ increase in $PM_{2.5}$ in 85 counties and 1.025 (0.990-1.061) in the 50 original counties. The fully adjusted RR was null in the western and eastern portions of the United States, including in areas with somewhat higher $PM_{2.5}$ levels, particularly 5 Ohio Valley states and California.

Conclusion: No significant relationship between $PM_{2.5}$ and total mortality in the CPS II cohort was found when the best available $PM_{2.5}$ data were used. The original 1995 analysis found a positive relationship by selective use of CPS II and $PM_{2.5}$ data. This independent analysis of underlying data raises serious doubts about the CPS II epidemiologic evidence supporting the $PM_{2.5}$ NAAQS. These findings provide strong justification for further independent analysis of the CPS II data.

James E. Enstrom

Here is another article in 2018 that describes Enstrom's efforts to expose US EPA air quality effects research misconduct.

Scientific Distortions in Fine Particulate Matter Epidemiology
James E. Enstrom, Ph.D., M.P.H.

ABSTRACT
The theoretical prevention of premature deaths from the inhalation of fine particulate matter is being used by the U.S. Environmental Protection Agency (EPA) to justify the National Ambient Air Quality Standard (NAAQS) and multibillion dollar regulations across the U.S., including the EPA Clean Power Plan and the California Air Resources Board (CARB) Truck and Bus Regulation. The epidemiology is severely flawed. Fine particulates probably make no significant contribution to premature mortality in the U.S. The publication of null findings has been blocked or marginalized and studies claiming excess mortality need to be reassessed.

Basics of Fine Particulate Matter

Fine particulate matter (PM2.5) is defined by its size (≤2.5 μm diameter), not its composition. Major sources in the U.S. are forest fires, commercial and residential burning, and diesel engines. In California, a major source is China; on some days up to 30% of fine particulates had crossed the Pacific Ocean.
Of these invisible particles, the average adult in the U.S., based on actual 2015 exposure levels, would inhale about 1 gram in an 80-year lifespan, assuming that he breathes about 10,000 liters of air a day at rest. For comparison, the amount inhaled while smoking 100 cigarettes is about 4 grams.1

In 1997, the EPA established the NAAQS for PM2.5 as 15 μg/ m3. This was lowered to 12 μg/m3 in 2012. This standard has been largely justified on the basis of secret science epidemiology. These regulations are very powerful and impose huge costs on American businesses. The PM2.5 NAAQS, has been used to justify several multi-billion-dollar rules, such as the EPA Clean Power Plan and the CARB Truck and Bus Regulation.

Although a significant effect from such extremely low levels is on its face highly implausible, the stringent EPA regulations are justified primarily by a claim of preventing premature deaths, assuming a value of $10 million per statistical life saved. The controversy over the issue was brought to general attention in 2002 by Professor Robert Phalen.2

Epidemiology of Fine Particulate Matter

The EPA claim that PM2.5 causes "premature deaths" is based on epidemiologic cohort studies purporting to show that the relative risk (RR) for total mortality is slightly greater than 1.0 in U.S. populations exposed to higher levels of PM2.5. No etiologic mechanism has been established, and there is no experimental evidence that inhalation of 1 g or 5 g of PM2.5 can cause death. Weakly positive RRs do not prove causality. Major difficulties include: (1) geographic and temporal variation in PM2.5 mortality risk; (2) exaggeration of actual human exposure by PM2.5 monitors, which measure ambient outdoor levels

far from the subjects; and (3) confounding variables such as co-pollutants. Moreover, the key study relied on by EPA, the American Cancer Society (ACS) 1982 Cancer Prevention Study (CPS II)3 is seriously flawed.

Reanalysis of the American Cancer Society Cancer Prevention Study II (ACS CPS II)

CPS II began in 1982 and is similar to the original CPS I, which began in 1959. The seminal paper published by Pope et al. in 19953 was so controversial that the Health Effects Institute (HEI) sought applications from teams consisting of two to four epidemiologists, statisticians, and airpollution exposure experts to conduct a reanalysis, including "sensitivity analyses to test the robustness of the original findings and interpretations to alternative analytic approaches."4 The HEI Reanalysis published in 2000 did not complete the mandated sensitivity analysis to assess the effect of alternate data.5 HEI published a report in 2009,6 which extended the mortality follow-up of the study from 1989 to 2000, but it did not incorporate the EPA Inhalable Particulate Network (IPN) PM2.5 data7,8 that I had called to the authors' attention in my 2005 paper.9

In 2016 I was able to obtain access to data in an original 1982-1988 version of CPS II. The data had been previously inaccessible since 1995 despite a congressional subpoena and repeated requests by different agencies. I am the only independent scientist who has gained access to the individual level data in both CPS I and CPS II. I was able to reproduce the same key results as Pope et al. by doing exactly what the authors did in 1995.3 However, their results were sensitive to the PM2.5 data that they used and to their particular analysis.

HEI did not follow its own mandate to conduct a comprehensive reanalysis. In particular, their sensitivity analysis was not done properly. Of the 13 teams that submitted reanalysis applications, HEI selected a 31-member team based in Canada, headed by statistician Daniel Krewski. It included a geographer, Michael Jerrett, and another statistician, Richard Burnett, but only had one epidemiologist, Yue Chen. Chen's degree was from Shanghai Medical University, and he was not a coauthor on either the 2000 HEI report5 or the 2009 HEI report.6 Thus, to reanalyze a major U.S. epidemiological study, HEI used a Canadian team that had essentially no epidemiologist.

An early clue to the existence of problems is seen in Figure 21 in the 2000 HEI Reanalysis Report.5 (Figure 1 in this article.) This map shows that in 50 cities across the U.S. the level of PM2.5 mortality risk varies. Higher risks were found mainly in the Rust Belt or the Ohio Valley, and levels were actually reasonably low

in California and throughout most of the western part of the U.S. Beginning in 2002, I asked the head of HEI, Daniel Greenbaum, and its principal scientist, Aaron Cohen, to send me the underlying data for that map. For 16 years, they have consistently refused to reveal this data to me.

Fine Particles and Mortality Risk
Figure 1. PM2.5 Levels and Mortality Risk in the U.S. [Reprinted from 2000 HEI Reanalysis Report,5 with permission.]

Thus, using the HEI PM2.5 data of Pope et al., 3 there is a statistically significant slight increase in RR of 1.082. That means that if the PM2.5 level increases by 10 μg/m3, the risk of dying goes up by about 8%. But, using the IPN PM2.5 data, the effect is nonsignificant, RR = 1.025 (95% CI, 0.990-1.061). Note that if one divides the U.S. into the Ohio Valley (Indiana, Kentucky, Ohio, Pennsylvania, and West Virginia) and the rest of the country, the RR is indistinguishable from 1.0, no matter what PM2.5 data is used. Only by combining the Ohio Valley, which has both a higher mortality risk and a higher level of PM2.5, with the rest of the country can HEI show a statistically significant effect.

My reanalysis10 has been published online since Mar 28, 2017, and so far its validity has not been challenged. The selection of data by HEI was also very interesting, as seen in Table 2. There were actually 11 counties in California that were part of the IPN network, and the HEI analyses omitted 7 of the 11 counties for reasons the authors have not explained. HEI had data from 50 different cities, and the only ones they included from California were Fresno, Los Angeles, San Francisco, and San Jose (in Santa Clara County). Two other counties that represent the extremes in PM2.5 levels are highlighted in the table. The Pope 1995 paper3 was based primarily on these extremes. HEI had Albuquerque, N.M., at 9 μg/

My analysis of the CPS II data revealed that the county of residence of subjects could be approximated based on the ACS Division and Unit numbers. The CPS II data were collected by about 70,000 researchers, including myself, who enrolled 1.2 million subjects in Fall 1982. I performed an analysis comparable to the HEI Reanalysis, as shown in Table 1. The PM2.5 data labeled IPN in the table was published in EPA reports from the Inhalable Particulate Network (IPN) by David Hinton et al. in 19847 and 1986.8 Because of the evasions that I have experienced in attempting to obtain information from HEI, I took a closer look at the 2000 HEI Reanalysis Report and found it actually contains the data that I used, although in a mislabeled and somewhat altered form. I have designated that data as HEIDC, which is labeled PM2.5 DC in the 2000 Report. This data was indirectly referred to in a couple of places in the 2000 HEI report, although it was not analyzed.

m3, as the lowest value, and Huntington, W.V., at 34.4 μg/m3, as the highest value. This is curious because the data that comes from the IPN network actually shows different high and low values. In fact, there is no measurement in the IPN for Huntington, W.V., but rather for Wheeling, W.V., listed in the IPN column. From the table, both the low and the high values are in California, both of which omitted from the HEI analysis. The low value is 10.6 μg/m3 in Santa Barbara County, and the high value is 42.0 μg/m3 in Riverside County. The PM2.5 DC data that I found in the 2000 HEI Report appendix table, labeled HEIDC by me, had more than 50 cities, but only five of the 63 total cities were from California. The IPN network as a whole has about 85 cities. These major inconsistencies need to be addressed by these investigators. And so far, there is nothing but silence. This is only one of the issues that must be addressed if the investigators want to maintain any credibility.

Table 1. Enstrom Analyses of ACS CPS II Data Using Three Sources of PM2.5 Data

Table 2. Comparison of Data on PM2.5 and Mortality from Enstrom and HEI9

Relationship between PM2.5 and Mortality in California

Because of the Feb 26, 2010, conference in Sacramento, which I attended along with Professor Robert Phalen, other prominent scientists, and impacted business groups, we were able to get an analysis done by HEI that dealt with the California portion of the national CPS II results. The California data was partitioned out from the national analysis in the 2009 HEI Report.6 Based on the four HEI California counties shown in Table 2, the RR is about 0.9, significantly below 1.0, as shown in Table 3. This inverse relationship was reproduced using either the HEI data or the IPN data. Of course, this relationship cannot be etiologically correct, but it shows what can result from data omission and manipulation.

Table 3. Relative Risk for PM2.5 and Mortality in California Based on Four Counties

Table 4. PM2.5 and Total Mortality in Six California Cohorts Both my analysis and that by Thurston et al. on the NIH
AARP cohort,14 summarized in Table 5, show no effect nation- wide or in California.

There are actually six California cohorts that have been used to analyze the relationship between PM2.5 and total mortality, as shown in Table 4. The cohort that I initially used is labeled CA CPS I;9 the cohort used by Jerrett et al.11 is labeled CA CPS II. The Adventist Health Study of Smog (AHSMOG) was the original cohort study in California.12 There are also the California Teachers Cohort,10 the "West" portion of the Medicare Cohort Air Pollution Study (MCAPS),13 and the National Institutes of Health-American Association of Retired Persons (NIH AARP) cohort, which was published in 2016 by Thurston et al.14 The NIH AARP cohort is supposed to be an open access database, but is apparently currently controlled by Thurston. I have been able to get access to only the California portion of the data, and my analysis shows no effect in California. Averaging all six cohorts gives an RR of exactly 1.00, which means no relationship between PM2.5 and total mortality.
The lack of an effect in California might explain why Pope et al.3 omitted seven California cities from the national analysis. As Figure 1 shows, there is tremendous variation across the country. Yet the most severe regulations are in California, despite the clear absence of mortality risk there!

Table 5. Comparison of Enstrom and Thurston Analyses for
U.S. and California

An International Perspective on PM2.5

Despite the null effect shown by their own data and analyses, prominent advocates of drastic measures to reduce PM2.5 levels state in a major paper in the May 13, 2017, Lancet that ambient PM2.5 was the fifth-ranking mortality risk factor worldwide in 2015. Aaron J. Cohen, until recently HEI Principal Scientist, is the lead author, and Pope is a coauthor. The study is part of the World Health Organization (WHO) Global Burden of Disease (GBD) Project and was largely funded by HEI. The article claims that PM2.5 causes 4.2 million deaths annually worldwide, with 88,000 deaths in the U.S. (see Table 6). The mean PM2.5 level is

8.4 μg/m3 in the U.S. and 58.4 μg/m3 in China. Clearly, the PM2.5 level and premature deaths are low in the U.S. and high in China, India, and Africa.

Table 6. Global Deaths Attributed to PM 15

Agenda-driven Science

Since publishing my 2005 critique of the relationship between PM2.5 and total mortality9 and my 2017 critique,10 I have sent numerous requests to Pope, ACS, HEI, and others, inviting a rebuttal. I have received no response that confirms or refutes any of my analyses. It has, however, been incorrectly asserted that, "The study by Enstrom does not contribute to the larger body of evidence on the health effects of PM2.5." ACS has criticized me for having CPS II data that they have deliberately tried to keep secret. My invitations to authors and ACS officials to attend meetings, teleconferences, and symposia have simply been ignored. They even ignored an August 1, 2013, subpoena from the U.S. House Science, Space, and Technology Committee.

The control over air pollution research and assessments that is recognized by EPA is not based on special expertise in epidemiology. Pope, the self-proclaimed "world's leading expert on the effects of air pollution on health," is a professor of economics at Brigham Young University and holds a 1981 Ph.D. in agricultural economics from Iowa State University, where he studied the dynamics of crop yields. Michael Jerrett, who is one of the most prolific publishers and a member of the HEI reanalysis team, has a 1996 Ph.D. in geography from the University of Toronto, and no formal training in epidemiology. Aaron J. Cohen, until recently HEI's Principal Scientist, does hold a 1991 D.Sc. degree in epidemiology from Boston University, but he has badly misused the principles and standards of epidemiology. Although he supervised the 1998-2000 HEI Reanalysis Project, he has refused to clarify findings from this project and has refused to confirm or refute the findings in my 2017 CPS II reanalysis. It is very disturbing that ACS has allowed CPS II data to be used for more than 20 years for research that misuses the principles and standards of epidemiology and that has nothing significant to do with cancer.

The principal qualification for admission to the elite circle of influence appears to be dedication to the agenda of global controls on economic activity via air pollution regulations. The conclusion reached by researchers is apparently predetermined, as stated in the last paragraph of the GBD study on ambient air pollution: "As the experience in the U.S. suggests, changes in ambient PM2.5 associated with aggressive air quality management programmes, focused on major sources of air pollution including coal combustion, household burning of solid fuels, and road transport, can lead to increased life expectancy over short timeframes."15

What is the state of scientific integrity? It is very dangerous to one's career to criticize views backed by powerful interests, and I do it only because I believe current trends are anti- science and dangerous to our country. Simply being a passive observer is no longer acceptable.

To disclose my own background, I obtained a Ph.D. in physics in 1970, but I became an epidemiologist starting in 1973 in order to apply the rigorous principles of physics to observational epidemiology. I had a long career as a research professor and researcher at the UCLA School of Public Health. My research has examined the influence of environmental and lifestyle factors on mortality, and has on occasion reached politically incorrect conclusions. My research in air pollution epidemiology has been strongly influenced by Dr. Frederick Lipfert and Professor Robert Phalen. In February 2010 I was terminated from UCLA without warning and told that my "research is not aligned with the academic mission of the Department." In

February 2015 I settled a three-year federal whistleblower retaliation lawsuit against UCLA and my termination was reversed. My case and some of the issues related to my air pollution epidemiology research have been discussed in this journal.16

My background and publications, including rejections of my research, often without peer review, are documented on my website, www.scientificintegrityinstitute.org. I believe that major journals simply will not accept articles that challenge the established view. Moreover, authors of the papers promoting PM2.5 premature deaths omit null results, even their own. For example, Jerrett is the lead author of a 2007 study that shows no increased mortality associated with PM2.5 in the CPS II cohort if the results are divided into five time periods.17 Although researchers are paid millions of dollars, they're not under any obligation to address any of the concerns about their work. Those who disagree with the agenda are denied research funding.

We must prevent American science from following historical examples like that of Trofim Denisovich Lysenko. He was a phony plant geneticist, who gained the favor of Joseph Stalin because he didn't believe in Mendelian genetics. Lysenko's views controlled much of Soviet agriculture in the 1930s, 1940s, and 1950s, with devastating effect. False crop statistics were published, and dissenting scientists were purged. Nikolai Vavilov, a renowned plant geneticist, was imprisoned by Stalin and died of malnutrition.
Concerns about integrity in Western science are being raised. Richard Horton, editor of The Lancet, writes: "The case against science is straightforward: much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects, invalid exploratory analyses, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness."18

A U.S. House of Representatives bill called the Secret Science Reform Act was passed in 2014 and 2015 in order "to prohibit the Environmental Protection Agency from proposing, finalizing, and disseminating regulations or assessments based upon science that is not transparent or reproducible." The bill was revived in 2017 as the Honest and Open New EPA Science Treatment (HONEST) Act, labeled H.R. 1430, and was passed by the U.S. House of Representatives.
American science needs to guard against the heirs of Sinclair Lewis's protagonist in his 1927 novel Elmer Gantry, an itinerant preacher who is able to sell false religion to gullible people. We have prominent scientists who have successfully sold the notion that inhaling 1 g of invisible particles over an 80-year lifetime can cause premature death.

Conclusions

There is strong evidence from two large national cohorts that PM2.5 does not cause premature deaths in the US. There is strong evidence that this relationship has been falsified by EPA, the Health Effects Institute, and leading researchers for more than 20 years. Better oversight to assure scientific integrity, such as access to data, transparency, and consideration of opposing views, is imperative.

James E. Enstrom, Ph.D., M.P.H., a physicist and epidemiologist, is a retired research professor from the University of California, Los Angeles, and president of the Scientific Integrity Institute in Los Angeles. Contact: jenstrom@ucla.edu

Abstract
The United States Environmental Protection Agency (USEPA) is charged with identifying and mitigating environmental risks. This article will discuss US EPA misguided decision to use Linear No Threshold as the template for Radiation Biophysics and Toxicology.
The Health Physics Society (HPS) has stated that reliance on the LNT model "...tends to foment the public's fear of all types of radiation . . . reliance on the LNT model, especially at very low doses and dose rates, is inappropriate and can exaggerate the risk." (Kirner 2017) (Ring et al. 2017). The HPS also condemns "collective" (cumulative) dose as a measure of biological radiation risk.
One hit or linear no threshold (LNT) radiation biophysics makes no sense as a theory for carcinogenesis. Most cancer cell types are hyper/multiploid due to telomeric mitotic dysfunction, not mutations of genetic code. Carcinogenesis is also enabled by immune system failure to eliminate malignant cell lines. Both phenomena are associated with aging.

The US EPA acceptance of the assertions on LNT of Biological Effects of Atomic Radiation (BEAR), Biological Effects of Ionizing Radiation (BEIR) and National Academy of Science (NAS) committees, has been so irrational as to assume there is no safe level of ionizing radiation. Nonsense.
The LNT cancer theorists ignore protective biological processes, even hormetic, certainly no effect evidence of low level radiation. (Ulsh 2010; Sacks and Siegel 2017; Welsh et al. 2017), Scott 2017), acknowledged by the National Council on Radiation Protection and Measurements (NCRP) over 15 years ago (NCRP 2001). "These experimental observations are not compatible with a single hit mechanism. . . hypothesis." (Trott and Rosemann 2000)
The fruit fly research by Hermann Muller and Curt Stern founded the LNT model, but the research actually showed a threshold, misrepresented by Muller, a committed advocate of LNT (Siegel et al. 2015; Calabrese 2017a, 2017b). Muller was a deceitful, relentless advocate of LNT, and, as a Nobel Laureate, very influential. (Calabrese 2017c)
The American Association of Physicists in Medicine (AAPM) strongly objects to the LNT approach as creating harm from adverse attitudes about imaging procedures. They consider the risks at or below 50 mSv [5 rem] for single procedures or 100 mSv [10 rem] for multiple procedures not detectable.
The USEPA use of LNT causes harm with no evidence of worthwhile benefit. US EPA claims that LNT is "conservative" and "cautious," translated as adoption of the misbegotten precautionary principle. The Fukishima mitigation, for example, was excessive, harmful and expensive, applied at doses far below the range of any negative public health consequences (Siegel et al. 2017c; Welsh et al. 2017).

Conclusions
The US EPA has been irresponsible and unscientific in its application of the Linear No Threshold template for radiation biophysics and toxicology. US EPA risk management is unscientific, unreliable and unjustified, wrongly derived from high dose rate environments and bench experimentation. Rat and mouse studies with exposures at lethal levels have created a long list of "carcinogens" that are then part of the LNT toxicology deception. (Calabrese 2018)
Society has become so fearful of radiation and chemicals that unnecessary steps are taken, and other risks are accepted, compliance costs are tolerated and are pursued energetically and expensively in a risk management environment of zero tolerance.
From the 1979 Three Mile Island to Fukishima in 2011, radiation incidents impacting large areas repeatedly show potential, variable risk for the immediate plant area, but, for example, even the terrible Chernobyl explosion, a stunningly limited harm from radiation beyond that.
The Fukishima event caused no radiation-related deaths (UNSCEAR 2013b), however the scare and the evacuation increased mortality, particularly in the elderly (Nomura et al. 2013; Yasumura et al. 2013; Uchimura et al. 2014, Ichiseki 2013) and the evacuations were scientifically unethical as a risk management strategy (Akabayashi and Hayashi 2012).
Changes, long overdue, on the matter of LDDR radiation risk management must go forward with the knowledge that adverse health effects are not detectable and that radiation exposures have a no effect, a harmful threshold of effect and even a sweet spot where radiation produces hormetic beneficial effects. (Calabrese 2013, Scott, 2017)
The USEPA Scientific Advisory Board (SAB) properly recommended a "change in the agency culture, change in how the agency works, and increased support for scientists and managers in programs and regional offices responsible for science integration." (Swackhamer and Burke 2012)
The radiation biophysics and toxicological precautionary principle needs a retirement in favor of rational risk assessment and mitigation.

Below is my abstract/monograph for a presentation to the Gulf Coast Geophysical Societies conference scheduled for late September of 2018. Here I summarize much of the research on human health impacts from warmer temperatures—that shows the benefits of warming. That debunks the catastrophic and ominous claims of the US EPA. There are certainly other reasons to object to US EPA clams that CO 2 is a pollutant and dangerous, but underlying those claims is their fraudulent and unsupported claim that warming would be deleterious to human health—when the opposite is true.

This if offered as just one exhibit that shows the US EPA has been irresponsible in its claims about the impact of CO2 rise and warming—there are other scientific research studies that show the claims about

11. Dunn on Global Warming and Climate Change EPA misconduct—the scam of making Carbon Dioxide a pollutant.

Warming is a Benefit to Humans and the Biosphere

John Dale Dunn MD JD

The Intergovernmental Panel on Climate Change (IPCC) predicts a global temperature increase of 3C or more by 2100, but other experts believe the best guess is 1C or less. We assert that increases in average temperature of the planet from the current 60 degrees F. will be beneficial to human health and the biosphere.

IPCC's alarms have led to widespread fear of the health effects of global warming (Schulte, 2008) and even political attack ads claiming people are dying of "carbon pollution" (WMC, 2015). These statements have no basis in scientific research and in fact and based on the evidence, warming will be a benefit to all living things. Carbon Dioxide that increases to even 1000 PPM will be beneficial to the biosphere and make the planet more hospitable and arable.

In fact, the litany of climate extremes postulated by the IPCC has been falsified by the actual record of climate measurements and observations. None of the environmental disasters, human displacements and disruptions predicted have come to pass during the past ten years, even as atmospheric carbon dioxide has continued to increase. We all know of the temperature "pause" that has accompanied an increase in atmospheric Carbon Dioxide.

In this document the benefits of fossil fuel use, and even warming, if it did occur, are explained in greater detail.

A warmer planet is beneficial to humanity as warmer temperatures lead to decreases in temperature-related mortality, premature deaths due to cardiovascular and respiratory disease, and stroke occurrences, and has little if any influence on vector-borne diseases such as malaria and dengue fever since vectors generally are not respectful of the definition of "tropical diseases.

Cool and colder temperatures kill while warmer temperatures are beneficial. It is troubling that, in the face of this evidence, environmentalists and politicians continue to frighten people with predictions of "killer heat waves" in a slightly warmer world. And yet, such claims are made. Severe heat waves are a weather phenomenon, not causally linked to average global temperature. Deaths from heat waves are most dramatic in areas with lack of adaptation—or general medical care for the disabled—who suffer from poor housing and medical problems that make them more susceptible.

Global Warming and Mortality Rates

- Medical research confirms and explains why cooler, colder temperatures cause increased disease and death rates. Warmer temperatures are associated with health benefits and decreased deaths.

- Population studies around the world show that warmer temperatures lead to a net decrease in mortality worldwide, even in those areas described as tropical.

- Carbon dioxide (CO2) is invisible, odorless, nontoxic, and does not seriously affect human health until the CO2 content of the air reaches approximately 15,000 ppm, more than 37 times greater than the current concentration of atmospheric CO2 (Luft et al., 1974). There is no reason to be concerned about any direct adverse human health consequences of the ongoing rise in the air's CO2 content now or in the future,

currently at about 400 parts per million (0.04%) since even extreme model predictions by warming advocates are for less than 2000 parts per million (2%).

The Intergovernmental Panel on Climate Change (IPCC), however, sees looming health threats. The Summary for Policymakers of IPCC's Working Group II's report for the Fifth Assessment Report (AR5) identified eight "key risk factors" regarding the effect of climate change on human wellbeing, all of them allegedly "identified with high confidence" (IPCC, 2014, emphasis in original). They are:

i) Risk of death, injury, ill-health, or disrupted livelihoods in low-lying coastal zones and small island developing states and other small islands, due to storm surges, coastal flooding, and sea level rise. 37[RFC1-5]

ii) Risk of severe ill-health and disrupted livelihoods for large urban populations due to inland flooding in some regions. 38 [RFC 2 and 3]

iii) Systemic risks due to extreme weather events leading to breakdown of infrastructure networks and critical services such as electricity, water supply, and health and emergency services. 39 [RFC 2-4]

iv) Risk of mortality and morbidity during periods of extreme heat, particularly for vulnerable urban populations and those working outdoors in urban or rural areas. 40 [RFC 2 and 3]

v) Risk of food insecurity and the breakdown of food systems linked to warming, drought, flooding, and precipitation variability and extremes, particularly for poorer populations in urban and rural settings. 41 [RFC 2-4]

vi) Risk of loss of rural livelihoods and income due to insufficient access to drinking and irrigation water and reduced agricultural productivity, particularly for farmers and pastoralists with minimal capital in semi-arid regions. 42 [RFC 2 and 3]

vii) Risk of loss of marine and coastal ecosystems, biodiversity, and the ecosystem goods, functions, and services they provide for coastal livelihoods, especially for fishing communities in the tropics and the Arctic. 43 [RFC 1, 2, and 4]

viii) Risk of loss of terrestrial and inland water ecosystems, biodiversity, and the ecosystem goods, functions, and services they provide for livelihoods. 44 [RFC 1, 3, and 4]

There is no scientific basis for believing global temperatures will rise to levels high enough to bring about any of these risks. Indeed, there is sound scientific support for believing warming will be a net positive rather than negative.

Here, we summarize only research on the effects of rising global temperatures on human health and the medical literature shows warmer temperatures and a smaller difference between daily high and low temperatures that results from some rising temperatures as occurred during the twentieth and early twenty-first centuries, reduce mortality rates (the subject of this section) as well as illness and mortality due to cardiovascular and respiratory disease and stroke occurrence.

Similarly, the research is quite clear that climate has exerted only a minimal influence on recent trends in vector-borne diseases such as malaria, dengue fever, and tick-borne diseases. Other factors, many of them related to economic and technological setbacks or progress and not to weather, are far more important in determining the transmission and presence of these "tropical" diseases that are not so tropical at all.

Warmer Temperature Impacts on Human Health

- Warmer temperatures lead to a decrease in temperature-related mortality, including deaths associated with cardiovascular disease, respiratory disease, and strokes. The evidence of this benefit comes from research conducted in every major country of the world.

- In the United States the average person who died because of cold temperature exposure lost in excess of 10 years of potential life, whereas the average person who died because of extreme heat related event lost no more than a few days or weeks of life because heat has a greater effect on more seriously debilitated and ill persons.

- In the U.S., some 4,600 deaths are delayed each year as people move from cold northeastern states to warm southwestern states. Between 3 and 7% of the gains in longevity experienced over the past three decades was due simply to people moving to warmer states.

- Cold-related deaths are far more numerous than heat-related deaths in the United States and the world. Coronary (heart attack) and cerebral thrombosis (stroke) account for about half of all cold-related mortality, events that are directed related to blood vessel and blood viscosity effects of cool or cold environments.

- Global warming, if it did occur, even to the degree predicted in the extreme, will reduce the incidence of cardiovascular diseases related to low temperatures and wintry weather by a much greater degree than the warming might increase the incidence of deaths or illness attributable to heat. Heat illness primarily produces fluid and electrolyte disturbances, loss of core temperature control and organ dysfunction from dehydration, circulatory failure and heat caused stress, not clotting events.

- The heat wave deaths of 1995 in Chicago and 2003 in Europe are pointed to by advocates of the claim that heat stress deaths will increase with any warming that might occur, but a closer look at heat event death rates in some of the studies below show acclimation increased awareness have blunted any heat stress death increases. In the case of Chicago and Europe temps rose to over 100 but the availability of air conditioning and ventilation along with attention to the needs of elderly and disabled individuals was determined to be a major reason for heat deaths.

- The heat deaths that occur during severe heat events are the result of stress and inability to acclimate to maintain normal core temperature control and avoid dehydration. Acclimatization and proper attention to the vulnerable populations failed in Chicago in 1995 and Europe, particularly France in 2003, for example with hundreds of heat deaths in the former and 20,000 or more deaths in the later.

- A large body of scientific examination and research contradicts and disproves the claim that malaria will expand across the globe and intensify as a result of CO2-induced warming. Malaria is historically a disease that was endemic to cool and even cold climates like Finland and Russia but has been suppressed by hygienic and vector control

measures.
- Concerns over large increases in vector-borne diseases such as dengue as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue disease. The Aedes Aegypti Anopheles and Asian Tiger mosquitos all have been found at higher latitudes.
- While temperature and climate effect the geographical distribution of ticks, they are not among the significant factors determining the incidence of tick-borne diseases. Moreover the effect of small increases in climate temperature, if does occur with certainly not impact the range of ticks that now live in the high latitudes, even in the mountains of those high latitudes.

Basis in Medical Science

Medical science explains why colder temperatures often cause diseases and sometimes fatalities whereas warmer temperatures are associated with health benefits.

Wang et al. collected daily mortality and meteorological data from 66 communities across China over the period 2006-2011. They then subjected these data to a series of analyses to elucidate the relationship between cold spell characteristics and human mortality. And what did those analyses reveal?

Not surprisingly, cold spells significantly increased human mortality risk in China. As indicated in Figure 1 below, the combined cumulative excess mortality risk (CER) for all of China when defining cold spells with a 5th and 2.5th percentile temperature intensity threshold was 28.5 and 39.7 percent, respectively. However, there were notable geographic differences; CER was tempered and near zero in the colder/higher latitudes, but increased to 58.7 and 92.9 percent at the corresponding 5th and 2.5th percentile temperature intensity

thresholds for the warmest and most southern latitude. Such geographic differences in mortality risk, according to the authors, are likely the product of better physiological and behavioral acclimatization of the northerly populations to cold weather.

Clearly, cold spells kill; and as has been found in almost every study of the subject, the risk of death from cold spells far exceeds that from heat waves (see the many reviews we have posted on this topic confirming this fact in our Subject Index under the heading Health Effects of Temperature: Hot vs, Cold Weather). As such, therefore, a little global warming would likely result in a net saving of lives by reducing the number of deaths that occur at the cold end of the temperature spectrum.

Antonio Gasparinni (2015) was lead author for a large international group of researchers who studied the effect of temperature extremes on death rates. Gasparrini and his co-authors analyzed data from 384 locations including the countries of Australia, Brazil, Canada, China, Italy, Japan, South Korea, Spain, Sweden, Taiwan, Thailand, the United Kingdom and the United States of America. By fitting a standard time-series Poisson model to the data obtained for each location, while controlling for trends and day of the week, they estimated temperature-mortality associations with a distributed lag non-linear model with 21 days of lag, after which they pooled the results they obtained in a multivariate meta-regression that included country indicators and temperature averages and ranges.

This work allowed them to calculate the number of human deaths attributable to heat and cold -- defined as temperatures above and below the optimum (minimum mortality) temperature -- for both moderate and extreme temperatures, the latter being defined "using cutoffs at the 2.5th and 97.5th temperature percentiles." And what did they thereby learn?

Based on data pertaining to a total of 74,225,200 human deaths that occurred between 1985 and 2012, the 23 researchers determined that 7.71% of the lives lost were caused by non-optimum temperatures; and among this group they found that "more temperature-attributable deaths were caused by cold (7.29%) than by heat (0.42%)" which makes cold in excess of seventeen times more deadly than heat. And they add, in this regard, that moderate "hot and cold temperatures represented most of the total health burden." Consequently, it seems pretty clear that any successful attempt to reverse or slow any potential increase in Earth's mean global temperature would likely come at a net cost of many human lives the world over, not a savings. The Gasparrini research provides a compelling confirmation of the reality that warmer temperatures are better for human welfare than cooler or colder temperatures. (Gasparrini Lancet 2015)

Keating and Donaldson (2001) explain that "cold causes mortality mainly from arterial thrombosis and respiratory disease, attributable in turn to cold-induced hemoconcentration and hypertension [in the first case] and respiratory infections [in the second case]." McGregor (2005) notes "anomalous cold stress can increase blood viscosity and blood pressure due to the activation of the sympathetic nervous system which accelerates the heart rate and increases vascular resistance (Collins et al., 1985; Jehn et al., 2002; Healy, 2003; Keatinge et al., 1984; Mercer, 2003; Woodhouse et al., 1993)," adding, "anomalously cold winters may also increase other risk factors for heart disease such as blood clotting or fibrinogen concentration, red blood cell count per volume and plasma cholesterol."

Wang et al. (2013) write, "A large change in temperature within one day may cause a sudden change in the heart rate and circulation of elderly people, which all may act to increase the risk of cardiopulmonary and other diseases, even leading to fatal consequences." This is significant for the climate change debate because, as Wang et al. also observe, "it has been shown that a rise of the minimum temperature has occurred at a rate three times that of the maximum temperature during the twentieth century over most parts of the world, which has led to a decrease of the diurnal temperature range (Karl et al., 1984, 1991)."

Robeson (2002) demonstrated, based on a 50-year study of daily temperatures at more than 1,000 U.S.

weather stations that daily (diurnal) temperature variability declines with warming and at a very substantial rate, so this aspect of a warmer world would lead to a reduction in temperature- related deaths.
Clearly, cold spells kill; and as has been found in almost every study of the subject, the risk of death from cold spells far exceeds that from heat waves. As such, therefore, a little global warming would likely result in a net saving of lives by reducing the number of deaths that occur at the cold end of the temperature spectrum.

Keatinge and Donaldson (2004) report coronary and cerebral thrombosis account for about half of all cold-related deaths, and respiratory diseases account for approximately half of the rest. They say cold stress causes an increase in arterial thrombosis "because the blood becomes more concentrated, and so more liable to clot during exposure to cold." As they describe it, "the body's first adjustment to cold stress is to shut down blood flow to the skin to conserve body heat," which "produces an excess of blood in central parts of the body," and to correct for this effect, "salt and water are moved out from the blood into tissue spaces," leaving behind "increased levels of red cells, white cells, platelets and fibrinogen" that lead to increased viscosity of the blood and a greater risk of clotting.
Keatinge and Donaldson also note "cold spells are closely associated with sharp increases in mortality rates," and "deaths continue for many days after a cold spell ends." On the other hand, they report, "increased deaths during a few days of hot weather are followed by a lower than normal mortality rate," because "many of those dying in the heat are already seriously ill
and even without heat stress would have died within the next 2 or 3 weeks."
With respect to the implications of global warming for human mortality, Keatinge and Donaldson state "since heat-related deaths are generally much fewer than cold-related deaths, the overall effect of global warming on health can be expected to be a beneficial one." They report, "The rise in temperature of 3.6°F expected over the next 50 years would increase heat-related deaths in Britain by about 2,000 but reduce cold-related deaths by about 20,000."
Keating and Donaldson's reference to deaths that typically would have occurred shortly even without excess heat is a phenomenon researchers call "displacement" or "harvesting." A study from Germany found "cold spells lead to excess mortality to a relatively small degree, which lasts for weeks," while "the mortality increase during heat waves is more pronounced, but is followed by lower than average values in subsequent weeks" (Laschewski and Jendritzky, 2002). The authors say the latter observation suggests people who died from short-term exposure to heat possibly "would have died in the short term anyway." They found the mean duration of above-normal mortality for the 51 heat episodes that occurred from 1968 to 1997 was 10 days, with a mean increase in mortality of 3.9%, after which there was a mean decrease in mortality of 2.3% for 19 days. Hence, the net effect of the two perturbations was an overall decrease in mortality of 0.2% over the full 29-day period.
The US EPA web site discussion of heat wave deaths referenced below reveals that the EPA recognizes heat wave deaths are not reliably counted because of loose death certificate definitions of heat caused versus heat related. Cardiovascular deaths is used as a catch all descriptor Although the deaths attributed to severe heat waves are described as Cardiovascular, the mechanism is metabolic and physiologic dysfunction and a collapse of the systems that maintain temperature equilibrium in endotherms like humans. The victims don't die of a heart attack, a coronary ischemic event caused by clots and narrowed coronary arteries, an occlusive event, they die of temperature effects and the failure of internal systems, including lung and cardiovascular system, solid organ, and brain malfunctions in the face of heat stress, dehydration, and rising core temperatures, along with dehydration and loss of mechanisms to maintain normal temperature. The victims are debilitated, and live in a stressfully hot environment and succumb for failure to acclimate and maintain normal body physiology.

Observational Research in Asia

Behar (2000) studied sudden cardiac death (SCD) and acute myocardial infarction (AMI) in Israel, concentrating on the role temperature may play in the incidence of these health problems. Behar notes "most of the recent papers on this topic have concluded that a peak of SCD, AMI and other cardiovascular conditions is usually observed in low temperature weather during winter." He cites an Israeli study by Green et al. (1994), which reported between 1976 and 1985 "mortality from cardio-vascular disease was higher by 50% in mid-winter than in mid-summer, both in men and women and in different age groups," even though summer temperatures in the Negev, where much of the work was conducted, often exceed 30°C and winter temperatures typically do not drop below 10°C. Behar concludes these results "are reassuring for populations living in hot countries."

Kan et al. (2003) investigated the association between temperature and daily in Shanghai, China, finding a V-like relationship between total mortality and temperature that had a minimum mortality risk at 26.7°C. Above this optimum temperature, they observe, "total mortality increased by 0.73% for each degree Celsius increase; while for temperatures below the optimum value, total mortality decreased by 1.21% for each degree Celsius increase." The net effect of a warming in Shanghai, China, therefore, would likely be reduced mortality on the order of 0.5% per degree Celsius increase in temperature, or perhaps more.

Guo et al. (2012) examine the nonlinear and delayed effects of temperature on cause- specific and age-specific mortality employing data from 1999 to 2008 for Chiang Mai, Thailand with a population of 1.6 million people. Controlling for season, humidity, ozone, and particulate matter (PM10) pollution, the three researchers found "both hot and cold temperatures resulted in immediate increase in all mortality types and age groups," but "the hot effects on all mortality types and age groups were short-term, while the cold effects lasted longer." The cold effects were greater, with more people dying from them than from the effects of heat.

Lindeboom et al. (2012) used daily mortality and weather data for the period 1983–2009 pertaining to Matlab, Bangladesh, to measure lagged effects of weather on mortality, controlling for time trends and

seasonal patterns. The four researchers report "mortality in the Matlab surveillance area shows overall weak associations with rainfall, and stronger negative association with temperature." They determined there was "a 1.4% increase in mortality with every 1°C decrease in mean temperature at temperatures below 29.2°C," but only "a 0.2% increase in mortality with every 1°C increase in mean temperature."

Wang et al. (2013) evaluated the short-term effect of diurnal temperature range (DTR) on emergency room (ER) admissions among elderly adults in Beijing. The nine researchers report "significant associations were found between DTR and four major causes of daily ER admissions among elderly adults in Beijing." They state "a 1°C increase in the 8-day moving average of DTR (lag 07) corresponded to an increase of 2.08% in respiratory ER admissions and 2.14% in digestive ER admissions," and "a 1°C increase in the 3-day and 6-day moving average of DTR (lag 02 and lag 05) corresponded to a 0.76% increase in cardiovascular ER admissions, and a 1.81% increase in genitourinary ER admissions, respectively.

Wu et al. (2013) assessed the health effects of temperature on mortality in four subtropical cities of China (Changsha, Kunming, Guangzhou, and Zhuhai). The 11 researchers report a U-shaped relationship between temperature and mortality was found in the four cities, indicating "mortality is usually lowest around a certain temperature and higher at lower or higher temperatures." Although "both low and high temperatures were associated with increased mortality in the four subtropical Chinese cities," Wu et al. state the "cold effect was more durable and pronounced than the hot effect."

Observational Research in Europe

Keatinge and Donaldson (2001) analyzed the effects on human mortality of temperature, wind, rain, humidity, and sunshine during high pollution days in the greater London area over the period 1976–1995. They observed simple plots of mortality rate versus daily air temperature revealed a linear increase as temperatures fell from 15°C to near 0°C. Mortality rates at temperatures above 15°C, however, were

"grossly alinear," as they describe it, showing no trend. Only low temperatures were found to have a significant effect on immediate and long-term mortality. They conclude "the large, delayed increase in mortality after low temperature is specifically associated with cold and is not due to associated patterns of wind, rain, humidity, sunshine, SO2, CO, or smoke."

Kysely and Huth (2004) calculated deviations of the observed number of deaths from the expected number of deaths for each day of the year in the Czech Republic for the period 1992– 2000. They found "the distribution of days with the highest excess mortality in a year is clearly bimodal, showing a main peak in late winter and a secondary one in summer." Regarding the smaller number of summer heat-wave-induced deaths, they also found "a large portion of the mortality increase is associated with the harvesting effect, which consists in short-term shifts in mortality and leads to a decline in the number of deaths after hot periods (e.g. Rooney et al., 1998; Braga et al., 2002; Laschewski and Jendritzky, 2002)." For the Czech Republic, they report, "the mortality displacement effect in the severe 1994 heat waves can be estimated to account for about 50% of the total number of victims." As they describe it, "people who would have died in the short term even in the absence of oppressive weather conditions made up about half of the total number of deaths."

Diaz et al. (2005) examined the effect of extreme winter temperature on mortality in Madrid, Spain for people older than 65, using data from 1,815 winter days over the period 1986– 1997, during which time 133,000 deaths occurred. They found that as maximum daily temperature dropped below 6°C, which they describe as an unusually cold day (UCD), "the impact on mortality also increased significantly." They also found the impact of UCDs increased as the winter progressed, with the first UCD of the season producing an average of 102 deaths/day at a lag of eight days and the sixth UCD producing an average of 123 deaths/day at a lag of eight days.

Laaidi et al. (2006) conducted an observational population study in six regions of France between 1991 and 1995 to assess the relationship between temperature and mortality in areas of widely varying climatic conditions and lifestyles. In all cases they found "more evidence was collected showing that cold weather was more deadly than hot weather." These findings, the researchers say, are "broadly consistent with those found in earlier studies conducted elsewhere in Europe (Kunst et al., 1993; Ballester et al., 1997; Eurowinter Group, 1997; Keatinge et al., 2000; Beniston, 2002; Muggeo and Vigotti, 2002), the United States (Curriero et al., 2002) and South America (Gouveia et al., 2003)." They also say their findings "give grounds for confidence in the near future," stating even a 2°C warming over the next half century "would not increase annual mortality rates."

Analitis et al. (2008) analyzed short-term effects of cold weather on mortality in 15 major European cities using data from 1990–2000, and found "a 1°C decrease in temperature was associated with a 1.35% increase in the daily number of total natural deaths and a 1.72%, 3.30% and 1.25% increase in cardiovascular, respiratory, and cerebro-vascular deaths, respectively." In addition, they report "the increase was greater for the older age groups," and the cold effect "persisted up to 23 days, with no evidence of mortality displacement." They conclude their results "add evidence that cold-related mortality is an important public health problem across Europe and should not be overlooked by public health authorities because of the recent focus on heat-wave episodes."

Wichmann et al. (2011) investigated the association between the daily three-hour maximum apparent temperature (which reflects the physiological experience of combined exposure to humidity and temperature) and deaths due to cardiovascular disease (CVD), cerebrovascular disease (CBD), and respiratory disease (RD) in Copenhagen over the period
1999–2006.

Monthly deaths in the Castile-Leon region of Spain attributable to cardiovascular disease.

Source: Adapted from Fernandez-Raga et al. (2010).

During the warm half of the year (April–September), they found a rise in temperature had an inverse or protective effect with respect to CVD mortality (a 1% decrease in death in response to a 1°C increase in apparent temperature). This finding is unusual but also has been observed in Dublin, Ireland, as reported by Baccini et al. (2008, 2011). Wichmann et al. found no association with RD and CBD mortality. At the other end of the thermal spectrum, during the cold half of the year, all three associations were inverse or protective. This finding, according to the researchers, is "consistent with other studies (Eurowinter Group, 1997; Nafstad et al., 2001; Braga et al., 2002; O'Neill et al., 2003; Analitis et al., 2008)."
Matzarakis et al. (2011) studied the relationship between heat stress and all-cause mortality in the densely populated city of Vienna (Austria). Based on data from 1970–2007, and after adjusting the long-term mortality rate to account for temporal variations in the size of the population of Vienna, temporal changes in life expectancy, and the changing age structure of Vienna's population, the three researchers found a significant relationship between heat stress and mortality. However, over this 38-year period, "some significant decreases of the sensitivity were found, especially in the medium heat stress levels," they report. These decreases in sensitivity, they write, "could indicate active processes of long-term adaptation to the increasing heat stress." In the discussion section of their paper, they write such sensitivity changes "were also found for other regions," citing Davis et al. (2003), Koppe (2005), Tan et al. (2007), and Donaldson and Keatinge (2008). In the conclusion of their paper, they refer to these changes as

"positive developments."
Kysely and Plavcova then examined "temporal changes in mortality associated with spells of large positive temperature anomalies (hot spells) in extended summer season in the population of the Czech Republic (Central Europe) during 1986–2009." They found declining mortality trends in spite of rising temperature trends, just the opposite of what IPCC claims will occur in response to global warming. The Czech scientists add, "the finding on reduced vulnerability of the population remains unchanged if possible confounding effects of within- season acclimatization and mortality displacement are taken into account," and "neither does it depend on the changing age structure of the population, since similar (and slightly more pronounced) declines in the mortality impacts are found in the elderly (age group 70+ years) when examined separately."

Observational Research in North America

Goklany and Straja (2000) examined trends in United States death rates over the period 1979– 1997 due to excessive hot and cold weather. They report there were no trends in deaths due to either extreme heat or cold in the entire population or in the older, more-susceptible age groups, those aged 65 and over, 75 and over, and 85 and over. Deaths due to extreme cold in these older age groups exceeded those due to extreme heat by as much as 80% to 125%. With respect to the absence of trends in death rates attributable to either extreme heat or cold, Goklany and Straja say this "suggests that adaptation and technological change may be just as important determinants of such trends as more obvious meteorological and demographic factors."
Davis et al. (2003) evaluated "annual excess mortality on days when apparent temperatures—an index that combines air temperature and humidity—exceeded a threshold value for 28 major metropolitan areas in the United States from 1964 through 1998." They found "for the 28-city average, there were 41.0 ± 4.8 excess heat-related deaths per year (per standard million) in the 1960s and 1970s, 17.3 ± 2.7 in the 1980s, and 10.5 ± 2.0 in the 1990s," a remarkable decline. They conclude, "heat-related mortality in the United States seems to be largely preventable at present."
Davis et al. (2004) examined the seasonality of mortality due to all causes, using monthly data for 28 major U.S. cities from 1964 to 1998, and then calculated the consequences of a future 1°C warming of the conglomerate of those cities. At all locations studied, they report "warmer months have significantly lower mortality rates than colder months." They calculate "a uniform 1°C warming results in a net mortality decline of 2.65 deaths (per standard million) per metropolitan statistical area" (emphasis added). The primary implication of Davis et al.'s findings, in their words, "is that the seasonal mortality pattern in US cities is largely independent of the climate and thus insensitive to climate fluctuations, including changes related to increasing greenhouse gases."
Deschenes and Moretti (2009) analyzed the relationship between weather and mortality, based on "data that include the universe of deaths in the United States over the period 1972– 1988," in which they "match each death to weather conditions on the day of death and in the county of occurrence." They discovered "hot temperature shocks are indeed associated with a large and immediate spike in mortality in the days of the heat wave," but "almost all of this excess mortality is explained by near-term displacement." As a result, "in the weeks that follow a heat wave, we find a marked decline in mortality hazard, which completely offsets the increase during the days of the heat wave," so "there is virtually no lasting impact of heat waves on mortality." In the case of cold temperature days, they also found "an immediate spike in mortality but "there is no offsetting decline in the weeks that follow," so "the cumulative effect of one day of extreme cold temperature during a thirty-day window is an increase in daily mortality by as much as 10%."

Global Warming and Cardiovascular Disease

The key findings are that

- Global warming, if it does occur, would reduce the incidence of fatal coronary events related to low temperatures and wintry weather by a much greater degree than it increases the incidence of death or serious heat related events associated with high temperatures and summer heat waves.

- Non-fatal myocardial infarction is also less frequent during unseasonably warm periods than during unseasonably cold periods.

- Any cost-benefit analysis that attributes an increase in cardiovascular events to warming is incorrect. Heat illness injures and kills by other means and has a much lesser death toll proportionately than cold related events. Heat illness injury and death in heat waves affects the debilitated and chronically ill in hot unventilated environments and the mechanism is dehydration and loss of core body temperature control.

Cardiovascular diseases affect the heart and or the blood vessels. They include arrhythmia, arteriosclerosis, congenital heart disease, and coronary artery disease, diseases of the aorta and its branches, disorders of the peripheral vascular system, endocarditis, heart valve disease, hypertension, orthostatic hypotension, and

shock. According to IPCC, exposure to rising temperatures and especially heat waves can cause premature deaths due to heat-induced illness. The claims that it causes stroke or myocardial infarctions are not correct except to concede that ultimately most deaths are cardiovascular in nature.
Empirical research suggests that heat illness can cause collapse and death, but the mechanism is fluid and circulatory collapse, not stroke or heart attack. Heat stroke is severe heat illness with loss of temperature control that produces brain dysfunction; it's not a cerebral thrombosis or hemorrhage, a true stroke.
That aside, the IPCC overlooks the fact that cooler temperatures cause an even larger number of premature deaths, with the result that a warmer world would experience fewer deaths in total due to cardiovascular disease.

Global Warming and Respiratory Disease

The key findings of this section include the following:

- Global warming, if it did occur would reduce incidence of death due to respiratory disease around the world, for example the Americas, Spain, Canada, Shanghai, and even on the subtropical island of Taiwan.

- Lower minimum temperatures are a strong risk factor for outpatient visits for respiratory diseases. Warmer temperatures reduce rates of respiratory disease.

- Any cost-benefit analysis that attributes increases in deaths or disease and disability or loss of work/school time to warming is incorrect and not a reliable guide for public policy.

Respiratory diseases are diseases affecting the organs and tissues that make gas exchange possible in humans and other higher organisms. They range from the common cold, allergies, asthma, and bronchiolitis to life-threatening conditions including pneumonia, pulmonary embolism, and lung cancer. Acute respiratory disease is a condition in which breathing becomes difficult and oxygen levels in the blood drop lower than normal. Respiratory diseases are widespread. For example, childhood asthma affects more than 300 million people worldwide (Baena-Cagnani and Badellino, 2011). Non-fatal respiratory diseases impose enormous social costs due to days lost from work and school (Mourtzoukou and Falagas, 2007).
According to IPCC, rising atmospheric carbon dioxide concentrations due to the combustion of fossil fuels causes global warming, and this temperature increase causes increased deaths due to respiratory disease. However, examination of real-world data reveals unassailable evidence that colder temperatures cause more deaths and hospital admissions due to respiratory disease than do warmer temperatures.
Some of the studies cited earlier in this chapter on lower death rates due to warmer temperatures and cardiovascular disease also identified specific reductions in fatalities due to respiratory diseases, so their research also appears in this section. Keatinge and Donaldson (2001), for example, studied of the effects of temperature on mortality in people over 50 years of age in the greater London area over the period 1976–1995. Simple plots of mortality rate versus daily air temperature revealed a linear increase in mortality as the air temperature fell from 15°C to near 0°C. Mortality rates at temperatures above 15°C, on the other hand, showed no trend. The authors say it is because "cold causes mortality mainly from arterial thrombosis and respiratory disease, attributable in turn to cold-induced hemo-concentration and hypertension and respiratory infections" (emphasis added).
Nafstad et al. (2001) studied the association between temperature and daily mortality in citizens of Oslo, Norway over the period 1990 to 1995. The results showed the mean daily number of respiratory-related

deaths was considerably higher in winter (October–March) than in summer (April–September). Winter deaths associated with respiratory diseases were 47% more numerous than summer deaths. They conclude, "A milder climate would lead to a substantial reduction in average daily number of deaths." Read milder as warmer.

Hajat and Haines (2002) examined the relationship between cold temperatures and the number of visits by the elderly to general practitioners for asthma, lower respiratory diseases other than asthma, and upper respiratory diseases other than allergic rhinitis as obtained for registered patients aged 65 and older from several London practices between January 1992 and September 1995. They found the mean number of consultations was higher in cool-season months (October–March) than in warm-season months (April–September) for all respiratory diseases. At mean temperatures below 5°C, the relationship between respiratory disease consultations and temperature was linear, and stronger at a time lag of six to 15 days A 1°C decrease in mean temperature below 5°C was associated with a 10.5% increase in all respiratory disease consultations.

Braga et al. (2002) conducted a time-series analysis of both the acute and lagged influence of temperature and humidity on mortality rates in 12 U.S. cities, finding no clear evidence for a link between humidity and respiratory-related deaths. With respect to temperature, they found respiratory-related mortality increased in cities with more variable temperature. This phenomenon, they write, "suggests that increased temperature variability is the most relevant change in climate for the direct effects of weather on respiratory mortality."

Gouveia et al. (2003) extracted daily counts of deaths from all causes, except violent

deaths and neonatal deaths (up to one month of age), from Sao Paulo, Brazil's mortality information system for the period 1991–1994 and analyzed them for effects of temperature. For respiratory-induced deaths, death rates due to a 1°C cooling were twice as great as death rates due to a 1°C warming in adults and 2.8 times greater in the elderly.

Nakaji et al. (2004) evaluated seasonal trends in deaths due to various diseases in Japan, using nationwide vital statistics from 1970 to 1999 and concurrent mean monthly air temperature data. They found the numbers of deaths due to respiratory diseases, including pneumonia and influenza, rise to a maximum during the coldest time of the year. The team of nine scientists concludes, "To reduce the overall mortality rate and to prolong life expectancy in Japan, measures must be taken to reduce those mortality rates associated with seasonal differences."

Bartzokas et al. (2004) "examined the relationship between hospital admissions for cardio-vascular (cardiac in general including heart attacks) and/or respiratory diseases (asthma etc.) in a major hospital in Athens [Greece] and meteorological parameters for an 8-year period." Over the whole year, they found, "there was a dependence of admissions on temperature," and low temperatures were "responsible for a higher number of admissions." Specifically, "there was a decrease of cardiovascular or/and respiratory events from low to high values [of temperature], except for the highest temperature class in which a slight increase was recorded."

Kovats et al. (2004) studied patterns of temperature-related hospital admissions and deaths in Greater London during the mid-1990s. For the three-year period 1994–1996, they found respiratory-related deaths were nearly 150% greater in the depth of winter cold than at the height of summer warmth. They also found the mortality impact of the heat wave of 29 July to 3 August 1995 (which boosted daily mortality by just over 10%) was so tiny it could not be discerned among the random scatter of plots of three-year-average daily deaths from cardiovascular and respiratory problems versus day of year. Similarly, in a study of temperature effects on mortality in three English counties (Hampshire, West Midlands, and West Yorkshire), McGregor (2005) found "the occurrence of influenza ... helps elevate winter mortality above that of summer."

Carder et al. (2005) investigated the relationship between outside air temperature and deaths due to all non-accident causes in the three largest cities of Scotland (Glasgow, Edinburgh, and Aberdeen) between January 1981 and December 2001. The authors observed "an overall increase in mortality as temperature decreases," which "appears to be steeper at lower temperatures than at warmer temperatures," and "there is little evidence of an increase in mortality at the hot end of the temperature range." Specifically regarding respiratory disease, they found "for temperatures below 11°C, a 1°C drop in the daytime mean temperature on any one day was associated with an increase in respiratory mortality of 4.8% over the following month."
Donaldson (2006) studied the effect of annual mean daily air temperature on the length of the yearly respiratory syncytial virus (RSV) season, the virus which causes bronchiolitis, in England and Wales for 1981–2004. Reporting "climate change may be shortening the RSV season," Donaldson found "the seasons associated with laboratory isolation of respiratory syncytial virus (for 1981–2004) and RSV-related emergency department admissions (for 1990– 2004) ended 3.1 and 2.5 weeks earlier, respectively, per 1°C increase in annual central England temperature ($P = 0.002$ and 0.043, respectively)." Consequently, since "no relationship was observed between the start of each season and temperature," he reports, so "the RSV season has become shorter." He concludes, "These findings imply a health benefit of global warming in England and Wales associated with a reduction in the duration of the RSV season and its consequent impact on the health service."
Frei and Gassner (2008) studied hay fever prevalence in Switzerland from 1926 to 1991, finding it rose from just under 1% of the country's population to just over 14%, but from 1991 to 2000 it leveled off, fluctuating about a mean value on the order of 15%. The authors write, "several studies show that no further increase in asthma, hay fever and atopic sensitization in adolescents and adults has been observed during the 1990s and the beginning of the new century," citing Braun-Fahrlander et al. (2004) and Grize et al. (2006). They write, "Parallel to the increasing hay fever rate, the pollen amounts of birch and grass were increasing from 1969 to 1990," but "subsequently, the pollen of these plant species decreased from 1991 to 2007." They say this finding "is more or less consistent with the changes of the hay fever rate that no longer increased during this period and even showed a tendency to decrease slightly." Nearly identical findings were presented a year later (Frei, 2009). Although some have claimed rising temperatures and CO2 concentrations will lead to more pollen and more hay fever (Wayne et al., 2002), the analyses of Frei (2009) and Frei and Gassner (2008) suggest that is not true of Switzerland.
Miller et al. (2012) extracted annual prevalence data for frequent otitis media (defined as three or more ear infections per year), respiratory allergy, and non-respiratory seizures in children from the U.S. National Health Interview Survey for 1998 to 2006. They also obtained average annual temperatures for the same period from the U.S. Environmental Protection Agency. They found "annual temperature did not influence the prevalence of frequent otitis media," "annual temperature did not influence prevalence of respiratory allergy," and "annual temperature and sex did not influence seizure prevalence." They conclude their findings "may demonstrate that average temperature is not likely to be the dominant cause of the increase in allergy burden or that larger changes in temperatures over a longer period are needed to observe this association." They further conclude, "In the absence of more dramatic annual temperature changes, we do not expect prevalence of otitis media to change significantly as global warming may continue to affect our environment."
Xu et al. (2013) examined the relationship between diurnal temperature range (DTR) and emergency department admissions for childhood asthma in Brisbane, Australia, from January 1st 2003 to December 31st 2009. The six scientists report "childhood asthma increased above a DTR of 10°C" and "was the greatest for lag 0–9 days, with a 31% increase in [hospital] emergency department admissions per 5°C increment of DTR," further noting, "male children and children aged 5–9 years appeared to be more vulnerable to the DTR effect than others."

Ge et al. (2013) also investigated respiratory health and DTR. The researchers collected numbers of daily emergency-room visits for RTI at one of the largest medical establishments in Shanghai, China (Huashan Hospital) between 1 January 2008 and 30 June 2009, along with DTR data and data pertaining to possible confounding air pollutants (PM10, SO2, and NO2). After making appropriate statistical analyses, the scientists determined increasing DTRs were closely associated with daily emergency-room visits for RTIs, such that "an increase of 1°C in the current-day and in the 2-day moving average DTR corresponded to a 0.94% and 2.08% increase in emergency-room visits for RTI, respectively."
Lin et al. (2013) used data on daily area-specific deaths from all causes, circulatory diseases, and respiratory diseases in Taiwan, developing relationships between each of these cause-of-death categories and a number of cold-temperature related parameters for 2000–2008. The five researchers discovered "mortality from [1] all causes and [2] circulatory diseases and [3] outpatient visits of respiratory diseases has a strong association with cold temperatures in the subtropical island, Taiwan." In addition, they found "minimum temperature estimated the strongest risk associated with outpatient visits of respiratory diseases."

Global Warming and Strokes

The key findings of this section include the following:

- Any warming would reduce the incidence of death due to stroke in many parts of the world, including Russia, Korea, Japan, Africa, Asia, Europe, Latin America, and the Caribbean.

- Low minimum temperatures are a stronger risk factor than high temperatures for stroke incidence and hospitalization.

- Any cost-benefit analysis that attributes increased strokes to a prediction of global warming is incorrect and not a reliable guide for public policy.

A stroke occurs when blood flow to an area in the brain is cut off. Ischemic stroke occurs when clots form in the brain's blood vessels, in blood vessels leading to the brain, or in blood vessels elsewhere in the body and then travel to the brain. Ischemic stroke can also occur when too much plaque (fatty deposits and cholesterol) clogs the brain's blood vessels. Hemorrhagic strokes occur when a blood vessel in the brain breaks or ruptures. The result is blood seeping into the brain tissue, causing damage to brain cells. The most common causes of hemorrhagic stroke are high blood pressure and brain aneurysms. An aneurysm is a bulge in a blood vessel caused by a weakness and thinning of the blood vessel wall. Aneurysms are prone to burst and a major cause of hemorrhagic stroke (WebMD, 2015).
According to IPCC, rising atmospheric carbon dioxide concentrations due to the combustion of fossil fuels causes global warming, and this temperature increase causes increased deaths due to strokes. Not true. Examination of real-world data reveals unseasonable cold temperatures cause more deaths and hospital admissions due to stroke than do unseasonable warm temperatures.
Feigin et al. (2000) examined the relationship between the incidence of stroke and ambient temperatures over the period 1982-1993 in Novosibirsk, Siberia, which has one of the highest stroke incidence rates in the world. Based on analyses of 2,208 patients with sex and age distributions similar to those of Russia as a whole, they found a statistically significant association between stroke and low ambient temperature. In the

case of ischemic stroke (IS), which accounted for 87% of all stroke types, they determined "the risk of IS occurrence on days with low ambient temperature [was] 32% higher than that on days with high ambient temperature." They conclude the "very high stroke incidence in Novosibirsk, Russia may partially be explained by the highly prevalent cold factor there." There is no reason to believe that temperature variations would have a discernible effect on hemorrhagic strokes that occur because of vascular pathology, not occlusion.

Hong et al. (2003) investigated the association between the onset of ischemic stroke and prior episodic decreases in temperature in 545 patients who suffered strokes in Incheon, Korea from January 1998 to December 2000. They report "decreased ambient temperature was associated with risk of acute ischemic stroke," with the strongest effect being seen on the day after exposure to cold weather, further noting "even a moderate decrease in temperature can increase the risk of ischemic stroke." They also found "risk estimates associated with decreased temperature were greater in winter than in the summer," which suggests "low temperatures as well as temperature changes are associated with the onset of ischemic stroke." Finally, they explain the reason for the 24- to 48-hour lag between exposure to cold and the onset of stroke "might be that it takes some time for the decreasing temperature to affect blood viscosity or coagulation.

Nakaji et al. (2004) evaluated seasonal trends in deaths due to various diseases in Japan using nationwide vital statistics from 1970 to 1999 together with mean monthly temperature data. They found the peak mortality rate due to stroke was two times greater in winter (January) than at the time of its yearly minimum (August and September).

Chang et al. (2004) analyzed data from the World Health Organization (WHO) Collaborative Study of Cardiovascular Disease and Steroid Hormone Contraception (WHO, 1995) to determine the effects of monthly mean temperature on rates of hospitalization for arterial stroke and acute myocardial infarction among women aged 15–49 from 17 countries in Africa, Asia, Europe, Latin America, and the Caribbean. They found among these women, a 5°C reduction in mean air temperature was associated with a 7% increase in the expected hospitalization rate due to stroke, and this effect was relatively acute, within a period of about a month, the scientists write.

Gill et al. (2012) write, "in the past two decades, several studies reported that meteorologic changes are associated with monthly and seasonal spikes in the incidence of aneurysmal subarachnoid hemorrhage (aSAH)," and "analysis of data from large regional databases in both hemispheres has revealed increased seasonal risk for aSAH in the fall, winter and spring," citing among other sources Feigin et al. (2001), Abe et al. (2008), and Beseoglu et al. (2008). Gill et al. identified the medical records of 1,175 patients at the Johns Hopkins Hospital in Baltimore, Maryland (USA) who were admitted with a radiologically confirmed diagnosis of aSAH between 1 January 1991 and 1 March 2009. The six scientists report both "a one-day decrease in temperature and colder daily temperatures were associated with an increased risk of incident aSAH," and "these variables appeared to act synergistically" and were "particularly predominant in the fall, when the transition from warmer to colder temperatures occurred." Gill et al. add their study "is the first to report a direct relationship between a temperature decrease and an increased risk of aSAH," and "it also confirms the observations of several reports of an increased risk of aSAH in cold weather or winter," citing Nyquist et al. (2001) and other sources. Authors' note: This study and others the authors of the study reference are outliers in the sense that they tally aneurysmal sub arachnoid hemorrhage, a different kind of stroke than ischemic strokes, so there is no "mechanism" of coagulation and clot formation that would relate to temperature that might be hypothesized as a cause of cold or cool to cause hemorrhagic stroke.

The reader should be informed that hemorrhagic stroke is because of a different mechanism, the rupture of a weakened wall of a blood vessel, often associated with a bulge called an aneurysm, as opposed to ischemic stroke discussed above that occur because of a blood clot in the brain blood vessel. However the temperature

effect is the same, cold produces an increase in hemorrhagic strokes in addition to its effect on the rate of ischemic strokes.

Global Warming and Insect-borne Diseases

The key findings of this section include the following:

- Research contradicts the claim that malaria will expand across the globe and intensify as a result of any possible warming.

- Concerns over large increases in dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue fever infection rates.

- Climate change has not been a significant factor driving the recent temporal patterns in the epidemiology of tick-borne diseases. Ticks are endemic at many latitudes.

The latest IPCC report, the Fifth Assessment Report (AR5) backs down from previous predictions that global warming would facilitate the spread of insect-borne diseases including malaria, dengue fever, and tick-borne diseases. The full report from Working Group II on the subject (IPCC, 2014a, Chapter 11, pp. 722-726) repeatedly admits there is no evidence that climate change has affected the range of vector-borne diseases including tick-borne diseases. However, the Summary for Policymakers inexplicably warns "Throughout the 21st century, climate change is expected to lead to increases in ill-health in many regions and especially in developing countries with low income, as compared to a baseline without climate change (high confidence)." Among the "examples" given is "vector-borne diseases (medium confidence)" (IPCC, 2014b, pp. 19-20). Such predictions are not supported by the evidence.

In a research report in Science, Rogers and Randolph (2000) note "predictions of global climate change have stimulated forecasts that vector-borne diseases will spread into regions that are at present too cool for their persistence." However, the effect of warmer temperatures on insect-borne diseases is complex, sometimes working in favor of and sometimes against the spread of a disease. For example, ambient temperature has historically not determined the range of insect-borne diseases, hotter weather shortens the lifespan of mosquitos, and human adaptation as well as vector control measures can neutralize any detrimental effect of warming, to overwhelm the role of climate. Even those who support IPCC, such as Marm Kilpatrick, an assistant professor in ecology and evolutionary biology at the University of California, Santa Cruz, admits "It's a little bit tricky to make a solid prediction" (Irfan, 2011).

Gething et al. (2010), writing specifically about malaria, may have put it best when they said there has been "a decoupling of the geographical climate-malaria relationship over the twentieth century, indicating that non-climatic factors have profoundly confounded this relationship over time." They note "non-climatic factors, primarily direct disease control and the indirect effects of a century of urbanization and economic development, although spatially and temporally variable, have exerted a substantially greater influence on the geographic extent and intensity of malaria worldwide during the twentieth century than have climatic factors." As for the future, they conclude climate-induced effects "can be offset by moderate increases in coverage levels of currently available interventions."

This section investigates the reliability of IPCC's claim with respect to the three main kinds of insect-borne diseases: malaria, dengue fever, and tick-borne diseases According to the results of a vast body of scientific examination and research on this topic, there is little support for the claims appearing in the latest IPCC Summary for Policymakers.

Malaria

A vast body of scientific examination and research contradict the claim that malaria will expand across the globe and intensify as a result of CO2-induced warming.

Jackson et al. (2010) say "malaria is one of the most devastating vector-borne parasitic diseases in the tropical and subtropical regions of the world," noting it affects more than 100 countries.

According to the World Health Organization, Africa carries the highest infection burden of any continent, with nearly 200 million cases reported in 2006, and the Centers for Disease Control and Prevention estimates between 700,000 and 2.7 million people each year die from the dreaded disease (Suh et al., 2004). In addition, Jackson et al. report "the African region bears 90% of these estimated worldwide deaths," and "three-quarters of all malaria related deaths are among African children," citing Breman (2001). According to Reiter (2000), claims that malaria resurgence is the product of CO2-induced global warming ignore other important factors and disregard known facts. A historical analysis of malaria trends, for example, reveals this disease was an important cause of illness and death in England during a period of colder-than-present temperatures throughout the Little Ice Age. Its transmission began to decline only in the nineteenth century, during a warming phase, when, according to Reiter, "temperatures were already much higher than in the Little Ice Age." In short, malaria was prevalent in Europe during some of the coldest centuries of the past millennium, and it has only recently undergone widespread decline, when temperatures have been warming.

Clearly, there are other factors at work in regards to malaria that are more important than temperature. Such factors include the quality of public health services, irrigation and agricultural activities, land use practices, civil strife, natural disasters, ecological change, population change, use of insecticides, and the movement of people (Reiter, 2000; Reiter, 2001; Hay et al., 2002).

Nevertheless, concerns have lingered about the possibility of widespread future increases in malaria due to global warming. These concerns are generally rooted in climate models that typically use only one, or at most two, climate variables in making their predictions of the future distribution of the disease over Earth, and they generally do not include any of the non-climatic factors listed in the preceding paragraph. When more variables are included, a less-worrisome future is projected.

In one modeling study, for example, Rogers and Randolph (2000) employed five climate variables and obtained very different results. Briefly, they used the present-day distribution of malaria to determine the specific climatic constraints that best define that distribution, after which the multivariate relationship they derived from this exercise was applied to future climate scenarios derived from state-of-the-art climate models, in order to map potential future geographical distributions of the disease.

Their study revealed very little change: a 0.84% increase in potential malaria exposure under the "medium-high" scenario of global warming and a 0.92% decrease under the "high" scenario. Rogers and Randolph explicitly state their quantitative model "contradicts prevailing forecasts of global malaria expansion" and "highlights the use of multivariate rather than univariate constraints in such applications. They found "climate warming, expressed as a systematic temperature increase over the 85-year period, does not appear to be responsible for an increase in malaria suitability over any region in Africa." They conclude "research on the links between climate change and the recent resurgence of malaria across Africa would be best served through refinements in maps and models of precipitation patterns and through closer examination of the role of nonclimatic influences."

Kuhn et al. (2003) analyzed the determinants of temporal trends in malaria deaths within England and Wales in 1840–1910 and found "a 1°C increase or decrease was responsible for an increase in malaria deaths of 8.3% or a decrease of 6.5%, respectively," which explains "the malaria epidemics in the 'unusually hot summers' of 1848 and 1859." Nevertheless, the long- term near-linear temporal decline in malaria deaths over the period of study, the researchers write, "was probably driven by nonclimatic factors," among which they identify increasing livestock populations (which tend to divert mosquito biting from humans), decreasing acreages of marsh wetlands (where mosquitoes breed), as well as "improved housing, better access to health care and medication, and improved nutrition, sanitation, and hygiene." Kuhn et al. say "the projected increase in proportional risk is clearly insufficient to lead to the reestablishment of endemicity."

Childs et al. (2006) present a detailed analysis of malaria incidence in northern Thailand based on a quarter-century monthly time series (January 1977 through January 2002) of total malaria cases in the country's 13 Northern provinces. Over this time period, when IPCC claims the world warmed at a rate and to a level unprecedented over the prior one to two millennia, Childs et al. report there was an approximately constant rate of decline in total malaria incidence (from a mean monthly incidence in 1977 of 41.5 cases per hundred thousand people to 6.72 cases per hundred thousand people in 2001). Noting "there has been a steady reduction through time of total malaria incidence in northern Thailand, with an average decline of 6.45% per year," they say this result "reflects changing agronomic practices and patterns of immigration, as well as the success of interventions such as vector control programs, improved availability of treatment and changing drug policies."

Reiter (2008) came to similar conclusions, writing "simplistic reasoning on the future prevalence of malaria is ill-founded; malaria is not limited by climate in most temperate regions, nor in the tropics, and in nearly all cases, 'new' malaria at high altitudes is well below the maximum altitudinal limits for transmission." He further states, "Future changes in climate may alter the prevalence and incidence of the disease, but

obsessive emphasis on 'global warming' as a dominant parameter is indefensible; the principal determinants are linked to ecological and societal change, politics and economics."
Hulden and Hulden (2009) analyzed malaria statistics collected in Finland from 1750 to 2008 via correlation analyses between malaria frequency per million people and all variables that have been used in similar studies throughout other parts of Europe, including temperature data, animal husbandry, consolidation of land by redistribution, and household size. Over the entire period, "malaria frequency decreased from about 20,000–50,000 per 1,000,000 people to less than 1 per 1,000,000 people," they report. The two Finnish researchers conclude, "Indigenous malaria in Finland faded out evenly in the whole country during 200 years with limited or no counter measures or medication," making that situation "one of the very few opportunities where natural malaria dynamics can be studied in detail." Their study indicates "malaria in Finland basically was a sociological disease and that malaria trends were strongly linked to changes in the human household size and housing standard."

Effects of climate and socioeconomic factors on the projected future global distribution of malaria.

Source: Béguin et al. (2011).

The many findings described above make it clear a vast body of scientific examination and research contradict the claim that malaria will expand across the globe and intensify as a result of CO2-induced warming.

Dengue Fever

Concerns over large increases in dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue fever.

According to Ooi and Gubler (2009), "dengue/dengue hemorrhagic fever is the most important vector-borne viral disease globally," with more than half the world's population living in areas deemed to be at risk of infection. Kyle and Harris (2008) note "dengue is a spectrum of disease caused by four serotypes of the most

prevalent arthropod-borne virus affecting humans today," and "its incidence has increased dramatically in the past 50 years," to where "tens of millions of cases of dengue fever are estimated to occur annually, including up to 500,000 cases of the life- threatening dengue hemorrhagic fever/dengue shock syndrome." Some of the research papers summarized in previous sections address dengue fever as well as malaria. With a few worthy exceptions, we do not repeat those summaries in this section. The most important exceptions are papers written by or coauthored by Paul Reiter (2001, 2003, 2010a, 2010b), one of the world's premier authorities on the subject. Reiter analyzed the history of malaria and dengue fever in an attempt to determine whether the incidence and range of influence of these diseases would indeed increase in response to CO2-induced global warming.

His reviews established what is now widely accepted among experts in the field, that the natural history of these vector-borne diseases is highly complex, and the interplay of climate, ecology, vector biology, and a number of other factors defy definition by the simplistic analyses utilized in the computer models relied on by environmental activists and the IPCC.

That there has in fact been a resurgence of these diseases in parts of the world is true, but as Reiter (2001) notes; it is "facile to attribute this resurgence to climate change." This he shows via a number of independent analyses that clearly demonstrate factors associated with politics, economics, and human activity is the principal determinants of the spread of these diseases. He describes these factors as being "much more significant" than climate in promoting disease expansion. Two years later, Reiter took up the subject again, this time with 19 other scientists as coauthors (Reiter et al., 2003), and yet again in 2010. Reiter's work remains the most comprehensive critique of the claims of the Intergovernmental Panel on Climate Change.

Kyle and Harris (2008) wrote "there has been a great deal of debate on the implications of global warming for human health," but "at the moment, there is no consensus." However, "in the case of dengue," they report, "it is important to note that even if global warming does not cause the mosquito vectors to expand their geographic range, there could still be a significant impact on transmission in endemic regions," because "a 2°C increase in temperature would simultaneously lengthen the lifespan of the mosquito and shorten the extrinsic incubation period of the dengue virus, resulting in more infected mosquitoes for a longer period of time." Nevertheless, they state there are "infrastructure and socioeconomic differences that exist today and already prevent the transmission of vector-borne diseases, including dengue, even in the continued presence of their vectors," citing Reiter (2001).

Wilder-Smith and Gubler (2008) conducted a review of the scientific literature, noting "the past two decades saw an unprecedented geographic expansion of dengue" and "global climate change is commonly blamed for the resurgence of dengue," but they add, "There are no good scientific data to support this conclusion." The two researchers report, "Climate has rarely been the principal determinant of [their] prevalence or range," and "human activities and their impact on local ecology have generally been much more significant." They cite as contributing factors "urbanization, deforestation, new dams and irrigation systems, poor housing, sewage and waste management systems, and lack of reliable water systems that make it necessary to collect and store water," further noting "disruption of vector control programs, be it for reasons of political and social unrest or scientific reservations about the safety of DDT, has contributed to the resurgence of dengue around the world."

In addition, Wilder-Smith and Guble write "large populations in which viruses circulate may also allow more co-infection of mosquitoes and humans with more than one serotype of virus," which would appear to be borne out by the fact that "the number of dengue lineages has been increasing roughly in parallel with the size of the human population over the last two centuries." Most important, perhaps, is "the impact of international travel," of which they say "humans, whether troops, migrant workers, tourists, business travelers, refugees, or others, carry the virus into new geographic areas," and these movements "can lead to

epidemic waves." The two researchers conclude, "Population dynamics and viral evolution offer the most parsimonious explanation for the observed epidemic cycles of the disease, far more than climatic factors." Russell et al. (2009) showed the dengue vector (the Aedes Aegypti mosquito) "was previously common in parts of Queensland, the Northern Territory, Western Australia and New South Wales," and it had, "in the past, covered most of the climatic range theoretically available to it," adding "the distribution of local dengue transmission has [historically] nearly matched the geographic limits of the vector." This being the case, they conclude the vector's current absence from much of Australia "is not because of a lack of a favorable climate." Thus, they reason "a temperature rise of a few degrees is not alone likely to be responsible for substantial increases in the southern distribution of A. Aegypti or dengue, as has been recently proposed." Instead of futile attempts to limit dengue transmission by controlling the world's climate, therefore, the medical researchers recommend "well resourced and functioning surveillance programs, and effective public health intervention capabilities, are essential to counter threats from dengue and other mosquito-borne diseases."

Reiter (2010a) observed "the introduction and rapidly expanding range of Aedes Albopictus in Europe is an iconic example of the growing risk of the globalization of vectors and vector-borne diseases," and "the history of yellow fever and dengue in temperate regions confirms that transmission of both diseases could recur, particularly if Aedes Aegypti, a more effective vector, were to be re-introduced." He states "conditions are already suitable for transmission." Much more important than a rise or fall of a couple degrees of temperature, Reiter says, is "the quantum leap in the mobility of vectors and pathogens that has taken place in the past four decades, a direct result of the revolution of transport technologies and global travel."

Carbajo et al. (2012) evaluated the relative contributions of geographic, demographic, and climatic variables to the recent spread of dengue in Argentina. They found dengue spatial occurrence "was positively associated with days of possible transmission, human population number, population fall and distance to water bodies." When considered separately, the researchers write, "the classification performance of demographic variables was higher than that of climatic and geographic variables." Thus, although useful in estimating annual transmission risk, Carbajo et al. conclude temperature "does not fully describe the distribution of dengue occurrence at the country scale," and "when taken separately, climatic variables performed worse than geographic or demographic variables."

These several observations indicate concerns over large increases in dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue fever.

Tick-borne Diseases

Climate change has not been the most significant factor driving the recent temporal patterns in the epidemiology of tick-borne diseases.

Sarah Randolph of the University of Oxford's Department of Zoology is a leading scholar on tick-borne diseases. She and fellow Oxford faculty member David Rogers observed in 2000 that tick-borne encephalitis (TBE) "is the most significant vector-borne disease in Europe and Eurasia," having "a case morbidity rate of 10–30% and a case mortality rate of typically 1–2% but as high as 24% in the Far East." The disease is

caused by a flavivirus (TBEV), which is maintained in natural rodent-tick cycles; humans may be infected with it if bitten by an infected tick or by drinking untreated milk from infected sheep or goats.

Early discussions on the relationship of TBE to global warming predicted the disease would expand its range and become more of a threat to humans in a warmer world. However, Randolph and Rogers (2000) note, "like many vector-borne pathogen cycles that depend on the interaction of so many biotic agents with each other and with their abiotic environment, enzootic cycles of TBEV have an inherent fragility," so "their continuing survival or expansion cannot be predicted from simple univariate correlations."

Randolph (2010) examined the roles played by various factors that may influence the spread of tick-borne diseases. After describing some of the outbreaks of tick-borne disease in Europe over the past couple of decades, Randolph states "the inescapable conclusion is that the observed climate change alone cannot explain the full heterogeneity in the epidemiological change, either within the Baltic States or amongst Central and Eastern European countries," citing Sumilo et al. (2007). Instead, she writes, "a nexus of interrelated causal factors—abiotic, biotic and human—has been identified," and "each factor appears to operate synergistically, but with differential force in space and time, which would inevitably generate the observed epidemiological heterogeneity."

Many of these factors, she continues, "were the unintended consequences of the fall of Soviet rule and the subsequent socio-economic transition (Sumilo et al., 2008b)," among which she cites "agricultural reforms resulting in changed land cover and land use, and an increased reliance on subsistence farming; reduction in the use of pesticides, and also in the emission of atmospheric pollution as industries collapsed; increased unemployment and poverty, but also wealth and leisure time in other sectors of the population as market forces took hold."

Randolph concludes "there is increasing evidence from detailed analyses that rapid changes in the incidence of tick-borne diseases are driven as much, if not more, by human behavior that determines exposure to infected ticks than by tick population biology that determines the abundance of infected ticks," as per Sumilo et al. (2008a) and Randolph et al. (2008). She ends her analysis by stating, "While nobody would deny the sensitivity of ticks and tick-borne disease systems to climatic factors that largely determine their geographical distributions, the evidence is that climate change has not been the most significant factor driving
the recent temporal patterns in the epidemiology of tick-borne diseases."

Conclusion

IPCC fails to acknowledge the human health benefits of a warming world, claiming instead that the net effect of warming is a cost rather than a benefit.

Fossil fuels have benefited human health by making possible the dramatic increase in human prosperity since the first Industrial Revolution, making investments possible in goods and services that are essential to protecting human health and prolonging human life. Fossil fuels further improve human health by making environmental protection both valued and financially possible and by powering technologies and production of goods and services, transportation, communication that all improve quality of life, and protect human health and welfare, extend life spans.
If the combustion of fossil fuels leads to some amount of global warming, then the positive as well as negative health effects of that warming should be included in any cost-benefit analysis of fossil fuels.
Medical science explains why colder temperatures often cause diseases and sometimes fatalities whereas warmer temperatures are associated with health benefits.
Empirical research confirms that warmer temperatures lead to a net decrease in temperature- related mortality in virtually all parts of the world, even those with tropical climates. The evidence of this benefit comes from research conducted in nearly every major country of the world.
Global warming is reducing the incidence of fatal coronary events related to low temperatures and wintry weather by a much greater degree than it increases the incidence of heat related illness or death attributable to heat waves. Respiratory illness, strokes and myocardial infarction are less frequent during unseasonably warm periods than during unseasonably cold periods.
Global warming is reducing the incidence of death due to respiratory disease in many parts of the world, including Spain, Canada, Shanghai, and even on the subtropical island of Taiwan. Low minimum temperatures have been found to be a stronger risk factor than high temperatures for outpatient visits for respiratory diseases. Warm weather reduces the incidence of death due to stroke around the world.
A vast body of scientific examination and research contradicts and refutes the claim that malaria will expand across the globe or intensify in some regions as a result of any predicted CO2-induced warming. Concerns over large increases in mosquito-transmitted dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature.

While climatic factors largely determine the geographical distribution of ticks, temperature and climate change are not among the significant factors determining the incidence of tick-borne diseases.
In the face of this extensive evidence of the positive effects of fossil fuels on human health, IPCC continues to claim the net impact on human health of fossil fuels will be negative. Because virtually all cost-benefit analyses incorporate the IPCC's incorrect assumptions into their calculation of the social cost of fossil fuels, they are unreliable guides to policymakers.

12. Conclusion

This is not a complete expose of the misconduct of the US EPA sponsored researchers and in house science and policy staff in matters of epidemiology and toxicology and it focuses on the US EPA research/ policy /regulatory activities in air quality science and policy making—an equally scandalous case can be made for US EPA work in other areas of responsibility where toxicology and epidemiology are abused and misused to expand the EPA list of targets for regulation and opportunities for EPA to scaremonger.

I also cannot take the time or the space in this discussion to expose the US EPA new area of scientific misconduct and scaremongering—epigenetics and their claims of inheritable acquired toxin carcinogenic genetic mutations—revisiting Lamarck and Lysenko long ago discredited theories about acquired genetic changes. Such irresponsible scares about inherited toxic and cancer effects are ideal for irresponsible aggressive environmental fanatic wannabee regulators and their obedient research army.

US EPA researchers in epigenetics are their new breed of scaremongers with the target people who think exposure to some named toxin might effect their children or grandchildren. The lust of power and influence and cheating on science go hand in hand.

All of what I have exposed above combines to make an effective and urgent argument for the proposed US EPA policy change to promote integrity and transparency of US EPA science in matters of regulatory policy decision making. The time for cleaning up the US EPA scientific perfidy and misconduct, malfeasance is long past overdue.

I anticipate there will be institutions and scientists panicked and anxious about proving up their research assertions and conclusions—a very beneficial and healthy development. The polity will benefit from science and policy making that is based on reliable methods used by researchers with integrity who are subjected to impartial and thorough competent reviews by experts who are not conflicted by ideological, political, monetary or social/professional influences.

Docket ID No. EPA-HQ-OA-2018-0259

Comments submitted on the Docket Subject titled

Strengthening Transparency in Regulatory Science
Comment on Strengthening Transparency in Regulatory Science, Environmental Protection Agency, 40 CFR Part 30, RIN 2080—AA14 [EPA-HQ-OA-2018-0259; FRL-9977-40-ORD].

Comments submitted by John Dale Dunn MD JD
Emergency Physician, inactive attorney
Lecturer, retired Clinical Instructor,
Emergency Medicine Residency
Carl R. Darnall Army Medical Center, Fort Hood, Texas.

Table of contents of elements of the submission

The Submitter's opinions are personal and not attributable to the US Army or Department of Defense.

This submitter has witnessed US EPA misconduct for a period of 3 decades on a scale that is stunning, or alarming, going back to the EPA decision to ban DDT in the early 1970s, resulting in the deaths of millions in the 3rd world, and a particularly horrific impact on children.

More recently in addition to serial misconduct with regards to toxicology and epidemiology research the EPA has compounded its scientific methodology misconduct with a systematic violation of domestic and international ethical and moral/legal norms in regards to human experimentation—promoting and funding, approving human experiments that resulted in uninformed subjects being involved in experiments at 10 domestic and 6 foreign medical research institutions where they were intentionally observed while inhaling small particle contaminated air while being observed for adverse effects. These experiments carried out by prominent Medical Schools, is in spite of US EPA public pronouncements and testimony before congress that small particles are toxic, lethal (Hundreds of thousands of deaths annually) and carcinogenic.

US domestic law prohibits human experiments that might harm and international medical ethical standards for human experiments prohibit human experiments with no exceptions except exigencies of great need if the researchers act as subjects. Any other human experiments with a risk of harm are prohibited, and no consent will remove that proscription.

In the past 3 decades US EPA air quality research has been an abomination, relying on junk toxicology/epidemiology and the precautionary principle. The submitter has actively tried to expose the misconduct.

The proposal by the US EPA, discussed here to force EPA scientific transparency and scientific integrity is salutary and significant in all its elements, and the submitter is grateful for the change from the formerly fraudulent toxicology and epidemiology of the EPA to impose a new form of integrity.

I will detail in this submission the nature of the EPA sponsored research fraud, the methods and data manipulation and management that have resulted in EPA fraud on the public about air quality health effects, toxicological claims in other areas of EPA responsibility and the EPA full blown commitment to the hoax of CO2 levels as a cause of catastrophic warming. In these three areas of EPA research and policy making it is easy to identify the frauds on the public that are supported by a well-paid band of hired researchers and an in house gang of committed environmental true believers. The result is a fraud and research and policy conduct that is so badly informed and poorly researched and developed that it includes systematic commission of civil and even criminal acts to further an EPA agenda of aggressive environmental regulations that have created tremendous economic burdens for no good reason other than a fanatic environmental ideological agenda.

I will elaborate with specific references and documents in the submission below—elaborate on the irresponsible and flagrantly unscientific research funded and promoted by the USEPA on all matters of toxicology and epidemiology and my admonition to any reader is that if we do not stop this junk science for politics and ideology, we will follow the path of fools for a cause—the path of true believers that is paved with confirmation biases and fallacious science and policy making that violates the law and cheats the taxpayer in two ways, scaremongering, and regulatory burdens that steal resources and assets for regulatory compliance that diminishes better use of those resources in the public and private sectors. My promise to the reader is I will show you how and how much the EPA disrespects and abuses the rules and methods of science.

1. Other commentaries I agree with highlighted

The Washington Post
By Robert Hahn
May 10, 2018

https://www.washingtonpost.com/opinions/many-mocked-this-scott-pruitt-proposal-they-should-have-read-it-first/2018/05/10/31baba9a-53c2-11e8-abd8-265bd07a9859_story.html?noredirect=on&utm_term=.f7bcbc0a1887

Robert Hahn is a visiting professor at Oxford University's Smith School of Enterprise and the Environment and a non-resident senior fellow at the Brookings Institution. He recently served as a commissioner on the U.S. Commission on Evidence-Based Policymaking.

When Environmental Protection Agency Administrator Scott Pruitt proposed a rule last month to improve transparency in science used to make policy decisions, he was roundly criticized by interest groups and academics. Several researchers asserted that the policy would be used to undermine a litany of existing environmental protections. Former Obama administration EPA officials co-wrote a New York Times op-ed in which they said the proposal "would undermine the nation's scientific credibility." The Economist derided the policy as "swamp science."

But there is a lot to cheer about in the rule that opponents have missed. A careful reading suggests it could promote precisely the kind of evidence-based policy most scientists and the public should support.

Critics typically argue that the proposed regulation would suppress research that contains confidential medical records and therefore scientists could not share underlying data publicly for privacy reasons. Such restrictions, these critics say, would have excluded landmark research, such as Harvard University's "Six Cities" study, which suggested that reducing fine particles in the air would dramatically improve human health and helped lead to more stringent regulation of fine particles in the United States.

...

But it appears that few defenders or opponents of the proposal have actually read the proposed EPA regulation, which is only seven pages long. Both sides distort the regulatory text.

Here's what the rule would actually do about the question of confidentiality of Personal Health Information under HIPAA or any other rule.

First, it would require the EPA to identify studies that are used in making regulatory decisions.

Second, it would encourage studies to be made publicly available "to the extent practicable."

Third, it would define "publicly available" by listing examples of information that could be used for validation, such as underlying data, models, computer code and protocols.

Fourth, the proposal recognizes not all data can be openly accessible in the public domain and that restricted access to some data may be necessary.

Fifth, it would direct the EPA to work with third parties, including universities and private firms, to make information available to the extent reasonable.

Sixth, it would encourage the use of efforts to de-identify data sets to create public-use data files that would simultaneously help protect privacy and promote transparency.

Seventh, the proposal outlines an exemption process when compliance is "impracticable." Finally, it would direct the EPA to clearly state and document assumptions made in regulatory analyses.

(It is this submitter's position that the privacy/confidentiality issues raised by EPA sponsored researchers are intended to be a distraction—there is nothing that prevents a release of the data used in the EPA studies of the 90s, and since, because data can be collected without identifiers that penetrate to reveal Personal Health Information or the identity of individuals. Most of the EPA Sponsored studies on small particle effects are death studies—there is nothing that is sacred and confidential about a death certificate. The Studies the on ozone effects can easily be done to redact personal health information.) Here's what the EPA's new proposed rule wouldn't do: nullify existing environmental regulations, disregard existing research, violate confidentiality protections, jeopardize privacy or undermine the peer-review process.

Taking steps to increase access to data, with strong privacy protections, is how society will continue to make scientific and economic progress and ensure that evidence in rule-making is sound. The EPA's proposed rule follows principles laid out in 2017 by the bipartisan Commission on Evidence-Based Policymaking — humility, transparency, privacy, capacity and rigor — and moves us toward providing greater access to scientific data while protecting individual privacy.

Instead of throwing stones, the scientific community should come together to offer practical suggestions to make the rule better. For example, the rule should recognize the incentives for scientists to produce new research. . . .

Done right, this could improve government policy not only in the United States but also around the world.
It's still hard to tell how this rule will affect EPA decisions, but one thing is clear: The rule will make the evidence by which we make policy decisions more transparent. The policy might not be perfect, but its benefits will likely far outweigh its costs.

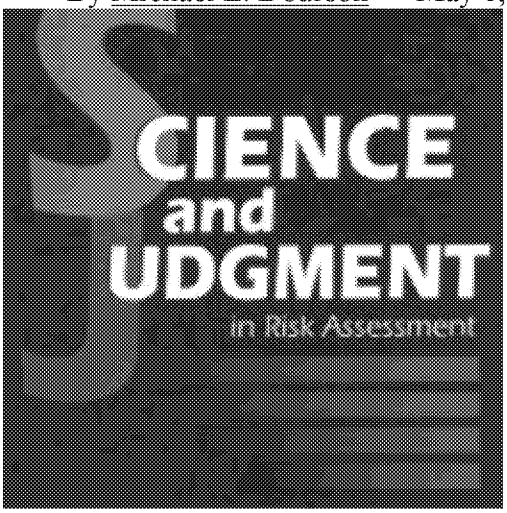
Comment by the submitter—this is blowing smoke and making excuses for the "secret science" that has dominated EPA activities for decades—there is no privacy or confidentiality problem with gathering data on deaths in studies that do not depend on personal data or release that personal data. Death Certificates with accompanying information do not violate confidentiality or privacy rules and can be used to assess the validity of the studies submitted—period.

Michael Dourson is a prominent toxicologist in the private sector. Here, again below I provide bold highlighting for his essay on the matter of the transparency proposal:

From A Risk-Assessment Perspective, EPA Getting Rid Of 'Secret Science' Makes Sense

•

By Michael L. Dourson — May 8, 2018 Washington Examiner



Science and Judgment in Risk Assessment - the "Blue Book"

Environmental Protection Agency Administrator Scott Pruitt's recent announcement that EPA will not use "secret science" — that is science for which the underlying data is not available — is challenging. Whereas EPA is routinely in receipt of unpublished toxicity studies for chemicals designed for commerce, not all important scientific findings are publishable. Nor do scientific journals generally have sufficient space to include all data.

Much has been made in recent weeks of this new EPA policy, including an op-ed opposing it by former EPA Administrator Gina McCarthy and former acting Assistant Administrator Janet McCabe.

The media coverage has focused attention on how science is considered acceptable and useful in EPA's rulemaking. But missing from this is the perspective of risk scientists charged with protecting public health. In the case of EPA, it is often not enough for any one positive study to be published in a peer-reviewed journal. Such work often needs replication because a positive finding occurs, on average, in one out of every 20 studies due to chance.

If a study cannot be replicated, then it at least needs to make sense within the pattern of available data. For pesticides regulated by EPA, these data are often from hundreds of studies done according to federal guidelines.

Studies that are not replicated or that do not make sense in an overall pattern are still considered, however. Risk scientists will often contact the authors to obtain additional information in order to conduct their own analysis, a common practice within EPA.

When such data are forthcoming, without the need to break confidentiality or disclose confidential business information, independent analyses can be conducted and the public health is better served. But when such information is withheld by the authors, government risk scientists are often left with a dilemma.

For example, imagine that a series of studies come out on a single human group that is exposed to a commonly used insecticide, and they show an unexpected effect at extremely low exposures. This finding

has not been replicated and clashes with multiple animal and human studies that point to danger only at much higher exposures.

In this case, EPA scientists would ask the authors for the underlying data to confirm this unexpected low-dose effect. But let's say they can't get it. EPA is then left with neither confirmatory studies, nor information that makes sense in light of other studies, nor the ability to conduct its own analysis. Understandably, Pruitt has chosen a policy of not using such studies.

There is one sense in which McCarthy and McCabe are spot on. The judgment over which epidemiology and/or toxicology data to use for risk or safety assessment purposes should be left to risk scientists. But from my perspective as a risk scientist, Pruitt's decision is still correct. The public's interest is best served when science is replicable and consistent with other information. When studies cannot be replicated or are inconsistent with other information, access to their underlying data is vital to independent analysis. When the underlying data are not provided to a risk scientist, it is difficult to use this study to make a credible risk judgment, much less national rulemaking.

In short, the public is often worried about chemical exposure, as they should be when such exposure exceeds a safety level. But the public's interest is best served by trusting in experts dedicated to public health protection, not by withholding scientific data from independent analysis.

2. Choices in Risk Assessment--Report for the DOE 1994 by Steve Milloy

Steve Milloy, the founder and main writer for JunkScience.com for 20 plus years wrote a major research Monograph on Toxicological Policy issues as a contractor for the US Department of Energy in the early 90s. He exposed the federal agency science and policy misconduct in a major report "Choices in Risk Assessment" completed in 1994 on EPA 'science policy' and 'default assumptions.'

What is science policy? From "Choices in Risk Assessment", below are 10 common science policy issues and default assumptions used in EPA risk assessment.

Click here for a PDF of "Choices in Risk Assessment." It is more than 200 pages that explain why the EPA has lost its way, had lost its way in the early 90s because of ideologically energized environmental nonsense science.

Following the end of the Cold War, the Department of Energy (DOE) faced clean-up costs for its nuclear weapons sites amounting to hundreds of billions of dollars. The high costs would largely have been incurred because of EPA standards that essentially would have required the former weapons sites be returned to "Garden of Eden" status.

At the time, the DOE took the EPA standards so seriously that it was actually developing essentially a giant vacuum cleaner to suck-up the top layer of sand at the Nevada Test Site (approximately 5,400 square miles in size), decontaminate it and replace the sand.

Overwhelmed by the magnitude of the clean-ups, the Bush administration DOE commissioned Milloy in 1992 to lead an investigation into whether EPA clean-up standards were based on science or politics. Milloy's team of science and policy experts (called the Regulatory Information Analysis Project) compiled a report titled, "Choices in Risk Assessment: The Role of Science Policy in the Environmental Risk Management Process."

Completed in the fall of 1994, the report concluded that environmental policy was largely based on politics, not science. But when the report was completed and circulated for review within the Clinton administration-run DOE, the report was flagged as politically incorrect and Milloy was ordered by Clinton appointee Carol Henry (a former EPA staffer) to keep the report secret.

Sacrificing his business relationship with the Clinton DOE, Milloy disobeyed the order and released the report, which was subsequently featured in a Wall Street Journal editorial.

The attention that "Choices in Risk Assessment" garnered coincided with the Republican takeover of 104th Congress and congressional focus on regulatory reform, vaulting Milloy into the regulatory reform debate about to take place on Capitol Hill. Milloy testified before the U.S. Senate about risk assessment in the context of DOE clean-up on March 6, 1995. The DOE never wound up spending hundreds of billions of dollars to clean up its weapons sites. No word on what ever happened to the giant NTS vacuum cleaner.

Dunn comment:

The DOE report by Milloy

CHOICES IN RISK ASSESSMENT: THE ROLE OF SCIENCE POLICY IN THE

ENVIRONMENTAL RISK MANAGEMENT PROCESS

Prepared for Sandia National Laboratories

Sponsored by the U.S. Department of Energy

Office of Environmental Management and Office of Environment, Safety and Health (1994)

There are more than 200 pages, so I provide some pertinent sections emphasized by Milloy that pertain to scientific issues that hit on the big issues.

This is the link to the document:

https://junkscience.com/wp-content/uploads/2018/05/Choices-In-Risk-Asscssment-v-01-01Interior-With-Cover.pdf

Below is the table of contents, that will give one a sense of the magnitude of the report.

Hereunder I also feature sections of the summary and conclusions of the report—that are stunning. Consider—this is a report written by one man, essentially, a biostatistician and lawyer, and it exposes the problem of risk management in a politically charged atmosphere—the scaremonger environment of the US federal agencies committed to the environmental cause. Misconduct of the federal agencies and their paid researchers in matters of toxicology/epidemiology/risk management.

My question would be—why didn't this author get a National Award for exposing scientific malfeasance and scaremongering in Federal Agencies in the early 1990s? Well the answer is found in an analysis of what has gone on since—Deep State, totalitarian, junk science fraud that promotes the precautionary principle approach in all matters of public health research and science, the agenda of leftist environmentalist fanatics.

The proposal for scientific integrity and transparency is long overdue and the damage done by ideologues in the federal agencies will require a major overhaul in methods and internal review processes.

Much of the damage could have been avoided, had Milloy's report been respectfully considered and used as a guide for federal agency risk management. Instead it was suppressed and ignored by the Clinton Administration environmental fanatics.

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

Many risks to human health and the environment are "unprovable."

Some risks to human health and the environment are provable. Provable risks can be measured or observed directly and include actuarial risks such as those associated with highway or air travel accidents. In contrast, other risks—such as those associated with low-doses of radiation or exposure

to chemicals in the environment—are often too small to be measured or observed directly with existing scientific methods and available resources. Additionally, specific health and environmental effects are often difficult to attribute to specific causes because other competing causes cannot be excluded with reasonable certainty. Such risks are unprovable. However, the fact that a risk is unprovable does not mean that it does not exist. Provable risks can be calculated, whereas unprovable risks can only be estimated through the risk assessment process. Although unprovable risks may be estimated and expressed in probabilistic terms, they are at best educated guesses and do not constitute knowledge or uncontroverted fact. In other words, the ability to produce a numerical estimate of an unprovable risk does not mean that the risk is proven.

Science policy issues are unavoidable in, and science policy decisions are essential to, the regulatory risk assessment process.

Risks are unprovable because of significant gaps and uncertainties in scientific knowledge, data, and method. When risk assessment is used to estimate unprovable risks, these gaps and uncertainties become science policy issues. Both risk assessors and risk managers make science policy decisions in order to bridge the gaps and uncertainties. Thus, science policy decisions enable the estimation of unprovable risks.

. . .

CHOICES IN RISK ASSESSMENT

The existence and extent of science policy in risk assessment are rarely fully and fairly disclosed.

. . .

The lack of disclosure causes risk assessment results to be communicated essentially as fact. Such communication is misleading. Lack of full and fair disclosure of the role of science policy in risk assessment is not the fault of regulators alone. Media communication of risk information tends to omit discussions of science policy because such discussions: (1) do not fit into sound bites; (2) tend to detract from the sensationalism of the risk information; or (3) are not simple to communicate, and subtleties are lost.

Science policy decisions are responsible for regulatory programs and regulatory impacts that are justified on the basis of risk assessment

. . .

CONCLUSIONS AND RECOMMENDATIONS

As in the risk assessment process, science policy and other assumptions play a significant role in the estimation of benefits and costs associated with regulatory programs.

When risks can only be estimated, the benefits of regulatory programs to reduce those risks also can only be estimated, are not verifiable, and depend on science policy-based assumptions. Similarly, cost assessments often depend on assumptions, are uncertain, and cannot constitute uncontroverted fact. An important distinction between estimates of costs and benefits is in the certainty of their existence. Because it is not possible to prove with certainty the existence of unprovable risks, the existence of benefits from regulatory

programs also cannot be proven. In contrast, while there is uncertainty involved in cost assessments, such uncertainty is associated with the magnitude of the estimated costs, not their existence.

Science policy decisions can be made so as to result in desired regulatory outcomes.

The case studies of fluoride in drinking water, asbestos in consumer products, unleaded gasoline, and used oil are examples of decisions where science policy-based assumptions help to justify desired regulatory outcomes.

- In the case of fluoride in drinking water, the weight-of-evidence science policy decision that fluoride was not carcinogenic in humans supported the continued fluoridation of water, a highly valued and desirable public health measure. This science policy decision also helped maintain the credibility of the Public Health Service, which has been promoting the use of fluoride since the 1940s.

- In the case of asbestos in consumer products, the science policy decision to consider only the estimated cancer risk from asbestos brake products and not to consider the potentially offsetting safety risk from the use of non-asbestos brake product substitutes helped justify EPA's decision to promulgate a ban on commercial uses of asbestos.

- In the case of unleaded gasoline, the science policy decision that mechanisms of carcinogenicity varied between rodents and humans provided the basis for concluding that unleaded gasoline is not carcinogenic to humans. This science policy decision helped maintain the credibility of EPA's program to remove lead from gasoline.

- In the case of used oil, the science policy decision that used oil is not a hazardous waste facilitates used oil recycling. Labeling of used oil as a hazardous waste would have resulted in a burdensome cradle-to-grave regulatory scheme for used oil that might have undermined recycling efforts and increased pollution from illegal or improper disposal of used oil.

CHOICES IN RISK ASSESSMENT

For the foreseeable future, science policy will remain the key to all regulatory programs that rely on quantitative risk assessment.

. . .

Recommendations

Policy makers, risk managers, the media, and the public should be made aware of the role of science policy in risk assessment and subsequent risk management decisions.

Although risk assessors are likely to be aware of science policy issues and decisions, the same cannot be said for policy makers, risk managers, the media, and the public. Risk assessors often fail to emphasize the existence and extent of science policy in risk assessment. Where the role of science policy is not explicitly explained, risk estimates may be erroneously communicated to policy makers, risk managers, the media, and the public as uncontroverted fact. Because these groups are unaware of the role of science policy, they often fail to inquire about its impact on risk assessment. Either failure may result in regulatory decisions that are made on an uninformed basis to an uninformed, misled, or unnecessarily alarmed public. Risk assessors

should ensure that such miscommunication does not occur. Policy makers, risk managers, and the media should inquire about the existence and extent of science policy.

The federal government should institute a mandatory training and continuing education program on regulatory risk assessment and risk management for policy makers, risk managers, risk assessors, and their staffs.

Communication of risk assessment results should emphasize the role of science policy.

Because risk assessments for unprovable risks are educated guesses, risk assessment results should never intentionally or inadvertently be presented as fact. Full disclosure of the role of science policy should accompany risk estimates wherever presented, including Federal Register notices, executive summaries of regulatory documents, press releases, and other public and media communications. Disclosure is ineffective if it is inaccessible, comprehensive, explicit, and understandable. Disclosure should attempt to address the following questions:

- **Is the risk of concern provable, and can it be calculated? If the risk is unprovable, is it because the risk is too small to be detected with current scientific methods or because competing risk factors cannot be sufficiently distinguished?**

- **If the risk is unprovable, or provable but incalculable, what are the gaps and uncertainties in scientific knowledge and data that preclude the calculation of risk?**

- **What science policy decisions have been made to bridge these gaps and uncertainties? For unprovable risks, what science policy decisions have been made that concern the existence of the risk?**

- **Could alternative science policy decisions have been considered? What would the impacts have been on the risk assessment of these alternative decisions?**

- **What are the implications for regulation of the science policy decisions made as well as the alternatives? Do alternative science policy decisions reduce or eliminate the basis for regulation? Does consideration of substitution risks or lifecycle risks affect the basis for regulation?**

Answers to these questions will facilitate understanding of the likelihood that a risk exists and its potential magnitude. Improved understanding will enable: (1) policy makers and risk managers to decide on a more fully informed basis whether and what resources should be expended to address the risk; and (2) the public and media to debate the issue on a more fully informed basis.

Risk assessment guidelines may help provide a framework for the use of science policy in risk assessment, but only if such guidelines are flexible and complied with in good faith.

Risk assessment guidelines can provide a framework within which regulators can make science policy decisions. Such a framework would provide the regulated community and the public with the "rules" for science policy decisions in regulatory risk assessment. . . . With respect to potential judicial review, although it will be difficult for a court to rule on the scientific merits of an agency science policy judgment, a court can rule whether that judgment has been explained adequately. Ultimately, the merits of the judgment will be evaluated, and the agency's credibility will be weighed in the court of public opinion as well as by the scientific community.

Precedent has been established, and agencies should be encouraged to give meaningful consideration to alternatives to the default assumptions used in risk assessment

Only when policy makers, risk managers, the public, and the media fully understand the role of science policy decisions in risk assessment can the "real" issue in environmental and public health protection be debated. We must determine what society is willing to pay to reduce or avoid risks to human health and the environment which have been identified and estimated using science policy rather than science alone. These risks may or may not actually exist. If they do exist, they are likely to be relatively small or indistinguishable from other risks. If risks are too small or indistinguishable, it likely will not be possible to know whether regulation produced any benefit. The open debate of the value and priority of regulating these types of risks will enable, but not guarantee, policy and regulatory decisions to be made on a fully informed basis.

3. Commentary on proposed new, more stringent EPA ambient air standards for 2006.

Submitted for consideration in the comment period to end April 17, 2006.

April 13, 2006

John Dale Dunn MD JD

Brownwood, Texas violations of epidemiological and toxicology scientific rules are a scandal that cannot be ignored. The Dockery 1993, Pope 1995, and Samet 2000 studies (see endnotes) and other studies of health effects of air pollution relied on by the EPA, all showed that large studies with adequate power could not demonstrate relative risk of any significance. The studies all showed effects less than ten percent, rather than the statistically and scientifically required 200 to 300 percent effect. It is astounding the EPA has the gall to announce an air pollution crisis and propose more stringent air quality standards when none of the studies the EPA relies on show and proof of health effects.

The EPA is obligated to educate the public on the clear evidence that air pollution may have aesthetic and cultural import, but that there is no air pollution health "crisis." The EPA and its sponsored and supported health effects researchers are now just raising their voice in this debate instead of trying to use science. The EPA air pollution health effects science is an emperor with no clothes, as discussed below.

This commentary challenges the EPA to show one study that proves that one person has died due to air pollution in America in this past 20 years. People die for various reasons, suddenly and not so suddenly, as will be discussed below. That reality eludes the work of numbers crunchers who slave at desks over death certificate information like Pope and Dockery. One doesn't die from an exposure to air pollution, one dies from failed medical therapy, arrhythmias caused by long term coronary disease, stroke, pulmonary embolism, which are not caused by air pollution. The Asthma problem is an increasing problem not related to air pollution, since the rate of asthma is increasing with decreasing air pollution. The deaths from asthma will be discussed below and have nothing to do with air pollution, it is a socioeconomic phenomenon. It is time to retire the air pollution health effects studies of crude death tallies and it's time for the EPA to stand down from this repeated use of crisis talk and aggressive pursuit of pure air—a religious campaign disguised as science in the public interest.

As a last and compelling consideration, this author is familiar with death in America. As an emergency physician, much more familiar with what kills people than economists and public health officials who don't know which is the business end of a ventilator and live in the world of death certificates and mortality data. People die for many reasons and under many circumstances in America, but air pollution doesn't kill them, even the worst levels of outdoor air pollution one might imagine in America don't create a toxic level, which reveals the other major flaw in the EPA crisis rhetoric, junk science toxicology that completely disregards any effort to define toxin or toxicity. That subject will also be dealt with herein below.

The scientific epidemiological and toxicological criticisms of the EPA health effects studies and policy making are:

1. The Dockery 1993 and Pope 1995 studies did not show valid evidence of death effects, since they showed a death effects relative risk below 1.1, a negligible relative risk that is 10 percent of the minimal relative risk all epidemiologists consider necessary for proof of causation. A 200% or 300% change in death effect is the lower limit. Some epidemiologists require relative risk of 4 or a 400% effect when evaluating poorly controlled cohort studies.

2. This relative risk problem cannot be overcome by EPA and health effects researchers emphasizing the misleading use of the term statistical significance, which is not a proof test, but a statistical reliability test. One can be statistically confident and reliable but absolutely wrong.

3. The EPA and its health effects researchers have consistently and persistently ignored the lack of proof of health effects in these studies, and have made public announcements and allowed media reports to proclaim that thousands are dying in America due to air pollution when the studies do not show any proof of death effect at all. Lying for justice or an environmental ideal does not make the lie any less dishonest.

4. The health effects research used by the EPA has consistently ignored the basic rules for toxicology and the well-known phenomenon of threshold for toxicity. Only at the EPA does straight line toxicology have any status, mostly because it avoids serious science. Main stream toxicology science is still committed to the idea of threshold of effect and the old saying—the dose makes the toxin. The EPA scientists in house know the truth, but again politics and a commitment to a policy/environmental ideal results in lies.

5. Under no valid scientific analysis retro or prospectively, can the EPA use the methodologies or the results of the Pope, Dockery, McDonnell, or Lipfert (see endnotes) studies to justify one more burdensome air pollution regulation, but there is strong evidence for rescinding the last round of Air Quality Standards.

6. The EPA has a mandate to act only on the basis of acceptable scientific evidence of health effects, and is obligated to abandon the precautionary principle approach to regulatory policy, a pathetic substitute for legitimate science and clearly a principle founded in politics, not science.

7. The EPA could never convince a Federal Court, operating under Federal Rules of Evidence 702 and the court dicta for expert and scientific testimony that the EPA air pollution health effects science is valid proof of anything. The Pope, Dockery and Lipfert or Samet studies cannot be massaged or misrepresented enough to create any proof of air pollution health effects. The studies show trends within an insignificant range and "associations," that are not evidence of proof of health effects.

8. Precautionary principles that are used by the EPA as stand-alone policy justification are nothing more than a dressed up version of anxiety, cannot pass muster for admissible scientific evidence in a Federal Court and ignore the reality of risk/benefit analysis.

9. Based on the information reviewed in this critique, the EPA must revisit old rigs, forgo new, more onerous and expensive regulatory interventions, and the EPA must suspend its rulemaking in air pollution until it can find valid and reliable science on health effects.

Toxic air pollution existed in the past, and still may occasionally occur in some places on the planet as a local phenomenon, as particulate and other noxious air pollution in industrial areas, from various sources. Certainly air in big cities, Pittsburg, Los Angeles, Houston, New York was fouled in the past by air pollutants and even when not toxic, was smelly and visible, but trends in air pollution in the past 30 years as reported and confirmed by the EPA, have all been positive, attributable to changes in industrial processes, regulatory efforts and cleaner petroleum and coal consumption. Any study or discussion of air pollution is focused on a moving, improving problem. However the public thinks the air is worse than ever and there is an air pollution health effects crisis, and that is the fault of the EPA, its favorite researchers, and the mass media, who love to scare the public, since EPA budgets and environmental organization budgets depend on the anxiety of the public.

The death and illness rates during smog and air pollution catastrophe periods in the past were affected by less effective medical management and heavier cigarette smoking but also significantly higher air pollution than exists anywhere in the United States today, for many reasons. Deaths from acute respiratory failure in the past were more common and less preventable, but that is an independent factor related to medical advances and not due to air pollution itself. Airway diseases, the main effect of any air pollution, were less treatable before the 1970s. Pulmonary Medicine has changed dramatically for the better since 1970. Many airway diseases were more dangerous in the past and medical therapies frequently failed to control disease and death. Medical expertise in respiratory illness and cardiovascular disease is changed, but Pope and Dockery still yearn for the good old days of killer air because it scares the public. Their research ignores the trends of the last 20 years and below I will discuss a conscious deception in the second half of the Pope research from NCI data. In addition the EPA air pollution researchers continue to ignore the weakness of their findings, hoping to keep alive the "deadly air" panic talk alive.

People die for lots of reasons in America, but not due to air pollution. Air pollution health effects researchers know that, but act as though nothing has changed. The EPA should carefully reevaluate the number of deaths that researchers claim are due to air pollution in the last 20 years, but the EPA has a conflict of interest. No air pollution crisis might mean reduced EPA funding. No air pollution crisis might mean no funding for the researchers and their support organizations.

The air pollution health effects studies are based on weak epidemiologic relationships and trends carelessly described without definition as "associations," or "trends." Well ice cream consumption and drowning or boating accidents are associated by season, but ice cream eating doesn't cause water accidents. Associations are not proof, they are observations of phenomena--clusters of events that may or may not mean something. Epidemiologists know these things and should be careful when describing data associations and trends within insignificant ranges like less than relative risk of 2, so that the reader or reporter won't mislead the public or a politician. However, the definitions are not forthcoming from the scientists and researchers because saying that there is no crisis of air pollution means no publications for air pollution researchers, no

invitations to swell events, no funding, no chance to pursue a political agenda and change the world, making your mother proud.

The uncertainties of the air pollution health effects studies, the weak relative risks and the methodological problems of the most influential of the health effects studies are so noticeable and remarkable that during this comment period the EPA should reassess what has gone wrong in air pollution health effects research. The EPA should assess how these weak studies have affected EPA policy and rule making. The EPA doesn't have the right to panic the public and political leaders with deceptive junk science in the service of religious and fanatic environmentalism.

DISCUSSION OF THE STATISTICAL AND METHODOLOGIC PROBLEMS OF THE SAMET, POPE, AND DOCKERY HEALTH EFFECT DEATH STUDIES.

Author's comments are in bold. Studies referenced are underlined and the cite is in the endnotes by name and year. Sorry to disappoint those who want numbered endnotes—not a formal paper.

J. Samet (Samet 2000) published in the New England Journal of Medicine, a study modeled after the studies of Pope (1995) and Dockery (1993). He compiled and studied deaths in twenty American cities over a period of years, and compared them with air pollution monitor reports for those cities.

Samet in this 2000 paper asserts the following:

--"the relative rate of death from all causes was 0.51 percent increase for each increase in the PM 10 (10 micron size particulates) of 10 micrograms per cubic meter." This effect is not proof of anything, and Dr. Samet knows it. Less than a 1-% death effect is a nonsense result in a big cohort study.

--"the relative rate of death from cardiovascular and respiratory diseases rises 0.68 percent for each increase of 10 micrograms per cubic meter" Trends of less than 1% inside of a meaningless range of relative risk less than 1.05? A serious epidemiologist would snicker?

--"we also analyzed the effects of levels of carbon monoxide, sulfur dioxide, and nitrogen dioxide in a fashion similar to that of the analysis of pm 10 levels. After adjustment for pm 10 and ozone levels we found little evidence that these pollutants had a significant effect on the relative rate of death." Hold it, hold it, Samet says that he can't find an effect, even itsy bitsy effects from ozone precursor and carbon monoxide, something the other EPA favorite researchers say are killing thousands? Samet is not helping the EPA here. What about those dastardly pollutants? We scientists and particularly toxicologists are smiling to see Samet make a fool of himself and by adoption of this weak and deceptive epidemiology, the EPA doesn't look too good either. This is the kind of research the EPA has been using in air pollution regulatory policy now for years.

--"We did not find an effect of ozone levels on the overall rate of death from all causes or from cardiovascular and respiratory causes during the full year periods. Ozone levels were positively associated with mortality rates during the summer months when ozone levels were highest, although the 95 percent posterior interval extended into the range indicating no effect of ozone levels on mortality." Might this non-Johns Hopkins man who owns no jacket with arm patches translate for the benighted—Samet says even ozone doesn't have a death effect in his study. Score so far on this paper—rational skeptics for people in search of truth 3, EPA and Samet 0.

--"We found no evidence that key socioeconomic factors such as low socioeconomic status affect the association between PM10 and the risk of death in linear regression models." Some might be surprised to know that Samet works at a School of Public Health and all Public Health research for the last 20 years has shown clearly that there is a socioeconomic effect that produces premature deaths. Skeptics now 4 and running away, EPA and Samet still 0. Socioeconomic noise cancels out air pollution effects; that's the way the epidemiologists put it.

--"Our analysis also did not address the extent to which life is shortened in association with daily exposure to the various pollutants." Well golly Dr. Samet, everyone dies, how can you talk about death effects if you don't measure whether deaths are premature? Skeptics 5, Samet and EPA still 0.

Additional comments by this author:

1. The rate of death changes in Samet's studies are less than 1%, which is epidemiologically meaningless and shows no respect for the relative risk of 2 (100%) or more, that all cohort studies have to show in order to be able to assert effect. Little effects, even in studies with good confidence intervals and lots of power, are still empty studies, make work exercises. Samet's study was a nothing, yet it got published in the New England Journal, so one must wonder about political and environmentalist agendas up in Boston. I suppose they are neutral on the environment and always demand valid research in support of political agendas. I suppose.

2. The study fails to age/sex adjust for the important analysis—premature death. How did Samet get published? Samet is asserting proof of effect at less than one two hundredth of what is required in epidemiology. Then he says he didn't bother with measuring whether air pollution caused premature deaths. This research is about acute death affects? At non-toxic pollution levels? There is no plausible biologic science to support the idea that non-toxic air pollution kills people. Samet is beyond redemption. He's in scientific denial, or he works for the EPA agenda and he will be funded until he is old and gray.

3. Low relative risks, below 1.2, are the results in Samet's studies and all the other EPA health effects studies. One study goes above 1.2, the Dockery 1993 smaller study at 1.26, since recalculated by Enstrom in his article, Enstrom 2005 to 1.13. Such weak and minimal findings are unacceptable for publication, much less serious EPA policy making. The EPA and the studies misuse the term statistical significance, trends or association if they mean proof. There is no proof in any of these studies of an air pollution health effect. These studies prove nothing in the relative risk ranges of less than 1.3, particularly in cohort studies of death certificates that are subject to serious confounding.

4. The failure by Samet to find any effect, even these minimal effects, from other air pollutants like nitrous and sulfur oxides (ozone precursors), ozone, and carbon monoxide should give the EPA cause to wonder about any further attempts to impose new ambient air standards. The EPA has noticeably ignored Samet conclusions about these pollutants, why?

5. Samet's assertion that socio economics do not effect death rates is a an extraordinarily faulty conclusion for a public health researcher, since his study only looked at average area incomes for the twenty cities; and there is a vast body of public health research that shows that socioeconomics independently are a significant factor in life expectancy. (Wong 2002, Fitzpatrick 2001, Lantz 1998).

6. Socioeconomics is a factor and would nullify the signal from air pollution effect, and could even be a cofactor in another way by causing poor indoor air quality from substandard housing and a higher rate of

smoking along with a higher rate of underreported smoking. For example the poor have outdoor jobs where they can smoke more, and culturally they may be much heavier smokers with more inhaling, a potential confounder. Such confounding might explain the Ohio and West Virginia data from Pope 1995. That's why relative risk has to be set high, to avoid the effect of confounders not seen or understood.

The Samet article includes cautionary notes on the limitations of the study's methodology. His caveats are applicable to the all the previously mentioned Pope and Dockery, favorite EPA studies on air pollution health effects:

1. "For the pollutants measured on an hourly basis we calculated the 24-hour average." Toxicologists cringe at that one.

2. "If the pollutants were measured at multiple locations in a metropolitan area, we averaged the data." Remember the basic principles of toxicology, if you're downwind from an air pollutant you're safe, how can he say these things with a straight face. You have to know the patient and the toxin and the dose to know anything much about the science. Population studies are very crude at non-toxic levels of exposure.

3. "Since the Environmental Protection Agency requires levels of PM 10 to be measured only every six days, data for ozone and other pollutants were generally more available on more days." Good grief, this is a sham, a toxicology study with exposures every so often in sub toxic ranges.

4. "We analyzed the effect of the day on which the pollution data were obtained (the current day, the day before, or two days before) on the association with mortality rates. The overall effect did not vary with the lag interval selected. We report data for a one day lag between pollution variables and mortality." This is the place where Dr. Samet shows he doesn't know anything about death. You could be sick to death in a hospital and I can keep you alive indefinitely until the family gives up—where do those cases fit in Dr. Samet's arbitrary lag time of one day? What about people who die in a bed at a nursing home and haven't been outside in two years? These public health wonks and economists who hate dirty air do research as if a death certificate signed by the local GP is a piece of reliable data on the health effects of air pollution. They are in dreamland.

Then Samet says they found a temporal-causal relationship -- astounding! He didn't find a causal relationship, but he can find a temporal relationship. Did he dredge and dredge until he found something to point at? What's he talking about? Who's to know when the blips in the data are differences of less than 1%? That's not about cause of death, that's about political agendas and a polemic dressed up as science that causes public anxiety.

The good Doctor continues.

5. "Data on levels of PM 2.5 (small particulates) are not yet available nationally, since a monitoring network for particles in this size range is currently being implemented." This writer believes that Dr. Samet is working the agenda for the "annuity." Small particulates are an annuity for the EPA and air pollution researchers because, along with ozone, dust will never go away. Those air pollution demons assure EPA power into the distant future and more regs and anxiety. Dust is bad. Dust is always going to be there. It's the perfect air pollutant for the EPA.

Samet and others in the air pollution junk science club just use the PM 10-micron data that is measured every six days as a surrogate for PM 2.5. The supportive press and academic colleagues forgive such a lapse since they are working on the agreed upon agenda.

6. "Our analyses also did not address the extent to which life is shortened in association with daily exposure to the various pollutants."

Extraordinary. If the endpoint is a death effect, then the study must analyze premature death in mortal man and assess acute events as a measure of effect and endpoint for acute and/or chronic disease. To determine premature death effect, age and sex adjusted death rates are the accepted methodology, but Samet is just doing death rates and he gets published in the New England Journal of Medicine? Politics and the right agenda trump science and peer review?

7. "The finding that the association between PM 10 levels and the risk of death was strongest for cardiovascular and respiratory causes of death is consistent with the hypothesis that persons made frail by advanced heart and lung disease are more susceptible to the adverse effects of air pollution."

Again they didn't show that at all, they showed less than a 1% effect on death rates. I thought these people were dying of air pollution caused illness, not acute effects of air pollution, which at current levels couldn't kill a canary. What gives? What gives is that Dr. Samet is clueless because he's a numbers cruncher for the EPA in cahoots with his friends in the spic and span air society. I know why people die and it isn't from air in America, or even from Air America. Air pollution comes in many forms but we are obligated to live with toxicology science, not anxiety. Living organisms don't die for the thought of a smoggy day or from a bad smell. Dr. Samet and his cottage clack of air pollution hand wringers should go to a hospital and see how and why people die before they do these desk analyses of death certificates.

Despite these caveats the Samet research group asserts in the conclusion of their paper:

"Our analyses provide evidence that particulate air pollution continues to have an adverse effect on the public's health and strengthen the rationale for limiting levels of respirable particles in outdoor air." Samet says nothing about the significance of their research showing no death effect from ozone, carbon monoxide, sulfur and nitrous oxides. That would certainly disrupt current EPA policy, and he avoids an admission that the relative risks and death rate changes he found do not reach epidemiologic significance.

This study by Samet is sham epidemiology/science, junk science with lipstick, and the deception and "newspeak" harkens back to junk science in the service of the King or the current tyrant. Pope, Dockery and Samet are the officials/magicians/astrologers/conjurers in the EPA court, providing the EPA regent with needed "expertise" to justify the latest edict.

Briefly we will discuss below Dr. Samet's mentors, the EPA's favorite air pollution haters, Drs Dockery and Pope, who work together and change places on the authors lists of their papers.

The Six City and Pope Studies?

Dockery (1993) and Pope (1995) did studies that were the model for the Samet study discussed above. The studies did do better than Samet, in that they measured relative risk of premature death by studying death rate with age sex adjusting. Both Dockery and Pope were unable to show significant relative risk of health effect. The Pope and Dockery studies were used in the mid 1990s to justify EPA Director Browner's "emergency" new ambient air quality standards on ozone and other pollutants. The resulting cost was

estimated by the Center for Study of American Business at Washington University, St. Louis, at more than 100 billion. The Browner action was taken unilaterally, in spite of protests from many agencies within the government and without the approval or support of EPA internal experts. This action was taken without proof of a health effect, since Pope and Dockery never showed an acceptable relative risk. They were limited again to Samet's "associations" and trends within meaningless ranges below a relative risk of 1.3.

There is a greater relative risk of whole milk causing lung cancer than the relative risk that the EPA has shown for air pollution. One might say that's because of some confounder—well duuuh, that's why relative risk has to be above a threshold of 2 and some say 3, so confounders don't make the epidemiologist look confounded. Samet, Pope, Dockery don't care, they're on a roll and have the support of the environmentalist zealots, and the EPA (whoops, that's redundant). Call public relations, the research shows air pollution is killing thousands. It causes CANCER.

This paper points out that the EPA and the researchers are cheatin', and Dr. K. Popper, famous philosopher of science favorably cited by the Supreme Court in the Daubert decision, says that science must be more serious and reliable than politics. Popper asserts that science must be based on proofs that are reliable. Popper even talks about what the air pollution research by Pope, Dockery and Samet and the spic and span society is—Popper says some "science" is so bad it can't be falsified. How does one falsify something that means nothing? Associations at the edge of or in the midst of nothingness is what Pope's and the other health effects studies assert should be the basis for society wide regulatory regimes. Breathtaking—no pun intended.

The EPA says that air pollution kills thousands, because air pollution kills thousands. That is a tautalogy, a common tool for junk scientists. IT IS BECAUSE IT IS. I write here to tell the EPA that their anxious pursuit of clean air is more about politics and power and anger with modern industrial society that is already cleaning up the air, more about the religion of environmentalism. That's why the crisis, without the deaths or the science is a political or a polemic tool, not science. Not nice to fool with science that way, particularly when there is a Federal mandate that the EPA insist on scientific integrity for policy making. The EPA should not be in the business of ginning up false crises and scaring mothers that their kids are going to suffer from the air just so that the bureaucracy will thrive at the Federal and State level.

The EPA cannot claim to be unaware of the failure to prove health effects by the insignificant level of relative risk in the Pope and Dockery studies. These are the most basic of epidemiologic rules. And no subsequent studies have rehabilitated the failures of the Pope and Dockery studies. Samet, as described above, just repeated the same mistakes and came to up with the same lack of proof of health effect, unjustified conclusions and excessive and activist recommendations.

The barriers to a good study on health effects of air pollution for Dockery and Pope were the same as for Samet,

1. mobile populations,

2. unreliable, non-continuous and fixed monitor information,

3. no monitor information on some pollutants all the time (2.5 micron particles for example) or part of the time (10 micron and others),

4. an attempt to assess long term chronic health effects of air pollution by death studies, an acute phenomenon,

5. death certificates and raw death data used without autopsies,

6. inside air quality ignored for populations living indoors, particularly during old age, advanced medical illness, and terminal illness,

7. But most of all, no biological plausibility because the deaths are in the setting of non-toxic levels of air pollution (the inane straight line effect toxicology of the EPA cannot continue to get a pass—it is advocacy at the expense of science).

The EPA in assessing the air pollution effects studies must revive Bradford-Hill Criteria for toxicology.

The Bradford Hill (BH) criteria for toxicology are elementary, and establish biological plausibility for toxin effects. They require the toxicologist to establish plausibility, dose effect, reproducibility, time relationship, and a pattern of predictable and observable effects. Sounds like good science, but that's only part of it. Karl Popper was referenced above as the guru of the philosophy of science, and master or curator of scientific principles. The Popper legacy of science rules are referred to reverently in the Supreme Court opinion in the Daubert v. Merrill Dow Case [509 U.S. 579 (1993)] on admissibility of scientific testimony. Falsifiability is the key. To be true science one must submit to the test of being proven wrong. Pope and Dockery study results can't be falsified because they don't even allow a legitimate assertion of proof. They are tools in the game of politics, not in the game of toxicology. The EPA is required by common sense and federal statute to apply the BH criteria in air pollution studies, and all other toxicology work, but instead this wildly deceptive use of small changes within insignificant ranges of effect is souped-up to become the reason the EPA must act, now, immediately, to save lives. The EPA is saving itself, but the air pollution regulations are not saving any lives because the research would show the lives lost with valid epidemiology, and it doesn't.

The only reason that the EPA can create a crisis from the Pope or Dockery studies if it holds its nose and just projects to the whole population of the United States, then relative risk of less than 5% becomes thousands of deaths, even though it fails to show proof of one death caused by the toxicity of air pollution. Not one death.

If the biological plausibility of air pollution causing disease and death consistent with the BH criteria was established or could be established, then EPA and air pollution health effects researchers like Pope, Dockery and Samet could rest with their laurels. If air really were a killer or a toxin, we wouldn't see these weak cohort studies from the EPA with itsy-bitsy relative risks, and the argument would be over.

The EPA is not the national agency or institute for the arts, culture, pleasantness and good smells, it has a serious public health responsibility and a federal mandate to find toxins with legitimate science, promulgate appropriate solutions for the public benefit and then assess the effectiveness of what it has done. None of those steps are being taken in the air pollution policy making of the EPA.

The air pollution health effects studies in America will never be able to show the required relative risk of 2 or 3. What was the EPA role in such deception?

The idea that seems to control the EPA policy making on air pollution in the past 15 years is--ignore methodology and statistical problems, science be damned, move on to the grand program of air purification.

Find the ultimate terrible pollutant that will never go away, even with all our regulations. That is why small particulates are so promising for the EPA, enough so that these health effects studies talk about small particulates without measuring them, or measuring them in only one part of the study and not everywhere. The project of demonizing small particulates is reflected in the Samet study. He makes strong assertions with extraordinarily weak evidence, but he goes to the meetings, he knows what the EPA is concerned about. With EPA leading and frequently funding the crusade—science and truth casualties are acceptable. Small particulates are the worst crisis in the history of air pollution, they might cause CANCER.

I grew up and still live on a farm. I consider dust a reality that cannot be regulated away, just like ozone is part of the Smoky Mountains. There is a form of air pollution that is now being generated by the EPA in its ozone and small particulates crisis project—it is composed of dust, water, methane, and biological particulates.

Joseph Shumpeter said that the first casualty of a commitment to an ideal is the truth. The second casualty, this author asserts, is the unwary taxpayer and public that depends on responsible government. Solzhenitsyn said "The simple step of a courageous individual is not to take part in the lie. One word of truth outweighs the world." The EPA has become a slave to the lie of junk science in health effects research because the agency is devoted to its own importance and the importance of its religious and political agendas. EPA dredges up and makes icons of the precautionary principle, the small numbers/large projections lie, small trends within meaningless relative risks in populations studies, the refusal to recognize basic toxicology concepts. The EPA is a rogue agency in need of a stand down and close internal inspection with regards to bad policy making on the basis of bad science.

The Killer Smog

In The New England Journal of Medicine, Dr. C. Arden Pope, clean air activist, and one of the EPA's all time favorite air pollution health effects researchers, describes killer air in Belgium in 1930, Pennsylvania in 1948, and London in 1952 -- and uses those incidents as examples of why he thinks there is good reason to pay attention to a study in that issue of the Journal that claims to show a causal relationship between non-toxic air pollution and children's pulmonary functions. Again the study he is supportive of shows no epidemiological proof, just "associations," which are nothing more than statistical cluster puffs in population studies subject, as pointed out above, to bias and confounders. But the key is the study includes two important things for environmentalist zealots, children, and air pollution. Most importantly this study, like all the air pollution health effect studies, is working in insignificant causation ranges of effects so Pope and the EPA can talk about little bitsy trends and associations and urge that something be done before children die on playgrounds. They talk of these numbers exercises like they foretell an apocalypse. Gather the elderly and children and go seek shelter from the air, says Dr. Pope, an economist who got in the air pollution health effects business because he hated the air in Utah—imagine if he had lived in New Jersey. Dr. Pope advises---Stop breathing, if you must.

People do not go out into the streets of America, choke and die. The days of the people of London and Pittsburgh wearing dark clothes to mask the effect of soot and smoke are gone. The public health hanky battalion wants Americans to think air is killing their children and old folks, but in America ambient air pollution did not kill anyone, last week, last year, or in the last ten years. The panicky talk has to stop and the EPA must stop being the sponsor of the lie. The medical journals have to put their scientist hats back on and stop wringing their hands about nonsense environmental crises. The EPA is so busy these days frightening people about their rat studies and the imagined effects of so many things. Hardly enough time in

the day to pursue air pollution, except the EPA has lots of staff and lots of money and much energy and religious devotion to the cause.

EPA Policy and Regulation Activity

Fredrick Bastiat is known for his "law of unintended consequences," best exemplified as the analysis of the Paris shopkeeper's broken window. Bastiat made a common sense observation that when government or individuals choose to spend money or act, it produces desired and undesired effects, always making a ripple within the society and economy.

Let us propose to the EPA that if asthma deaths are predominately in young adult black males in America because of poor compliance (McFadden 1997), due to cost and availability of asthma treatment for disadvantaged adult black males or some other socio-economic or political problem, the EPA would be foolish to work on parsing senseless air quality regulations in preference to better asthma health care. The EPA would not be a party to such nonsense, would it, to relieve the anxiety of anxious environmentalists or satisfy the EPA staff's need for power and control?

There are no free regulatory actions. Every choice has multiple consequences, and government interventions have effects unforeseen. The EPA takes taxpayer dollars for every jot and tittle, every phone call, every new grand idea of every zealous bureaucrat. Every dollar spent for the EPA's ideal of pure air comes from somewhere and is taken from somewhere else.

The EPA is charged with responsible health effects research and policy making. The questions raised in the mid 1990s and now are the same:

1. If relative risk is a well known measure of cause and effect in epidemiology, why does the EPA allow relative risk below acceptable levels of proof to influence policy making?

2. Considering that EPA regulatory activity is tremendous burden to the economy, and the air regulations have a cost effect measured in billions per year taken from the taxpayer. If socioeconomic factors are an undeniable influence on quality of life and life expectancy, then can weak and unacceptable health effects epidemiology as described above, be excused for some abstract ideal of pure air?

3. Can studies that measure acute events in any way be considered studies of cumulative health effects? Are these death studies that Pope and the other air pollution researchers insist on basically flawed and deceptive. The answer is yes.

4. If some of the studies can't eliminate confounders, does the EPA have the authority to impose an onerous regulatory regime on the American society on the theory that cleaner air is a worthwhile, even if it doesn't have any effect on health?

Enstrom Particulate Air pollution Health Effects Study of 50,000 elderly Californians. 2005

Dr. James Enstrom, in the attached article found in appendix A, studied deaths in elderly Californians in 25 counties. He found that the relationship between fine particulates and mortality was very weak during the 1973-2002, particularly after 1982. He also reviewed the cohort studies on health effects of fine particulates and mortality by Pope, Dockery, McDonnell, and Lipfert, and found that their results were fairly similar to his, with the weakest health effects being present during the most recent years.

Enstrom finds:

1. The relative risks, age and sex adjusted and homogenized, are close to 1.00 in his and the other death studies (Pope, Dockery, McDonnell, Lipfert) he reviews in Table 10—there is no proof of health effect shown from particulate air pollution in his or the other studies.

2. Pope's year 2000 16 year follow up to the earlier (Pope 1995) study of the same cohort (Pope 2002) shows a declining cumulative risk from 1.07 to 1.04, first half to second That means to all but the innumerate that the relative risk in the second decade is well below 1.04. Hello Dr. Pope, Helloooo EPA.

3. Enstrom points out there are substantial geographic variation between the California populations of his study and Pope's Ohio, Kentucky and West Virginia data. The potential for confounders should be considered. I know something about that, and people in those states aren't the same as people in Enstrom's study. They might live different lives from their fellow citizens in Lala land. That's what homogenizing and sampling in epidemiology is all about. Without the data from those three states, Pope's studies would be more epidemiologically insignificant than they are, if that were possible. So much for avoiding cherry picking and the admonition to chip off the edges of the data to norm a cohort analysis.

The important points of the Enstrom study: .

1. Deaths and air pollution relative risks were assessed for 25 California counties, a cohort of 50,000 elderly Californians, and 39,000 dead before the end of the study in 2002. The relative risks were measured with proper confidence and homogeneity.

2. Relative risk found was extremely small and insignificant, 1.04 in the first part of the study (1973-1982), then relative risk of death from air pollution disappeared altogether in the second part of the study (1983-2002). Which will it be EPA, a crisis or salvation from killer air.

3. For the entire period the relative risk was 1.01 Pulleeez, 1-% risk? That's a relative risk of 1.01. I am closer than that to being rich and good looking, like Michael Jordan. The results would have to be 2.00 to be proof of any health effect, 1.00 is no effect.)

4. This Enstrom study, like all the other studies that the EPA uses to analyze health effects, and supposedly to study small particulate effects, is limited by the lack of PM 2.5 micron monitors before 1979 and only limited monitors after.

5. No increased death effects of any kind were shown in the counties with higher levels of air pollution, eliminating any dose response effect (a favorite rhetorical tool of the EPA researcher group), that, some of the higher pollution counties had lower relative risks. So is air pollution good for you if you live in California? In this range of relative risk absence of trend is meaningless but Dr. Enstrom does the

prescribed exercise, since the air pollution cabal likes to do trending and associations. The idea of a trend within an insignificance is interesting to consider, for fun, but not for science.)

6. Table 10 in Enstrom's paper shows a comprehensive review of comparable relative risks from large (Pope, Enstrom) and small (Dockery, McDonnell, Lipfert) studies, showing that only the Dockery study published in 1993 in a small cohort shows a relative risk above 1.1 at 1.15. All the other studies show relative risk similar to Enstrom, in the range of 1.07 or less.

7. In table 10 a number of the confidence intervals cross 1.0, the cumulative relative risk of the Pope study for the second half is lost in the failure to separate out the second half, indicating there is a reason to believe that in the second half of his study 1990-98, Pope had a relative risk approaching an insignificant 1.01. I worry, sort of, about Pope hiding this bad trend downward of an already weak relative risk. Could one suppose he has revealed this problem to his friends at the EPA?

Suresh Moolgavkar comments

It would not be practical here to cover all the writings of Suresh Moolgavkar on the epidemiologic and methodology problems he identifies in the EPA air pollution health effects research and policy making, and this writer does not understand some of the subtleties. Dr. M's brain and pen are too capable for an adequate treatment here, by a mere emergency physician. Dr. Moolgavkar's recent in depth review and critique of EPA particulate and air pollution research and policy making is in Appendix B.

Moolgavkar 2005 wrote a commentary on Enstrom's paper for Inhalation Toxicology discussed above (see second part of App. A). He asked the rhetorical question "Can contemporary epidemiological and statistical tools reliably detect miniscule risks, particularly with strong risk factors as potential confounders?" (Dr. Moolgavkar is too kind. He politely avoids exposing the junk science, the obvious, that miniscule risks in a cohort study like the results in the Pope, Dockery and other studies show no health effects at all and talking about trends in those ranges is silly.)

Moolgavkar objects to the methodology of proportional hazards modeling because "it is highly unlikely that proportionality of hazards would hold over the entire period of time covered by these studies." (The long term air pollution health affects studies). He asserts that it can be argued that "the SO 2 effect wipes out the PM signal in joint pollutant models." He does not even address the Samet study showing no SO 2 effect, so even that problem may ignore the more basic one that is so apparent—there is no detectable causal effect between air pollution and death. Dr. M is operating with the assumption that SO2 still is on the top of the list of bad pollutants. No doubt it is more toxic than others, but again, we must repeat the toxicology commandment—the dose makes the toxin. The air pollution health effect studies relied on by the EPA are ridiculously weak and are used as silly substitutes for a lack of laboratory proof that the current air conditions cause disease. The health effects research of Pope Dockery and Samet is just an exercise in the traditional deception of the "data dredge," the tool of crisismongers.

What is the point of quibbling about miniscule, below threshold of proof, differences in a cohort death study, some slavish devotion to arithmetic? I benefit, I suppose from not liking higher math, in this circumstances, that's why I focus on the medicine and the proper analysis of death studies and why people die.

Moolgavkar (2005 See App. B) wrote a lengthy review and criticism of EPA policy in Regulatory Toxicology and Pharmacology that exposes the epidemiologic and toxicological problems of the EPA air pollution health effects research discussed above.

Moolgavkar asserts: "evidence fell far short of supporting a causal association between particle mass concentration and human health." He goes on "the results of observational epidemiology studies can be seriously biased, particularly when estimated risks are small, as is the case with studies of air pollution. The Agency (EPA) has largely ignored these issues." "I conclude that a particle mass standard is not defensible on the basis of a causal association between ambient particle mass and adverse effects on human health."

Although Moolgavkar allows that the EPA may be bending the science in an attempt to pursue the precautionary principle on particulates, the precautionary principle under a mandate of good science in the public interest is not good policy. It is the default position for making concerns, feelings and aesthetics into the basis for regulatory actions that cost society billions for compliance. However no sandal-footed environmentalist gang of enviro-religious concerned citizens can allow the EPA to reject science.

The EPA is prohibited by federal mandate from ignoring science in the pursuit of the precautionary principle. The precautionary principle is anti-science and irrational by definition. Health effects not showed scientifically trumps feeling, concern and governmental overreach. The EPA is mandated by federal law to halt the overreach of the air pollution crisis crusade until it can resuscitate science in the public interest.

Fine Particulate Air Pollution and Total Mortality Among Elderly Californians, 1973–2002

James E. Enstrom

Jonsson Comprehensive Cancer Center, University of California, Los Angeles, California, USA, and

Scientific Integrity Institute, Los Angeles, California, USA

Fine particulate air pollution has been associated with increases in long-term mortality in selected cohort studies, and this association has been influential in the establishment of air quality regulations for fine particles (PM2.5).However, this epidemiologic evidence has been questioned because of methodological issues, conflicting findings, and lack of an accepted causal mechanism. To further evaluate this association, the long-term relation between fine particulate air pollution and total mortality was examined in a cohort of 49,975 elderly Californians, with a mean age of 65 yr as of 1973. These subjects, who resided in 25 California counties, were enrolled in 1959, recontacted in 1972, and followed from 1973 through 2002; 39,846 deaths were identified. Proportional hazards regression models were used to determine their relative risk of death (RR) and 95% confidence interval (CI) during 1973–2002 by county of residence. The models adjusted for age, sex, cigarette smoking, race, education, marital status, body mass index, occupational exposure, exercise, and a dietary factor. For the 35,789 subjects residing in 11 of these counties, county-wide exposure to fine particles was estimated from outdoor ambient concentrations measured during 1979–1983 and RRs were calculated as a function of these PM2.5 levels (mean of 23.4 μg/m 3). For the initial period, 1973–1982, a small positive risk was found: RR was 1.04 (1.01–1.07) for a 10-μg/m 3 increase in PM2.5.For the subsequent period, 1983–2002, this risk was no longer present: RR was 1.00 (0.98–1.02). For the entire follow-up period, RR was 1.01 (0.99–1.03). The RRs varied somewhat among major subgroups defined by sex, age, education level, smoking status, and health status. None of the subgroups that had significantly elevated RRs during 1973–1982 had significantly elevated RRs during 1983–2002. The RRs showed no substantial variation by county of residence during any of the three follow-up periods. Subjects in the two counties with the highest PM2.5 levels (mean of 36.1 μg/m 3) had no greater risk of death than those in the two counties with the lowest PM2.5 levels (mean of 13.1 μg/m 3). These epidemiologic results do not support a current relationship between fine particulate pollution and total mortality in elderly Californians, but they do not rule out a small effect, particularly before 1983.

Table ten is present as originally published in a pdf file of the article. Attached.

Fine Particles and Mortality

Suresh H. Moolgavkar

Fred Hutchinson Cancer Research Center Seattle, Washington, USA

In an interesting paper in a recent issue (vol 17, issue 14)

of the journal, Enstrom examined the association between fine particulate matter (PM) pollution and mortality in a cohort of elderly Californians. The analyses used proportional hazards

regression and after adjusting for age, sex, cigarette smoking, and other potential confounders, Enstrom concluded, "These epidemiologic results do not support a current relationship between

fine particulate pollution and total mortality in elderly Californians, but they do not rule out a small effect, particularly

before 1983." Enstrom's analyses were based on a sub-cohort of individuals enrolled in the first Cancer Prevention

Study (CPS I) conducted by the American Cancer Society (ACS). Enstrom's conclusion is consistent with the conclusions of a cohort study among veterans conducted by Lipfert et al.

(2000), but is at odds with the results from analyses of the second ACS cohort (CPS II) by Pope and others (Pope et al., 1995, 2002; Krewski et al., 2000), which reported statistically

significant associations between fine particulate pollution and mortality.

Every epidemiological study has weaknesses and limitations and, undoubtedly, both proponents and skeptics of the 'fine par-ticles cause death' thesis will find much to criticize in the studies

that do not support their conclusions. These discrepant results raise an important question, however. Can contemporary epidemiological

and statistical tools reliably detect miniscule risks, particularly with strong risk factors as potential confounders? All the cohort studies referred to above use proportional haz-ards modeling for data analyses. But is proportional hazards really the appropriate tool for these analyses? First, it is highly unlikely that proportionality of hazards would hold over the en-tire period of time covered by these studies. Statistical tests for departures from proportionality of hazards have low power. En-strom states that, in his analyses, these tests failed to reject pro-portionality of hazards. However, his finding of a higher relative risk associated with fine particles over the period 1973–1982 is inconsistent with proportionality of hazards over the entire

I have discussed the original CPS II study (Pope et al., 1995)

and reanalyses (Krewski et al., 2000; Pope et al., 2002) in de-tail

elsewhere (Moolgavkar, 2005). I note here, however, that

the reanalysis by Krewski et al. (2000) of the original (Pope

et al., 1995) study (which considered no pollutant other than

PM), showed quite clearly that the pollutant most strongly as-sociated

with mortality was not PM but SO2.In fact, when SO2

was considered along with PM in the model for all-cause mor-tality, the coefficient for sulfates was reduced to less than a third of its original value, that for fine particles was reduced to a sixth of its original value, and both became statistically insignif-icant. It is also of interest to note that consideration of spatial correlations attenuated the PM coefficients to a much greater extent than the coefficients for SO2.Given the much stronger and more robust association of SO2 with mortality in the CPS II reanalyses, I find it surprising that this study continues to be taken as providing strong support for the PM mortality asso-ciation. It can be plausibly argued on biological grounds that SO2 could not be causally associated with mortality. But that still does not explain why SO2 wipes out the PM signal in joint pollutant models. This awkward fact has simply been dismissed as being irrelevant. In a more recent study of the CPS II cohort that doubles the follow-up time and triples the number of deaths, Pope et al (2002) reported significant associations between fine particles and oxides of sulfur with all-cause, cardiovascular and lung cancer mortality. Surprisingly, despite the findings in the Krewski analyses that SO2 was the pollutant most strongly as-sociated with mortality, no joint pollutant analyses were carried

Abstract only

A review and critique of the EPA's rationale for a fine particle standard

Suresh H. Moolgavkar

Sciences International, Inc., King Street Station, 1800 Diagonal Road, Suite 500, Alexandria, VA 22314, USA

Received 18 November 2004

Available online 24 March 2005

Abstract I review the rationale for the Environmental Protection Agency_s 1996 fine particle standard, which was based almost entirely on the epidemiological data with neither support from Toxicology nor understanding of mechanism. While many epidemiological papers available in 1996 reported associations between ambient particles and adverse effects on human health, many others did not and the evidence fell far short of supporting a causal association between particle mass concentration and human health.

The literature appearing after 1996 further complicates the picture. The large studies that have appeared after 1996, such as National Mortality Morbidity and Air Pollution Study, and the reanalyses of the American Cancer Society II study, report risks that are substantially smaller than the risks reported in the 1996 Criteria Document and Staff Paper. Moreover, concerns about confounding by weather, temporal trends and co-pollutants remain unresolved. Other issues having to do with model choice have resurfaced as a result of reanalyses of critical data to address a glitch in a widely used software package for time-series epidemiology studies of air pollution. Finally, contemporary examples show that the results of observational epidemiology studies can be seriously biased, par-ticularly when estimated risks are small, as is the case with studies of air pollution. The Agency has largely ignored these issues. I conclude that a particle mass standard is not defensible on the basis of a causal association between ambient particle mass and adverse effects on human health. Such a standard may be justifiable on the basis of the precautionary principle, however. The Agency could argue that the Science raises concerns about current levels of air pollution, and that reduction of ambient fine par-ticulate matter mass, if it could be achieved without an increase in the level of the ultrafines, could have positive effects on human health. If the Agency justifies a particulate matter mass standard on these grounds then the debate over the form and level of the standard will, for all practical purposes, belong strictly in the Policy arena.

4. Dunn submission on Ozone October 8, 2007

Subject: Comments on Ozone Standards 2007

Submitted via the a-and-r-docket@EPA.gov 10-9-07

Docket ID No. EPA-HQ-OAR-2005-0172

Comments by John Dale Dunn, MD, JD, Civilian Emergency Medicine Faculty, Carl R. Darnall Army Medical Center, Fort Hood, Texas, Policy Advisor, Heartland Institute, Chicago, IL. Member, Board of Scientific and Policy Advisers, American Council on Science and Health, New York, NY.

Corrected and revised final draft submitted 0915 CDT 10-9-07.

1. The EPA ozone science does not justify continued aggressive ozone regulation and a new lower 8-hour standard.

2. The observational air pollution studies and the weak exercise/ozone inhalation studies cited by the EPA show weak associations and relative risk less than 1.5, as well as lab results best described as non adverse. The study evidence cited by the EPA would not be admissible in a Federal Court because it violates basic epidemiology and toxicology scientific rules.

3. The EPA's own Clean Air Scientific Advisory Committee advised in the past that ozone effects research did not show adverse effects and the ozone standard should be left as is.

4. There is no EPA research that shows any benefits from the air quality improvements of the past 20 years. Is it that the EPA doesn't want to report any improvement, for fear it will jeopardize agency funding? Is it evidence that the air pollution wars of the past 20 years were against a PHANTOM MENACE? Are the weak population studies on air pollution weak for a reason--there was no killer air in America?

DISCUSSION

The EPA cited health effects studies are weak on adverse ozone health effects and weak generally on air pollution adverse effects.

The Scientific studies discussed in the proposal document are reviewed below. Although the studies are cited by the EPA to justify the ozone standard, they are not what the EPA commentary says they are. They do not excuse the old standard, or justify the new proposed ozone standards because they are a combination of weak observational studies and no-effect intense exercise/high ozone studies.

Commentary on some of the prominent studies:

1 Dockery DW, Pope CA 3d, Xu X, et. al. An association between air pollution and mortality in six U.S. cities. N Engl J Med 1993;329:1753-9.

Weak observational study that mentions, but does not control confounders. The results are small effects with relative risks of an insignificant magnitude that is proof of nothing.

2 Pope CA, Thun MJ, Namboodiri MM, et.al. Particulate air pollution as a predictor of mortality in a prospective study of U.S. adults. Am J Respir Crit Care Med 1995;151:669-74.

Like the Dockery study above, one of the EPA's most important studies for justifying air pollution regulations. This study is another example of weak epidemiology with weak relative risks and no correction for confounders.

Even after the congress passed a law sponsored by Senator Shelby, requiring Pope and Dockery to produce their data sets, they still dodge and feint, and have not complied. Pope and Dockery are still in the inside clique of EPA favored and sponsored epidemiologists. They continue unhindered and well funded by the EPA and other governmental grant sources friendly to an aggressive regulatory agenda.

3 Hrostman DH Ozone concentration and pulmonary response relationships for 6.6 hour exposures with five hours of moderate exercise to 0.9, 0.10, and 0.12 PPM. American Review of Resp Dis Nov, 1990; 142: 1158-63.

Even heavy exercise with ozone inspired above current limits shows little ozone effect and no disease. The effect shown was mostly subjective respiratory mechanical effect. Ozone makes air heavy and increases its suspended/solute load.

4 Samet JM, Dominici F, Curriero FC, et.al. Fine particulate air pollution and mortality in 20 U.S. cities, 1987-1994. NEJM 2000; 343:1742-9.

Study of cities that claims to know how many days it takes for air pollution to kill someone, then proceeds to find no kill effect from all the air pollution factors, including ozone and ozone precursors, except small particulates, but then admits that the small particle monitor information is not available for the study and that big particles were used as a surrogate. Breathtaking, but published by Dr. Samet's friends in Boston. Incidentally the EPA on its air web site now has announced that large particles are no longer monitored or controlled because they do not cause adverse effects, but the old studies that concluded the dangers of small particles admit they used large particle monitor data as a surrogate for the small particles, since small particle monitors only became available in the late 1990s.

5 Wong JD, Shapiro MF, Boscardin WJ, et. al. Contribution of major diseases to disparities in mortality. N Engl J Med 2002;347:1585-92.

Discussion of confounders in death studies. Apparently has not been read by EPA sponsored and in-house epidemiologists, since the proposal documentation of the EPA makes little mention of he problem of the studies that are relied on—they make assertions without caveats like they were environmental gurus.

6 Fitzpatrick R. Ed. Social status and mortality. Ann Intern Med 2001 134;10:1001-2.

Lantz 1998 Lantz PM, Lepkowski JM et. al. Low income was an independent risk factor for premature death after controlling for health behaviors. JAMA 1998; 279:1703-8.

None of the studies used by the EPA for air pollution regulatory strategies control well for socio-economic status. Some of the studies do nothing more than mention that average income and education were used over large areas. Very similar to the casual use of wide-area, even regional monitors as measures of exposure to pollution.

7 McFadden ER jr., Warren EL. Observations on asthma mortality. Ann Intern Med 1997;127:142-7.

Shows that asthma mortality is in a select group of patients and caused by under-treatment and socioeconomic factors.

8 Mcconnell R, Berhane KT Gilliland F, "Asthma in exercising children exposed to ozone: a cohort study, Lancet 359 (2002) 386-91.

Selective reporting of this study ignored the protective effect of ozone, (yes, protective) in the whole cohort while making much of a minimal evidence of detrimental effects in one group--kids who were in three sports. McConnell is part of the Gauderman group that specializes in studying air in Southern California and always finds detrimental effects, even though many times the methodology and the evidence of risk are questionable and weak.

9 Gauderman WJ, Vora H, McConnell R, et al. Effect of exposure to traffic on lung development from 10 to 18 years of age: a cohort study. Lancet (on line) Jan 26, 2007. www.thelancet.com.

This study by the Southern California group had two major problems--1. Very small pulmonary function differences, less than 5%, which is insignificant, and no real negative trend, since the trend line only existed because of one outlier. There was also a high drop out rate. 2. The study measured differences in groups up to 1500 meters, dividing by 500 meters except for a group within 300 meters. Research shows that air quality from roadways is at background by 300 meters. The air quality on Southern California roadways was reported by H. Zhu in Atmospheric Environment 2002; 36: 4325-35 and in Environmental Science and Technology 2006; 40: 2531-36. Gauderman's group is well sponsored by a division of the California EPA. Imagine their funding stream if they reported no roadway effects?

Studies and analysis ignored by the EPA

The EPA also refuses to recognize the research and analysis that contradicts the EPA air regulation proposals.

Lipfert FW, Perry HM, Miller JP, et.al. The Washington University—EPRI veteran's cohort mortality study: preliminary results. Inhal. Toxicol. 2000, 12 S4:41-73. (Insignificant air pollution health effects.)

Enstrom J. Fine particulate air pollution and total mortality among elderly Californians, 1973-2002. Inhalation Toxicology 2005; 17:803-16. (Very large and long term study shows no air pollution death effect, in fact a counter intuitive protective effect of air pollution in many California cities. This study essentially nullifies the weak studies of Pope and Dockery as well as other death studies that are used by the EPA to push tighter NAAQS)

Moolgavkar S. Let. Fine particles and mortality. Inhalation Toxicology 2006;18:93-4. (Refutes the EPA air pollution project dogma. Discussion of EPA overreach and excessive regulatory zeal.)

Moolgavkar S. A review and critique of the EPA's rationale for a fine particle standard. Reg Tox Pharm 2005; 42:123-44. (Expose' of the EPA's failure to use good science to justify its agenda to make current ambient air pollution appear to be a serious health risk for Americans.)

Schwartz, J. No Way Back: Why Air Pollution Will Continue to Decline, (Washington: American Enterprise Institute, 2003). (Discussion of declining air pollution and improving air quality.)

The situation is so bad that the EPA and its sponsored epidemiologists and public health toxicologists control the literature and the journals. Journal editors now ignore toxicology and relative risk rule breaking. A recent poll by the National Institute for Statistical Science indicates that epidemiology journal editors no longer require data set production, p value calculation adjustments for multiple testing, and compliance with the rule on relative risk. The epidemiology journals have become political commentary on the hot environmental and social issues of the day—a mirror on the mental state of the academy.

Federal Rules of Evidence

The persistent failure of research on ozone and other air pollution observational studies to meet the requirement for relative risk of 2 and the p valued calculations without adjustment for multiple testing are examples of pseudo-science. The measure of scientific integrity, however, goes outside the academic and journal community. The Federal Courts have a stake in reliable evidence and the Federal Trial Court Judge makes the call on admissible scientific evidence.

The Federal Judicial Center's *Reference Manual on Scientific Evidence*, 2nd Edition (2000, West Group), also free on line at http://www.fjc.gov) Chapter on Epidemiology, written by highly esteemed experts, including Leon Gordis, the former Chair of epidemiology at Johns Hopkins School of Public Health deals with various matters of admissibility. The Manual states, at page 384:

> The threshold for concluding that an agent was more likely than not the
>
> cause of an individual's disease is a relative risk greater than 2.0. Recall that a
>
> relative risk of 1.0 means that the agent has no effect on the incidence of disease. When the relative risk reaches 2.0, that implies that the agent is responsible (with certain qualifications noted below) and implies a 50% likelihood that an exposed individual's disease was caused by the agent.
>
> A relative risk greater than 2.0 would permit an inference that an individual plaintiff's disease was more likely than not caused by the implicated agent. Thus, a relative risk of 2.0 would permit an inference that an individual plaintiff's disease was more likely than not caused by the implicated agent.

There are no major studies of ozone health effects relied on by the EPA that show a relative risk 2 or more. In fact there is not, at this time, a way to design a study on ozone that will show evidence of any relative risk, because there is no end point to measure. Ozone is a benign molecule, and doesn't cause death or disease. Exercise studies with excess exposure are a house of scientific cards for any EPA effort to build a toxicology argument against ozone.

The only reason the EPA can use these studies with relative risk of 1.5 or less, and not blush or apologize, is a political climate of panic about the environment and collusion in the academic and journal community collecting around the non-scientific social science concept of the precautionary principle. Discarding the relative risk rule is necessary to the survival of the precautionary principle, since the scientific evidence on ozone and most other pollutants cannot be shown to reach the relative risk of 2.

Expanding the effect of the EPA with "susceptibility."

The EPA also misuses the concept of sensitive or susceptible groups to make any exposure a concern for regulation. Susceptibility allows the EPA extraordinary latitude. There is always someone who is really, really sensitive—therefore the EPA plans to play the sensitive game and will make the society pay, eliminating any target toxin, regardless of the cost of the ablution. The rational regulatory regime does not adopt such a nonsensical approach, but the EPA embraces the concept as an excuse to overdo.

Reviewing the EPA United States air quality map, there are presently very few unsafe air quality areas, but that map will deceptively and dramatically change if the new ozone standard is implemented, along with the nonsense of the susceptibility. It will make no difference whether the standard is 0.06 ppm or .07 ppm, the non-compliance expansion guarantees that the EPA will exist into eternity.

The EPA is no longer in the business of protecting the public health and preserving the environment, the new range of ozone standards is an example of an EPA attempt to redefine what the environment should be and assure itself agency immortality. The EPA wants the world to be a scrubbed down bubble with no dust and no ozone for its own purposes, with no consideration of the rules of scientific integrity or even the mission of the agency to protect the environment and the public. Next the EPA will be regulating nitrogen, which is toxic if found at too high a percentage in the air. Really toxic.

The EPA is consciously and intentionally pushing the limits of scientific concepts of toxicity and epidemiology and cheating on the margins with the help of aggressive and flexible toxicology and epidemiology research. At this point a responsible Federal Judge, properly informed by the Federal Judicial Center Reference Manual on Scientific Evidence, chapters on toxicology and epidemiology, would throw out the "evidence" the EPA is using for this round of ozone standards.

The EPA refuses to study the health effects of the air quality improvements of the past 20 years. Why?

The EPA, like most government agencies or political advocacy groups, lives or dies by the old H.L. Mencken maxim about practical politics, that the public must be frightened, and anxious to be led to safety. False ozone fears and air pollution anxiety prop up the EPA. The EPA and its allies in the environmental movement feed the irrational and uninformed concern that the public has about a declining air quality, in the face of contrary evidence of improving air.

Why is there no research from the EPA that shows a public health benefit from the 20-year improvement in the quality of the air in the United States? Is the health benefit there and not shown or is it possible that the ambient air of 20 years ago, including the ozone levels, was not toxic? Generally even a blind toxicologist can prove a toxic effect by showing that the removal of a toxin caused a benefit. If there are air quality improvements that the EPA documents in its monitor information, then there should be a corresponding improvement in the health of the public.

Los Angeles and Houston air have improved—why no research to show the benefits? Is the EPA a one trick pony—they can only talk panic and crisis and bad air. Good air is not in the lexicon, only bad air and assertions of people dying from bad air? The proof of benefit would be the logical scientific inquiry to show the value of EPA activity and tighter air standards. Where are those studies of benefit?

If there is no real change in life expectancy or quality of life from air quality improvements, what will the EPA do, more importantly what should the country and the society do? Fire the EPA for lying or malpractice? The EPA and its allies in state and local government agencies, and in the non-governmental

environmental advocacy sector would be decimated by reports that there is no crisis in the environment, never was. They would also be, incidentally, unemployed and unemployable as pollution sheriffs.

Air Pollution Trends and Policy

Some places in America will be naturally dusty; some places will have natural background ozone levels that create haze. West Texas exemplifies the first, the Smoky Mountains the second. Trends in air pollution, control of ozone and ozone precursors in the past 30 years have all been positive, yet the EPA does not and will not report any benefit or improvement and continues to aggressively and energetically pursue every opportunity to increase its regulatory empire and authority. The EPA even sponsors and funds non-governmental entities like the American Lung Association and other rabid environmental groups that sue the EPA to push more environmental intrusions. That raises a question about conflicts and influence peddling, and contaminates the very important debate about EPA responsibilities to protect health and preserve the environment and maintain a high level of integrity in its science and research.

The blow back on the latest round of EPA overreach in ramming down the ozone standard is the protest of reasonable people confronting a new regulatory burden based on weak science. Ten years ago the EPA Clean Air Scientific Advisory Committee advised the EPA that ozone could not be shown to produce adverse health effects at the standard then, 0.12 PPM. Even then the CASAC, which is inclined to favor EPA policy proposals as a creature of the agency, was reluctant to support the ozone standard reduction from 0.120 ppm to a lower number. Chairman George Wolff said " although the panel member's opinions differed, none supported the lower end of EPA staff's recommendations, and a majority of members stated a position which included . . . the present standard."

EPA Clean Air Scientific Advisory Committee

The EPA Clean Air Scientific Advisory Committee (CASAC) in the late 1980s pointed out that ozone respiratory effects were not "adverse" health effects, and the CASAC in the 1990s refused to support using the Pope and Dockery studies to justify new NAAQS in 1997, but now the EPA is less scientific or objective in its analyses. The CASAC of today has become an advocacy committee committed to EPA agendas, even advocating more aggressive EPA activity. The CASAC of today has not and cannot be objective about ozone issues, and the current CASAC commentaries are not objective science but advocacy for aggressive environmentalism, now and forever.

There is no explanation for the CASAC conduct of the past few years other than political commitment to the environmental movement and the precautionary principle. In the past the CASAC and other agencies were the only chance that fanatic EPA officials would be brought under control, but now the CASAC has gone to the political side and cannot be trusted to show objectivity. Any argument for more regulation is supported. They represent the politicization of environmental science. CASAC commentary on small particulates last year was over the top.

Only 6 of 21 CASAC members supported the small particulate standards in 1996, the CASAC in 1996 advised in favor of the standard for ozone remaining at 0.120 ppm. Times have changed, the CASAC is now no restraint on junk science, and the CASAC of today is predictably in favor of any new and more stringent standard.

There are many in America who believe that the air quality is worse now than ever. That is because they get no reliable information from the EPA. The EPA is no longer a public agency that protects the public, but a

political propaganda mill, intent on panicking the public and working an environmentalist agenda. Informing the public of the improvements in air quality would reduce public anxiety and EPA and environmental group funding. Environmentalism would suffer a setback as a movement. The EPA is intentionally giving the public incorrect information about the current air quality, creating more anxiety, pollution warnings and claims about deaths.

This proposed new ozone standard is part of the deception, since the day the standard goes into place the American Lung Association, the EPA and the usual environmentalist organizations like Sierra Club will announce a new dirty air crisis. This latest round for ozone standard setting appears to be an effort by an EPA and its allies to reinvigorate their position as protecting the innocent public from killer air. They offer the naïve members of he public the proposal to create a pristine environment, more pristine than even Mother Nature could produce.

Consider, instead the reality as described by an environmental regulation expert:

> The United States has made tremendous progress in reducing air pollution during the last forty years. Air pollution has declined dramatically since the 1960s and 1970s, and virtually the entire nation now meets federal health standards for carbon monoxide (CO), sulfur dioxide (SO2), and nitrogen dioxide (NO2). Many areas of the country still exceed health standards for ground-level ozone ("smog") and airborne particulate matter (PM), but both of these pollutants continue to decline as well. Half of the nation's ozone-monitoring locations exceeded the federal one-hour ozone standard in the early 1980s, but only 13 percent exceeded the standard by the end of 2002. PM measurement methods have changed a number of times during the last forty years, but all trend data show PM levels dropping. Average levels of PM2.5—the form of PM now of greatest regulatory concern—have declined by a third during the last twenty years. (Joel Schwartz, 2003)

A good example of irrational panic mongering is in the September 9, 2004 issue of New England Journal of Medicine, in which C. Arden Pope, an economist cum environmentalist, describes as a companion piece to another children are victims of bad air article, describes killer air in Belgium in 1930, Pennsylvania in 1948, and London in 1952 and proposes those incidents as examples of why he thinks there is good reason to be worried. Pope is always worried, although he can't show me one person in his studies who really died from air pollution. They died as members of the cohort and he counted them as dead from air pollution after he looked at their death certificates. That's not a proper toxicologic analysis, that's an association. People don't die on epidemiologist's desks from associations.

In America ambient air pollution did not kill anyone, last week, last year, or in the last ten years. The crisis of bad air is long past, and the real health effects from air are non existent, but won't go away because the EPA is too big and too influential and too aggressive to go silent.

I agree with the Chairman of the Texas Commission on Environmental Quality, Buddy Garcia, who said in his letter of September 25, 2007 to EPA Administrator Johnson that ozone non-compliance will be the rule rather than the current exception, if the new standard is put in place. Mr. Garcia points out that 0.06 is well

known to the EPA as a background level in many environments—and that such a standard is irrational and cannot be complied with in places like the Gulf Coastal Plain.

Chairman Garcia also points out a little problem that the EPA ignores, that ozone precursors are mostly a product of mobile sources, not point/stationary sources, so the penalties and costs will be imposed on cities and communities for things they can't fix. Why is it that the EPA appears to care little about Mr. Garcia's concerns and his appeals for sensible science and policy making?

Summary

The research used to justify the proposed new ozone standard does not demonstrate results that meet the basic rule for proof of detrimental health effects. In fact the consistent findings of the EPA ozone research is insignificant ambient ozone pollution relative risk and laboratory evidence of fleeting effects if humans or animals are forced to breath high levels of ozone and exercise.

Research studies have shown that low relative risk results and pervasive confounders make it very unlikely that the proposed new ozone rules will have measurable beneficial or protective health effects. The EPA has failed to show the previous reduction in ozone levels has produced any benefits.

The EPA should abandon this precautionary-principle driven and junk science justified new standard, and retreat from continued aggressive tightening of ozone and other air quality standards.

Conclusion and recommendation.

There is no health effects science that justifies the current ozone standard of 0.08 ppm, so I urge the EPA to reset the ozone standard at the more reasonable 0.12 ppm, pending evaluation of the ozone control program for termination. Ozone should go the way of large particles, no longer on the list of EPA targets.

Imagine a government control program that has an end.

Economic and political effects of adoption of the recommendation.

I project that billions of taxpayer dollars and compliance costs could be returned to the citizens as soon as the EPA gives up chasing ozone, a benign component of the natural world.

I also project that a chastened and re-dedicated EPA might,fter the end of the ozone campaign, eschew future goose chases, and focus on serious, non-political, scientific inquiries in the public interest.

11-15-07

5. Dunn Presentation to the Health Risk Assessment Subcommittee of the and Executive Committee of the US EPA Board of Scientific Counselors 2007, 2008

John Dale Dunn MD JD

November 15, 2007 in person Bethesda, Maryland

Committee members and staff,

My name is John Dale Dunn. I am an inactive attorney. I teach emergency medicine at the Carl R. Darnall Army Medical Center, Fort Hood, Texas.

I asked for more time to present in early October, but I will do the best I can with the 3 minutes allotted. Dr. Stan Young from the National Institute for Statistical Science, and Dr. James Enstrom, epidemiologist from UCLA, will follow my presentation on the phone. We are not professionally or financially affiliated, but we share a concern about EPA scientific activity and integrity. In the future we will ask for more time to discuss our concerns with the BOSC.

H.L. Mencken made the prescient observation that the goal of practical politics is to create a hobgoblin, and make the public clamorous to be led to safety.

1. The Federal Judicial Center's Reference Manual on Scientific Evidence, published in 2000, and provided to the committee, was written by experts like Leon Gordis and Bernard Goldstein.

2. The scientific advice and rules provided to judges in the Manual are generally held and well known to the committee.

3. My concern is that EPA research repeatedly violates the Reference Manual rules on observational study relative risk as proof of causation and the rules on toxicology. I think well established and reliable scientific rules should govern EPA research.

4. The Manual insists on Relative Risk of at least 2 for proof of causation in observational studies. The EPA sponsored and funded research repeatedly and flagrantly violates that rule and claims small effects are reliable.

5. The Manual recites the traditional rules of toxicology, including the concept of threshold. The EPA violates those rules by arguing for high-dose toxin experiments on hybrid homogeneous rats and mice, combined with linear modeling as proof of toxicity.

EPA Administrator Browner had the chutzpah to claim that the adoption of ambient air standards proposed in 1995, that were based on Pope and Dockery small effects results, would prevent 20,000 deaths.

The quality of air and the environment is better now, but Americans think the environment is worse due to EPA public relations and research activities.

The BOSC is charged with assuring reliable and credible EPA research and policy making. EPA science should not risk a sensible judge applying the rules and finding EPA research inadmissible. It should be research and that does not panic the public with weak and incredible claims, like those made by Ms. Browner.

The BOSC should prevent the EPA shouting "consensus," intimidating the academic and journal community into breaking the rules and creating unjustified public anxiety.

Respectfully,

John Dale Dunn MD JD

Dunn Comments on small particle standards--2006.

Dunn Comments on ozone standards--2007.

Reference Manual on Scientific Evidence 2nd Ed. (2000)

Submission with this email:

2001 Editorial by Drs. Samet and Burke in American Journal of Public Health defending use of small effects studies.

Amicus brief submitted on behalf of Drs. Wogan, Eaton and 29 other distinguished Scientists criticizing EPA Linear Modeling on dioxin.

DUNN PUBLIC COMMENT SUBMISSION

MEETING OF THE EXECUTIVE COMMITTEE

Board of Scientific Counselors (BOSC) OF THE EPA

JANUARY 24-25, 2008 by phone with written submission emailed.

In the recent months I have provided materials and commentary on scientific integrity issues that fall within the BOSC Mission. The submissions and commentary were to the HHRA meeting and NERL meetings.

I renew for the Executive committee, my concerns about the following:

1. EPA sponsored scientists have repeatedly used relative risk in the negligible range as proof of health effects causation, in spite of epidemiology rules to the contrary, as recited in the Reference Manual on Scientific Evidence, published by the Federal Judicial Center.

2. The same is true of EPA sponsored science on the issue of hi dose rodent toxicology combined with linear modelling with no threshold. Again, I submitted the Reference Manual chapter on toxicology.

3. In addition to the Reference Manual materials, I submitted the brief filed on behalf of the American Council on Science and Health and many distinguished scientists criticizing EPA linear modelling and no threshold toxicology.

I will not resubmit these materials today, since they are already available to the Executive Committee, in addition to submissions by Dr. Stan Young on multiple testing unreliability and Dr. James Enstrom's submissions on his concerns about conduct in the scientific community that stifles inquiry and penalizes legitimate scientists.

The Executive Committee is composed of members much more expert than in the problems of data dredging in small effects science. The EPA is also embarked on a new series of toxicology projects that will increase the chance for problems, the genomic effects toxicology and small effects chemical toxicology research projects that increases the risk of more uncertain and unreliable research in health effects.

I ask the Executive Committee to begin to make more inquiries in these areas, and hold the EPA to a higher standard of reliability. The BOSC represents the interests of the public in assuring EPA science does not just promote interests and agendas of the EPA, but a balanced and reliable effort on behalf of the public interest and deserving of the public's trust.

Thank you for your consideration.

6. Essay by John Dale Dunn for congressional Aides of the Space, Science and Technology Committee of the House, on matter of Science and the Law

10-10-11

Introduction to fallacious and erroneous science and the law.

In addition to reviewing the Reference Manual on Scientific Evidence of the Federal Judicial Center, txt and links in this folder, there are also some excerpts from a book by Peter Huber, PhD and attorney, and Ken Foster PhD on the meaning of the new rules of admissibility for scientific evidence and testimony.

The section of the book excerpted focuses on fallacies in science and the intellectual, epistemological, political, social and psychological aspects of bad science.

First, however, anyone attempting to understand the current state of affairs should read the folder file on Angelo Codevilla, the essay on scientific pretense, along with the farewell speech by Dwight D Eisenhower in 1960 that discussed after the military-industrial complex, the government-research complex and in that section Ike warns of the danger of big government funding research programs and how such developments might corrupt the scientific process, which is not about authority and consensus, but skepticism and humility, the self-questioning that is essential for good science.

After reviewing the essay by Codevilla, one might expand on the problem of oligarchies in the other essay by Angelo Codevilla on the Ruling Class in America, that discusses the problem of elitist oligarchy dominated government tainted by group think and statist agendas. That is critical to the development of science in the service of politics.

Peter Huber, Kenneth Foster *Judging Science* (1997 MIT Press)

The chapters of importance in this book discuss the judicial articulation of what is good science, then essays and discussion on '

Testability and Falsification—Chapter 3

Errors in Science—Chapter 4

Reliability—Chapter 5

Scientific Validity—Chapter 6

That's enough for this folder material and will be summarized with the excerpts from the book including in the materials of the folder.

The materials are valuable, because they include original essays by many of the important figures in the philosophy of science. This summary is by John Dunn, but the original writers are better in their original discussion for more in depth inquiry.

1. Karl Popper is quoted and his teaching on good science is adhered to in the Blackmun Daubert opinion. Popper, a philosopher, emphasizes the importance of the deductive method of development of scientific concept and solutions, which is heavily focused on evidence and testing theories developed for evidence that might falsify the theory. Falsifiable is essential to a good scientific theory, otherwise Popper considers the theory non science. Pp. 35- 55

2. Weinberg proposes a concept of trans-science that is not practically verifiable or it may exceed the sensitivity of the instruments and methodology. Pp 55, 56.

3. An example of trans-science is epidemiology in the range below proof of effect, for example uncertain methodology or Relative Risk of less than 2. P 57.

4. Another concept of trans-science that is rhetorically in widespread use is to prove no risk, to prove the negative. P 58.

5. Reliability and validity are not the same, for example a reproducible and reliable measure may be invalidated because of a poor instrument or methods or bad underlying science. The first error is easier to identify and correct than the second, which looks valid. P 69-71.

6. Confounders produce validity errors and are the reason observational studies require effects of 100 percent—there are many confounders, listed at p 71, migrations or maturation of the study group, attrition, selection, regression to the mean, sequence of effects, experimenter and subject biases and behavior, even simple things like recall bias and overreliance on recall.

7. Confidence interval is another form of measure of reliability of the data, providing a range of accuracy or reliability around a result. P 79, 81. But some say that confidence interval is too loose. One important consideration is that if a confidence interval includes 1.0, there is no basis to argue for an effect. STUDIES RELIED ON BY US EPA THAT INCLUDE 1.0 IN THE CONFIDENCE INTERVAL (CI) ARE NOT RELAIBLE TO SUPPORT AN ASSERTION OF TOXICITY. A CONFIDENCE INTERVAL THAT INCLUDES 1.0 SHOWS A NULL EFFECT.

8. When the signal (results) is in the range of the noise (background natural variability) the reliability of the research is compromised by the signal to noise confusion. In studies with small effects like the US EPA air pollution premature death studies, confirmation bias (also called tunnel vision) energized by intellectual passion and commitment to a political agenda produce studies that do not justify the policies proposed and pursued or the regulatory regimes imposed. P 84.

9. Fallacies and fallacious thinking and research derive from reliance on authority, consensus, acceptance of a vote of those present, obfuscation or cover and selection bias in the service of intellectual passion or ambition, or the "gold effect" which is another form of intellectual passion combined with social

pressure consensus bias. All these biases and prejudices and fallacies of thinking are in contravention to the gold standard for scientific inquiry—skeptical experimentation by researchers who are the most strict judge of the nature and reliability of their research and disciplined in analyzing whether their evidence is proof of a theory. P 85.

10. Intellectual passion and ego of the researcher are sources of bad science and one of the most important conflicts of interest. Ego produces a failure to test one's theory adequately and produces confirmation bias—gathering supportive evidence and rejecting dissent or disagreement and evidence that falsifies the theory in favor. All researchers tend to mythologize themselves and their research, and lack the humility to recognize their own fallibility or see the limits or weakness of their research. Their investment in their career and stature make them rigid and uncritical in their assertions of theory or positing of solutions or answers. P 86

11. Sick science is characterized by:

a. The maximum effect is produced by a phenomenon of barely detectable intensity.

b. Observations are made near the threshold of visibility of the eyes or instruments.

c. There are claims of great accuracy (and significance).

d. Ad hoc excuses are used to nullify any dissent or criticism.

e. The supporters rise and then fall.

12. Another characteristic of sick science is the cargo cult syndrome—pretense of scientific methodology that has no substance. P 89.

13. Another characteristic of sick science is the reports of effects that are considered ominous are in the range of background. E.g. EMG that was proposed to cause terrible carcinogenic effects in the range of the earth's magnetic fields.

14. The pattern of error that goes to policy making, for example ignoring opportunity benefits, fear of introducing new technologies on the precautionary principle, ignoring safety risks associated with a proposed regulatory regime or remedy, ignoring large existing benefits in favor of fear of risk or the precautionary principle, or MOST IMPORTANT, IGNORING THE UNINTENDED CONSEQUENCES OF PROPOSED SOLUTIONS, EITHER IN TERMS OF COMPLIANCE COSTS OR DIRECT AND KNOWN RISKS AND DETRIMENTS.

15. Procrustean data torturing is not different from opportunistic data torturing, and certainly no less pernicious and deceitful. P 99.

16. The seven deadly sins of knowledge or the cognitive illusions that are nefarious;

a. overconfidence

b. magical thinking

c. predictability in hindsight

d. anchoring or tunnel vision

e. ease of deception

f. probability blindness or chance ignorance

g. the game of conjuring of linkages and ignoring the weak links in a chain P 118, 119

17. Reliability refers to the reproducibility of the data. Reliability is measured in terms of sensitivity and specificity. Bayes' theorem measures positive and negative predictive values that are both dependent on sensitivity and specificity. P 113-115.

18. Back to Popper, the soundness of a theory depends on

a. the conclusions must be internally consistent

b. avoid tautological statements that prove nothing but just reference the assertion

c. look for scientific advances in a theory

d. test a theory with experiments

19. The theory must be logically consistent, falsifiable, must assert something new, or novel, and it must be verified by experimental evidence (p 138, 139).

20. There are a fistful of fallacies

a. indirect cause asserted

b. necessary causes are not always sufficient cause

c. temporal or post hoc causation is not real causation

d. ecological fallacy transfers observations about populations to individuals

e. the faggot fallacy piles small and suspect items of proof or evidence and attempts to validate by the bundle or the height of the pile

f. weight of evidence fallacy is similar to e. and relies on the pile

g. bellman's fallacy is another form of the pile fallacy

h. fallacy of risk is the confusion of absolute and relative risk and using one or the other to deceive

i. inappropriate extrapolation is the assumption that one knows the trends and can project

j. new syndrome fallacy is novelty to an extreme

k. insignificant significance—overemphasizing the importance of statically significance in proof of a theory

l. Fallacy of ignoring large effects in small studies because hey fail a statistical significance test.

m. Positive results are fallaciously given more significance

n. Denial of medical mistakes (all these are on P 143)

21. There are good rules for reading and evaluating a paper as a reviewer. P 149-150

22. Feinstein dissects fallacious and alarming medical reports on reserpine causing breast cancer, coffee causing pancreatic cancer, and alcohol and breast cancer. Feinstein reviews how the studies on these reports were flawed. P 156.

It is important to note that the book Judging Science is an exceptional effort by extraordinary authors and this writer cannot do them justice. The books sections are excerpted by necessity.

Buying the book will be the best choice for anyone compelled to learn the intricacies of legal management of scientific evidence and the theories of science that underlie any reasonable discussion of scientific reliability and veracity.

7. An abbreviated story of the effort by John D. Dunn MD JD to expose the misconduct of the US EPA in matters of toxicology and epidemiology.

The Environmental Protection Agency's Particulate Matter Rules: One Physician's Crusade against Cargo Cult Science (JPANDS Spring 2014)

John Dale Dunn, M.D., J.D.

http://www.jpands.org/vol19no1/dunn.pdf

The U.S. Environmental Protection Agency has an annual budget of almost $10 billion, and influence and power far beyond that, with U.S. industry and society always subject to EPA orders, regulations, guidelines, fines, and edicts on environmental compliance.

My effort to expose EPA's bad science and policy making began in the early 1990s, and has culminated in the past 2 years in EPA's admissions, in declarations under penalty of perjury, that inadequate and unreliable, even unethical science underlies EPA regulatory regimes under the Clean Air Act (CAA).

In the infamous Tuskegee syphilis experiment, innocent black Americans suffered the depredations of advanced syphilis as federal public health agents denied them treatment. Now EPA-sponsored studies deliberately expose human subjects to pollutants that the EPA claims to be toxic, lethal, and carcinogenic. The Tuskegee experiment was unnecessary—the effects of advanced syphilis had been known for centuries. The EPA claims it already knows how dangerous fine-particulate air pollution is, but the agency is funding human exposure experiments with what EPA-published air quality standards say are toxic levels of fine-particulate air pollution.

Environmental Law Course

I was a small-town emergency physician and inactive attorney when the dean of sciences at the local Howard Payne University asked me to teach environmental law for the new undergraduate major in environmental science. I obtained the federal and state statute books and put the course on the curriculum to

include adult education for community people interested in compliance issues, as well as the environmental science students.

My study of the economics and politics of environmental regulation led to the conclusion that it involved a **form of cargo cult science** (fake science that looks like science), as described by Nobel Prize winner Richard Feynman,1 that develops when government money is lavishly given to people in the academy to support a political agenda built on a false threat of public harm. EPA's cargo cult science was in the area of epidemiology (population studies) and toxicology (study of poisons and harmful substances). It allowed EPA to beat the panic drum and scare people about killer environmental poisons that were not harming anyone in the ambient environment. This coincided with the growth of the radical environmentalist movement, which I would describe as a cult built on pantheism and a commitment to statist control of society.

One of my guest lecturers, an engineer responsible for compliance for Phillips 66 and an alumnus of Howard Payne, said that EPA would eventually take as much as five percent out of the gross domestic product. His predictions didn't seem so exaggerated when, in the mid-1990s, ozone air standards proposed by EPA Administrator Carol Browner under President Clinton were estimated by economists to cost the economy more than $100 billion. Browner pushed ahead in spite of objections and opposition by EPA's in-house Clean Air Scientific Advisory Committee, and all the Democrat administration-controlled executive agency divisions and offices.

Many aspects of junk science in the public health sector promoted by agencies like EPA are explained by biostatistician and lawyer Steve Milloy in his books *Science Without Sense* (Cato, 1995), *Silencing Science* (with Michael Gough, Cato, 1998), and *Junk Science Judo* (Cato, 2001). Other valuable books on bad science are by Peter Huber: *Galileo's Revenge* (Basic Books, 1991); *Phantom Risk: Scientific Inference and the Law* (MIT Press, 1993); and the most extraordinary study of junk science I have read, *Judging Science: Scientific Knowledge and the Federal Courts* (with Kenneth Foster, MIT Press 1997). The last focuses on the question of science as evidence and how rules of evidence should be used to determine admissibility of scientific testimony and evidence in court proceedings.

"Clean" Air vs. Safe Air: Justifying Regulatory Overreach

The cottage industry of air pollution research is committed to the proposition that air pollution panic is justifiable if it allows regulatory reach by the EPA that would satisfy an aesthetic demand for "clean" air. In my opinion, the research community is distorting the intent of the Clean Air Act (CAA), which should have been named the Safe Air Act since it is impossible to make the air"clean" of pollutants (such as dust, for example). The statutory language of the CAA required the EPA to identify harmful air pollution and mitigate the effects, not make the air "clean."

One of the most prominent EPA-sponsored researchers in air pollution is Jonathan Samet, M.D., chair of epidemiology at Johns Hopkins Bloomberg School of Public Health and chair of the EPA Clean Air Scientific Advisory Committee (CASAC). In a 2000 paper in New England Journal of Medicine, 2 he claimed that fine particles were causing deaths. This claim was based on an inadequately small association of fine particulates and deaths in a study of 20 cities. Small associations are not proof of causation and could easily be a random effect or result from data mining and dredging. By the year 2000 EPA had used its junk science to stack up a well-funded and sponsored pile of papers using the same bad methodology and claims

as the Samet paper, going all the way back to the Pope 3 and Dockery 4 foundational air pollution studies that created the EPA air pollution research and regulation crusade of the 1990s.

Samet and his fellow air pollution researchers, who had become advocates, would mine the data to find a small association and then announce a threat and crisis. In his 2000 paper, 2 however, Samet made an admission that I thought very important: he could not find a toxic effect from the other EPA criteria air pollutants, carbon monoxide, sulfur oxides, ozone, or ozone precursors such as nitrogen oxides and volatile organics. Today, however, Samet campaigns against ozone as if he had never written that paper.

After a two-part science and legal critique that I wrote on Samet's 2000 New England Journal of Medicine 20-city study of effects of air pollution at the website of the American Council on Science and Health, 5,6 James Enstrom, Ph.D., research professor at the University of California at Los Angeles, contacted me and asked for assistance with his efforts to stop California government efforts to create more air pollution regulations that would harm business and industry. I submitted public comments opposing proposed EPA particulate and ozone regulations in 20067 and 2007, 8 with no effect on EPA policy or attitude. EPA continued to make absurd claims that this or that air pollution regulation would save lives.

During that same period, I benefited from the statistics expertise of S. Stanley Young, Ph.D., of the National Institute for Statistical Science in Research Triangle Park, North Carolina.

U.S. EPA Board of Scientific Counselors

In 2007 Enstrom, Young, and I decided to approach EPA's Board of Scientific Counselors (BOSC), an outside independent scientific advisory group that was supposed to monitor and critique EPA science and policy making to encourage research compliance with basic scientific rules. BOSC was composed of members of high professional standing who were in private or state activities, and not EPA employees.

We articulated our positions, based on our areas of concern for BOSC subcommittee meetings in late 2007, and then the executive committee in early 2008. Our pleas and arguments were:

1) Irresponsible and false epidemiology and toxicology by EPA researchers claimed an effect that clearly fell well below any threshold needed to show a toxic effect in observational epidemiological population studies. Evidence for claimed air pollution death effects was inadequate to prove any causation and was asserted without a plausible toxicological mechanism.

2) Studies with multiple inquiries exaggerate the chance of false positives. The EPA was misusing the concept of statistical significance by failing to adjust for the multiple inquiries.

3) The EPA and its sponsored researchers and reviewers ignored studies that disproved their theories and suffered from tunnel vision and confirmation bias. Moreover they persecuted researchers like Enstrom who found results that didn't support the EPA agenda.9

I traveled to Maryland to present my concerns in person to the BOSC subcommittee of the Human Health Risk Assessment Committee, and Enstrom and Young presented by telephone. After waiting through hours of presentations by insider EPA officials and researchers before the scheduled public comment period, each of us was allowed only three minutes. Considering the inhospitable reception we received, it was not surprising we were the only outside commenters. Many lectures of an hour or more had been followed by laudatory comments from other EPA employees and officials present. I also noted that the roster of

committee members was clearly made up of people who had previously, or would in the future, want to be grantees of EPA largesse. It was definitely a home game, with home umpires.

I reviewed the Board of Counselors minutes for the previous five years and found there were no public comments at Board of Counselors meetings in those years. Even highly placed people in private industry, who were severely affected by its regulations, had no taste for criticizing EPA or its sponsored researchers. Favoritism and influence peddling are constant factors in governmental programs. Enstrom, Young, and I decided that appeals to the supposedly independent BOSC were worthless. Nonetheless, we made presentations to another subcommittee and then the BOSC executive committee.

The CARB Toxic Air Machine Project of 2007-2008

The battle was over at EPA, since it was a fixed game, but at the same time there was a battle going on in California led by Enstrom, which heated up in 2008 because of a new set of diesel engine rules focused on fine-particulate air pollution. These regulations were proposed and supported by research sponsored by EPA and the California Air Resources Board (CARB), a subdivision of the California EPA.

In 2005 Enstrom published his results of a robust and current study on the effects of fine-particulate air pollution in California. The study (10) involved 50,000 people in the years 1973-2002. It showed no premature death effect in California from fine- particulate air pollution. Moreover, California's air pollution of the 1950s and 1960s had declined for 30 years. Nonetheless, the increasing rate of asthma was misrepresented as a sign of an air pollution crisis justifying more air pollution regulations for no discernible benefit. Enstrom was also concerned that economic hardships would prove to be important causes of deprivation and decreased human life expectancy, as demonstrated in reliable population studies.11

In 2007, the CARB "solicitation" and review process was set up for a document entitled "Methodology for Estimating Premature Deaths Associated with Long-term Exposure to Fine Airborne Particulate Matter in California." The process included three scientific advisors and six "independent" but paid reviewers well known to, and allies of, CARB. Then CARB staff in May of 2008 released a draft report and proposed regulatory regime, claiming that air pollution caused premature deaths in California. A public comment period began, and the CARB business-as-usual process ran into vigorous critiques 12 submitted by Enstrom and other distinguished public health scientists and engineers in July 2008.

Public criticisms of the CARB draft report included:

1) Panel reviewers were reviewing their own or their close colleagues' air pollution studies.

2) CARB had discarded the Enstrom study and ignored geographic and time trend evidence available in the reviewed research that argued against their conclusions of air pollution death effects in California and the need for more regulations.

3) CARB had failed to adjust for changes in engines and emissions that also made older studies invalid.

4) Basic rules of the sciences of epidemiology and toxicology were violated in the CARB research that made claims based on small associations that were inadequate to claim a premature death effect.

My critique 10, pp 129-135 of the comments document discusses basic principles of scientific evidence that the EPA violates in its overreach. According to the Federal Judicial Center's Reference Manual on Scientific Evidence, 13, 14 which discusses the magnitude of toxic effect required in observational studies that are

used in public health toxicology research, an agent was more likely than not the cause of an individual's disease when the relative risk (RR) is 2.0, that is, a 100 percent increase in the disease or effect (e.g. premature death) in the exposed population. For example, the research on effects of cigarette smoking showed the RR of lung cancer in cigarette smokers is 10.

An RR greater than 2.0 would permit an inference that an individual plaintiff's disease was more likely than not caused by the implicated agent. None of the cited foundational and supportive studies EPA or CARB use to justify air pollution regulatory regimes have the minimum RR of 2 needed to assert evidence in associations of causation.

While epidemiologists study population effects, toxicologists study adverse effects. In the early 1950s, Sir Austin Bradford Hill, British icon of public health research, originated nine criteria referred to by the Federal Judicial Center in the Reference Manual for proving toxicity. Hill's first and most important criterion was evidence of a measurable and significant toxic effect. Other criteria include that the toxic effect proposed has to be plausible, has to make temporal and dosage exposure sense, and should be evaluated to make sure some other factor is not in play.15

EPA has consistently disregarded the Bradford Hill criteria, in particular using small associations that fail the test of adequate evidence of effect. There is no real knowledge of actual exposure of individuals alleged to be affected or dead, and certainly no assurance that outside air quality is the exposure that is appropriate to measure, since people spend the majority of their time indoors. A final and important consideration is that EPA research shows no evidence of a current understanding of a plausible mechanism for fine-particle toxicity or lethality.

CARB staff in October 2008 issued a final report that was the same as the preliminary draft report of May 2008. CARB staff admitted that they didn't show the public scientific critiques to the expert panel or request an expert response to those criticisms of CARB research conclusions or policy proposals.

In December 2008, Enstrom and three other prominent California air pollution experts directly contacted CARB board members to urge rejection of the 2008 report. The four also wrote a public letter to CARB to recommend that CARB reassess the report and delay any decision on air pollution and diesel regulations.16

Enstrom and Young checked the credentials of Hien Tran, lead author of the CARB Report on Fine Particles and Premature Death in California, and found that he had a fake Ph.D., purchased for $1,000 from a drop box, Thornhill University.17 Enstrom and others also pursued another scandal—that CARB executive Mary Nichols knew of the Tran fraud and had not reported it to the CARB Board before Dec 12, 2008, when it voted to approve the Truck and Bus Regulation. Enstrom's research into the enabling legislation for CARB also found that most members of the Scientific Review Panel on Toxic Air Contaminants had served in their positions longer than the specified term of 3 years without following the nomination and appointment process of members required by the 1983 enabling statute. Pacific Legal Foundation filed a lawsuit in June 2009 to force compliance with the nomination and appointment process, resulting in the removal of five of the nine members.

A taxpayers' protest was held with speeches and demonstrations at the State Capitol on Aug 28, 2009, reinforced by the sound of a 220-truck convoy sponsored by the California Dump Truck Owners Association (now the California Construction Trucking Association). The convoy circled the Capitol building and, on

cue, sounded truck horns for one minute. The convoy and the Capitol steps rally on California agency overreach were not covered by the press, but the legislators were there.

Business leaders and industry sectors that use diesel engines raised their voices. Dr.Bill Wattenberg, an engineer and influential talk show host from San Francisco's KGO, railed against CARB. Bloggers and other radio hosts joined in. Bryan Bloom, Lee Brown, and Betty Plowman and other trucking industry people were eloquent in public meetings. Jay McKeenan for the California Independent Oil Marketers Association, representatives of the logging industry organizations, Bill Davis with the Southern California Contractors Association, and Shelly Sullivan of the California Manufacturers and Technology Association, all pressed for a CARB suspension of the new diesel rules and a sensible agency retreat from its aggressive stance. Skip Brown, construction executive, was a steady and important participant as a speaker and writer.

California Assemblyman Roger Niello (R-5th Assembly District) presented a bipartisan letter with 52 signers demanding that CARB suspend the new diesel rules. Senator Robert Dutton (R-31st Senate District) and Assemblyman Dan Logue (R-3rd Assembly District) introduced bills to slow down CARB implementation plans on greenhouse gas and global warming regulations. Gov. Arnold Schwarzenegger weighed in to advocate a suspension of any new fine particulate/diesel regulations until the California economy could recover.

As a result of this 2-year campaign, CARB attempted to repair its damaged reputation for reliable research with a full-day scientific discussion and "cage match" debate on Feb 26, 2010 at the California EPA hearing room in Sacramento.

CARB designated three experts from the original scientific review panel: Daniel Krewski, Ph.D., Michael Jerrett, Ph.D., and Arden Pope, Ph.D., well-credentialed and also longtime friends and beneficiaries of CARB and EPA grants, members of the insider air pollution club with senior status. CARB paid for them to appear just as they had paid for previous research and review work.

Krewski has headed a large group that did a national study.18 A close look at the results showed that they found no air pollution "associations" that would support a claim of human health effects in California, but they ignored their own results, which would argue against their basic premise. During the symposium, Jerrett admitted that he couldn't find an air pollution health effect in California, but a year later he manipulated the data to show a minor association in one of his models19 created by a trick in methodology and geographic gerrymandering that he called "conurbation."20 As noted above, the Pope and Dockery group 3,4 have been prolific and always predictably produced studies with very weak associations that they claim support their position that air pollution kills.

For the opposing public critics, James Enstrom, Ph.D., Fred Lipfert, Ph.D., Robert Phalen, Ph.D., Roger McClellan, D.V.M., Suresh Moolgavkar, M.D., Ph.D, and Tom Hesterberg, Ph.D., M.B.A., appeared. These well-qualified researchers urged no more regulations and no more exaggeration of the science on air pollution health effects.

The webcast is seven hours long. 21 The net effect was that the public commenters exposed the nature of the CARB malfeasance on human health effects science, and demonstrated that the CARB research project was a setup that involved conflicts of interest and a failure to objectively evaluate competing data and evidence on the question of California air quality and its effect on health.

No regulatory relief came from the debate and the proof of CARB malfeasance, and CARB proceeded with the originally planned air pollution regulations.

Washington Politics

The Space Science and Technology Committee of the House of Representatives contacted me in 2010, and I provided information from the CARB wars and the previous challenges of EPA air pollution research claims and policy making. Congress had hearings in the fall of 2010 and through 2011 on EPA air pollution research and regulations. In 2011 and 2012, the House Energy and Commerce Committee also had activities and an interest, and in February 2012 former chairman Rep. Joe Barton (R-Texas) gave a speech outlining the perfidy of the EPA on many aspects of science and policy, as well as legal aspects of EPA misconduct.

Barton condemned:

- EPA's refusal to assess risk and benefit on regulations;
- EPA's burdensome and nonsensical power plant regulations;
- EPA's failure to cooperate with congressional oversight;
- Persistent and flagrant conflicts of interest among EPA researchers and advisers who receive tens of millions of dollars in research grants from the agency while serving as reviewers of EPA research;22
- EPA researchers' refusal to comply with basic rules of public health research in toxicology and epidemiology;
- Inappropriate reliance on the precautionary principle;
- Circumvention of congressional oversight; and
- Grant-giving to non-governmental advocacy groups that then enter into collusive lawsuits and aggressive regulatory requests that promote the agency's agenda and expand its regulatory and political power.

As Barton pointed out, "I believe that the American public and taxpayers should not be paying for an agency that manipulates data and funds researchers in the form of exterior grants, who in turn serve on the internal committees within the EPA to create policy and work in an oversight capacity. This is an incredible conflict of interest to the American public."23

Rep. Barton's dressing-down of EPA and its administrator was a first step in the right direction. But now Rep. Barton and his colleagues need to follow through by implementing real solutions that will stop EPA's regulatory excesses.

EPA and the Admissibility of Scientific Evidence

EPA research on human health effects of air pollution consistently violates the rules of science and is not admissible in a federal court under the rules of Daubert v. Merrell Dow, 509 U.S. 579 (1993). The Daubert majority opinion, written by Justice Harry Blackmun, discarded the old rule of "generally accepted" for scientific testimony and evidence, from the 1923 case of Frye v. United States, 293 F. 1013 (D.C. Cir. 1923) and adopted new, more rigorous tests for admissibility of science testimony and evidence, under Federal

Rules of Evidence (1975), particularly Rule of Evidence 702 on Testimony by Experts. The rule provides that if scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue (Rule 104 test), a witness qualified as an expert by knowledge, skill, experience, training, or education, may testify thereto in the form of an opinion or otherwise.

In his written opinion, Justice Blackmun provided an erudite discussion on the philosophy of science, with a strong dose of the theories of a respected philosopher of science, Karl Popper.

Justice Blackmun's major points were as follows:

1) Trial judges were the gate keepers to assure that reliable science was admitted as evidence.

2) Scientific testimony and other scientific evidence had to be consistent with everyday good scientific practice.

3) The science would be assessed generally as follows:

a. The general acceptance rule of Frye did not survive the new Federal Rules of Evidence.

b. Knowledge is more than subjective belief or unsupported speculation; it must be supported by evidence and proven methods.

c. An expert witness is permitted wide latitude under the federal rules of evidence to offer opinions, including those that are not based on firsthand knowledge or observation.

d. Under Federal Rule of Evidence 104, a federal trial judge must determine the threshold question of whether the evidence is relevant and material to the case and will assist the trier of fact.

Justice Blackmun continued that if the threshold test of Rule 104 is satisfied (3d above), then the judge, in applying the rules of Daubert, must assess the admissibility of the scientific evidence and testimony on the basis of four tests under Federal Rule of Evidence 702 on Testimony of Experts:

1) Whether the theory or technique can be and has been tested;

2) Whether the theory or technique has been subjected to peer review and publication (this test is not dispositive, only additive);

3) Whether the technique or method has a known or potential rate of error; and

4) Acceptance of the theory or technique within a relevant scientific community of scholars.

Professor Michael Fenner of Creighton Law School wrote a helpful, in-depth review of the Daubert opinion. 24 In *Judging Science*, 25 Kenneth Foster and Peter Huber (MIT Press 1995) also review and analyze Daubert, providing much background analysis on the problems of junk science and fallacious science and also on the methods that produce reliable evidence and avoid scientific negligence and misconduct.

The Federal Rules of Evidence provide a means to challenge EPA-sponsored research, claims, conduct, actions, and policy-making. The burden of the challenge to an action, or ruling or fine or penalty, is to prove that the agency was arbitrary and capricious in its analysis of the pertinent science and research on human health effects and detriment. A common-sense understanding of those words entails actions taken without good justification or rationale. The courts have been inclined to be excessively deferential and allow agency

hegemony, even refusing to hear arguments on the arbitrary and capricious standard for agency acceptance of scientific research assertions.

Jurisprudence allows for judicial deference to agency discretion in matters of ambiguous statutory provisions, described by Justice Antonin Scalia in *Whitman v. American Trucking Association*. 26 What the erudite Justice Scalia fails to constrain is the inordinate and inappropriate expansion of the deference allowed EPA in reference to interpretation of ambiguous statutory language to include arbitrary and capricious agency acceptance of what would be arguably inadmissible scientific testimony and evidence.

Judges are, however, and always have been, the ones to decide what's admissible as evidence. Agency discretion under the jurisprudence of the Chevron decision 27 should not allow unreliable scientific evidence into the record under the rules of *Daubert*, whether it's a hearing or a trial. The evidence must be admissible for purposes of proving that the agency is or is not being arbitrary or capricious, which makes the decision on evidentiary admissibility and reliability separate from whatever idea the court might have about agency authority and discretion.

Unreliable scientific evidence is inadmissible and therefore cannot be used to justify agency actions. The admissibility rulings on evidence trump some arcane idea about agency discretion that is all tied up in the jurisprudence on congressional delegation. There is no law that Congress has passed that permits agencies to use and promote junk science.

In the excessive support of congressional delegation to agencies under the statutes, and the general deference for agency discretion under Chevron, Scalia allows EPA research to cheat and avoid a challenge under the "arbitrary and capricious" standard. Justice Scalia just plain ignores the commonly and legally understood meaning of "arbitrary and capricious." Proposing inadmissible scientific evidence and testimony on critical research assertions that are foundations for policy and regulatory action would certainly cross the threshold of "arbitrary and capricious" under the Administrative Procedure Act.

The Role of the Administrative Procedure Act (APA)

The Administrative Procedure Act (APA) allows a successful challenge of agency conduct when that action is arbitrary (without good reason) and capricious (on a whim and without a good reason). Violating scientific rules, like the ones that are clearly outlined in the *Reference Manual on Scientific Evidence* 11, 12 to educate judges on science, would certainly raise the question of irrationality that is the fundamental issue for claiming that an agency has acted in an arbitrary and capricious manner.

The courts have, however, been very lenient with the EPA on the violations of scientific rules and provided many opportunities for agencies to violate the rules of science, so legislative actions may be necessary to force better science and policymaking at EPA. The alternative is to find a judge with integrity and an appellate court that doesn't undermine a judgment of inadmissibility, or will entertain and find valid an appeal to reverse an improper judgment on Daubert admissibility.

Legislative Remedies

In the political sphere, Congress can modify standards of administrative and judicial review to demand good science and a better standard for agency conduct, with more reasonable rules on challenges to EPA actions. This is similar to the rules for challenges to actions by the Occupational Safety and Health Administration, which carry a preponderance-of-evidence burden.

The pertinent legislative act is the Congressional Review Act (CRA), found at 5 U.S.C. 801, which allows Congress to jump in when the agencies are involved in misconduct. CRA was enacted as section 251 of the Contract with America

Advancement Act of 1996, also known as the Small Business Regulatory Enforcement Fairness Act of 1996 (SBREFA). The law allows Congress to review, by means of an expedited legislative process, new federal regulations and, by passage of a joint resolution, to overrule a regulation.

Another legislative effort to bring the pressure to bear on the federal agency and their sponsored researchers is the **Data Quality Act**, which requires agency-sponsored research to hold to good scientific principles or be subject to review and possible modification or recision.

Even without legislation, responsible, competent, and serious legislators can find reasons to question EPA conduct, and lawyers can frame evidentiary challenges so that the courts and administrative hearings will be required to make clear rulings on admissibility of scientific evidence with an accompanying rationale for appellate review.

A bad evidentiary ruling is a reversible error; a good ruling will nurture good science in the courtroom. No lawyer but a pettifogger would admit to arguing for bad science that violates the public trust.

At present EPA, following Samet, 28 asserts the theory of "no threshold" for a toxic effect of air pollution, allowing EPA to pursue any pollutant to the last molecule. This impossible goal allows for unlimited expansion of EPA power. Chemical toxicology still is based on thresholds. **"No threshold" chemical air pollutant toxicology turns the Clean Air Act (42 USC 7401. 1963, amended 1970, 1990) on its head and nullifies and abandons the strategy Congress intended.**

Human Experimentation Scandal

As previously described in this journal, 29 EPA has been sponsoring research in which human subjects are exposed to air pollutants at levels far exceeding those EPA declares to be toxic or lethal. It is illegal, unethical, and immoral to expose experimental subjects to harmful or lethal toxins.30 The Reference Manual on Scientific Evidence, 3rd ed. (2011), [12, p 555] declares that exposing human subjects to toxic substances is "proscribed" by law, and cites case law. The editor of Environmental Health Perspectives (EHP) refused a request by Steve Milloy of JunkScience.com to withdraw a paper based on one such study and conduct an investigation.31

According to information obtained by Milloy from a Freedom of Information Act (FOIA) request, a University of North Carolina research study exposed 42 people to what EPA says are harmful or lethal levels of fine particles, with some receiving 10 times EPA's declared safe level of 35 micrograms per cubic meter of air. The EPA human experiments described were conducted from January 2010 to June 2011, and ended three months before then-EPA Director Lisa Jackson's congressional testimony, during which she still asserted dramatic claims of the lethality of small particulates less than 2.5 microns in diameter (PM2.5), claiming thousands of deaths and hundreds of billions of dollars in economic consequences from the deaths and disabilities caused by fine particles.

There have been no publications of toxic effects as declared by the authors of the paper, other than the one case report of a cardiac arrhythmia described earlier; 29 the researchers failed to report that none of the other

subjects had any adverse effects, despite the obligation of researchers to report results both for and against their hypothesis.

Did EPA risk the deaths of 42 subjects? Or are EPA officials lying in their testimony about the dangers of small-particle air pollution and deliberately misleading Congress and the public?

After filing complaints with EPA officials and the editor of EHP, Milloy and I filed complaints with the North Carolina Board of Medicine and the University of North Carolina (UNC) School of Medicine. The North Carolina medical board found no violation of the Medical Practice Act by the physicians, and no action was taken by the UNC School of Medicine.

A lawsuit was filed in Federal District Court in Arlington, Va., to ask for injunctive relief or a remedy that would stop the human experiments. The Court said it didn't have the authority or jurisdiction to stop the human experiments, but declarations under penalty of perjury obtained from officials of the EPA research team at UNC Chapel Hill School of Medicine were revealing.

Eugene Cascio, M.D., a lead EPA physician in the research team, declared that 10 domestic medical schools and six foreign medical schools were doing human exposure experiments. They included some of the most prominent medical schools in the United States—Rutgers, Rochester, Ohio State, University of Michigan, Michigan State, University of Washington, University of California at Los Angeles, University of Southern California, and Lovelace Clinic affiliated with the University of New Mexico. The foreign medical schools included three in Europe, one in Canada, and two in the UK.32

Two other declarations produced by EPA officials in the lawsuit were critical to understanding EPA misconduct. Martin Case, program administrator, declared that he told the subjects they could die from the exposures, but he did not write that warning in the consents obtained.33 Milloy has obtained the consent forms from UNC and other medical schools involved in the project for human experimentation, and none of programs warned subjects of EPA's position that fine particles were toxic, lethal, and carcinogenic, and that the subjects might suffer the consequences.34

Robert Devlin, Ph.D., senior research official for EPA and part of the UNC team, stated in his declaration under penalty of perjury that the EPA was sponsoring the human experimentation because the results of epidemiological studies are not reliable enough and do not establish a strong enough case for toxicity of air pollution.35

In paragraph 8, Devlin states:

> Controlled human exposure studies conducted by EPA scientists and EPA-funded scientists at multiple U.S. universities fill an information gap that cannot be filled by large population studies. In 1998 the Committee on Research Priorities for Airborne Particulate Matter was established by the National Research Council in response to a request from Congress. The committee was charged with producing four reports over a five- year period which describe a conceptual framework for an integrated national program of particulate-matter research, and identified the most critical research needs linked to key policy-related scientific uncertainties.

The committee states on page 36 of its report:

> Controlled human exposure studies offer the opportunity to study small numbers of human subjects under carefully controlled exposure conditions and gain valuable insights into both the relative deposition of inhaled particles and the resulting health effects. Individuals studied can range from healthy people to individuals with cardiac or respiratory diseases of varying degrees of severity. In all cases, the specific protocols defining the subjects, the exposure conditions, and the evaluation procedures must be reviewed and approved by institutional review boards providing oversight for human experimentation. The exposure atmospheres studied vary, ranging from well-defined, single- component aerosols (such as black carbon or sulfuric acid) to atmospheres produced by recently developed particle concentrators, which concentrate the particles present in ambient air. The concentrations of particles studied are limited by ethical considerations and by concern for the range of concentrations, from the experimental setting to typical ambient concentration, over which findings need to be extrapolated.

Controlled human exposures studies have been conducted for decades on important pollutants such as ozone, particulate matter, nitrogen dioxide (NO2), sulfur dioxide (SO2), VOCs [volatile organic compounds] emitted [in] new homes, and carbon monoxide (CO).

In paragraph 9 of his Declaration, Devlin states: "Controlled human exposure studies assess the biological plausibility of the associations observed in the large-population epidemiological studies."

So we have come full circle. For 20 years I have argued that EPA is involved in corrupted, invalid, unreliable epidemiology. Now, under pressure from a lawsuit for unethical conduct, it admits what we knew already, that epidemiology is being misused as a false portfolio of evidence of air pollution toxicity. The most astounding aspect of this human experiments scandal is the refusal of state boards of medicine, institutional review boards (IRBs), deans of medical schools, and EPA officials to investigate and stop the misconduct. This is in spite of the well-known and remembered Tuskegee and horrific wartime

Nazi/Japanese medical experiments on prisoners.

What we have discovered with EPA misconduct and that of the grantees at numerous medical schools is very sobering. These are not trivial violations of the ethical rules on human experimentation with which the IRBs are familiar. The rule is that one cannot perform harmful human exposure experiments— period. In only a very few circumstances where significant benefit is anticipated could subjects be exposed to harmful substances, after they are informed of the risks.

Conclusion

For 20 years or more EPA has promulgated bad epidemiology and bad toxicology that eventually evolved into research with unethical human exposure experiments. There is no easy way to excuse unethical human experiments to substantiate claims made in congressional hearings, despite lack of evidence, that air pollution or other forms of pollution are toxic and lethal.

If EPA is lying about the toxicity, the regulations fall. If it isn't, a federal agency is committing battery and unethical research that is criminal, unethical, and violates agency rules on human research. Either way, innocent experimental subjects are victimized.

Daubert and the *Reference Manual* guidelines could be used to restore sanity and objectivity to EPA regulatory activities so that they would improve public health policy-making rather than serving a political agenda.

Environmental Protection Agency's Air Pollution Research: Unethical and Illegal?

Steve Milloy, M.H.S., J.D., L.L.M., John Dale Dunn, M.D., J.D (JPANDS Winter 2012)

- www.jpands.org/vol17no4/dunn.pdf

"First, do no harm"is a fundamental precept of medical ethics. So how do U.S. Environmental Protection Agency physicians explain their non-therapeutic experiments in which they exposed health-impaired people to high levels of concentrated diesel exhaust and other air pollutants?

A federal court may soon help clarify this dilemma.

Since at least 2004, EPA physicians have been intentionally exposing human beings to various forms of concentrated airborne particulate matter (PM), including diesel exhaust, at an EPA laboratory at the University of North Carolina School of Medicine (UNC). The diesel exhaust is generated by idling a diesel truck with its exhaust pipe located right under the air intake for the exposure chamber.

The university not only houses the EPA facility, but also provides on a contract basis the mandatory institutional review board (IRB) intended to serve as the last line of defense for human study subjects.

Although these experiments materially violate every law, regulation, and standard developed since World War II for the protection of human subjects, there are two primary violations.1

First, these experiments should never have been approved by UNC or conducted by EPA given the allegedly lethal nature of PM as determined by EPA.

Since 1997, the agency has regulated PM on the basis that it kills people. In 2004, EPA clarified its views of PM's lethality by concluding that any inhalation of PM could result in death within hours of exposure.2 The EPA reiterated this view in its 2009 scientific assessment of PM.3

In July 2011, Dr. Jon Samet, chairman of EPA's Clean Air Scientific Advisory Committee, wrote in the New England Journal of Medicine that there is no safe exposure to PM.4 This view was repeatedly echoed by EPA air chief Gina McCarthy in a February 2012 letter to House Energy and Commerce Chairman Fred Upton (R-Mich.).5

EPA Administrator Lisa Jackson testified before Congress in September 2011: "Particulate matter causes premature death. It doesn't make you sick. It's directly causal to dying sooner than you should. She added,"If we could reduce particulate matter to levels that are healthy we would have an identical impact to finding a cure for cancer."6 Cancer kills about 570,000 in the U.S. annually, according to the American Cancer Society.

In addition to the EPA-determined lethal nature of PM, EPA also says there is strong evidence that PM is carcinogenic.7

These characterizations of PM essentially portray it as one of the most toxic substances known to man—at least according to EPA. Though every poison has a lethal dose, any exposure to PM can kill, and kill quickly (within hours), EPA claims. Although exposure to carcinogens like asbestos, benzene, and vinyl chloride may cause cancers decades after exposure, or after decades of exposure, these risks obviously pale in comparison to that of PM in the view of EPA.

EPA, then, is experimenting on human beings with what it views as one of the most toxic substances known to man for the simple (and illegal) purpose of evaluating what would happen, apparently in an effort to bolster its epidemiological (i.e. statistical) claims.8,9 Worse, many of the study subjects are health-impaired, suffering from metabolic syndrome, asthma, old age, or combinations thereof.

The idea of a government agency deliberately exposing sick people to what it portrays as an extremely toxic substance is shocking. This is, however, only part of the story.

Second, informed consent is the cornerstone of medical practice and human testing protocols. Failure to obtain informed consent, among other misconduct, resulted in the execution of 16 of 23 Nazi doctors at the Nuremberg tribunal. The so-called "Common Rule" has been adopted by American medical researchers, including EPA, as a standard for conducting human experiments, and it prohibits harmful human experiments.10

Although EPA went through the motions of having its study subjects read and sign consent forms, the forms never mentioned that any exposure to PM could result in death within hours of the experiment. Study subjects were instead told, for example, "You may experience some minor degree of airway irritation, cough or shortness of breath or wheezing. These symptoms typically disappear two to four hours after exposure, but may last longer for particularly sensitive people."10

At least hundreds, and possibly thousands of human subjects have been so experimented upon by EPA physicians or EPA- grantee physicians at universities around the country. These experiments continue even as these concerns have been pointed out to EPA in recent months.

Has anyone been harmed? At least one 58-year-old obese woman with a personal and family history of heart problems had her experiment terminated early when she developed atrial fibrillation/flutter. The case was reported, 11 and it was said to be "the first case report of cardiovascular disease after exposure to elevated concentrations of any air pollutant." The rhythm resolved spontaneously about 2 hours after termination of the exposure. The authors concluded: "The resolution of the arrhythmia with termination of the particle exposure further supports a causal relationship between the two."They made this strong inference even while acknowledging evidence of a high frequency of supraventricular ectopy prior to exposure, numerous preexisting risk factors, and the fact that an

electrophysiologic study 6 weeks later revealed a re-entrant circuit, which was ablated. The authors suggested a potential mechanism of "disruption of the normal cardiac autonomic control," without

acknowledging the confounding factor of a potential emotional reaction to being in a setting resembling a gas chamber and being the subject of an exposure to an inhaled air mixture in a lab.

Although EPA physicians attributed the subject's arrhythmia to her PM exposure, they nevertheless did not modify the consent forms for subsequent human test subjects to reflect this risk.

As a result, the American Tradition Institute, a nonprofit public policy group, has filed suit in federal court against the EPA seeking an end to this illegal experimentation (American Tradition Institute Environmental Law Center v. U.S. EPA, Case 1:12- cv-01066-AJT-TCB, U.S. District Court for the Eastern District of Virginia—Alexandria Division).

Complaints have been filed with the North Carolina Medical Board concerning three of the North Carolina-licensed EPA physicians involved in the illegal experimentation. This investigation continues. The University of North Carolina School of Medicine has announced an internal review.

Congress has gotten involved, too. Sen. Jim Inhofe (R-Okla.) has requested that the Senate Environment and Public Works Committee, the committee responsible for overseeing EPA, schedule hearings on the scandal. Spearheaded by Rep. Paul Broun,

M.D. (R-Ga.-10), the House Science Committee has requested that the EPA Office of Inspector General conduct an investigation.

The lawsuit has already produced a notable admission of sorts from an EPA employee. In his declaration,12 EPA Clinical Studies Coordinator Martin W. Case asserted that he verbally informs human subjects in an ongoing trial that, "There is the possibility you may die from this." In addition to the shocking nature of this"warning,"even if it were acceptable to risk the lives of human study subjects for the sake of science—and it's not—such a warning would need to be in writing, according to federal regulations.

It's clear that "first, do no harm" was not a high priority concern of EPA physicians involved in this shocking experimentation. EPA and UNC are now in defensive postures, and the medical community needs to hold them accountable. Given past outrages of medical science, like the Nazi experiments and the Tuskegee syphilis experiments to name just two, what will the medical, political, and legal communities do to stop this ongoing research sponsored by a United States federal agency and funded with taxpayer dollars?

Another possibility is that the EPA does not believe its own testimony to Congress, and that oppressive, costly regulations have been imposed on American industry on the basis of flawed epidemiologic studies, unwarranted extrapolations, and contrived estimates of benefits. The experiments may be designed to find a potential mechanism of harm, like the one suggested in the case report by Ghio et al.11 If so, the very purpose of the experiments is to cause harm to human beings in an effort to justify false testimony.

[Editor's Note: In a letter from the Environmental Protection Agency Office of Inspector General, dated October 22, 2012, Assistant Inspector General for Program Evaluation, Carolyn Copper, indicated the agency "plans to begin an evaluation of the Environmental Protection Agency's (EPA's) Research on Human Subjects...to determine whether EPA: 1) Obtained sufficient approval to expose subjects to specific levels of diesel exhaust emissions or concentrated airborne particles; 2) Obtained adequate informed consent from human study subjects before exposing them to diesel exhaust emissions or concentrated airborne particles; 3) Adequately addressed any adverse events that occurred, including notifying the University of

North Carolina at Chapel Hill's Institutional Review Board (IRB), the Human Studies Review Board, and the Human Subjects Research Review Official, revising consent forms as needed, and providing clinical follow- up in accordance with the approved protocol." https://junkscience.com/2018/05/pope-fails-to-find-error-in-enstroms-2017-reanalysis-of-pope-1995-pm2-5-study/

The study below is a reanalysis of earlier studies relied on by the US EPA.

Dr. Enstrom shows that the studies not only show small associations that are proof of nothing, but in some cases reanalyzing the data shows Confidence Intervals that include Relative Risk of 1.0 so the studies failed in every way to show an effect. Dr. Enstrom also provides information on a systematic effort by journals to suppress his expose'.

James E. Enstrom, Original Article Fine Particulate Matter and Total Mortality in Cancer Prevention Study Cohort Reanalysis

Enstrom J. Fine particulate matter and total mortality in cancer prevention study cohort reanalysis. Dose-Response: January-March 2017 1-12 DOI: 10.1177/1559325817693345
https://www.ncbi.nlm.nih.gov/pubmed/28473741

Abstract

Background: In 1997 the US Environmental Protection Agency (EPA) established the National Ambient Air Quality Standard (NAAQS) for fine particulate matter ($PM_{2.5}$), largely because of its positive relationship to total mortality in the 1982 American Cancer Society Cancer Prevention Study (CPS II) cohort. Subsequently, EPA has used this relationship as the primary justification for many costly regulations, most recently the Clean Power Plan. An independent analysis of the CPS II data was conducted in order to test the validity of this relationship.

Methods: The original CPS II questionnaire data, including 1982 to 1988 mortality follow-up, were analyzed using Cox proportional hazards regression. Results were obtained for 292 277 participants in 85 counties with 1979-1983 EPA Inhalable Particulate Network $PM_{2.5}$ measurements, as well as for 212 370 participants in the 50 counties used in the original 1995 analysis.

Results: The 1982 to 1988 relative risk (RR) of death from all causes and 95% confidence interval adjusted for age, sex, race, education, and smoking status was 1.023 (0.997-1.049) for a 10 $\mu g/m^3$ increase in $PM_{2.5}$ in 85 counties and 1.025 (0.990-1.061) in the 50 original counties. The fully adjusted RR was null in the western and eastern portions of the United States, including in areas with somewhat higher $PM_{2.5}$ levels, particularly 5 Ohio Valley states and California.

Conclusion: No significant relationship between $PM_{2.5}$ and total mortality in the CPS II cohort was found when the best available $PM_{2.5}$ data were used. The original 1995 analysis found a positive relationship by selective use of CPS II and $PM_{2.5}$ data. This independent analysis of underlying data raises serious doubts about the CPS II epidemiologic evidence supporting the $PM_{2.5}$ NAAQS. These findings provide strong justification for further independent analysis of the CPS II data.

James E. Enstrom

Here is another article in 2018 that describes Enstrom's efforts to expose US EPA air quality effects research misconduct.

Scientific Distortions in Fine Particulate Matter Epidemiology
James E. Enstrom, Ph.D., M.P.H.

ABSTRACT
The theoretical prevention of premature deaths from the inhalation of fine particulate matter is being used by the U.S. Environmental Protection Agency (EPA) to justify the National Ambient Air Quality Standard (NAAQS) and multibillion dollar regulations across the U.S., including the EPA Clean Power Plan and the California Air Resources Board (CARB) Truck and Bus Regulation. The epidemiology is severely flawed. Fine particulates probably make no significant contribution to premature mortality in the U.S. The publication of null findings has been blocked or marginalized and studies claiming excess mortality need to be reassessed.

Basics of Fine Particulate Matter

Fine particulate matter (PM2.5) is defined by its size (≤2.5 μm diameter), not its composition. Major sources in the U.S. are forest fires, commercial and residential burning, and diesel engines. In California, a major source is China; on some days up to 30% of fine particulates had crossed the Pacific Ocean.
Of these invisible particles, the average adult in the U.S., based on actual 2015 exposure levels, would inhale about 1 gram in an 80-year lifespan, assuming that he breathes about 10,000 liters of air a day at rest. For comparison, the amount inhaled while smoking 100 cigarettes is about 4 grams.1

In 1997, the EPA established the NAAQS for PM2.5 as 15 μg/ m3. This was lowered to 12 μg/m3 in 2012. This standard has been largely justified on the basis of secret science epidemiology. These regulations are very powerful and impose huge costs on American businesses. The PM2.5 NAAQS, has been used to justify several multi-billion-dollar rules, such as the EPA Clean Power Plan and the CARB Truck and Bus Regulation.

Although a significant effect from such extremely low levels is on its face highly implausible, the stringent EPA regulations are justified primarily by a claim of preventing premature deaths, assuming a value of $10 million per statistical life saved. The controversy over the issue was brought to general attention in 2002 by Professor Robert Phalen.2

Epidemiology of Fine Particulate Matter

The EPA claim that PM2.5 causes "premature deaths" is based on epidemiologic cohort studies purporting to show that the relative risk (RR) for total mortality is slightly greater than 1.0 in U.S. populations exposed to higher levels of PM2.5. No etiologic mechanism has been established, and there is no experimental evidence that inhalation of 1 g or 5 g of PM2.5 can cause death. Weakly positive RRs do not prove causality. Major difficulties include: (1) geographic and temporal variation in PM2.5 mortality risk; (2) exaggeration of actual human exposure by PM2.5 monitors, which measure ambient outdoor levels

far from the subjects; and (3) confounding variables such as co-pollutants. Moreover, the key study relied on by EPA, the American Cancer Society (ACS) 1982 Cancer Prevention Study (CPS II)3 is seriously flawed.

Reanalysis of the American Cancer Society Cancer Prevention Study II (ACS CPS II)

CPS II began in 1982 and is similar to the original CPS I, which began in 1959. The seminal paper published by Pope et al. in 19953 was so controversial that the Health Effects Institute (HEI) sought applications from teams consisting of two to four epidemiologists, statisticians, and airpollution exposure experts to conduct a reanalysis, including "sensitivity analyses to test the robustness of the original findings and interpretations to alternative analytic approaches."4 The HEI Reanalysis published in 2000 did not complete the mandated sensitivity analysis to assess the effect of alternate data.5 HEI published a report in 2009,6 which extended the mortality follow-up of the study from 1989 to 2000, but it did not incorporate the EPA Inhalable Particulate Network (IPN) PM2.5 data7,8 that I had called to the authors' attention in my 2005 paper.9

In 2016 I was able to obtain access to data in an original 1982-1988 version of CPS II. The data had been previously inaccessible since 1995 despite a congressional subpoena and repeated requests by different agencies. I am the only independent scientist who has gained access to the individual level data in both CPS I and CPS II. I was able to reproduce the same key results as Pope et al. by doing exactly what the authors did in 1995.3 However, their results were sensitive to the PM2.5 data that they used and to their particular analysis.

HEI did not follow its own mandate to conduct a comprehensive reanalysis. In particular, their sensitivity analysis was not done properly. Of the 13 teams that submitted reanalysis applications, HEI selected a 31-member team based in Canada, headed by statistician Daniel Krewski. It included a geographer, Michael Jerrett, and another statistician, Richard Burnett, but only had one epidemiologist, Yue Chen. Chen's degree was from Shanghai Medical University, and he was not a coauthor on either the 2000 HEI report5 or the 2009 HEI report.6 Thus, to reanalyze a major U.S. epidemiological study, HEI used a Canadian team that had essentially no epidemiologist.

An early clue to the existence of problems is seen in Figure 21 in the 2000 HEI Reanalysis Report.5 (Figure 1 in this article.) This map shows that in 50 cities across the U.S. the level of PM2.5 mortality risk varies. Higher risks were found mainly in the Rust Belt or the Ohio Valley, and levels were actually reasonably low

in California and throughout most of the western part of the U.S. Beginning in 2002, I asked the head of HEI, Daniel Greenbaum, and its principal scientist, Aaron Cohen, to send me the underlying data for that map. For 16 years, they have consistently refused to reveal this data to me.

Fine Particles and Mortality Risk
Figure 1. PM2.5 Levels and Mortality Risk in the U.S. [Reprinted from 2000 HEI Reanalysis Report,5 with permission.]

Thus, using the HEI PM2.5 data of Pope et al., 3 there is a statistically significant slight increase in RR of 1.082. That means that if the PM2.5 level increases by 10 μg/m3, the risk of dying goes up by about 8%. But, using the IPN PM2.5 data, the effect is nonsignificant, RR = 1.025 (95% CI, 0.990-1.061). Note that if one divides the U.S. into the Ohio Valley (Indiana, Kentucky, Ohio, Pennsylvania, and West Virginia) and the rest of the country, the RR is indistinguishable from 1.0, no matter what PM2.5 data is used. Only by combining the Ohio Valley, which has both a higher mortality risk and a higher level of PM2.5, with the rest of the country can HEI show a statistically significant effect.

My reanalysis10 has been published online since Mar 28, 2017, and so far its validity has not been challenged. The selection of data by HEI was also very interesting, as seen in Table 2. There were actually 11 counties in California that were part of the IPN network, and the HEI analyses omitted 7 of the 11 counties for reasons the authors have not explained. HEI had data from 50 different cities, and the only ones they included from California were Fresno, Los Angeles, San Francisco, and San Jose (in Santa Clara County). Two other counties that represent the extremes in PM2.5 levels are highlighted in the table. The Pope 1995 paper3 was based primarily on these extremes. HEI had Albuquerque, N.M., at 9 μg/

My analysis of the CPS II data revealed that the county of residence of subjects could be approximated based on the ACS Division and Unit numbers. The CPS II data were collected by about 70,000 researchers, including myself, who enrolled 1.2 million subjects in Fall 1982. I performed an analysis comparable to the HEI Reanalysis, as shown in Table 1. The PM2.5 data labeled IPN in the table was published in EPA reports from the Inhalable Particulate Network (IPN) by David Hinton et al. in 19847 and 1986.8 Because of the evasions that I have experienced in attempting to obtain information from HEI, I took a closer look at the 2000 HEI Reanalysis Report and found it actually contains the data that I used, although in a mislabeled and somewhat altered form. I have designated that data as HEIDC, which is labeled PM2.5 DC in the 2000 Report. This data was indirectly referred to in a couple of places in the 2000 HEI report, although it was not analyzed.

m3, as the lowest value, and Huntington, W.V., at 34.4 μg/m3, as the highest value. This is curious because the data that comes from the IPN network actually shows different high and low values. In fact, there is no measurement in the IPN for Huntington, W.V., but rather for Wheeling, W.V., listed in the IPN column. From the table, both the low and the high values are in California, both of which omitted from the HEI analysis. The low value is 10.6 μg/m3 in Santa Barbara County, and the high value is 42.0 μg/m3 in Riverside County. The PM2.5 DC data that I found in the 2000 HEI Report appendix table, labeled HEIDC by me, had more than 50 cities, but only five of the 63 total cities were from California. The IPN network as a whole has about 85 cities. These major inconsistencies need to be addressed by these investigators. And so far, there is nothing but silence. This is only one of the issues that must be addressed if the investigators want to maintain any credibility.

Table 1. Enstrom Analyses of ACS CPS II Data Using Three Sources of PM2.5 Data

Table 2. Comparison of Data on PM2.5 and Mortality from Enstrom and HEI9

Relationship between PM2.5 and Mortality in California

Because of the Feb 26, 2010, conference in Sacramento, which I attended along with Professor Robert Phalen, other prominent scientists, and impacted business groups, we were able to get an analysis done by HEI that dealt with the California portion of the national CPS II results. The California data was partitioned out from the national analysis in the 2009 HEI Report.6 Based on the four HEI California counties shown in Table 2, the RR is about 0.9, significantly below 1.0, as shown in Table 3. This inverse relationship was reproduced using either the HEI data or the IPN data. Of course, this relationship cannot be etiologically correct, but it shows what can result from data omission and manipulation.

Table 3. Relative Risk for PM2.5 and Mortality in California Based on Four Counties

Table 4. PM2.5 and Total Mortality in Six California Cohorts Both my analysis and that by Thurston et al. on the NIH
AARP cohort,14 summarized in Table 5, show no effect nation- wide or in California.

There are actually six California cohorts that have been used to analyze the relationship between PM2.5 and total mortality, as shown in Table 4. The cohort that I initially used is labeled CA CPS I;9 the cohort used by Jerrett et al.11 is labeled CA CPS II. The Adventist Health Study of Smog (AHSMOG) was the original cohort study in California.12 There are also the California Teachers Cohort,10 the "West" portion of the Medicare Cohort Air Pollution Study (MCAPS),13 and the National Institutes of Health-American Association of Retired Persons (NIH AARP) cohort, which was published in 2016 by Thurston et al.14 The NIH AARP cohort is supposed to be an open access database, but is apparently currently controlled by Thurston. I have been able to get access to only the California portion of the data, and my analysis shows no effect in California. Averaging all six cohorts gives an RR of exactly 1.00, which means no relationship between PM2.5 and total mortality.
The lack of an effect in California might explain why Pope et al.3 omitted seven California cities from the national analysis. As Figure 1 shows, there is tremendous variation across the country. Yet the most severe regulations are in California, despite the clear absence of mortality risk there!

Table 5. Comparison of Enstrom and Thurston Analyses for
U.S. and California

An International Perspective on PM2.5

Despite the null effect shown by their own data and analyses, prominent advocates of drastic measures to reduce PM2.5 levels state in a major paper in the May 13, 2017, Lancet that ambient PM2.5 was the fifth-ranking mortality risk factor worldwide in 2015. Aaron J. Cohen, until recently HEI Principal Scientist, is the lead author, and Pope is a coauthor. The study is part of the World Health Organization (WHO) Global Burden of Disease (GBD) Project and was largely funded by HEI. The article claims that PM2.5 causes 4.2 million deaths annually worldwide, with 88,000 deaths in the U.S. (see Table 6). The mean PM2.5 level is

8.4 μg/m3 in the U.S. and 58.4 μg/m3 in China. Clearly, the PM2.5 level and premature deaths are low in the U.S. and high in China, India, and Africa.

Table 6. Global Deaths Attributed to PM 15

Agenda-driven Science

Since publishing my 2005 critique of the relationship between PM2.5 and total mortality9 and my 2017 critique,10 I have sent numerous requests to Pope, ACS, HEI, and others, inviting a rebuttal. I have received no response that confirms or refutes any of my analyses. It has, however, been incorrectly asserted that, "The study by Enstrom does not contribute to the larger body of evidence on the health effects of PM2.5." ACS has criticized me for having CPS II data that they have deliberately tried to keep secret. My invitations to authors and ACS officials to attend meetings, teleconferences, and symposia have simply been ignored. They even ignored an August 1, 2013, subpoena from the U.S. House Science, Space, and Technology Committee.

The control over air pollution research and assessments that is recognized by EPA is not based on special expertise in epidemiology. Pope, the self-proclaimed "world's leading expert on the effects of air pollution on health," is a professor of economics at Brigham Young University and holds a 1981 Ph.D. in agricultural economics from Iowa State University, where he studied the dynamics of crop yields. Michael Jerrett, who is one of the most prolific publishers and a member of the HEI reanalysis team, has a 1996 Ph.D. in geography from the University of Toronto, and no formal training in epidemiology. Aaron J. Cohen, until recently HEI's Principal Scientist, does hold a 1991 D.Sc. degree in epidemiology from Boston University, but he has badly misused the principles and standards of epidemiology. Although he supervised the 1998-2000 HEI Reanalysis Project, he has refused to clarify findings from this project and has refused to confirm or refute the findings in my 2017 CPS II reanalysis. It is very disturbing that ACS has allowed CPS II data to be used for more than 20 years for research that misuses the principles and standards of epidemiology and that has nothing significant to do with cancer.

The principal qualification for admission to the elite circle of influence appears to be dedication to the agenda of global controls on economic activity via air pollution regulations. The conclusion reached by researchers is apparently predetermined, as stated in the last paragraph of the GBD study on ambient air pollution: "As the experience in the U.S. suggests, changes in ambient PM2.5 associated with aggressive air quality management programmes, focused on major sources of air pollution including coal combustion, household burning of solid fuels, and road transport, can lead to increased life expectancy over short timeframes."15

What is the state of scientific integrity? It is very dangerous to one's career to criticize views backed by powerful interests, and I do it only because I believe current trends are anti- science and dangerous to our country. Simply being a passive observer is no longer acceptable.

To disclose my own background, I obtained a Ph.D. in physics in 1970, but I became an epidemiologist starting in 1973 in order to apply the rigorous principles of physics to observational epidemiology. I had a long career as a research professor and researcher at the UCLA School of Public Health. My research has examined the influence of environmental and lifestyle factors on mortality, and has on occasion reached politically incorrect conclusions. My research in air pollution epidemiology has been strongly influenced by Dr. Frederick Lipfert and Professor Robert Phalen. In February 2010 I was terminated from UCLA without warning and told that my "research is not aligned with the academic mission of the Department." In

February 2015 I settled a three-year federal whistleblower retaliation lawsuit against UCLA and my termination was reversed. My case and some of the issues related to my air pollution epidemiology research have been discussed in this journal.16

My background and publications, including rejections of my research, often without peer review, are documented on my website, www.scientificintegrityinstitute.org. I believe that major journals simply will not accept articles that challenge the established view. Moreover, authors of the papers promoting PM2.5 premature deaths omit null results, even their own. For example, Jerrett is the lead author of a 2007 study that shows no increased mortality associated with PM2.5 in the CPS II cohort if the results are divided into five time periods.17 Although researchers are paid millions of dollars, they're not under any obligation to address any of the concerns about their work. Those who disagree with the agenda are denied research funding.

We must prevent American science from following historical examples like that of Trofim Denisovich Lysenko. He was a phony plant geneticist, who gained the favor of Joseph Stalin because he didn't believe in Mendelian genetics. Lysenko's views controlled much of Soviet agriculture in the 1930s, 1940s, and 1950s, with devastating effect. False crop statistics were published, and dissenting scientists were purged. Nikolai Vavilov, a renowned plant geneticist, was imprisoned by Stalin and died of malnutrition.
Concerns about integrity in Western science are being raised. Richard Horton, editor of The Lancet, writes: "The case against science is straightforward: much of the scientific literature, perhaps half, may simply be untrue. Afflicted by studies with small sample sizes, tiny effects, invalid exploratory analyses, and flagrant conflicts of interest, together with an obsession for pursuing fashionable trends of dubious importance, science has taken a turn towards darkness."18

A U.S. House of Representatives bill called the Secret Science Reform Act was passed in 2014 and 2015 in order "to prohibit the Environmental Protection Agency from proposing, finalizing, and disseminating regulations or assessments based upon science that is not transparent or reproducible." The bill was revived in 2017 as the Honest and Open New EPA Science Treatment (HONEST) Act, labeled H.R. 1430, and was passed by the U.S. House of Representatives.
American science needs to guard against the heirs of Sinclair Lewis's protagonist in his 1927 novel Elmer Gantry, an itinerant preacher who is able to sell false religion to gullible people. We have prominent scientists who have successfully sold the notion that inhaling 1 g of invisible particles over an 80-year lifetime can cause premature death.

Conclusions

There is strong evidence from two large national cohorts that PM2.5 does not cause premature deaths in the US. There is strong evidence that this relationship has been falsified by EPA, the Health Effects Institute, and leading researchers for more than 20 years. Better oversight to assure scientific integrity, such as access to data, transparency, and consideration of opposing views, is imperative.

10. Dunn on US EPA Linear No Threshold Misconduct 2018.

This is a paper by the submitter Dunn that is intended to be an abstract as a presentation to a conference of the American Nuclear Society and the Health Physics Society on the problem of Linear No Threshold toxicology. The Conference is scheduled for early October 2018.

AN ENVIRONMENTAL NOBLE LIE,
LINEAR NO-THRESHOLD Radiation Biophysics Toxicology,
IT NEEDS TO GO

John Dale Dunn MD JD
American Nuclear Society/Health Physics Society Conference
Sept 30-Oct 3, 2018
Pasco, Washington

Abstract
The United States Environmental Protection Agency (USEPA) is charged with identifying and mitigating environmental risks. This article will discuss US EPA misguided decision to use Linear No Threshold as the template for Radiation Biophysics and Toxicology.
The Health Physics Society (HPS) has stated that reliance on the LNT model "...tends to foment the public's fear of all types of radiation . . . reliance on the LNT model, especially at very low doses and dose rates, is inappropriate and can exaggerate the risk." (Kirner 2017) (Ring et al. 2017). The HPS also condemns "collective" (cumulative) dose as a measure of biological radiation risk.
One hit or linear no threshold (LNT) radiation biophysics makes no sense as a theory for carcinogenesis. Most cancer cell types are hyper/multiploid due to telomeric mitotic dysfunction, not mutations of genetic code. Carcinogenesis is also enabled by immune system failure to eliminate malignant cell lines. Both phenomena are associated with aging.

The US EPA acceptance of the assertions on LNT of Biological Effects of Atomic Radiation (BEAR), Biological Effects of Ionizing Radiation (BEIR) and National Academy of Science (NAS) committees, has been so irrational as to assume there is no safe level of ionizing radiation. Nonsense.
The LNT cancer theorists ignore protective biological processes, even hormetic, certainly no effect evidence of low level radiation. (Ulsh 2010; Sacks and Siegel 2017; Welsh et al. 2017), Scott 2017), acknowledged by the National Council on Radiation Protection and Measurements (NCRP) over 15 years ago (NCRP 2001). "These experimental observations are not compatible with a single hit mechanism. . . hypothesis." (Trott and Rosemann 2000)
The fruit fly research by Hermann Muller and Curt Stern founded the LNT model, but the research actually showed a threshold, misrepresented by Muller, a committed advocate of LNT (Siegel et al. 2015; Calabrese 2017a, 2017b). Muller was a deceitful, relentless advocate of LNT, and, as a Nobel Laureate, very influential. (Calabrese 2017c)
The American Association of Physicists in Medicine (AAPM) strongly objects to the LNT approach as creating harm from adverse attitudes about imaging procedures. They consider the risks at or below 50 mSv [5 rem] for single procedures or 100 mSv [10 rem] for multiple procedures not detectable.
The USEPA use of LNT causes harm with no evidence of worthwhile benefit. US EPA claims that LNT is "conservative" and "cautious," translated as adoption of the misbegotten precautionary principle. The Fukishima mitigation, for example, was excessive, harmful and expensive, applied at doses far below the range of any negative public health consequences (Siegel et al. 2017c; Welsh et al. 2017).

Conclusions
The US EPA has been irresponsible and unscientific in its application of the Linear No Threshold template for radiation biophysics and toxicology. US EPA risk management is unscientific, unreliable and unjustified, wrongly derived from high dose rate environments and bench experimentation. Rat and mouse studies with exposures at lethal levels have created a long list of "carcinogens" that are then part of the LNT toxicology deception. (Calabrese 2018)
Society has become so fearful of radiation and chemicals that unnecessary steps are taken, and other risks are accepted, compliance costs are tolerated and are pursued energetically and expensively in a risk management environment of zero tolerance.
From the 1979 Three Mile Island to Fukishima in 2011, radiation incidents impacting large areas repeatedly show potential, variable risk for the immediate plant area, but, for example, even the terrible Chernobyl explosion, a stunningly limited harm from radiation beyond that.
The Fukishima event caused no radiation-related deaths (UNSCEAR 2013b), however the scare and the evacuation increased mortality, particularly in the elderly (Nomura et al. 2013; Yasumura et al. 2013; Uchimura et al. 2014, Ichiseki 2013) and the evacuations were scientifically unethical as a risk management strategy (Akabayashi and Hayashi 2012).
Changes, long overdue, on the matter of LDDR radiation risk management must go forward with the knowledge that adverse health effects are not detectable and that radiation exposures have a no effect, a harmful threshold of effect and even a sweet spot where radiation produces hormetic beneficial effects. (Calabrese 2013, Scott, 2017)
The USEPA Scientific Advisory Board (SAB) properly recommended a "change in the agency culture, change in how the agency works, and increased support for scientists and managers in programs and regional offices responsible for science integration." (Swackhamer and Burke 2012)
The radiation biophysics and toxicological precautionary principle needs a retirement in favor of rational risk assessment and mitigation.

Below is my abstract/monograph for a presentation to the Gulf Coast Geophysical Societies conference scheduled for late September of 2018. Here I summarize much of the research on human health impacts from warmer temperatures—that shows the benefits of warming. That debunks the catastrophic and ominous claims of the US EPA. There are certainly other reasons to object to US EPA clams that CO 2 is a pollutant and dangerous, but underlying those claims is their fraudulent and unsupported claim that warming would be deleterious to human health—when the opposite is true.

This if offered as just one exhibit that shows the US EPA has been irresponsible in its claims about the impact of CO2 rise and warming—there are other scientific research studies that show the claims about

11. Dunn on Global Warming and Climate Change EPA misconduct—the scam of making Carbon Dioxide a pollutant.

Warming is a Benefit to Humans and the Biosphere

John Dale Dunn MD JD

The Intergovernmental Panel on Climate Change (IPCC) predicts a global temperature increase of 3C or more by 2100, but other experts believe the best guess is 1C or less. We assert that increases in average temperature of the planet from the current 60 degrees F. will be beneficial to human health and the biosphere.

IPCC's alarms have led to widespread fear of the health effects of global warming (Schulte, 2008) and even political attack ads claiming people are dying of "carbon pollution" (WMC, 2015). These statements have no basis in scientific research and in fact and based on the evidence, warming will be a benefit to all living things. Carbon Dioxide that increases to even 1000 PPM will be beneficial to the biosphere and make the planet more hospitable and arable.

In fact, the litany of climate extremes postulated by the IPCC has been falsified by the actual record of climate measurements and observations. None of the environmental disasters, human displacements and disruptions predicted have come to pass during the past ten years, even as atmospheric carbon dioxide has continued to increase. We all know of the temperature "pause" that has accompanied an increase in atmospheric Carbon Dioxide.

In this document the benefits of fossil fuel use, and even warming, if it did occur, are explained in greater detail.

A warmer planet is beneficial to humanity as warmer temperatures lead to decreases in temperature-related mortality, premature deaths due to cardiovascular and respiratory disease, and stroke occurrences, and has little if any influence on vector-borne diseases such as malaria and dengue fever since vectors generally are not respectful of the definition of "tropical diseases.

Cool and colder temperatures kill while warmer temperatures are beneficial. It is troubling that, in the face of this evidence, environmentalists and politicians continue to frighten people with predictions of "killer heat waves" in a slightly warmer world. And yet, such claims are made. Severe heat waves are a weather phenomenon, not causally linked to average global temperature. Deaths from heat waves are most dramatic in areas with lack of adaptation—or general medical care for the disabled—who suffer from poor housing and medical problems that make them more susceptible.

Global Warming and Mortality Rates

- Medical research confirms and explains why cooler, colder temperatures cause increased disease and death rates. Warmer temperatures are associated with health benefits and decreased deaths.

- Population studies around the world show that warmer temperatures lead to a net decrease in mortality worldwide, even in those areas described as tropical.

- Carbon dioxide (CO2) is invisible, odorless, nontoxic, and does not seriously affect human health until the CO2 content of the air reaches approximately 15,000 ppm, more than 37 times greater than the current concentration of atmospheric CO2 (Luft et al., 1974). There is no reason to be concerned about any direct adverse human health consequences of the ongoing rise in the air's CO2 content now or in the future,

currently at about 400 parts per million (0.04%) since even extreme model predictions by warming advocates are for less than 2000 parts per million (2%).

The Intergovernmental Panel on Climate Change (IPCC), however, sees looming health threats. The Summary for Policymakers of IPCC's Working Group II's report for the Fifth Assessment Report (AR5) identified eight "key risk factors" regarding the effect of climate change on human wellbeing, all of them allegedly "identified with high confidence" (IPCC, 2014, emphasis in original). They are:

i) Risk of death, injury, ill-health, or disrupted livelihoods in low-lying coastal zones and small island developing states and other small islands, due to storm surges, coastal flooding, and sea level rise. 37[RFC1-5]

ii) Risk of severe ill-health and disrupted livelihoods for large urban populations due to inland flooding in some regions. 38 [RFC 2 and 3]

iii) Systemic risks due to extreme weather events leading to breakdown of infrastructure networks and critical services such as electricity, water supply, and health and emergency services. 39 [RFC 2-4]

iv) Risk of mortality and morbidity during periods of extreme heat, particularly for vulnerable urban populations and those working outdoors in urban or rural areas. 40 [RFC 2 and 3]

v) Risk of food insecurity and the breakdown of food systems linked to warming, drought, flooding, and precipitation variability and extremes, particularly for poorer populations in urban and rural settings. 41 [RFC 2-4]

vi) Risk of loss of rural livelihoods and income due to insufficient access to drinking and irrigation water and reduced agricultural productivity, particularly for farmers and pastoralists with minimal capital in semi-arid regions. 42 [RFC 2 and 3]

vii) Risk of loss of marine and coastal ecosystems, biodiversity, and the ecosystem goods, functions, and services they provide for coastal livelihoods, especially for fishing communities in the tropics and the Arctic. 43 [RFC 1, 2, and 4]

viii) Risk of loss of terrestrial and inland water ecosystems, biodiversity, and the ecosystem goods, functions, and services they provide for livelihoods. 44 [RFC 1, 3, and 4]

There is no scientific basis for believing global temperatures will rise to levels high enough to bring about any of these risks. Indeed, there is sound scientific support for believing warming will be a net positive rather than negative.

Here, we summarize only research on the effects of rising global temperatures on human health and the medical literature shows warmer temperatures and a smaller difference between daily high and low temperatures that results from some rising temperatures as occurred during the twentieth and early twenty-first centuries, reduce mortality rates (the subject of this section) as well as illness and mortality due to cardiovascular and respiratory disease and stroke occurrence.

Similarly, the research is quite clear that climate has exerted only a minimal influence on recent trends in vector-borne diseases such as malaria, dengue fever, and tick-borne diseases. Other factors, many of them related to economic and technological setbacks or progress and not to weather, are far more important in determining the transmission and presence of these "tropical" diseases that are not so tropical at all.

Warmer Temperature Impacts on Human Health

- Warmer temperatures lead to a decrease in temperature-related mortality, including deaths associated with cardiovascular disease, respiratory disease, and strokes. The evidence of this benefit comes from research conducted in every major country of the world.

- In the United States the average person who died because of cold temperature exposure lost in excess of 10 years of potential life, whereas the average person who died because of extreme heat related event lost no more than a few days or weeks of life because heat has a greater effect on more seriously debilitated and ill persons.

- In the U.S., some 4,600 deaths are delayed each year as people move from cold northeastern states to warm southwestern states. Between 3 and 7% of the gains in longevity experienced over the past three decades was due simply to people moving to warmer states.

- Cold-related deaths are far more numerous than heat-related deaths in the United States and the world. Coronary (heart attack) and cerebral thrombosis (stroke) account for about half of all cold-related mortality, events that are directed related to blood vessel and blood viscosity effects of cool or cold environments.

- Global warming, if it did occur, even to the degree predicted in the extreme, will reduce the incidence of cardiovascular diseases related to low temperatures and wintry weather by a much greater degree than the warming might increase the incidence of deaths or illness attributable to heat. Heat illness primarily produces fluid and electrolyte disturbances, loss of core temperature control and organ dysfunction from dehydration, circulatory failure and heat caused stress, not clotting events.

- The heat wave deaths of 1995 in Chicago and 2003 in Europe are pointed to by advocates of the claim that heat stress deaths will increase with any warming that might occur, but a closer look at heat event death rates in some of the studies below show acclimation increased awareness have blunted any heat stress death increases. In the case of Chicago and Europe temps rose to over 100 but the availability of air conditioning and ventilation along with attention to the needs of elderly and disabled individuals was determined to be a major reason for heat deaths.

- The heat deaths that occur during severe heat events are the result of stress and inability to acclimate to maintain normal core temperature control and avoid dehydration. Acclimatization and proper attention to the vulnerable populations failed in Chicago in 1995 and Europe, particularly France in 2003, for example with hundreds of heat deaths in the former and 20,000 or more deaths in the later.

- A large body of scientific examination and research contradicts and disproves the claim that malaria will expand across the globe and intensify as a result of CO2-induced warming. Malaria is historically a disease that was endemic to cool and even cold climates like Finland and Russia but has been suppressed by hygienic and vector control

measures.
- Concerns over large increases in vector-borne diseases such as dengue as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue disease. The Aedes Aegypti Anopheles and Asian Tiger mosquitos all have been found at higher latitudes.
- While temperature and climate effect the geographical distribution of ticks, they are not among the significant factors determining the incidence of tick-borne diseases. Moreover the effect of small increases in climate temperature, if does occur with certainly not impact the range of ticks that now live in the high latitudes, even in the mountains of those high latitudes.

Basis in Medical Science

Medical science explains why colder temperatures often cause diseases and sometimes fatalities whereas warmer temperatures are associated with health benefits.

Wang et al. collected daily mortality and meteorological data from 66 communities across China over the period 2006-2011. They then subjected these data to a series of analyses to elucidate the relationship between cold spell characteristics and human mortality. And what did those analyses reveal?

Not surprisingly, cold spells significantly increased human mortality risk in China. As indicated in Figure 1 below, the combined cumulative excess mortality risk (CER) for all of China when defining cold spells with a 5th and 2.5th percentile temperature intensity threshold was 28.5 and 39.7 percent, respectively. However, there were notable geographic differences; CER was tempered and near zero in the colder/higher latitudes, but increased to 58.7 and 92.9 percent at the corresponding 5th and 2.5th percentile temperature intensity

thresholds for the warmest and most southern latitude. Such geographic differences in mortality risk, according to the authors, are likely the product of better physiological and behavioral acclimatization of the northerly populations to cold weather.

Clearly, cold spells kill; and as has been found in almost every study of the subject, the risk of death from cold spells far exceeds that from heat waves (see the many reviews we have posted on this topic confirming this fact in our Subject Index under the heading Health Effects of Temperature: Hot vs, Cold Weather). As such, therefore, a little global warming would likely result in a net saving of lives by reducing the number of deaths that occur at the cold end of the temperature spectrum.

Antonio Gasparinni (2015) was lead author for a large international group of researchers who studied the effect of temperature extremes on death rates. Gasparrini and his co-authors analyzed data from 384 locations including the countries of Australia, Brazil, Canada, China, Italy, Japan, South Korea, Spain, Sweden, Taiwan, Thailand, the United Kingdom and the United States of America. By fitting a standard time-series Poisson model to the data obtained for each location, while controlling for trends and day of the week, they estimated temperature-mortality associations with a distributed lag non-linear model with 21 days of lag, after which they pooled the results they obtained in a multivariate meta-regression that included country indicators and temperature averages and ranges.

This work allowed them to calculate the number of human deaths attributable to heat and cold -- defined as temperatures above and below the optimum (minimum mortality) temperature -- for both moderate and extreme temperatures, the latter being defined "using cutoffs at the 2.5th and 97.5th temperature percentiles." And what did they thereby learn?

Based on data pertaining to a total of 74,225,200 human deaths that occurred between 1985 and 2012, the 23 researchers determined that 7.71% of the lives lost were caused by non-optimum temperatures; and among this group they found that "more temperature-attributable deaths were caused by cold (7.29%) than by heat (0.42%)" which makes cold in excess of seventeen times more deadly than heat. And they add, in this regard, that moderate "hot and cold temperatures represented most of the total health burden." Consequently, it seems pretty clear that any successful attempt to reverse or slow any potential increase in Earth's mean global temperature would likely come at a net cost of many human lives the world over, not a savings. The Gasparrini research provides a compelling confirmation of the reality that warmer temperatures are better for human welfare than cooler or colder temperatures. (Gasparrini Lancet 2015)

Keating and Donaldson (2001) explain that "cold causes mortality mainly from arterial thrombosis and respiratory disease, attributable in turn to cold-induced hemoconcentration and hypertension [in the first case] and respiratory infections [in the second case]." McGregor (2005) notes "anomalous cold stress can increase blood viscosity and blood pressure due to the activation of the sympathetic nervous system which accelerates the heart rate and increases vascular resistance (Collins et al., 1985; Jehn et al., 2002; Healy, 2003; Keatinge et al., 1984; Mercer, 2003; Woodhouse et al., 1993)," adding, "anomalously cold winters may also increase other risk factors for heart disease such as blood clotting or fibrinogen concentration, red blood cell count per volume and plasma cholesterol."

Wang et al. (2013) write, "A large change in temperature within one day may cause a sudden change in the heart rate and circulation of elderly people, which all may act to increase the risk of cardiopulmonary and other diseases, even leading to fatal consequences." This is significant for the climate change debate because, as Wang et al. also observe, "it has been shown that a rise of the minimum temperature has occurred at a rate three times that of the maximum temperature during the twentieth century over most parts of the world, which has led to a decrease of the diurnal temperature range (Karl et al., 1984, 1991)."

Robeson (2002) demonstrated, based on a 50-year study of daily temperatures at more than 1,000 U.S.

weather stations that daily (diurnal) temperature variability declines with warming and at a very substantial rate, so this aspect of a warmer world would lead to a reduction in temperature- related deaths.
Clearly, cold spells kill; and as has been found in almost every study of the subject, the risk of death from cold spells far exceeds that from heat waves. As such, therefore, a little global warming would likely result in a net saving of lives by reducing the number of deaths that occur at the cold end of the temperature spectrum.

Keatinge and Donaldson (2004) report coronary and cerebral thrombosis account for about half of all cold-related deaths, and respiratory diseases account for approximately half of the rest. They say cold stress causes an increase in arterial thrombosis "because the blood becomes more concentrated, and so more liable to clot during exposure to cold." As they describe it, "the body's first adjustment to cold stress is to shut down blood flow to the skin to conserve body heat," which "produces an excess of blood in central parts of the body," and to correct for this effect, "salt and water are moved out from the blood into tissue spaces," leaving behind "increased levels of red cells, white cells, platelets and fibrinogen" that lead to increased viscosity of the blood and a greater risk of clotting.
Keatinge and Donaldson also note "cold spells are closely associated with sharp increases in mortality rates," and "deaths continue for many days after a cold spell ends." On the other hand, they report, "increased deaths during a few days of hot weather are followed by a lower than normal mortality rate," because "many of those dying in the heat are already seriously ill
and even without heat stress would have died within the next 2 or 3 weeks."
With respect to the implications of global warming for human mortality, Keatinge and Donaldson state "since heat-related deaths are generally much fewer than cold-related deaths, the overall effect of global warming on health can be expected to be a beneficial one." They report, "The rise in temperature of 3.6°F expected over the next 50 years would increase heat-related deaths in Britain by about 2,000 but reduce cold-related deaths by about 20,000."
Keating and Donaldson's reference to deaths that typically would have occurred shortly even without excess heat is a phenomenon researchers call "displacement" or "harvesting." A study from Germany found "cold spells lead to excess mortality to a relatively small degree, which lasts for weeks," while "the mortality increase during heat waves is more pronounced, but is followed by lower than average values in subsequent weeks" (Laschewski and Jendritzky, 2002). The authors say the latter observation suggests people who died from short-term exposure to heat possibly "would have died in the short term anyway." They found the mean duration of above-normal mortality for the 51 heat episodes that occurred from 1968 to 1997 was 10 days, with a mean increase in mortality of 3.9%, after which there was a mean decrease in mortality of 2.3% for 19 days. Hence, the net effect of the two perturbations was an overall decrease in mortality of 0.2% over the full 29-day period.
The US EPA web site discussion of heat wave deaths referenced below reveals that the EPA recognizes heat wave deaths are not reliably counted because of loose death certificate definitions of heat caused versus heat related. Cardiovascular deaths is used as a catch all descriptor Although the deaths attributed to severe heat waves are described as Cardiovascular, the mechanism is metabolic and physiologic dysfunction and a collapse of the systems that maintain temperature equilibrium in endotherms like humans. The victims don't die of a heart attack, a coronary ischemic event caused by clots and narrowed coronary arteries, an occlusive event, they die of temperature effects and the failure of internal systems, including lung and cardiovascular system, solid organ, and brain malfunctions in the face of heat stress, dehydration, and rising core temperatures, along with dehydration and loss of mechanisms to maintain normal temperature. The victims are debilitated, and live in a stressfully hot environment and succumb for failure to acclimate and maintain normal body physiology.

Observational Research in Asia

Behar (2000) studied sudden cardiac death (SCD) and acute myocardial infarction (AMI) in Israel, concentrating on the role temperature may play in the incidence of these health problems. Behar notes "most of the recent papers on this topic have concluded that a peak of SCD, AMI and other cardiovascular conditions is usually observed in low temperature weather during winter." He cites an Israeli study by Green et al. (1994), which reported between 1976 and 1985 "mortality from cardio-vascular disease was higher by 50% in mid-winter than in mid-summer, both in men and women and in different age groups," even though summer temperatures in the Negev, where much of the work was conducted, often exceed 30°C and winter temperatures typically do not drop below 10°C. Behar concludes these results "are reassuring for populations living in hot countries."

Kan et al. (2003) investigated the association between temperature and daily in Shanghai, China, finding a V-like relationship between total mortality and temperature that had a minimum mortality risk at 26.7°C. Above this optimum temperature, they observe, "total mortality increased by 0.73% for each degree Celsius increase; while for temperatures below the optimum value, total mortality decreased by 1.21% for each degree Celsius increase." The net effect of a warming in Shanghai, China, therefore, would likely be reduced mortality on the order of 0.5% per degree Celsius increase in temperature, or perhaps more.

Guo et al. (2012) examine the nonlinear and delayed effects of temperature on cause- specific and age-specific mortality employing data from 1999 to 2008 for Chiang Mai, Thailand with a population of 1.6 million people. Controlling for season, humidity, ozone, and particulate matter (PM10) pollution, the three researchers found "both hot and cold temperatures resulted in immediate increase in all mortality types and age groups," but "the hot effects on all mortality types and age groups were short-term, while the cold effects lasted longer." The cold effects were greater, with more people dying from them than from the effects of heat.

Lindeboom et al. (2012) used daily mortality and weather data for the period 1983–2009 pertaining to Matlab, Bangladesh, to measure lagged effects of weather on mortality, controlling for time trends and

seasonal patterns. The four researchers report "mortality in the Matlab surveillance area shows overall weak associations with rainfall, and stronger negative association with temperature." They determined there was "a 1.4% increase in mortality with every 1°C decrease in mean temperature at temperatures below 29.2°C," but only "a 0.2% increase in mortality with every 1°C increase in mean temperature."

Wang et al. (2013) evaluated the short-term effect of diurnal temperature range (DTR) on emergency room (ER) admissions among elderly adults in Beijing. The nine researchers report "significant associations were found between DTR and four major causes of daily ER admissions among elderly adults in Beijing." They state "a 1°C increase in the 8-day moving average of DTR (lag 07) corresponded to an increase of 2.08% in respiratory ER admissions and 2.14% in digestive ER admissions," and "a 1°C increase in the 3-day and 6-day moving average of DTR (lag 02 and lag 05) corresponded to a 0.76% increase in cardiovascular ER admissions, and a 1.81% increase in genitourinary ER admissions, respectively.

Wu et al. (2013) assessed the health effects of temperature on mortality in four subtropical cities of China (Changsha, Kunming, Guangzhou, and Zhuhai). The 11 researchers report a U-shaped relationship between temperature and mortality was found in the four cities, indicating "mortality is usually lowest around a certain temperature and higher at lower or higher temperatures." Although "both low and high temperatures were associated with increased mortality in the four subtropical Chinese cities," Wu et al. state the "cold effect was more durable and pronounced than the hot effect."

Observational Research in Europe

Keatinge and Donaldson (2001) analyzed the effects on human mortality of temperature, wind, rain, humidity, and sunshine during high pollution days in the greater London area over the period 1976–1995. They observed simple plots of mortality rate versus daily air temperature revealed a linear increase as temperatures fell from 15°C to near 0°C. Mortality rates at temperatures above 15°C, however, were

"grossly alinear," as they describe it, showing no trend. Only low temperatures were found to have a significant effect on immediate and long-term mortality. They conclude "the large, delayed increase in mortality after low temperature is specifically associated with cold and is not due to associated patterns of wind, rain, humidity, sunshine, SO2, CO, or smoke."

Kysely and Huth (2004) calculated deviations of the observed number of deaths from the expected number of deaths for each day of the year in the Czech Republic for the period 1992– 2000. They found "the distribution of days with the highest excess mortality in a year is clearly bimodal, showing a main peak in late winter and a secondary one in summer." Regarding the smaller number of summer heat-wave-induced deaths, they also found "a large portion of the mortality increase is associated with the harvesting effect, which consists in short-term shifts in mortality and leads to a decline in the number of deaths after hot periods (e.g. Rooney et al., 1998; Braga et al., 2002; Laschewski and Jendritzky, 2002)." For the Czech Republic, they report, "the mortality displacement effect in the severe 1994 heat waves can be estimated to account for about 50% of the total number of victims." As they describe it, "people who would have died in the short term even in the absence of oppressive weather conditions made up about half of the total number of deaths."

Diaz et al. (2005) examined the effect of extreme winter temperature on mortality in Madrid, Spain for people older than 65, using data from 1,815 winter days over the period 1986– 1997, during which time 133,000 deaths occurred. They found that as maximum daily temperature dropped below 6°C, which they describe as an unusually cold day (UCD), "the impact on mortality also increased significantly." They also found the impact of UCDs increased as the winter progressed, with the first UCD of the season producing an average of 102 deaths/day at a lag of eight days and the sixth UCD producing an average of 123 deaths/day at a lag of eight days.

Laaidi et al. (2006) conducted an observational population study in six regions of France between 1991 and 1995 to assess the relationship between temperature and mortality in areas of widely varying climatic conditions and lifestyles. In all cases they found "more evidence was collected showing that cold weather was more deadly than hot weather." These findings, the researchers say, are "broadly consistent with those found in earlier studies conducted elsewhere in Europe (Kunst et al., 1993; Ballester et al., 1997; Eurowinter Group, 1997; Keatinge et al., 2000; Beniston, 2002; Muggeo and Vigotti, 2002), the United States (Curriero et al., 2002) and South America (Gouveia et al., 2003)." They also say their findings "give grounds for confidence in the near future," stating even a 2°C warming over the next half century "would not increase annual mortality rates."

Analitis et al. (2008) analyzed short-term effects of cold weather on mortality in 15 major European cities using data from 1990–2000, and found "a 1°C decrease in temperature was associated with a 1.35% increase in the daily number of total natural deaths and a 1.72%, 3.30% and 1.25% increase in cardiovascular, respiratory, and cerebro-vascular deaths, respectively." In addition, they report "the increase was greater for the older age groups," and the cold effect "persisted up to 23 days, with no evidence of mortality displacement." They conclude their results "add evidence that cold-related mortality is an important public health problem across Europe and should not be overlooked by public health authorities because of the recent focus on heat-wave episodes."

Wichmann et al. (2011) investigated the association between the daily three-hour maximum apparent temperature (which reflects the physiological experience of combined exposure to humidity and temperature) and deaths due to cardiovascular disease (CVD), cerebrovascular disease (CBD), and respiratory disease (RD) in Copenhagen over the period
1999–2006.

Monthly deaths in the Castile-Leon region of Spain attributable to cardiovascular disease.

Source: Adapted from Fernandez-Raga et al. (2010).

During the warm half of the year (April–September), they found a rise in temperature had an inverse or protective effect with respect to CVD mortality (a 1% decrease in death in response to a 1°C increase in apparent temperature). This finding is unusual but also has been observed in Dublin, Ireland, as reported by Baccini et al. (2008, 2011). Wichmann et al. found no association with RD and CBD mortality. At the other end of the thermal spectrum, during the cold half of the year, all three associations were inverse or protective. This finding, according to the researchers, is "consistent with other studies (Eurowinter Group, 1997; Nafstad et al., 2001; Braga et al., 2002; O'Neill et al., 2003; Analitis et al., 2008)."
Matzarakis et al. (2011) studied the relationship between heat stress and all-cause mortality in the densely populated city of Vienna (Austria). Based on data from 1970–2007, and after adjusting the long-term mortality rate to account for temporal variations in the size of the population of Vienna, temporal changes in life expectancy, and the changing age structure of Vienna's population, the three researchers found a significant relationship between heat stress and mortality. However, over this 38-year period, "some significant decreases of the sensitivity were found, especially in the medium heat stress levels," they report. These decreases in sensitivity, they write, "could indicate active processes of long-term adaptation to the increasing heat stress." In the discussion section of their paper, they write such sensitivity changes "were also found for other regions," citing Davis et al. (2003), Koppe (2005), Tan et al. (2007), and Donaldson and Keatinge (2008). In the conclusion of their paper, they refer to these changes as

"positive developments."
Kysely and Plavcova then examined "temporal changes in mortality associated with spells of large positive temperature anomalies (hot spells) in extended summer season in the population of the Czech Republic (Central Europe) during 1986–2009." They found declining mortality trends in spite of rising temperature trends, just the opposite of what IPCC claims will occur in response to global warming. The Czech scientists add, "the finding on reduced vulnerability of the population remains unchanged if possible confounding effects of within- season acclimatization and mortality displacement are taken into account," and "neither does it depend on the changing age structure of the population, since similar (and slightly more pronounced) declines in the mortality impacts are found in the elderly (age group 70+ years) when examined separately."

Observational Research in North America

Goklany and Straja (2000) examined trends in United States death rates over the period 1979– 1997 due to excessive hot and cold weather. They report there were no trends in deaths due to either extreme heat or cold in the entire population or in the older, more-susceptible age groups, those aged 65 and over, 75 and over, and 85 and over. Deaths due to extreme cold in these older age groups exceeded those due to extreme heat by as much as 80% to 125%. With respect to the absence of trends in death rates attributable to either extreme heat or cold, Goklany and Straja say this "suggests that adaptation and technological change may be just as important determinants of such trends as more obvious meteorological and demographic factors."
Davis et al. (2003) evaluated "annual excess mortality on days when apparent temperatures—an index that combines air temperature and humidity—exceeded a threshold value for 28 major metropolitan areas in the United States from 1964 through 1998." They found "for the 28-city average, there were 41.0 ± 4.8 excess heat-related deaths per year (per standard million) in the 1960s and 1970s, 17.3 ± 2.7 in the 1980s, and 10.5 ± 2.0 in the 1990s," a remarkable decline. They conclude, "heat-related mortality in the United States seems to be largely preventable at present."
Davis et al. (2004) examined the seasonality of mortality due to all causes, using monthly data for 28 major U.S. cities from 1964 to 1998, and then calculated the consequences of a future 1°C warming of the conglomerate of those cities. At all locations studied, they report "warmer months have significantly lower mortality rates than colder months." They calculate "a uniform 1°C warming results in a net mortality decline of 2.65 deaths (per standard million) per metropolitan statistical area" (emphasis added). The primary implication of Davis et al.'s findings, in their words, "is that the seasonal mortality pattern in US cities is largely independent of the climate and thus insensitive to climate fluctuations, including changes related to increasing greenhouse gases."
Deschenes and Moretti (2009) analyzed the relationship between weather and mortality, based on "data that include the universe of deaths in the United States over the period 1972– 1988," in which they "match each death to weather conditions on the day of death and in the county of occurrence." They discovered "hot temperature shocks are indeed associated with a large and immediate spike in mortality in the days of the heat wave," but "almost all of this excess mortality is explained by near-term displacement." As a result, "in the weeks that follow a heat wave, we find a marked decline in mortality hazard, which completely offsets the increase during the days of the heat wave," so "there is virtually no lasting impact of heat waves on mortality." In the case of cold temperature days, they also found "an immediate spike in mortality but "there is no offsetting decline in the weeks that follow," so "the cumulative effect of one day of extreme cold temperature during a thirty-day window is an increase in daily mortality by as much as 10%."

Global Warming and Cardiovascular Disease

The key findings are that

- Global warming, if it does occur, would reduce the incidence of fatal coronary events related to low temperatures and wintry weather by a much greater degree than it increases the incidence of death or serious heat related events associated with high temperatures and summer heat waves.

- Non-fatal myocardial infarction is also less frequent during unseasonably warm periods than during unseasonably cold periods.

- Any cost-benefit analysis that attributes an increase in cardiovascular events to warming is incorrect. Heat illness injures and kills by other means and has a much lesser death toll proportionately than cold related events. Heat illness injury and death in heat waves affects the debilitated and chronically ill in hot unventilated environments and the mechanism is dehydration and loss of core body temperature control.

Cardiovascular diseases affect the heart and or the blood vessels. They include arrhythmia, arteriosclerosis, congenital heart disease, and coronary artery disease, diseases of the aorta and its branches, disorders of the peripheral vascular system, endocarditis, heart valve disease, hypertension, orthostatic hypotension, and

shock. According to IPCC, exposure to rising temperatures and especially heat waves can cause premature deaths due to heat-induced illness. The claims that it causes stroke or myocardial infarctions are not correct except to concede that ultimately most deaths are cardiovascular in nature.
Empirical research suggests that heat illness can cause collapse and death, but the mechanism is fluid and circulatory collapse, not stroke or heart attack. Heat stroke is severe heat illness with loss of temperature control that produces brain dysfunction; it's not a cerebral thrombosis or hemorrhage, a true stroke.
That aside, the IPCC overlooks the fact that cooler temperatures cause an even larger number of premature deaths, with the result that a warmer world would experience fewer deaths in total due to cardiovascular disease.

Global Warming and Respiratory Disease

The key findings of this section include the following:

- Global warming, if it did occur would reduce incidence of death due to respiratory disease around the world, for example the Americas, Spain, Canada, Shanghai, and even on the subtropical island of Taiwan.

- Lower minimum temperatures are a strong risk factor for outpatient visits for respiratory diseases. Warmer temperatures reduce rates of respiratory disease.

- Any cost-benefit analysis that attributes increases in deaths or disease and disability or loss of work/school time to warming is incorrect and not a reliable guide for public policy.

Respiratory diseases are diseases affecting the organs and tissues that make gas exchange possible in humans and other higher organisms. They range from the common cold, allergies, asthma, and bronchiolitis to life-threatening conditions including pneumonia, pulmonary embolism, and lung cancer. Acute respiratory disease is a condition in which breathing becomes difficult and oxygen levels in the blood drop lower than normal. Respiratory diseases are widespread. For example, childhood asthma affects more than 300 million people worldwide (Baena-Cagnani and Badellino, 2011). Non-fatal respiratory diseases impose enormous social costs due to days lost from work and school (Mourtzoukou and Falagas, 2007).
According to IPCC, rising atmospheric carbon dioxide concentrations due to the combustion of fossil fuels causes global warming, and this temperature increase causes increased deaths due to respiratory disease. However, examination of real-world data reveals unassailable evidence that colder temperatures cause more deaths and hospital admissions due to respiratory disease than do warmer temperatures.
Some of the studies cited earlier in this chapter on lower death rates due to warmer temperatures and cardiovascular disease also identified specific reductions in fatalities due to respiratory diseases, so their research also appears in this section. Keatinge and Donaldson (2001), for example, studied of the effects of temperature on mortality in people over 50 years of age in the greater London area over the period 1976–1995. Simple plots of mortality rate versus daily air temperature revealed a linear increase in mortality as the air temperature fell from 15°C to near 0°C. Mortality rates at temperatures above 15°C, on the other hand, showed no trend. The authors say it is because "cold causes mortality mainly from arterial thrombosis and respiratory disease, attributable in turn to cold-induced hemo-concentration and hypertension and respiratory infections" (emphasis added).
Nafstad et al. (2001) studied the association between temperature and daily mortality in citizens of Oslo, Norway over the period 1990 to 1995. The results showed the mean daily number of respiratory-related

deaths was considerably higher in winter (October–March) than in summer (April–September). Winter deaths associated with respiratory diseases were 47% more numerous than summer deaths. They conclude, "A milder climate would lead to a substantial reduction in average daily number of deaths." Read milder as warmer.

Hajat and Haines (2002) examined the relationship between cold temperatures and the number of visits by the elderly to general practitioners for asthma, lower respiratory diseases other than asthma, and upper respiratory diseases other than allergic rhinitis as obtained for registered patients aged 65 and older from several London practices between January 1992 and September 1995. They found the mean number of consultations was higher in cool-season months (October–March) than in warm-season months (April–September) for all respiratory diseases. At mean temperatures below 5°C, the relationship between respiratory disease consultations and temperature was linear, and stronger at a time lag of six to 15 days A 1°C decrease in mean temperature below 5°C was associated with a 10.5% increase in all respiratory disease consultations.

Braga et al. (2002) conducted a time-series analysis of both the acute and lagged influence of temperature and humidity on mortality rates in 12 U.S. cities, finding no clear evidence for a link between humidity and respiratory-related deaths. With respect to temperature, they found respiratory-related mortality increased in cities with more variable temperature. This phenomenon, they write, "suggests that increased temperature variability is the most relevant change in climate for the direct effects of weather on respiratory mortality."

Gouveia et al. (2003) extracted daily counts of deaths from all causes, except violent

deaths and neonatal deaths (up to one month of age), from Sao Paulo, Brazil's mortality information system for the period 1991–1994 and analyzed them for effects of temperature. For respiratory-induced deaths, death rates due to a 1°C cooling were twice as great as death rates due to a 1°C warming in adults and 2.8 times greater in the elderly.

Nakaji et al. (2004) evaluated seasonal trends in deaths due to various diseases in Japan, using nationwide vital statistics from 1970 to 1999 and concurrent mean monthly air temperature data. They found the numbers of deaths due to respiratory diseases, including pneumonia and influenza, rise to a maximum during the coldest time of the year. The team of nine scientists concludes, "To reduce the overall mortality rate and to prolong life expectancy in Japan, measures must be taken to reduce those mortality rates associated with seasonal differences."

Bartzokas et al. (2004) "examined the relationship between hospital admissions for cardio-vascular (cardiac in general including heart attacks) and/or respiratory diseases (asthma etc.) in a major hospital in Athens [Greece] and meteorological parameters for an 8-year period." Over the whole year, they found, "there was a dependence of admissions on temperature," and low temperatures were "responsible for a higher number of admissions." Specifically, "there was a decrease of cardiovascular or/and respiratory events from low to high values [of temperature], except for the highest temperature class in which a slight increase was recorded."

Kovats et al. (2004) studied patterns of temperature-related hospital admissions and deaths in Greater London during the mid-1990s. For the three-year period 1994–1996, they found respiratory-related deaths were nearly 150% greater in the depth of winter cold than at the height of summer warmth. They also found the mortality impact of the heat wave of 29 July to 3 August 1995 (which boosted daily mortality by just over 10%) was so tiny it could not be discerned among the random scatter of plots of three-year-average daily deaths from cardiovascular and respiratory problems versus day of year. Similarly, in a study of temperature effects on mortality in three English counties (Hampshire, West Midlands, and West Yorkshire), McGregor (2005) found "the occurrence of influenza ... helps elevate winter mortality above that of summer."

Carder et al. (2005) investigated the relationship between outside air temperature and deaths due to all non-accident causes in the three largest cities of Scotland (Glasgow, Edinburgh, and Aberdeen) between January 1981 and December 2001. The authors observed "an overall increase in mortality as temperature decreases," which "appears to be steeper at lower temperatures than at warmer temperatures," and "there is little evidence of an increase in mortality at the hot end of the temperature range." Specifically regarding respiratory disease, they found "for temperatures below 11°C, a 1°C drop in the daytime mean temperature on any one day was associated with an increase in respiratory mortality of 4.8% over the following month."
Donaldson (2006) studied the effect of annual mean daily air temperature on the length of the yearly respiratory syncytial virus (RSV) season, the virus which causes bronchiolitis, in England and Wales for 1981–2004. Reporting "climate change may be shortening the RSV season," Donaldson found "the seasons associated with laboratory isolation of respiratory syncytial virus (for 1981–2004) and RSV-related emergency department admissions (for 1990– 2004) ended 3.1 and 2.5 weeks earlier, respectively, per 1°C increase in annual central England temperature ($P = 0.002$ and 0.043, respectively)." Consequently, since "no relationship was observed between the start of each season and temperature," he reports, so "the RSV season has become shorter." He concludes, "These findings imply a health benefit of global warming in England and Wales associated with a reduction in the duration of the RSV season and its consequent impact on the health service."
Frei and Gassner (2008) studied hay fever prevalence in Switzerland from 1926 to 1991, finding it rose from just under 1% of the country's population to just over 14%, but from 1991 to 2000 it leveled off, fluctuating about a mean value on the order of 15%. The authors write, "several studies show that no further increase in asthma, hay fever and atopic sensitization in adolescents and adults has been observed during the 1990s and the beginning of the new century," citing Braun-Fahrlander et al. (2004) and Grize et al. (2006). They write, "Parallel to the increasing hay fever rate, the pollen amounts of birch and grass were increasing from 1969 to 1990," but "subsequently, the pollen of these plant species decreased from 1991 to 2007." They say this finding "is more or less consistent with the changes of the hay fever rate that no longer increased during this period and even showed a tendency to decrease slightly." Nearly identical findings were presented a year later (Frei, 2009). Although some have claimed rising temperatures and CO2 concentrations will lead to more pollen and more hay fever (Wayne et al., 2002), the analyses of Frei (2009) and Frei and Gassner (2008) suggest that is not true of Switzerland.
Miller et al. (2012) extracted annual prevalence data for frequent otitis media (defined as three or more ear infections per year), respiratory allergy, and non-respiratory seizures in children from the U.S. National Health Interview Survey for 1998 to 2006. They also obtained average annual temperatures for the same period from the U.S. Environmental Protection Agency. They found "annual temperature did not influence the prevalence of frequent otitis media," "annual temperature did not influence prevalence of respiratory allergy," and "annual temperature and sex did not influence seizure prevalence." They conclude their findings "may demonstrate that average temperature is not likely to be the dominant cause of the increase in allergy burden or that larger changes in temperatures over a longer period are needed to observe this association." They further conclude, "In the absence of more dramatic annual temperature changes, we do not expect prevalence of otitis media to change significantly as global warming may continue to affect our environment."
Xu et al. (2013) examined the relationship between diurnal temperature range (DTR) and emergency department admissions for childhood asthma in Brisbane, Australia, from January 1st 2003 to December 31st 2009. The six scientists report "childhood asthma increased above a DTR of 10°C" and "was the greatest for lag 0–9 days, with a 31% increase in [hospital] emergency department admissions per 5°C increment of DTR," further noting, "male children and children aged 5–9 years appeared to be more vulnerable to the DTR effect than others."

Ge et al. (2013) also investigated respiratory health and DTR. The researchers collected numbers of daily emergency-room visits for RTI at one of the largest medical establishments in Shanghai, China (Huashan Hospital) between 1 January 2008 and 30 June 2009, along with DTR data and data pertaining to possible confounding air pollutants (PM10, SO2, and NO2). After making appropriate statistical analyses, the scientists determined increasing DTRs were closely associated with daily emergency-room visits for RTIs, such that "an increase of 1°C in the current-day and in the 2-day moving average DTR corresponded to a 0.94% and 2.08% increase in emergency-room visits for RTI, respectively."
Lin et al. (2013) used data on daily area-specific deaths from all causes, circulatory diseases, and respiratory diseases in Taiwan, developing relationships between each of these cause-of-death categories and a number of cold-temperature related parameters for 2000–2008. The five researchers discovered "mortality from [1] all causes and [2] circulatory diseases and [3] outpatient visits of respiratory diseases has a strong association with cold temperatures in the subtropical island, Taiwan." In addition, they found "minimum temperature estimated the strongest risk associated with outpatient visits of respiratory diseases."

Global Warming and Strokes

The key findings of this section include the following:

- Any warming would reduce the incidence of death due to stroke in many parts of the world, including Russia, Korea, Japan, Africa, Asia, Europe, Latin America, and the Caribbean.

- Low minimum temperatures are a stronger risk factor than high temperatures for stroke incidence and hospitalization.

- Any cost-benefit analysis that attributes increased strokes to a prediction of global warming is incorrect and not a reliable guide for public policy.

A stroke occurs when blood flow to an area in the brain is cut off. Ischemic stroke occurs when clots form in the brain's blood vessels, in blood vessels leading to the brain, or in blood vessels elsewhere in the body and then travel to the brain. Ischemic stroke can also occur when too much plaque (fatty deposits and cholesterol) clogs the brain's blood vessels. Hemorrhagic strokes occur when a blood vessel in the brain breaks or ruptures. The result is blood seeping into the brain tissue, causing damage to brain cells. The most common causes of hemorrhagic stroke are high blood pressure and brain aneurysms. An aneurysm is a bulge in a blood vessel caused by a weakness and thinning of the blood vessel wall. Aneurysms are prone to burst and a major cause of hemorrhagic stroke (WebMD, 2015).
According to IPCC, rising atmospheric carbon dioxide concentrations due to the combustion of fossil fuels causes global warming, and this temperature increase causes increased deaths due to strokes. Not true. Examination of real-world data reveals unseasonable cold temperatures cause more deaths and hospital admissions due to stroke than do unseasonable warm temperatures.
Feigin et al. (2000) examined the relationship between the incidence of stroke and ambient temperatures over the period 1982-1993 in Novosibirsk, Siberia, which has one of the highest stroke incidence rates in the world. Based on analyses of 2,208 patients with sex and age distributions similar to those of Russia as a whole, they found a statistically significant association between stroke and low ambient temperature. In the

case of ischemic stroke (IS), which accounted for 87% of all stroke types, they determined "the risk of IS occurrence on days with low ambient temperature [was] 32% higher than that on days with high ambient temperature." They conclude the "very high stroke incidence in Novosibirsk, Russia may partially be explained by the highly prevalent cold factor there." There is no reason to believe that temperature variations would have a discernible effect on hemorrhagic strokes that occur because of vascular pathology, not occlusion.

Hong et al. (2003) investigated the association between the onset of ischemic stroke and prior episodic decreases in temperature in 545 patients who suffered strokes in Incheon, Korea from January 1998 to December 2000. They report "decreased ambient temperature was associated with risk of acute ischemic stroke," with the strongest effect being seen on the day after exposure to cold weather, further noting "even a moderate decrease in temperature can increase the risk of ischemic stroke." They also found "risk estimates associated with decreased temperature were greater in winter than in the summer," which suggests "low temperatures as well as temperature changes are associated with the onset of ischemic stroke." Finally, they explain the reason for the 24- to 48-hour lag between exposure to cold and the onset of stroke "might be that it takes some time for the decreasing temperature to affect blood viscosity or coagulation.

Nakaji et al. (2004) evaluated seasonal trends in deaths due to various diseases in Japan using nationwide vital statistics from 1970 to 1999 together with mean monthly temperature data. They found the peak mortality rate due to stroke was two times greater in winter (January) than at the time of its yearly minimum (August and September).

Chang et al. (2004) analyzed data from the World Health Organization (WHO) Collaborative Study of Cardiovascular Disease and Steroid Hormone Contraception (WHO, 1995) to determine the effects of monthly mean temperature on rates of hospitalization for arterial stroke and acute myocardial infarction among women aged 15–49 from 17 countries in Africa, Asia, Europe, Latin America, and the Caribbean. They found among these women, a 5°C reduction in mean air temperature was associated with a 7% increase in the expected hospitalization rate due to stroke, and this effect was relatively acute, within a period of about a month, the scientists write.

Gill et al. (2012) write, "in the past two decades, several studies reported that meteorologic changes are associated with monthly and seasonal spikes in the incidence of aneurysmal subarachnoid hemorrhage (aSAH)," and "analysis of data from large regional databases in both hemispheres has revealed increased seasonal risk for aSAH in the fall, winter and spring," citing among other sources Feigin et al. (2001), Abe et al. (2008), and Beseoglu et al. (2008). Gill et al. identified the medical records of 1,175 patients at the Johns Hopkins Hospital in Baltimore, Maryland (USA) who were admitted with a radiologically confirmed diagnosis of aSAH between 1 January 1991 and 1 March 2009. The six scientists report both "a one-day decrease in temperature and colder daily temperatures were associated with an increased risk of incident aSAH," and "these variables appeared to act synergistically" and were "particularly predominant in the fall, when the transition from warmer to colder temperatures occurred." Gill et al. add their study "is the first to report a direct relationship between a temperature decrease and an increased risk of aSAH," and "it also confirms the observations of several reports of an increased risk of aSAH in cold weather or winter," citing Nyquist et al. (2001) and other sources. Authors' note: This study and others the authors of the study reference are outliers in the sense that they tally aneurysmal sub arachnoid hemorrhage, a different kind of stroke than ischemic strokes, so there is no "mechanism" of coagulation and clot formation that would relate to temperature that might be hypothesized as a cause of cold or cool to cause hemorrhagic stroke.

The reader should be informed that hemorrhagic stroke is because of a different mechanism, the rupture of a weakened wall of a blood vessel, often associated with a bulge called an aneurysm, as opposed to ischemic stroke discussed above that occur because of a blood clot in the brain blood vessel. However the temperature

effect is the same, cold produces an increase in hemorrhagic strokes in addition to its effect on the rate of ischemic strokes.

Global Warming and Insect-borne Diseases

The key findings of this section include the following:

- Research contradicts the claim that malaria will expand across the globe and intensify as a result of any possible warming.

- Concerns over large increases in dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue fever infection rates.

- Climate change has not been a significant factor driving the recent temporal patterns in the epidemiology of tick-borne diseases. Ticks are endemic at many latitudes.

The latest IPCC report, the Fifth Assessment Report (AR5) backs down from previous predictions that global warming would facilitate the spread of insect-borne diseases including malaria, dengue fever, and tick-borne diseases. The full report from Working Group II on the subject (IPCC, 2014a, Chapter 11, pp. 722-726) repeatedly admits there is no evidence that climate change has affected the range of vector-borne diseases including tick-borne diseases. However, the Summary for Policymakers inexplicably warns "Throughout the 21st century, climate change is expected to lead to increases in ill-health in many regions and especially in developing countries with low income, as compared to a baseline without climate change (high confidence)." Among the "examples" given is "vector-borne diseases (medium confidence)" (IPCC, 2014b, pp. 19-20). Such predictions are not supported by the evidence.

In a research report in Science, Rogers and Randolph (2000) note "predictions of global climate change have stimulated forecasts that vector-borne diseases will spread into regions that are at present too cool for their persistence." However, the effect of warmer temperatures on insect-borne diseases is complex, sometimes working in favor of and sometimes against the spread of a disease. For example, ambient temperature has historically not determined the range of insect-borne diseases, hotter weather shortens the lifespan of mosquitos, and human adaptation as well as vector control measures can neutralize any detrimental effect of warming, to overwhelm the role of climate. Even those who support IPCC, such as Marm Kilpatrick, an assistant professor in ecology and evolutionary biology at the University of California, Santa Cruz, admits "It's a little bit tricky to make a solid prediction" (Irfan, 2011).

Gething et al. (2010), writing specifically about malaria, may have put it best when they said there has been "a decoupling of the geographical climate-malaria relationship over the twentieth century, indicating that non-climatic factors have profoundly confounded this relationship over time." They note "non-climatic factors, primarily direct disease control and the indirect effects of a century of urbanization and economic development, although spatially and temporally variable, have exerted a substantially greater influence on the geographic extent and intensity of malaria worldwide during the twentieth century than have climatic factors." As for the future, they conclude climate-induced effects "can be offset by moderate increases in coverage levels of currently available interventions."

This section investigates the reliability of IPCC's claim with respect to the three main kinds of insect-borne diseases: malaria, dengue fever, and tick-borne diseases According to the results of a vast body of scientific examination and research on this topic, there is little support for the claims appearing in the latest IPCC Summary for Policymakers.

Malaria

A vast body of scientific examination and research contradict the claim that malaria will expand across the globe and intensify as a result of CO2-induced warming.

Jackson et al. (2010) say "malaria is one of the most devastating vector-borne parasitic diseases in the tropical and subtropical regions of the world," noting it affects more than 100 countries.

According to the World Health Organization, Africa carries the highest infection burden of any continent, with nearly 200 million cases reported in 2006, and the Centers for Disease Control and Prevention estimates between 700,000 and 2.7 million people each year die from the dreaded disease (Suh et al., 2004). In addition, Jackson et al. report "the African region bears 90% of these estimated worldwide deaths," and "three-quarters of all malaria related deaths are among African children," citing Breman (2001). According to Reiter (2000), claims that malaria resurgence is the product of CO2-induced global warming ignore other important factors and disregard known facts. A historical analysis of malaria trends, for example, reveals this disease was an important cause of illness and death in England during a period of colder-than-present temperatures throughout the Little Ice Age. Its transmission began to decline only in the nineteenth century, during a warming phase, when, according to Reiter, "temperatures were already much higher than in the Little Ice Age." In short, malaria was prevalent in Europe during some of the coldest centuries of the past millennium, and it has only recently undergone widespread decline, when temperatures have been warming.

Clearly, there are other factors at work in regards to malaria that are more important than temperature. Such factors include the quality of public health services, irrigation and agricultural activities, land use practices, civil strife, natural disasters, ecological change, population change, use of insecticides, and the movement of people (Reiter, 2000; Reiter, 2001; Hay et al., 2002).

Nevertheless, concerns have lingered about the possibility of widespread future increases in malaria due to global warming. These concerns are generally rooted in climate models that typically use only one, or at most two, climate variables in making their predictions of the future distribution of the disease over Earth, and they generally do not include any of the non-climatic factors listed in the preceding paragraph. When more variables are included, a less-worrisome future is projected.

In one modeling study, for example, Rogers and Randolph (2000) employed five climate variables and obtained very different results. Briefly, they used the present-day distribution of malaria to determine the specific climatic constraints that best define that distribution, after which the multivariate relationship they derived from this exercise was applied to future climate scenarios derived from state-of-the-art climate models, in order to map potential future geographical distributions of the disease.

Their study revealed very little change: a 0.84% increase in potential malaria exposure under the "medium-high" scenario of global warming and a 0.92% decrease under the "high" scenario. Rogers and Randolph explicitly state their quantitative model "contradicts prevailing forecasts of global malaria expansion" and "highlights the use of multivariate rather than univariate constraints in such applications. They found "climate warming, expressed as a systematic temperature increase over the 85-year period, does not appear to be responsible for an increase in malaria suitability over any region in Africa." They conclude "research on the links between climate change and the recent resurgence of malaria across Africa would be best served through refinements in maps and models of precipitation patterns and through closer examination of the role of nonclimatic influences."

Kuhn et al. (2003) analyzed the determinants of temporal trends in malaria deaths within England and Wales in 1840–1910 and found "a 1°C increase or decrease was responsible for an increase in malaria deaths of 8.3% or a decrease of 6.5%, respectively," which explains "the malaria epidemics in the 'unusually hot summers' of 1848 and 1859." Nevertheless, the long- term near-linear temporal decline in malaria deaths over the period of study, the researchers write, "was probably driven by nonclimatic factors," among which they identify increasing livestock populations (which tend to divert mosquito biting from humans), decreasing acreages of marsh wetlands (where mosquitoes breed), as well as "improved housing, better access to health care and medication, and improved nutrition, sanitation, and hygiene." Kuhn et al. say "the projected increase in proportional risk is clearly insufficient to lead to the reestablishment of endemicity."

Childs et al. (2006) present a detailed analysis of malaria incidence in northern Thailand based on a quarter-century monthly time series (January 1977 through January 2002) of total malaria cases in the country's 13 Northern provinces. Over this time period, when IPCC claims the world warmed at a rate and to a level unprecedented over the prior one to two millennia, Childs et al. report there was an approximately constant rate of decline in total malaria incidence (from a mean monthly incidence in 1977 of 41.5 cases per hundred thousand people to 6.72 cases per hundred thousand people in 2001). Noting "there has been a steady reduction through time of total malaria incidence in northern Thailand, with an average decline of 6.45% per year," they say this result "reflects changing agronomic practices and patterns of immigration, as well as the success of interventions such as vector control programs, improved availability of treatment and changing drug policies."

Reiter (2008) came to similar conclusions, writing "simplistic reasoning on the future prevalence of malaria is ill-founded; malaria is not limited by climate in most temperate regions, nor in the tropics, and in nearly all cases, 'new' malaria at high altitudes is well below the maximum altitudinal limits for transmission." He further states, "Future changes in climate may alter the prevalence and incidence of the disease, but

obsessive emphasis on 'global warming' as a dominant parameter is indefensible; the principal determinants are linked to ecological and societal change, politics and economics."
Hulden and Hulden (2009) analyzed malaria statistics collected in Finland from 1750 to 2008 via correlation analyses between malaria frequency per million people and all variables that have been used in similar studies throughout other parts of Europe, including temperature data, animal husbandry, consolidation of land by redistribution, and household size. Over the entire period, "malaria frequency decreased from about 20,000–50,000 per 1,000,000 people to less than 1 per 1,000,000 people," they report. The two Finnish researchers conclude, "Indigenous malaria in Finland faded out evenly in the whole country during 200 years with limited or no counter measures or medication," making that situation "one of the very few opportunities where natural malaria dynamics can be studied in detail." Their study indicates "malaria in Finland basically was a sociological disease and that malaria trends were strongly linked to changes in the human household size and housing standard."

Effects of climate and socioeconomic factors on the projected future global distribution of malaria.

Source: Béguin et al. (2011).

The many findings described above make it clear a vast body of scientific examination and research contradict the claim that malaria will expand across the globe and intensify as a result of CO2-induced warming.

Dengue Fever

Concerns over large increases in dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue fever.

According to Ooi and Gubler (2009), "dengue/dengue hemorrhagic fever is the most important vector-borne viral disease globally," with more than half the world's population living in areas deemed to be at risk of infection. Kyle and Harris (2008) note "dengue is a spectrum of disease caused by four serotypes of the most

prevalent arthropod-borne virus affecting humans today," and "its incidence has increased dramatically in the past 50 years," to where "tens of millions of cases of dengue fever are estimated to occur annually, including up to 500,000 cases of the life- threatening dengue hemorrhagic fever/dengue shock syndrome." Some of the research papers summarized in previous sections address dengue fever as well as malaria. With a few worthy exceptions, we do not repeat those summaries in this section. The most important exceptions are papers written by or coauthored by Paul Reiter (2001, 2003, 2010a, 2010b), one of the world's premier authorities on the subject. Reiter analyzed the history of malaria and dengue fever in an attempt to determine whether the incidence and range of influence of these diseases would indeed increase in response to CO2-induced global warming.

His reviews established what is now widely accepted among experts in the field, that the natural history of these vector-borne diseases is highly complex, and the interplay of climate, ecology, vector biology, and a number of other factors defy definition by the simplistic analyses utilized in the computer models relied on by environmental activists and the IPCC.

That there has in fact been a resurgence of these diseases in parts of the world is true, but as Reiter (2001) notes; it is "facile to attribute this resurgence to climate change." This he shows via a number of independent analyses that clearly demonstrate factors associated with politics, economics, and human activity is the principal determinants of the spread of these diseases. He describes these factors as being "much more significant" than climate in promoting disease expansion. Two years later, Reiter took up the subject again, this time with 19 other scientists as coauthors (Reiter et al., 2003), and yet again in 2010. Reiter's work remains the most comprehensive critique of the claims of the Intergovernmental Panel on Climate Change.

Kyle and Harris (2008) wrote "there has been a great deal of debate on the implications of global warming for human health," but "at the moment, there is no consensus." However, "in the case of dengue," they report, "it is important to note that even if global warming does not cause the mosquito vectors to expand their geographic range, there could still be a significant impact on transmission in endemic regions," because "a 2°C increase in temperature would simultaneously lengthen the lifespan of the mosquito and shorten the extrinsic incubation period of the dengue virus, resulting in more infected mosquitoes for a longer period of time." Nevertheless, they state there are "infrastructure and socioeconomic differences that exist today and already prevent the transmission of vector-borne diseases, including dengue, even in the continued presence of their vectors," citing Reiter (2001).

Wilder-Smith and Gubler (2008) conducted a review of the scientific literature, noting "the past two decades saw an unprecedented geographic expansion of dengue" and "global climate change is commonly blamed for the resurgence of dengue," but they add, "There are no good scientific data to support this conclusion." The two researchers report, "Climate has rarely been the principal determinant of [their] prevalence or range," and "human activities and their impact on local ecology have generally been much more significant." They cite as contributing factors "urbanization, deforestation, new dams and irrigation systems, poor housing, sewage and waste management systems, and lack of reliable water systems that make it necessary to collect and store water," further noting "disruption of vector control programs, be it for reasons of political and social unrest or scientific reservations about the safety of DDT, has contributed to the resurgence of dengue around the world."

In addition, Wilder-Smith and Guble write "large populations in which viruses circulate may also allow more co-infection of mosquitoes and humans with more than one serotype of virus," which would appear to be borne out by the fact that "the number of dengue lineages has been increasing roughly in parallel with the size of the human population over the last two centuries." Most important, perhaps, is "the impact of international travel," of which they say "humans, whether troops, migrant workers, tourists, business travelers, refugees, or others, carry the virus into new geographic areas," and these movements "can lead to

epidemic waves." The two researchers conclude, "Population dynamics and viral evolution offer the most parsimonious explanation for the observed epidemic cycles of the disease, far more than climatic factors." Russell et al. (2009) showed the dengue vector (the Aedes Aegypti mosquito) "was previously common in parts of Queensland, the Northern Territory, Western Australia and New South Wales," and it had, "in the past, covered most of the climatic range theoretically available to it," adding "the distribution of local dengue transmission has [historically] nearly matched the geographic limits of the vector." This being the case, they conclude the vector's current absence from much of Australia "is not because of a lack of a favorable climate." Thus, they reason "a temperature rise of a few degrees is not alone likely to be responsible for substantial increases in the southern distribution of A. Aegypti or dengue, as has been recently proposed." Instead of futile attempts to limit dengue transmission by controlling the world's climate, therefore, the medical researchers recommend "well resourced and functioning surveillance programs, and effective public health intervention capabilities, are essential to counter threats from dengue and other mosquito-borne diseases."

Reiter (2010a) observed "the introduction and rapidly expanding range of Aedes Albopictus in Europe is an iconic example of the growing risk of the globalization of vectors and vector-borne diseases," and "the history of yellow fever and dengue in temperate regions confirms that transmission of both diseases could recur, particularly if Aedes Aegypti, a more effective vector, were to be re-introduced." He states "conditions are already suitable for transmission." Much more important than a rise or fall of a couple degrees of temperature, Reiter says, is "the quantum leap in the mobility of vectors and pathogens that has taken place in the past four decades, a direct result of the revolution of transport technologies and global travel."

Carbajo et al. (2012) evaluated the relative contributions of geographic, demographic, and climatic variables to the recent spread of dengue in Argentina. They found dengue spatial occurrence "was positively associated with days of possible transmission, human population number, population fall and distance to water bodies." When considered separately, the researchers write, "the classification performance of demographic variables was higher than that of climatic and geographic variables." Thus, although useful in estimating annual transmission risk, Carbajo et al. conclude temperature "does not fully describe the distribution of dengue occurrence at the country scale," and "when taken separately, climatic variables performed worse than geographic or demographic variables."

These several observations indicate concerns over large increases in dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature, as climatic indices are poor predictors for dengue fever.

Tick-borne Diseases

Climate change has not been the most significant factor driving the recent temporal patterns in the epidemiology of tick-borne diseases.

Sarah Randolph of the University of Oxford's Department of Zoology is a leading scholar on tick-borne diseases. She and fellow Oxford faculty member David Rogers observed in 2000 that tick-borne encephalitis (TBE) "is the most significant vector-borne disease in Europe and Eurasia," having "a case morbidity rate of 10–30% and a case mortality rate of typically 1–2% but as high as 24% in the Far East." The disease is

caused by a flavivirus (TBEV), which is maintained in natural rodent-tick cycles; humans may be infected with it if bitten by an infected tick or by drinking untreated milk from infected sheep or goats.

Early discussions on the relationship of TBE to global warming predicted the disease would expand its range and become more of a threat to humans in a warmer world. However, Randolph and Rogers (2000) note, "like many vector-borne pathogen cycles that depend on the interaction of so many biotic agents with each other and with their abiotic environment, enzootic cycles of TBEV have an inherent fragility," so "their continuing survival or expansion cannot be predicted from simple univariate correlations."

Randolph (2010) examined the roles played by various factors that may influence the spread of tick-borne diseases. After describing some of the outbreaks of tick-borne disease in Europe over the past couple of decades, Randolph states "the inescapable conclusion is that the observed climate change alone cannot explain the full heterogeneity in the epidemiological change, either within the Baltic States or amongst Central and Eastern European countries," citing Sumilo et al. (2007). Instead, she writes, "a nexus of interrelated causal factors—abiotic, biotic and human—has been identified," and "each factor appears to operate synergistically, but with differential force in space and time, which would inevitably generate the observed epidemiological heterogeneity."

Many of these factors, she continues, "were the unintended consequences of the fall of Soviet rule and the subsequent socio-economic transition (Sumilo et al., 2008b)," among which she cites "agricultural reforms resulting in changed land cover and land use, and an increased reliance on subsistence farming; reduction in the use of pesticides, and also in the emission of atmospheric pollution as industries collapsed; increased unemployment and poverty, but also wealth and leisure time in other sectors of the population as market forces took hold."

Randolph concludes "there is increasing evidence from detailed analyses that rapid changes in the incidence of tick-borne diseases are driven as much, if not more, by human behavior that determines exposure to infected ticks than by tick population biology that determines the abundance of infected ticks," as per Sumilo et al. (2008a) and Randolph et al. (2008). She ends her analysis by stating, "While nobody would deny the sensitivity of ticks and tick-borne disease systems to climatic factors that largely determine their geographical distributions, the evidence is that climate change has not been the most significant factor driving
the recent temporal patterns in the epidemiology of tick-borne diseases."

Conclusion

IPCC fails to acknowledge the human health benefits of a warming world, claiming instead that the net effect of warming is a cost rather than a benefit.

Fossil fuels have benefited human health by making possible the dramatic increase in human prosperity since the first Industrial Revolution, making investments possible in goods and services that are essential to protecting human health and prolonging human life. Fossil fuels further improve human health by making environmental protection both valued and financially possible and by powering technologies and production of goods and services, transportation, communication that all improve quality of life, and protect human health and welfare, extend life spans.
If the combustion of fossil fuels leads to some amount of global warming, then the positive as well as negative health effects of that warming should be included in any cost-benefit analysis of fossil fuels.
Medical science explains why colder temperatures often cause diseases and sometimes fatalities whereas warmer temperatures are associated with health benefits.
Empirical research confirms that warmer temperatures lead to a net decrease in temperature- related mortality in virtually all parts of the world, even those with tropical climates. The evidence of this benefit comes from research conducted in nearly every major country of the world.
Global warming is reducing the incidence of fatal coronary events related to low temperatures and wintry weather by a much greater degree than it increases the incidence of heat related illness or death attributable to heat waves. Respiratory illness, strokes and myocardial infarction are less frequent during unseasonably warm periods than during unseasonably cold periods.
Global warming is reducing the incidence of death due to respiratory disease in many parts of the world, including Spain, Canada, Shanghai, and even on the subtropical island of Taiwan. Low minimum temperatures have been found to be a stronger risk factor than high temperatures for outpatient visits for respiratory diseases. Warm weather reduces the incidence of death due to stroke around the world.
A vast body of scientific examination and research contradicts and refutes the claim that malaria will expand across the globe or intensify in some regions as a result of any predicted CO2-induced warming. Concerns over large increases in mosquito-transmitted dengue fever as a result of rising temperatures are unfounded and unsupported by the scientific literature.

While climatic factors largely determine the geographical distribution of ticks, temperature and climate change are not among the significant factors determining the incidence of tick-borne diseases.
In the face of this extensive evidence of the positive effects of fossil fuels on human health, IPCC continues to claim the net impact on human health of fossil fuels will be negative. Because virtually all cost-benefit analyses incorporate the IPCC's incorrect assumptions into their calculation of the social cost of fossil fuels, they are unreliable guides to policymakers.

12. Conclusion

This is not a complete expose of the misconduct of the US EPA sponsored researchers and in house science and policy staff in matters of epidemiology and toxicology and it focuses on the US EPA research/ policy /regulatory activities in air quality science and policy making—an equally scandalous case can be made for US EPA work in other areas of responsibility where toxicology and epidemiology are abused and misused to expand the EPA list of targets for regulation and opportunities for EPA to scaremonger.

I also cannot take the time or the space in this discussion to expose the US EPA new area of scientific misconduct and scaremongering—epigenetics and their claims of inheritable acquired toxin carcinogenic genetic mutations—revisiting Lamarck and Lysenko long ago discredited theories about acquired genetic changes. Such irresponsible scares about inherited toxic and cancer effects are ideal for irresponsible aggressive environmental fanatic wannabee regulators and their obedient research army.

US EPA researchers in epigenetics are their new breed of scaremongers with the target people who think exposure to some named toxin might effect their children or grandchildren. The lust of power and influence and cheating on science go hand in hand.

All of what I have exposed above combines to make an effective and urgent argument for the proposed US EPA policy change to promote integrity and transparency of US EPA science in matters of regulatory policy decision making. The time for cleaning up the US EPA scientific perfidy and misconduct, malfeasance is long past overdue.

I anticipate there will be institutions and scientists panicked and anxious about proving up their research assertions and conclusions—a very beneficial and healthy development. The polity will benefit from science and policy making that is based on reliable methods used by researchers with integrity who are subjected to impartial and thorough competent reviews by experts who are not conflicted by ideological, political, monetary or social/professional influences.

Lecturer, retired Clinical Instructor,
Emergency Medicine Residency
Carl R. Darnall Army Medical Center, Fort Hood, Texas.

Table of contents of elements of the submission

Introductory remarks in support of the proposed US EPA Transparency action that are submitted as comments.

The attachment includes 12 sections that support my commentary and assertions. ments listed as

I will detail in the attachment submitted the nature of the EPA sponsored research fraud, the methods and data manipulation and management that have resulted in EPA fraud on the public about air quality health effects, toxicological claims in other areas of EPA responsibility and the EPA full blown commitment to the hoax of CO2 levels as a cause of catastrophic warming. In these three areas of EPA research and policy making it is easy to identify the frauds on the public that are supported by a well-paid band of hired researchers and an in house gang of committed environmental true believers. The result is a fraud and research and policy conduct that is so badly informed and poorly researched and developed that it includes systematic commission of civil and even criminal acts to further an EPA agenda of aggressive environmental regulations that have created tremendous economic burdens for no good reason other than a fanatic environmental ideological agenda.

I will elaborate with specific references and documents in the attached document that provides items 1-12 listed above the irresponsible and flagrantly unscientific research funded and promoted by the USEPA on all matters of toxicology and epidemiology and my admonition to any reader is that if we do not stop this junk science for politics and ideology, we will follow the path of fools for a cause—the path of true believers.

This submitter has witnessed US EPA misconduct for a period of 3 decades on a scale that is stunning, or alarming, going back to the EPA decision to ban DDT in the early 1970s, resulting in the deaths of millions in the 3rd world, and a particularly horrific impact on children.

More recently in addition to serial misconduct with regards to toxicology and epidemiology research the EPA has compounded its scientific methodology misconduct with a systematic violation of domestic and

international ethical and moral/legal norms in regards to human experimentation—promoting and funding, approving human experiments that resulted in uninformed subjects being involved in experiments at 10 domestic and 6 foreign medical research institutions where they were intentionally observed while inhaling small particle contaminated air while being observed for adverse effects. These experiments carried out by prominent Medical Schools, is in spite of US EPA public pronouncements and testimony before congress that small particles are toxic, lethal (Hundreds of thousands of deaths annually) and carcinogenic.

US domestic law prohibits human experiments that might harm and international medical ethical standards for human experiments prohibit human experiments with no exceptions except exigencies of great need if the researchers act as subjects. Any other human experiments with a risk of harm are prohibited, and no consent will remove that proscription.

In the past 3 decades US EPA air quality research has been an abomination, relying on junk toxicology/epidemiology and the precautionary principle. The submitter has actively tried to expose the misconduct.

The proposal by the US EPA for scientific transparency and scientific integrity is salutary and significant in all its elements and will impose on the US EPA research and policy a new form of integrity.

The Regulatory Science Transparency proposal is a vital and very important policy for the EPA that will have beneficial effects in that help to end US EPA research misconduct I put on display in the attachment that has been intentionally and viciously put forward as good science for purely partisan ideological purposes, not to serve the US EPA obligation to identify real risks and mitigate the effects of those risks.

Cordially and respectfully,
/JDunn MD/

Docket ID No. EPA-HQ-OA-2018-0259

Comments submitted on the Docket Subject titled

Strengthening Transparency in Regulatory Science
Comment on Strengthening Transparency in Regulatory Science, Environmental Protection Agency, 40 CFR Part 30, RIN 2080—AA14 [EPA-HQ-OA-2018-0259; FRL-9977-40-ORD].

Attachment to comments submitted by John Dale Dunn MD JD
Emergency Physician, inactive attorney
Lecturer, retired Clinical Instructor,
Emergency Medicine Residency
Carl R. Darnall Army Medical Center, Fort Hood, Texas.

Table of contents of elements of the attachment.

Introductory remarks in support of the proposed US EPA Transparency action that are submitted as comments.

Then in the attachment, the following documents listed as items 1-12.

I will detail in the attachment submitted the nature of the EPA sponsored research fraud, the methods and data manipulation and management that have resulted in EPA fraud on the public about air quality health effects, toxicological claims in other areas of EPA responsibility and the EPA full blown commitment to the hoax of CO2 levels as a cause of catastrophic warming. In these three areas of EPA research and policy

making it is easy to identify the frauds on the public that are supported by a well-paid band of hired researchers and an in house gang of committed environmental true believers. The result is a fraud and research and policy conduct that is so badly informed and poorly researched and developed that it includes systematic commission of civil and even criminal acts to further an EPA agenda of aggressive environmental regulations that have created tremendous economic burdens for no good reason other than a fanatic environmental ideological agenda.

I will elaborate with specific references and documents in the attached document that provides items 1-12 listed above the irresponsible and flagrantly unscientific research funded and promoted by the USEPA on all matters of toxicology and epidemiology and my admonition to any reader is that if we do not stop this junk science for politics and ideology, we will follow the path of fools for a cause—the path of true believers that is paved with confirmation biases and fallacious science and policy making that violates the law and cheats the taxpayer in two ways, scaremongering, and regulatory burdens that steal resources and assets for regulatory compliance that diminishes better use of those resources in the public and private sectors. My promise to the reader is I will show you how and how much the EPA disrespects and abuses the rules and methods of science.

The Submitter's opinions are personal and not attributable to the US Army or Department of Defense.

This submitter has witnessed US EPA misconduct for a period of 3 decades on a scale that is stunning, or alarming, going back to the EPA decision to ban DDT in the early 1970s, resulting in the deaths of millions in the 3rd world, and a particularly horrific impact on children.

More recently in addition to serial misconduct with regards to toxicology and epidemiology research the EPA has compounded its scientific methodology misconduct with a systematic violation of domestic and international ethical and moral/legal norms in regards to human experimentation—promoting and funding, approving human experiments that resulted in uninformed subjects being involved in experiments at 10 domestic and 6 foreign medical research institutions where they were intentionally observed while inhaling small particle contaminated air while being observed for adverse effects. These experiments carried out by prominent Medical Schools, is in spite of US EPA public pronouncements and testimony before congress that small particles are toxic, lethal (Hundreds of thousands of deaths annually) and carcinogenic.

US domestic law prohibits human experiments that might harm and international medical ethical standards for human experiments prohibit human experiments with no exceptions except exigencies of great need if the researchers act as subjects. Any other human experiments with a risk of harm are prohibited, and no consent will remove that proscription.

In the past 3 decades US EPA air quality research has been an abomination, relying on junk toxicology/epidemiology and the precautionary principle. The submitter has actively tried to expose the misconduct.

The proposal by the US EPA, discussed here to force EPA scientific transparency and scientific integrity is salutary and significant in all its elements, and the submitter is grateful for the change from the formerly fraudulent toxicology and epidemiology of the EPA to impose a new form of integrity.

Please consider the materials in the attachment as specified to support the position I take, that the Transparency proposal is a vital and very important policy for the EPA that will have beneficial effects in that it will identify the nature and magnitude of the US EPA research misconduct I put on display in the attachment that has been intentionally and viciously put forward as good science for purely partisan ideological purposes, not the pursuit of science that allows the US EPA to identify real risks and mitigate the effects of those risks.

Cordially and respectfully,
/JDunn MD/

U.S. Environmental Protection Agency

Public Hearing on

Strengthening Transparency in Regulatory Science

9:00 a.m. to 5:45 p.m.

Tuesday, July 17, 2018

U.S. Environmental Protection Agency

1201 Constitution Avenue N.W.

Washington, DC 20460

US EPA Panel Members:

MS. JENNIFER ORME-ZAVALETA (Hearing Official)

MR. CHRIS ROBBINS (Hearing Official)

MS. MARY ELLEN RADZIKOWSKI (Hearing Official)

MS. CAROLYN HUBBARD (Hearing Official)

MR. BRUCE RODAN (Hearing Official)

MR. KEVIN TEICHMAN

MS. MARIA DOA

MS. LYNN FLOWERS

MS. SUSAN BURDEN

MR. LOU D'AMICO

Non-EPA Panel Members:

Ms. LAUREN HALL, SC&A INC.

Ms. LESLEY STOBERT, SC&A INC.

P R O C E E D I N G S

MS. ORME-ZAVALETA: So I want to say hello, and I want to thank you all for coming. We are now calling this public hearing into session. My name is Jennifer Orme-Zevaleta, and I'm with EPA's Office of Research and Development, and I'll be one of the hearing officials today.

Kevin Teichman is also with me from the Office of Research and Development, and we also have some contract staff, Nanishka , Lauren, and Lesley from SC&A Incorporated, who will be helping with the logistics.

The purpose of today's hearing is to accept public comments on EPA's proposed rule, "Strengthening the Transparency in Regulatory Science."

EPA is accepting comments on all aspects of the proposed regulation. This public hearing is a formal legal proceeding, and the testimonies will become part of the administrative record on which EPA will base its decision.

Public notice of this hearing was

published in the Federal Register on April 30, 2018 (83 FR 18768), and EPA is proposing this rule under the authority of 5 U.S.C 301, in addition to the authorities that were listed in the proposed rule document dated April 30th of 2018.

So my role today is to ensure that EPA receives your comments in an orderly fashion, and then -- although EPA panel members here may ask clarifying questions, the intent of this hearing is to hear from you and to listen to your comments and not to discuss or debate the proposal.

So now, for a few housekeeping and ground rules. Please refrain from interrupting speakers or asking questions, shouting, noise making, or any disruptive conduct which prevents speakers or hearing officials from being heard are not permitted. Please listen quietly so that we can hear each testimony and to ensure that the court reporter is able to record comments accurately, and listeners on the phone can hear the oral testimonies.

For everyone's awareness, the hearing is

open to the press and we may have members of the media present with us today. This event is also open to any form of recording, video, audio, and photos. We ask that you not cause any disruption to those who are testifying or observing the hearing.

There is no formal lunch break, so you may leave for lunch and return to the hearing, but just be advised that you'll need to clear security again if you do that.

If you would like to make an oral comment on today's hearing and did not preregister to speak, please see the hearing staff just outside here at the door at the registration table, and they'll be able to sign you up.

If you would like to provide written comments to the official record, you may hand-submit it to EPA staff today, or mail it, fax it, or e-mail it, your comment. So see the staff at the registration table for instructions on how to submit written comments.

There is a comment box at the

registration table where you can leave hard copies of your oral testimony, or written copies. All comments received will be included in the official docket.

If you submit written comments, it is not necessary for you to give the same comments orally. Written comments and oral testimonies will receive equal consideration by EPA in preparing the final rulemaking decision.

EPA has extended the comment period and written comments must now be received on or before August 16th of 2018. So EPA will only consider comments related to the proposed rule, "Strengthening Transparency in Regulatory Science," so please refrain from making any other comments that are not related to this action.

EPA will not provide responses during the hearing, rather EPA will prepare a written summary of comments received that include responses. The Response to Comments document will be available at the time EPA issues its final decision. EPA will not make a final decision until all comments

submitted during the public comment period have been considered.

The hearing is being recorded by a court reporter who will be preparing a verbatim record of this hearing, so please speak clearly and slowly into the microphone so that the court reporter can record your comments accurately. A copy of the transcript will be placed in the docket. And this hearing is also being audio streamed through Adobe Connect and via phone lines.

The hearing is scheduled from 8:00 a.m. to 8:00 p.m., or one hour after the last registered speaker has spoken, whichever is earlier. And it's divided into three sessions. 8:00 a.m. to 12:00 p.m., 12:00 to 4:00, and 4:00 to 8:00.

Public restrooms are located on both sides down the hall, men's to the left, women's to the right, and we will have staff escort you so that you're able to get through the security point and be able to come back. And please note the

location of emergency exits, primarily as you come in and you know, out where you entered this morning will be the main emergency exit for you.

So please take a moment to silence your cell phones. Speakers should have been given a sticker on entry that lists your assigned session, and if you plan to speak and have not received a sticker, please go back to the registration table so they can give you one.

For this session, the 8:00 a.m. to 12:00 p.m. session, the speaker sticker color is neon green so we can see you. Speakers will be called to the speaker's table, which is located right across from us, and will be coming up in pairs to that speaker's table. When it's your turn to speak, please come up to the table. Watch your step as you come up the steps over there, and state and spell your name slowly so that we can have that for the record. And if you are appearing on behalf of someone else or some organization, be sure to clear that -- make that clear as well. If you are not in the room when

it's your turn to speak, I will call you after all other speakers have made their oral arguments.

Each speaker is allotted five minutes for remarks, elected and appointed government officials may be provided additional time since they are representing large groups of constituents. Speakers will be notified when their time is ended. We have a time keeping system just over here. It runs by the yellow -- green, yellow, and red-light system. So when you begin to speak the green light will come on and you have five minutes. When you have one-minute left to speak you'll see a yellow light. And then when the red light appears, your time is up. At that moment I will ask you to wrap up your comments so that we can make room for the next speaker to come forward.

Speakers Numbers 1 and 2, if you could go ahead and please come on up and take your seat at the speaker's table. We will start with Speaker Number 1. And again, if I could ask you to please speak directly into the microphone and state and

spell your name for the record.

And if I could ask, Speakers 3 and 4, if you could just stand at the steps so that you'll be ready, and we'll be able to keep this moving. So, Speaker Number 1.

MR. STEICHEN: Good morning. My name is Ted Steichen, and it's S-T-E-I-C-H-E-N, and I am representing the American Petroleum Industry.

API is the only national trade association -- boy, it's not very bright here. Sorry. The American Petroleum Institute is the only national trade association with all facets of the oil and natural gas industry which supports 10.3 million U.S. speakers (sic).

Sorry. I'm having a little trouble this morning.

All right. So, supports 10.3 million U.S. jobs and nearly 8 percent of the U.S. economy. Our 620 corporate members from large integrative oil companies to small independent companies comprise all segments of the industry. API members are producers, refiners, suppliers,

retailers, pipe line operators, and marine transporters as well as service supply companies supporting most of the national energy.

The members of API are dedicated to continuous improvement in compatibility with their operations with the environment, while environmentally, economically developing energy resources, supplying high-quality products and services to consumers.

Our members recognize the responsibility to work with the public, the government, and others to develop and use natural resources in an environmentally sound manner that protects the health and safety of employees and the public.

API supports the use of sound science for a critical component of public policy, to the extent possible and consistent with the protections of other compelling interests, such as privacy, trade secrets, intellectual property, and other confidentiality protections, data and analysis used in establishing or evaluating environmental health, welfare and economic impacts

should be transparent and reproducible and available as early as possible in the rulemaking process.

Transparency and reproducibility should be able to underly -- also be underlying data and information such as environmental and economic impact data and models that are utilized in protecting and predicting the costs, benefits, market impacts, and environmental effects of specific regulations.

API members are aware that there are obstacles to full transparency and reproducibility, and are committed to working with other stakeholders in developing practices and maximize science transparency while preserving existing confidential strictures.

The EPA -- as the EPA goes forward with this rulemaking, API recommends the following principles be followed. Openness to science and related findings underpinning the laws, regulations, standards, and guidance documents. Reproducibility of research and associated

findings, including fully annotated data, methodologies, model inputs, code and other critical information that support the conclusions of research. All of these should be available to the public.

The inclusion of clear requirements to ensure that the data underline the decision-making are publicly available in a manner sufficient for independent validation as much as practicable. Privacy concerns are important, but advances in encryption technology and blinding of data may make it possible to enhance transparency while ensure privacy as necessary to comply with the law.

Protection for confidential business information used in the regulatory process and supporting actions should also be taken into account, explicitly addressing and highlighting uncertainties in data, models, and analysis when utilizing those studies in decision-making. Broad application of these principles to inform the use of policy for setting scientific, economic, and

environment impact requirements and models that are designed to protect health and environment, engaging stakeholders as early as possible in the decision-making process to ensure application of data transparency principles for studies to be included, and to address how those studies have not been reproduced or are not reproducible will be considered in the process, application of these principles as early as possible in the pre-rule making stage, as technical support documents are prepared.

In closing, as described above, API supports the use of sound transparent science and public policy making, and we plan to submit written comments to the docket.

MS. ORME-ZAVALETA: Thank you.

MS. FELD: Good morning. My name is Jodi Feld, J-O-D-I F-E-L-D, and I'm the Chief Scientist in the New York City office of the New York State Attorney General's Environmental Protection Bureau.

On behalf of New York Attorney General,

Barbara Underwood, I thank you for the opportunity to speak before you today. The Office strongly opposes EPA's proposed rule to limit the use of science in agency rulemakings. The proposed rule was developed without any input from the scientific community and has been widely criticized by the scientific and public health communities. It is vague, poorly reasoned, and violates fundamental legal requirements for a valid rulemaking.

Most importantly, while the proposed rule has the stated purpose of strengthening the foundation of EPA's regulatory actions, it would have the opposite effect. It would exclude relevant probative scientific studies, models, and other information from EPA decision-making that have been validated by peer review, simply because the underlying data are not available to the public. The proposed rule broadly and squarely conflicts with core EPA statutory duties. It violates the very federal laws that EPA is required to uphold by limiting EPA's access to the

most current, best available, and generally accepted science that these laws mandate be used by EPA in developing new rules and standards. Quite simply, it is bad science.

It departs abruptly from the best practices of the scientific community and disregards both well-established reasons why public sharing of all study data is not possible or necessary, and why studies relying on such data demand consideration in agency decision-making.

The result of the proposed rule would be to profoundly weaken EPA's science-based regulatory decision-making, and ultimately its protection of public health in the environment in New York and elsewhere across the nation. We urge EPA to abandon this damaging and misguided effort. It appears that the proposed rule was developed with a total absence of independent scientific input. The proposal offers no rationale for the premise that only studies for which the underlying data are publicly available can be used for decision-making, nor any evidence that EPA's

current approach to selecting studies for decision-making is resulting in scientifically unsound decision-making, or is somehow overly protective of public health and the environment. Hence, at its core, the proposed rule is a solution in search of a problem.

Requiring that study data be publicly available as a prerequisite to its consideration by EPA would be an abrupt and unprecedented break from well-established best practices of the scientific community. The scientific community recognizes what the proposed rule ignores, that there are often very good reasons why some research data simply cannot be fully available to the public, such as the protection of personal privacy and confidentiality.

Within the scientific community the validity of research is judged on multiple grounds, including how well studies are designed, how clearly data are collected, how carefully analysis are performed and described, and how thoroughly findings of related studies are cited.

In other words, within the scientific community studies are validated through rigorous expert peer review. They are not summarily judged and valid and discarded simply because all underlying data cannot be fully shared.

Perhaps the strongest indicator that the proposed rule is flawed as a matter of science is the overwhelmingly negative reception it has received from the scientific community. We are not aware of a single major independent scientific organization that has expressed support for the proposed rule, while many have urged EPA to stop and reconsider the proposal.

Contrary to EPA's position, the proposed rule would certainly hurt states. EPA standards and regulations are a fundamental important to states and actions that affect these standards and regulations directly affect us. In fact, many states, environmental laws, and regulations explicitly adopt EPA standards. By undermining the basis of EPA standards and regulations, the proposed rule would likely have direct damaging

impacts on New York and other states' abilities to protect the health and environment of their residents. These impacts will be felt most historically by our most vulnerable populations, the young, the elderly, and the sick, and those living in communities that have borne a disproportionate share of environmental hazards, including communities of color and low-income communities.

From a legal perspective, the proposed rule fails to meet the most fundamental requirements for a valid rulemaking. It is exceedingly vague, creating many more questions than it answers. For example, exactly how, when, and to what the rule will be applied is entirely unclear. And critical information such as its actual cost is entirely missing.

In May, the New York Attorney General, joined by seven other attorneys general, wrote to then, Administrator Pruitt, expressing strong opposition to the proposed rule and calling for it to be withdrawn. Today, the State of New York

renews our call to Acting Administrator Wheeler to withdraw the proposed rule.

I thank you for your time and for providing me with an opportunity to speak on this important matter.

MS. LAUREN HALL: Thank you. If we could have Speakers 3 and 4 come to the table, and then 5 and 6 on-deck?

MR. SUSSMAN: Good morning. My name is Bob Sussman, and I am a former EPA official in the Clinton and Obama --

MS. HALL: Could you bring your microphone --

MR. SUSSMAN: -- administrations --

MS. HALL: Yes, thank you.

MR. SUSSMAN: -- and now a consultant and an attorney.

I'm here today representing Safer Chemicals, Healthy Families, which leads a coalition of 450 organizations and businesses united by a common concern about toxic chemicals in our homes, places of work, and products we use

every day.

I believe that the EPA proposal we are discussing today is flawed and misconceived. In the name of transparency, it will burden EPA scientists with unnecessary and costly procedures that run counter to the Agency's long-standing obligation to base public health decisions on the best available science.

The premise of the proposal is that unless EPA can guarantee full public access to a study's underlying data, the study must be deemed unreliable and should play no role in assessing a pollutant or chemical's effects on public health. This premise ignores the many ways in which the scientific community, regulators, and the public have traditionally determined the quality and relevance of scientific evidence.

Study reports typically explain the protocols use to gather data, the methods used for data analysis, the doses or exposure concentrations at which effects were and were not observed, the nature, severity, and incidence of

such effects, and any unusual occurrences that may affect interpretation of the results.

This information plays an important role in the peer review process, informing the judgment of independent reviewers as to whether a study is worthy of publication in the scientific literature. Agency reviewers likewise consider these indicators of reliability in deciding how much weight a study deserves in making judgments about hazard and risk.

In principle, no one disputes the benefits of improving access to underlying data. The goals of open science have received support from several organizations in leading scientific journals and research institutions. These voluntary efforts, however, do not justify the unprecedented step of requiring EPA to guarantee access to the underlying data for every study it may use for decision-making, and to forfeit the ability to consider a study if this requirement has not been met.

EPA scientists working on risk and hazard

assessments collect and review thousands of studies. Published reports of these studies typically do not include all underlying data. In such cases, EPA would need to contact the researcher, ascertain the nature and extent of underlying data, and put in place a mechanism for the public to access the data.

Even with diligent efforts by EPA, there are many reasons why disclosure of data sufficient to replicate a study may be impossible. The EPA proposal duly notes these obstacles to study replication and provides that exemptions may be granted on a case-by-case basis. But an exemption process will add to the considerable cost and effort required to implement the proposed rule and will undoubtedly result in disputes and even litigation over whether exemptions are justified. Is the damage it will inflict on the quality and timeliness of EPA scientists justified by the benefits of the proposed rule?

EPA leaders have painted a bleak picture of EPA reliance on quote, "secret science"

developed behind, quote, "closed doors," based on data that has, quote, "been withheld from the American people."

This is not the reality that I experienced in my several years at EPA. I saw a very different reality. I saw EPA science assessments providing an exhaustive and critical review of relevant studies, and a full explanation of how they're being interpreted. I saw extensive information about each study being placed in the public record. I saw public comment and peer review of all EPA assessments. And of course, as part of public comment, members of the regulatory community had an opportunity at any time to replicate studies they deemed flawed.

In short, the problem that the proposed rule seeks to fix is imaginary. In conclusion, the Agency's leadership needs to fundamentally rethink the proposed rule. The stakes for EPA science and the protection of public health are simply too high to finalize a proposal which is deeply problematic and unnecessary. Thank you.

MS. ORME-ZAVALETA: Thank you.

DR. ROSENBERG: Good morning. I am Dr. Andrew Rosenberg, R-O-S-E-N-B-E-R-G. I'm the Director of the Center for Science and Democracy at the Union of Concerned Scientists. And we advocate for the role of science and public policy.

I'm here today to ask that you rescind this proposed rule because it would only restrict EPA's ability to use the best available science to fulfill its mission of protecting public health and the environment, while doing nothing to improve transparency and decision-making.

First and foremost, the proposal is fatally flawed because it provides almost no justification of analysis of the impacts of the proposed change in policy. There is no cost-benefit analysis of the rule with respect to the agency, and external researches, nor how it would affect EPA's mission and critical work.

Additionally, the proposal would affect -- effectively prevent the EPA from using many

kinds of scientific studies vital to its decision-making. This includes, but it is not limited to studies that rely on personal health data, confidential business information, intellectual property, or older studies where authors and data sources may not be accessible.

Without the ability to use this scientific information EPA would be unable to meet its mission and statutory obligations. This proposal would make it significantly harder for EPA to use the best available science to protect the public, including from harmful emissions of hazardous air pollutants, particulate matter and ozone, exposure to dangerous chemicals and commerce, drinking water contaminated with toxic chemicals, such as PFAS or lead.

Further, CBO has calculated that such restrictions would substantially increase costs and burdens to an agency that is already experiencing budget cuts, reorganizations and understaffing, thus undermining the ability of EPA to make decisions based on science.

The proposed rule could also prevent the Agency from addressing the impacts of dangerous chemicals at low concentrations where direct measurements are very difficult. This would have the effect of leaving Americans unprotected, even when there was clear indication of harm to human health.

I have over 30 years of experience in government service, academia, and non-profit leadership. I've offered -- authored or reviewed hundreds of peer-reviewed scientific papers. As part of my government service I worked as a scientist and in a policy position at a regulatory agency, and universities as a faculty member and dean. I understand how agencies use science in policy making, how research at universities is conducted, and how these entities incorporate best practices of transparency into their scientific work. As a frequent peer reviewer, I do not review the raw data for studies, since that would tell me little. I review the research questions, the methods that summarize data, the results and

conclusions in order to assess the quality of the work. EPA's proposed rule would do nothing to improve transparency for scientists, policy makers, or the public.

Crafting the rule without consulting with the scientific community is a fatal error for this proposal. Even the Agency's own Science Advisory Board has noted the need to consult with scientists in any further development of this proposal.

A further fatal flaw is that the proposed rule would replace scientific evidence with political judgment. The rule would grant the EPA administrator broad authority to exclude individual studies or entire decisions from being subject to its provisions. Decisions on which science is to rely on should be made by the Agency's scientific experts based on established criteria for best available science.

Five minutes is not enough time to cover all the problems with this proposal. At best, this proposed rule is a misguided attempt at

transparency. At worst, it is a back-door attempt to prevent EPA from protecting public health. UCS supports real transparency reforms. We support scientific integrity policies that prevent political interference in scientific analysis and reporting. We do not believe researchers should be put in the absurd position of choosing between protecting study participant privacy or informing the EPA's effort to protect public health and safety.

On behalf of the Union of Concerned Scientists, and I have 500,000 supporters, I urge the EPA not to move forward with this rulemaking and to continue to allow agency scientists and policy analysts to use the best science available to inform their work. Thank you very much.

MS. HALL: Thank you. Would Paul Tonko and Suzanne Bonamici please approach the speaker's table. Speakers A and B, respectively. And Speakers 5, Daniel Greenbaum, and 6, Jennifer McPartland, please take your seats at the on-deck circle.

MR. TONKO: Good morning.

MS. ORME-ZAVALETA: Good morning.

MR. TONKO: Can I begin? Okay. Thank you. Good morning and thank you for the opportunity to address the panel.

I am Congressman Paul Tonko. I represent the 20th Congressional District of New York State, more specifically the Capital Region and Mohawk Valley, an area rich in environmental stewardship.

As the Energy and Commerce, Environment Subcommittee ranking member, I have come here today to express grave concerns about the Environment Protection Agency's proposed rule published on April 30th of 2018, entitled "Strengthening Transparency in Regulatory Science."

This proposal would severely limit the types of research that EPA could take into account when developing policies. It has been cloaked in arguments about transparency. But let's all admit here that this emperor has no clothes. This has nothing to do with transparency. It is a thinly

veiled campaign to limit serious and highly credible scientific research that supports critical regulatory action.

This administration has used this bad faith argument about transparency to say that the many studies, including many epidemiological studies that rely on private, personal, medical data should be excluded entirely from EPA rulemaking. Why would a science-driver public agency undertake such a radical departure from existing and widely accepted scientific standards? I have yet to hear a credible answer to this question that is not rooted in favors to industry polluters.

The current political leadership at EPA has shown a pattern of bad faith in pushing policies that undermine this Agency's -- EPA's mission, and the public trust.

Today's proposal and its false claims about transparency are consistent with that pattern; a fact that was put on full display when the administration realized its broad approach

would hurt regulated industries too, since many EPA chemical reviews rely upon confidential business information. To get around this, the rule would give the EPA administrator complete discretion to exempt studies, especially or essentially guaranteeing that political interests will always matter more than science. That's why I refer to this policy as selective science.

This proposed rule would be used to erode landmark achievements in public health and environmental safety. For example, we know the Clean Power Plan would have led to reductions in pollution that were predicted to prevent some 3,600 premature deaths, 19,000 asthma attacks in children, and 300,000 missed school and work days each year. Many of these health benefits were partially determined by landmark clean air studies like the Harvard Six Cities Study.

Opponents of Clean Air Act protections would like nothing more than to see such landmark public health findings excluded from EPA reviews. I'm not here speaking alone. Nearly 1,000

scientists in many leading scientific organizations are united in vocally opposing this policy. Countless everyday Americans stand with us too, with many more listening in and watching for news to see if anyone in a position to do something about this will finally admit the obvious; this is not about transparency. This is not about protecting human health or our environment. This emperor, again, has no clothes.

This rule would limit the scientific research available to EPA policy makers as they draft public protections and environmental guidelines. I implore EPA to put science and public interest ahead of political and special interests, and withdraw this rule, ill-conceived, that's based on -- its negative impacts on science and public health. A very discouraging and concerning proposal. And I just felt compelled to come here today and vehemently speak against it.

MS. ORME-ZAVALETA: Thank you, sir.

MS. BONAMICI: Thank you. Good morning.

MS. ORME-ZAVALETA: Good morning.

MS. BONAMICI: And thank you to Acting Administrator Wheeler and Director Sinks. I am Suzanne Bonamici. I represent the First Congressional District of the State of Oregon. I serve on the House Committee on Science, Space, and Technology, where I am the ranking Democrat on the Subcommittee on Environment. I appreciate the opportunity to testify before you today.

I am opposed to the Environmental Protection Agency's proposed rule titled, "Strengthening Transparency in Regulatory Science." The proposed rule would impede, if not eradicate the EPA's ability to protect Americans from significant risks to human health and to the environment by limiting the scope of research that the EPA could consider in making decisions.

The proposed rule perpetuates the incorrect notion that the science the EPA relies on is somehow hidden. It is not. This misconception is based on conflating the meaning of secret and confidential. None of the information used by the EPA is secret. Some of

the information may be confidential if, for example, it includes the personal health information of individuals who participated in a study.

As a cornerstone of its regulatory process, the EPA relies on peer-reviewed science. The EPA already publicly discloses studies that support regulatory action. The proposed rule simply attempts to block access to good science. Much of the science that is used to inform regulatory actions is developed outside of the agency. Scientific studies often include personal information and other confidential data. Because this data is legally protected from disclosure, the EPA would be forced to ignore valuable information discovered during their research, because it contains confidential information. This would have chilling consequences for the EPA and for every person who benefits from clean air and clean water.

It is also deeply troubling that the proposed rule is inconsistent with the Agency's

statutory obligation to use the best available science as required in the Toxic Substances Control Act, Safe Drinking Water Act, and Clean Water Act. The proposed rule would preclude the use of a range of scientific research that has long been used to safeguard the public.

There is also tremendous uncertainty whether the proposed rule would retroactively apply to existing standards and regulations. Retroactive application would severely undermine existing public health and environmental protections that keep the public safe and healthy.

Transparency is a laudable goal, and it could be accomplished through collaboration with, and input from the scientific community. It is noteworthy that thousands of scientists and many leading scientific originations also propose this proposed rule. If the proposed rule is implemented it is possible, or even likely, that scientists, organizations, and research institutions will be less inclined to participate in EPA funded research because of the risk of

improperly disclosing personal information. It may also be more challenging for researchers to recruit participants for their studies because of the fear that personal data could be shared.

Over the last few years, the House Committee on Science, Space, and Technology has considered several iterations of legislation that have many similarities to the proposed rule. I have been a vocal opponent of these bills for the reasons I just stated.

I also want to note that despite repeated efforts by the majority, the so-called secret science legislation has not passed both chambers. Congress has the sole constitutional authority to legislate, and this proposed rule is an administrative attempt to circumvent the legislative process. I strongly urge you to withdraw this proposed rule. It will undermine scientific integrity, jeopardize bedrock public health and environmental standards, and endanger the EPA's ability to protect the American people, which is its mission.

Thank you for the consideration of my testimony.

MS. ORME-ZAVALETA: Thank you both for coming.

MR. TONKO: Our pleasure.

MS. HALL: Would Daniel Greenbaum, Speaker Number 5 and Speaker Number 6, Jennifer McPartland, please approach the speaker's table. And would Speaker Number 7, David Michaels and Speaker Number 8, Paul Billings, please take a seat in the on-deck circle.

MR. GREENBAUM: Let there be light. And there was light.

My name is Daniel Greenbaum. That's green, like the color, B-A-U-M. I'm the President of the Health Effects Institute, and I'm very pleased on behalf of the Health Effects Institute to provide these brief oral comments today. We are preparing and will submit much more detailed written comments.

As many in this audience know, HEI has a longstanding commitment to the principles being --

attempting to be addressed by this proposal, producing science of the highest integrity and quality with special attention to issues of reproducibility and transparency.

This includes rigorous research and statistical design, subject to competition, continuous oversight, data quality assurance audits, and more, extensive efforts that test all findings against a wide range of different statistical techniques and assumptions, intensive and independent peer review with all results published, and an active data access policy which for nearly 20 years has been working to ensure access to underlying data for all HEI funded studies.

In our view, reproducibility is a critical challenge for science. Can the results of an important study be reproduced? However, in our view the most effective way to test reproducibility and the validity of science is not necessarily to simply reproduce the same results in the same data sets. Rather it is most

important to answer the question, "Are the results consistent when tested in other independent studies?" For example, studies that use new and different data sets not affiliated with the original studies. Studies that have different investigators applying the same and/or alternative statistical techniques. And studies that test the sensitivity of the results against a wide range of possible other explanations like smoking or socioeconomic status.

In a limited number of cases where there are not comparable studies, it may be useful to gain access to the original study data and analytic codes to allow for independent evaluation. Can the original results be replicated, and are they robust to a wide range of alternative assumptions, models, and potential confounders? This is, of course, exactly what the Health Effects Institute did when we conduced an independent rigorous reanalysis of the Harvard Six Cities and American Cancer Society studies. And I've attached and will submit the summary

description of that reanalysis from HEI's final report.

This approach can and did provide comprehensive assurance of the quality, integrity, and validity of the original results. However, this is a highly cost-intensive and time-consuming endeavor, which should only be applied in cases where there are only one or just a few studies in a particular arena.

HEI also agrees with the continued need to enhance transparency and data access, but would note that these issues are not new. We've had our own data access policy for over 20 years, and have been -- and they've been addressed now for over 15 yeas by administrations from both parties, and by the scientific community. This is -- it included guidelines for the Information Quality Act adopted by OIRA in 2002, numerous actions by the scientific community and journals to enhance access, and most recently the requirements for enhanced data access across the federal government promulgated by OSTP in February 2013.

We would strongly urge EPA to review the progress already made under these several major initiatives and to carefully consider whether or not there are additional efforts that could further enhance transparency and to do so before proceeding with a final ruling.

Finally, access to private medical information is essential to conducting high quality and reproducible air quality and health research. There are of course longstanding federal rules for protecting the privacy of individual medical information of the subjects of studies. And gaining access to data from older studies may be difficult, but given the privacy commitments that were made to study subjects in the past.

However, there are today, several means to make such data available to investigators with appropriate privacy protections. Medicare makes it available, federal research data centers make it available, and many investigators already have been taking advantage of these.

Although it is possible, as some have suggested, to create a depersonalized data set by stripping all personal identifiers, such as address, date of birth, et cetera, it's not possible to conduct a high-quality air pollution and health study without knowing the location of those being studied. I.e., Where do they live and what are the sources and levels of their air pollution exposure? So it can't be simply put on a disk and handed out.

Thank you for this opportunity to testify. We look forward to submitting our detailed written comments, and would welcome the opportunity to further assist EPA in these efforts to ensure that the widest array of science is available for decisions.

MS. ORME-ZAVALETA: Thank you.

MS. McPARTLAND: Good morning. My name is Jennifer McPartland, M-C-P-A-R-T-L-A-N-D, and I'm a Senior Scientist at Environment Defense Fund.

EPA's proposed rule represents a

disregard for the Agency's core mission, protection of human health and the environment. Under the guise of transparency, EPA's proposal handcuffs the Agency's use of best available science in violation of many of its statutes. If finalized, the rule will erode critical public health protections, and with them, the scientific integrity and public trust of the agency.

EPA's censored science proposal would prohibit EPA's use of critical scientific studies in developing regulatory requirements unless all the data underlying the studies have been made public. As the authors of this proposal know well, this unnecessary and unworkable standard would effectively bar the Agency from using high-quality scientific research in studying public health safeguards.

The data underlying many scientific studies are not publicly available and cannot be made publicly available. For example, research involving human subjects often rely on medical or other personal information; information that

researchers cannot make public.

Additionally, advances in data science have made it increasingly more challenging to effectively deidentify study subjects and protect their privacy. In other instances, studies may have been published decades ago and the underlying data are no longer available. It is exactly these types of studies that EPA and other authorities use to protect people from harmful environmental exposures like lead, formaldehyde, methylene chloride, benzyne, arsenic, and perchlorate, just to name a few. It is the science generated by our most prestigious scientific institutions. It is the knowledge we rely on to ensure our water is safe to drink, our air is safe to breath, and our land is safe for our children to play.

Beyond jeopardizing critical public health protections, the proposed rule completely disregards established effectiveness mechanisms used to vet scientific research including peer-review, data sharing agreements, and consensus in findings across multiple studies. Indeed, EPA

provides no explanation or justification, showing that this proposal would improve upon these established mechanisms.

The proposed rule also raises several troubling concepts that are contrary to scientific best practices and chemical assessment, as discussed extensively in the Seminole National Academy's report, Science and Decisions.

Specifically, the proposed rule ignores the report's conclusions that thresholds of effect for chemical exposures are the exception rather than the rule, given by a logical and exposure variability across the population. The rule also seeks to demote the use of health protective defaults and risk assessment, again at odds with the recommendations of the National Academies.

Additionally, the proposal gives more value to studies in employ of a variety of dose response models, an approach that can be misleading. Multiple bad analysis does not make a study more credible.

More broadly, the proposed rule seeks to

codify scientific practices and irregulation. It is a consistently frowned upon approach given the continuously evolving nature of science. EPA's development of the proposal also represents a total disregard for process. The Agency sidestepped review by its external Scientific Advisory Board, which has now voiced serious concerns about the proposal and has recommended that it undergo full SAB review before possible finalization.

The White House OMB review of the proposal was also quite dubious, involving a revision to the original date its review had been completed to seemingly align with the fact that former Administrator Pruitt had signed the proposed rule a day prior. The final OMB review process took course over just a few days, an impossible amount of time for any legitimate interagency review of the complex scientific issues at stake in this rulemaking, even though they have implications for all other federal agencies that rely on sound science.

Not surprisingly, the proposed rule does not grapple with the challenging steps necessary for legitimate effort to support greater data availability. It does not consider the digital infrastructure that would be required to make underlying study data publicly available in a secure manner, nor the resources needed for researchers in the Agency to use and maintain such a system.

Indeed, the congressional budget office estimated that a similar piece of legislation would cost millions of dollars. Americans need and expect the EPA to use the best available science. Right now, Americans across the country are drinking water contaminated with per- and polyfluoroalkyl substances, or PFASs.

In May, EPA publicly committed to initiating steps to regulate two of the most well-studied, PFOA and PFOS, toxic substances linked to cancer, thyroid effects, and reproductive harm. Some of the best available data on PFOA comes from the C8 Health Project, which involved a community-

wide assessment of 69,000 residents living around Parkersburg, West Virginia, who had been exposed to PFOA for decades. Studies resulting from the project will be critical to EPA as it takes steps to address PFOA and PFOS, yet the censored science proposal would make it difficult, if not impossible for EPA to rely on those studies.

EPA's censored science proposal serves the interest of polluters, not the public. It is designed to undermine EPA's use of critical research, EDF supports, meaning full transparency and science, and the ongoing efforts in the scientific community provide that transparency. But this proposal is not about transparency. It is about rolling back public health protections and environmental protections.

EDF strongly recommends that EPA withdraw the proposed rule. Thank you.

MS. HALL: Thank you. Would Speaker Number 7, David Michaels, and Speaker Number 8, Paul Billings, please approach the speaker's table. And Speaker Number 9, Gary Timm, and

Speaker Number 10, Tyler Smith, please take a seat in the on-deck chairs.

MR. MICHAELS: Good morning. My name is David Michaels, M-I-C-H-A-E-L-S. I'm an epidemiologist and Professor of Environmental and Occupational Health at the George Washington University School of Public Health. I'm also submitting a longer set of comments, copies of which I have available.

From 2009 to January 2017, I served as Assistant Secretary of Labor for OSHA, the longest serving in OSHA's history. From 1998 to 2001, I was Assistant Secretary of Energy for Environment, Safety, and Health, charged with protecting the workers, community, residents, and environment in and around the nation's nuclear weapons complex.

As a scientist who has been deeply involved in promulgating regulations that protect the public's safety, health, and environment, I recognize the importance of open science and using the best available science. However, the proposed rule does not accomplish these goals. Instead, it

would make it more difficult for EPA to use scientific findings to protect public health. I have no doubt it would result in more people made sick by pollution or toxic chemicals that would have been prevented in the absence of this new regulation.

This cynical approach proposed by EPA can be best described as weaponized transparency. Decades ago, when studies started to show that smoking killed not only smokers, but also their non-smoking spouses, the tobacco industry recognized the government would use this evidence to reduce smoking. In response, the tobacco industry demanded access to the raw data of these studies.

Big tobacco turned transparency, an important scientific principal, into a weapon. The strategy worked for tobacco for years, helping to delay regulation and increase the death toll from smoking related illness. Since then, polluters and manufacturers of deadly products have followed big tobacco's playbook. First

supporting legislation, and then when that was unsuccessful, this proposed rule.

If promulgated, this regulation would permit the EPA administrator to deny the Agency use of findings of any study unless the raw data and other related materials are provided to the Agency and posted on the Agency's website. There are no constraints on the administrator. She or he is not required to provide any rationale for rejecting a study because the underlying information is not publicly available.

The underlying justification for this quote/unquote, "transparency proposal," is a caricature of how science really works. It is not sound science. It is something that sounds like science, but isn't.

While in theory, most studies could be reproduced, they rarely are because it's a waste of resources. The scientific enterprise involves approaching the same question in different ways to determine if the results support each other. Reanalyzing the same study over and over is little

different from checking on a surprising newspaper article by buying additional copies of the same newspaper to see if it says the same thing.

Under the provisions of the Administrative Procedures Act, the EPA administrator does not have the authority to refuse to consider any comments submitted to the agency. If he or she thinks it's not valid, inaccurate, or inapplicable, she or he must explain why. Under the EPA submissions, including scientific studies, cannot arbitrarily or capriciously be discarded because the underlying data are not provided.

When I was an OSHA administrator, we wanted to protect the integrity of the science used in setting regulations, so we explored asking for conflict of interest disclosures, similar to those requested by every leading scientific and medical journal.

Our legal experts determined that we could request this disclosure, but we could not reject submissions that failed to include them.

This is a comparable situation; rejecting submitted studies because the underlying data are not available is prohibited under the EPA.

Furthermore, many of the EPA's authorizing laws require the Agency to use the best science. For example, the Clean Air Act mandates that air quality criteria accurately reflect the latest scientific knowledge. In the past the EPA has considered all available studies in issuing these criteria without consideration of the availability of the underlying data. Promulgation of this proposed rule would be a violation of these provisions of the Clean Air Act.

When the loss similar to this NPRM was first considered by congress, the EPA told the Congressional Budget Office that it estimated the cost of gathering, redacting, and posting the data on the public website, at $250,000,000 annually. The cost estimate made by the current administration for a substantially similar law dropped to $1 million a year from $250,000,000 a

year, because in the candid shocking words of the CBO, EPA officials explained this approach would significantly reduce the number of studies the Agency relies on when issuing or proposing covered actions.

In summary, by turning scientific transparency into a virtual weapon, the EPA will inflict severe damage to the nation's scientific enterprise. It will undermine the credibility and application of scientific evidence and impose costs and impediments that will discourage scientists from undertaking studies of great importance. Limiting the EPA's use of scientific evidence in the name of increased transparency will impede its ability to protect the health, safety, and environment of the nation. This proposal must be withdrawn.

MS. ORME-ZAVALETA: Thank you.

MR. BILLINGS: Good morning. I am Paul Billings, B-I-L-L-I-N-G-S, National Senior Vice President Public Policy at the American Lung Association. The American Lung Association is the

nation's oldest voluntary health agency. Our volunteer leaders take great pride in that our work is always grounded in the best available science. The American Lung Association opposes this rule and we urge the EPA to withdraw it.

Make no mistake, this proposal is not an effort to strengthen transparency or improve regulatory science. As I will discuss, this proposal is an effort to exclude important studies whose conclusions, especially studies that shows particulate air pollution causes premature death, are inconvenient. Together with the efforts to discount or exclude benefits from pollution reductions, this is a coordinated effort to ignore the science that is inconvenient to EPA's agenda to roll back regulations that reduce air pollution and save lives.

The EPA Science Advisory Board has asked to review the rule under the authority vested in it by the Environmental Research, Development and Demonstration Authorization Act. The SAB sent a letter to the EPA administrator, raising many of

the same scientific issues of confidentiality, feasibility, and the need for a clearer definition of crucial concepts, such as replication and validation. We urge the EPA to fully consult with the SAB before moving forward with this rule.

After the SAB review is complete, EPA should either withdraw the proposal, or provide an additional opportunity for public comment based on that SAB review.

We are disappointed that the EPA has made this proposal. This is not a new fight. It started in the early 1990s, when the tobacco industry tried to undermine the science that supported EPA's landmark risk assessment that showed that second-hand smoke kills. The tobacco industry and its allies lost a decade-long fight about whether or not second-hand smoke causes lung cancer, heart disease, asthma attacks, and other adverse health effects.

We know many of the details the tobacco industry's efforts, because -- as a result of the landmark tobacco litigation, nearly 90 million

pages of tobacco industry documents are housed at the University of California, San Francisco, Truth Tobacco Industry Documents library. Now we know the truth.

Within this archive are documents that show how PR firms, lawyers, and front groups attempted to undermine the credibility of EPA science. The documents show the tobacco industry launched this effort in the name of sound science that not only attacked the second-hand smoke risk assessment, but EPA's efforts to protect the public from ozone air pollution, radon, pesticides, and more. Remember, in 2006, the big tobacco companies were found guilty of civil racketeering for their decades-long conspiracy to defraud the public about the health risks associated with smoking.

The attack on science continued throughout the 90s, when EPA set the first standard for fine particulate matter. The PM2.5 standard. That national ambient air quality standard has saved thousands of lives. This was a

concerted effort by industry and the tobacco industry and their allies, and make no mistake, tobacco industry did not only focus on second-hand smoke. They attacked all of EPA's science. The other polluters came along for the ride and now we're leading that effort.

There was a concerted effort to undermine the Six Cities Study, and the American Cancer Society study. To address the questions being raised, and we just heard from the Health Effects Institute, the HEI, while protecting patient confidentiality, conducted an independent review of the data and these studies. The HEI reaffirmed the results from those studies. These landmark studies were key to informing the rules that cut PM2.5 pollution over the past two decades. Thousands of people are alive, and millions are breathing easier because of those efforts.

These studies depend on patient participation. Protecting patient confidentiality must be paramount and is key to recruiting study participants. This proposal will censor science,

will exclude important well-done peer-reviewed studies that are informing EPA actions, or will threaten that patient confidentiality. This is an unacceptable choice. EPA must use the best science, with within established frameworks, and not limit access to the best science to inform regulatory decisions. We urge the EPA to withdraw this proposal. Thank you very much.

MS. HALL: Thank you, both.

Would Speaker Number 9, Gary Timm, and Speaker Number 10, Tyler Smith, please come up to the speaker's table. Would Speaker Number 11, Eugenia Economos, and Speaker Number 12, Anne LeHuray, please take your seat in the on-deck chairs.

MR. TIMM: Good morning. My name is Gary Timm, G-A-R-Y T-I-M-M. I worked at EPA for 38 years and retired in 2011.

I was Chief of the Chemical Testing Branch in the Office of Pollution, Prevention, and Toxics for 10 of those years. The Chemical Testing Branch is responsible for implementing the

testing provisions of Section 4 of the Toxic Substances Control Act.

Today, my remarks will focus on three things. Our studies traditionally used in support of regulation, and vis-à-vis, the proposed transparency policy, it's interaction with TSCA Section 4, and its interaction with our obligations to accept studies conducted in accordance with OECD test guidelines.

Let us be clear, if EPA had adopted this data transparency limitation and past risk assessments, EPA would not have been able to take many of its historic actions to protect children, families, and the environment. No reduction or elimination of the exposure to children to lead and paint, gasoline and drinking water, no air quality standards for particulate matter and other air pollutants, and the list goes on and on.

The proposed policy would affect assessments that will soon be carried out under TSCA Section 6. TSCA gives EPA the authority to regulate the manufacture, processing, distribution

and commerce, use, and disposal of chemicals. The problem formulation documents, which set forth EPA's approach for assessing the first 10 chemicals under the amended TSCA are open for public comment now.

How these chemicals are assessed will be the model for future assessments. The proposed policy would in fact make it impossible for EPA to consider the full array of well-conducted and peer reviewed scientific studies of the health and environmental effects of pollution. It would bias the body of information in favor of industry supplied studies, since they would all have the means to provide the underlying data.

Assessment of all relevant scientific information is essential in making sound judgments about protecting human health and the environment. And it is a legal requirement in all major environmental legislation.

TSCA also contains provisions to require chemical manufactures to test the chemicals that they manufacture and process. To require industry

to test chemicals under Section 4, EPA must make a set of legal findings. It is the data inadequacy finding that we are interested in today, for it is the nexus between TSCA Section 4, and the proposed transparency policy.

To make this finding, EPA conducts a thorough literature search and usually issues a rule to require studies that have not been published to be submitted to the agency. Typically, the bulk of information considered, however, is studies published in the peer reviewed scientific journals. Despite being accepted by the scientific community, these studies do not meet the transparency requirements of the published rule, since it requires that all raw underlying data and the models used to analyze the data supporting their study are available for public review.

Thus, if the Transparency Rule were in effect, under TSCA Section 4's second finding, EPA would have to judge studies from peer reviewed journals as inadequate. Ignoring this large

category of information would cost industry hundreds of millions of dollars to repeat perfectly good scientifically acceptable studies, which the public would ultimately pay for through higher prices. And it would significant delay, or in some cases preclude assessment and regulation of risks to human health and environment.

Another aspect not discussed in the proposed transparency policy is the obligation of the U.S. to accept data generated in accordance with the Mutual Acceptance of Data treaty. The U.S. and other Organizations for Economic Co-operation and Development member countries realize that differences in testing requirements on countries, meant that companies would in some cases have to retest a chemical in order to market it in other areas. This was needlessly costly and resulted in a delay in obtaining information needed for regulatory assessment.

As a result, the OECD member nations agreed to accept, for regulatory purposes, data generated in accordance with the OECD test

guidelines. Submission of underlying data is not a requirement of the Mutual Acceptance of Data treaty. Therefore, the proposed policy which requires underlying data to be made available to be used for risk assessments would run counter to our obligations under the Mutual Acceptance of Data treaty.

In short, the proposed policy is a trojan horse. I can only conclude that this proposal constitutes fraud, as it is deceptive. Waste, rejecting perfectly valid studies and abuse, for it is arbitrary and capricious.

Thank you for giving me the opportunity to provide comments this morning.

MS. ORME-ZAVALETA: Thank you.

MR. SMITH: Good morning. My name is Tyler Smith. I'm a staff scientist at Earthjustice. We are the largest non-profit environmental law organization in the country.

EPA's proposed rule is an attack on the science used to protect children's health. Simply put, it would weaken risk assessments for

chemicals that harm kids. These chemicals include organophosphate pesticides like chlorpyrifos, which EPA scientists long ago concluded present grave risks to children.

Earthjustice therefore urges the Agency to reconsider its approach and withdraw the proposal immediate. Under the Food Quality Protection Act, EPA is required to abide by an additional safety factor of 10 when setting the level of exposure to a pesticide that may harm infants and children. It is well established that children are more susceptible to the toxicity caused by pesticide exposure than adults. The law therefore requires that EPA take this into account and ensure that the most vulnerable among us are protected.

Under the statute, EPA may decide to apply a different safety factor if, and only if it concludes on the basis of reliable data that such margin will be safe for infants and children. The most reliable data, including epidemiological studies conducted in three different perspective

cohorts clearly establish that prenatal exposure to chlorpyrifos and other organophosphates, harms the developing nervous system. This exposure reduces IQ, and it increases the risk of developmental disorders, such as ADHD.

All of this science was peer reviewed prior to publication, and EPA scientists and the independent experts who serve on the FIFRA Scientific Advisory Panel reviewed it extensively and repeatedly over many years. Accordingly, chlorpyrifos risk assessments conducted in 2014, and again in 2016, included the required safety factor, and both assessments found that exposures exceeded the identified levels of concern.

Accordingly, the EPA proposed banning all uses of chlorpyrifos on food in 2015. But last year, political appointees at the Agency disregarded this science and announced that the Agency would not finalize the proposed ban. EPA now may wait years to reconsider. And it appears that the same political appointees who disregarded the science, now want to weaken the chlorpyrifos

risk assessments in advance of their next review.

Indeed, the pesticide industry responded to EPA's conclusions on chlorpyrifos by proposing novel requirements that are strikingly similar to what the Agency now proposes to do for all science. CropLife America, an industry trade association, asked EPA to quote, "Require access to raw data as a prerequisite to relying on any study to support regulatory decisions," unquote. And Dow AgroSciences, which manufactures chlorpyrifos, also complained in comments that the Agency is not quote, "Secured and shared the raw data underlying the epidemiology studies," unquote.

Now EPA did seek a study -- or, I'm sorry, did seek data from a study conducted at Columbia University. However, Columbia determined that it could not provide all of the requested data without violating its obligations to the mothers and children who had participated in the research.

Notably, EPA did not respond to these

concerns by refusing to consider the Columbia study. Rather, scientists from the Agency and Columbia met to discuss the study in greater detail, and the University produced extensive supplemental analysis in response to agency questions.

Furthermore, Columbia offered to make all of the data available to agency scientists for analysis in a secured facility on Columbia's campus. Now these efforts suggest there are numerous alternatives to the rigid requirements the proposed rule would impose on the use of science and agency rulemaking.

As epidemiologic studies of chlorpyrifos support retaining the safety factor to protect infants and children, EPA may believe that such studies fall within the vague definition of dose response data and models contained in the rule. If so, EPA may believe that the continued efforts by Columbia to protect the hundreds of mothers and children who participated in its research preclude the use of these data because they cannot be made

publicly available.

EPA may believe this precludes the use of other epidemiologic studies as well. As a result, this proposal could be used to avoid protecting infants, children, and others from exposure to chlorpyrifos and more than two dozen other organophosphate pesticides. It is simply outrageous that EPA, an agency charged with utilizing science to protect public health, would do the bidding of the pesticide industry it regulates, and try to circumvent its own scientific conclusions by choosing to ignore the best available science.

I urge the Agency to reconsider this proposal and withdraw this deeply flawed rule. Thank you.

MS. HALL: Thank you. Would Speaker Number 11, Eugenia Economos, and Speaker Number 12, Anne LeHuray, approach the speaker's table. And Speaker Number 13, Diana Van Vleet and Speaker Number 14, John Auerbach, please take a seat in the on-deck chairs.

The speakers are reminded to please speak into the mic, and also state who you're speaking for. Thank you.

MS. ECONOMOS: Hi. I am Eugenia Economos, E-U-G-E-N-I-A E-C-O-N-O-M-O-S. I am with the Farmworker Association of Florida. We are a grassroots farmworker organization that's over 35 years old. I say that because it's important to understand that our organization was co-founded by a man who was a farmworker himself. Our staff are almost all former farmworkers. Our board of directors are farmworkers. They're from farmworker families. And I'm here on behalf of our communities who are mostly African/American, Hattian, and Hispanic farmworkers who harvest the food that feed all the rest of us, the food that we eat is harvested by farmworkers in the field who are exposed regularly to pesticides. And I'm here on their behalf.

Our organization is very involved in pesticide health and safety, and in doing that we have participated in community based participatory

research projects, including a four-year project with Emory University that we did. It was funded by NIOSH, and in that study, we looked at farmworkers and in the nursery industry that did ornamental plants in Central Florida, and farmworkers in the fernery industry, which are also ornamental plants.

And we looked at the reproductive health effects of occupational exposures, including occupational exposure to pesticides. We are well-trusted in the community because we are based in our communities and because we are of, by, and for the farmworker communities. And we're able to do these studies because we have the trust of our community members.

In that study with Emory University, we did surveys with 260 women of reproductive age. One of the things we looked at was -- we additionally did urine samples on 100 women, including women that were pregnant, looking at levels of organophosphate pesticides and the pesticide, mancozeb, in their urine.

One of the reasons we chose mancozeb, because that is a fungicide that was implicated in birth defects that happened in Omokollee, Florida in 2004 and 2015, and we wanted to look at the levels of the pesticide in the urine of the women that we studied.

The results of that study showed very high levels of organophosphate pesticides and mancozeb in the urine of the women that we studied, much higher than the NHANES national averages.

We used that information in order to both develop a training for the women about how to protect themselves from pesticides. But we also used that information to write up a paper about -- because mancozeb is coming up for re-review, and we think it's very important to understand the levels that we found of the mancozeb in the urine.

I say that because we would not be able to do that study if we did not have the trust of the people. And we had that trust because we ensured their confidentiality. We would not be

able to do this if there was any sense at all that their confidentiality could be compromised. You're talking about people who are minorities. Many of them are immigrants. They're already under attack in their communities for many other reasons, and if we could not assure their confidentiality, we would not have participation.

I have people come to me all the time with different complaints from their work environments. And it's heartbreaking to me when people come to me and talk about being exposed to pesticides, and then they're afraid to make a report because they're afraid of losing their job, or they're afraid of retaliation.

We would -- we cannot, we would not, we would never engage in studies if we could not ensure that our people, our community would be protected from any kind of revelation of their identities or of their information. So that's why we are opposed to this proposed rule. We're also concerned about that epidemiological data is really important to look at synergistic and

cumulative effects of pesticide exposure, and you cannot find that without doing epidemiological studies. So we are also concerned that we're -- I'm sorry. We're also looking at the body burden of pesticides in the farmworkers that we study, and farmworkers are exposed to multiple different kinds of pesticides. And if you're not looking at epidemiological studies to look at that, then you are ignoring an important role of science in the farmworker community.

I am saying that, I am sitting here, and I just want you to know that even though I'm sitting here, behind me are tens of thousands of farmworkers in Florida and around the country, and I'm here on their behalf. And on their behalf, I'm asking you to reject this rule. Thank you.

MS. ORME-ZAVALETA: Thank you.

MS. LeHURAY: Good morning. My name is Anne LeHuray, L-E-H-U-R-A-Y. And that's Anne, with an E. And I am here as the Executive Director of the Pavement Coatings Technology Council, also I'll call it PCTC.

PCTC, their members manufacture products that are used in pavement maintenance programs to extend the useful life of an asphalt parking lot, for example. Airport surfaces, and the like.

Our members are almost exclusively small family-owned businesses, and their customers, who we also represent, are virtually 100 percent small family -- small and maybe even say micro family owned businesses.

So at PCTC, we strongly support the concept of what EPA is proposing in the "Strengthening Transparency in Regulatory Science" rule, however we urge EPA to go beyond what it has proposed with a goal of improving on EPA's current procedures which lack any meaningful remedies when the Agency relies on science that has been shown to be unreproducible.

The Council supports the efforts of the Agency to ensure that scientific studies, data, and models on which it relies in developing regulations, guidance, and policies are sufficiently transparent. Doing so helps ensure

that others can attempt to reproduce the results in which the Agency bases its regulation, guidance, and policies.

However, the council believes the proposed rule does not go far enough. PCTC has witnessed first-hand the distortions and bad public policy that can result from what has been called in other venues, secret science, by which we mean, science that has been shown not to be reproducible.

And EPA has contributed to this problem. They were not the source of the unproducible science, but they've contributed to the problem by using that unreproducible science, because to use the Agency's words, it is fit for purpose. Meaning, we suppose, that it suits the Agency's desire to regulate, even if the science says that the regulation is unwarranted.

So PCTC's experience causes it to be concerned that the Agency proposes to restrict its increased focus on transparency to only dose response data and models, to only final

regulations, and to only pivotal studies as narrowly defined the proposed rule.

We would note that worldwide scientists and science organizations have recognized the crucial rule of transparency to the very crux of the scientific enterprise, which is, science has to be falsifiable. That means that it has to be reproducible.

At a minimum, the Agency should be as concerned as the publishers of peer reviewed science journals, that all the science it considers is possibly key or pivotal to a right to a regulatory purpose, any regulatory purpose meets the standard of transparency.

EPA's role is to translate and distill research results into regulations, guidance, and policies that have significant impacts in the real world. It is therefore the obligation of EPA to ensure that it uses the best available science, which by definition includes science that has been shown to be reproducible on any issue of any important EPA policy making.

Now to promote the idea of use of reproducible science and transparency, and an understanding in all agency actions, PCTC has two specific recommendations. One is that it gives preference to studies, not just when industry submits a study as part of let's say registering a pesticide, this requires that that study has to follow GLP, Good Laboratory Procedures -- Good Laboratory Practices.

GLP is a formal program. It relies on, like OECD, guidance, methods, test methods. But there's also a thing called the Spirit of OECD, which simply means following good standard scientific practice.

So we recommend and go into detail in our written comments about that the GLP should be given preference in all science that all -- that EPA considers in any of its policy making decisions. And we also have a specific recommendation about how the Office of the Science Advisor should consider combining the roles of the information quality function at EPA, and the

Office of Scientific Integrity, and I thank you very much for your attention and we expand on this in our written comments.

MS. HALL: Thank you very much.

Would Speaker Number 13, Diana Van Vleet, and Speaker Number 14, John Auerbach, please come up to the speaker's table. And Speaker Numbers 15, Harvey Fernbach, and 16, Joseph Stanko, please take a seat on the on-deck chairs.

MS. VAN VLEET: Hello. My name is Diana Van Vleet, D-I-A-N-A, Van Vleet, V-A-N V-L-E-E-T. I work for the American Lung Association, but I am sharing comments on behalf of Health Care Without Harm today.

As the organization leading the global movement for sustainable healthcare, Health Care Without Harm strongly opposes the proposed rule, "Strengthening Transparency in Regulatory Science." The rule would impede the Agency from upholding its mission to protect human health and the environment by limiting the use of scientific research.

It was the EPA's conclusions regarding the human health impacts of dioxin that lead the formation of our organization in 1996. Since then, we have led the charge to transition the U.S. healthcare sector away from medical waste incineration, the leading source of dioxin pollution.

In the United Sates, more than 5,000 medical waste incinerators were in operation in the mid-90s. Today, fewer than 16 medical waste incinerators remain. This work would not have been possible without the EPA relying on sound science to make determinations about the toxicity of dioxin pollution for human health.

Currently, Health Care Without Harm works with hospitals and health systems to transition to renewable energy and to prepare for the impacts of climate change. We look to the EPA to heed the science regarding the human health effects of fossil fuels and climate change when making decisions so that our hospitals are in the best position to protect their patients.

By artificially limiting the research it considers when making decisions, the EPA would endanger health and put lives at risk. We urge the EPA not to adopt this proposed rule.

MS. ORME-ZAVALETA: Thank you.

MR. AUERBACH: Good morning.

MS. ORME-ZAVALETA: Good morning.

MR. AUERBACH: My name is John, that's spelled A-U-E-R-B-A-C-H.

I am a public health practitioner. I've been a leader in the public health field for about 30 years. I was a city health commissioner, a state health commissioner, and an official at the Centers for Disease Control, and currently I am the President and Chief Executive Officer of Trust for America's Health, or TFAH.

TFAH is a non-profit, non-partisan public health and science-based organization that promotes optimal health for every person and community, and makes the prevention of illness and injury a national priority.

TFAH has been focused on issues like

clean air and clean water, because they are fundamental to ensuring that all Americans have the opportunity to live long and healthy lives. This is particularly crucial since we know that unhealthy air or contaminated drinking water disproportionately affect some of our more vulnerable subpopulations, including children, older adults, and lower income Americans who are more likely to include racial and ethnic minorities.

As a component of our mission to promote health we issue a series of reports every year that examine some of our nation's most pressing health issues, and we rely heavily on all available research and evidence to develop recommendations for decision makers on how they can most effectively respond to improve health.

For example, in 2011, TFAH and the Environmental Defense Fund released a report that analyzed the savings and health care spending associated with four different EPA regulations. In so doing, we relied on the EPA's own regulatory

impact analysis that measured reduced mortality, reduced incident of chronic bronchitis, reduced incident of heart attack, and decreased hospital emissions and emergency room visits. These studies estimated that nearly half a million lives could be saved by these four EPA standards alone.

Because of the importance of having access to such scientific data in order to protect the public's health, we oppose the "Strengthening Transparency and Regulatory Science" proposed rule. Research and evidence is the foundation of EPA's policies and has been necessary for success of laws like the Clean Air Act and improving and in saving lives from the dangers of air pollution.

Congress intentionally directed EPA to consider peer reviewed research under the Clean Air Act, and mandates regular reviews of the science to ensure that EPA is reviewing and considering the most up to date science. We believe that the proposal would prevent EPA from using the best science to inform decision-making, and the result would be weaker standards at the

expense of American's health. For example, the proposal would exclude several landmark air quality studies from the evidence base that EPA is permitted to consider, largely on the basis that these studies include confidential patient information that would make them less transparent under the constructs of the proposed rule.

The practical result would be weaker air pollution standards, despite the fact that the science behind these studies is pointing us in the opposite direction. The current methodology and system for review is sound, reliable, and has operated effectively for years. And that's why we have joined with the American Lung Association, the American Academy of Pediatrics, the American Public Health Association, and over 70 additional public health, medical, and academic organizations in opposing this regulation, this proposal.

As a long-term public health practitioner and the President of TFAH, I remain committed to ensuring that federal health policy and practices are guided by the evidence in a transparent and

accountable manner. EPA and other federal agencies should be no exception. We at TFAH look forward to working with congress, with the EPA and others, as we continue to advocate for policies and practices that uphold these principles and protect and promote the health of every American. Thank you very much.

MS. HALL: Thank you very much. If I could ask those that are in the room to please refrain from talking. There's a lot of whispering and it's distracting. If you do need to have a conversation, please step outside the room. Thank you.

Would Speaker Number 15, Harvey Fernbach and Speaker Number 16, Joseph Stanko, please approach the speaker's table. And Speaker Number 17, Peter Lurie and Speaker Number 18, Jamie Wells, please take a seat in the on-deck chairs.

What speaker number are you?

MR. STANKO: Sixteen.

MS. HALL: So, do we have Speaker Number 15? Harvey Fernbach?

[No audible response.]

MS. HALL: Okay, so we'll move ahead.

[Discussion off the record.]

MS. HALL: Number 17, Peter Lurie, would you like to take a seat up here? And then Speaker Number 19, Ami Zota, please take a seat in the on-deck chairs. Thank you.

MR. STANKO: Thank you. My name is Joseph Stanko, S-T-A-N-K-O. Thank you for the opportunity to address EPA's proposal entitled, "Strengthening Transparency in Regulatory Science." My name is Joseph Stanko, and I am counsel to the NAAQS Implementation Coalition.

The Coalition is comprised of trade associations, companies, and other entities who confront challenges in permitting and operating manufacturing and other facilities under increasingly stringent National Ambient Air Quality Standards.

Our members --

MS. ORME-ZAVALETA: If we could ask you to move the microphone a little bit more in front.

MR. STANKO: Sure.

MS. ORME-ZAVALETA: No, the other way. There you go.

MR. STANKO: All right.

MS. ORME-ZAVALETA: Thank you.

MR. STANKO: Our members, and the companies they represent have a proven record of working with states and regional EPA offices on implementing emissions reduction strategies to attain NAAQS.

However, increasingly more stringent NAAQS have caused demonstration requirements for Clean Air Act permits to exceed the limits of current tools and policies for NAAQS implementation. This makes it increasingly more difficult for companies to attain the approvals needed for new state of the art projects that create jobs and bring much-needed tax revenue to local communities.

Without a transparent NAAQS process, underlying studies lack robust external review, leading to standards that may not provide

objective public benefit. In certain cases, increasingly stringent standards have pushed NAAQS to concentrations at or near background levels, beyond the feasible limits of implementation. While inaccurate assumptions in both setting and implementing NAAQS could be more readily absorbed under prior less stringent NAAQS levels, recent more stringent standards have eroded such tolerances.

Addressing this new reality starts with an inherently forward-looking NAAQS review process that assesses science and policy in a rigorous and holistic manner. The transparency proposal fosters such an open-source approach to pivotal regulatory science, one that enables the public to more meaningfully comment on the science underlying NAAQS review. This can foster a more effective NAAQS implementation that still meets the Clean Air Act's mandate to protect public health.

While we support the principles behind the transparency proposal, its sound policy goals

should be balanced with legal and ethical obligations to protect private, sensitive, and confidential information. As the transparency proposal is implemented, efforts must be made to address protected health information under the Health Insurance Portability and Accountability Act, or HIPAA.

Disclosure limitations also exist for proprietary information and trade secrets. We agree with EPA that dose response data and models should be exempt from public review as necessary to protect private, sensitive, and confidential information. However, we believe that EPA can protect such information while still seeking maximum possible transparency.

As the transparency proposal notes, many generally acceptable techniques exist to deidentify personally identifiable information. Where such deidentification is not possible, EPA could facilitate review of sensitive data sets by a diverse group of experts subject to HIPAA compliant nondisclosure agreements.

If all other options to expand review have been exhausted, EPA could decide that a study could not be subject to outside review and verification, and consider the study accordingly without excluding it from a rulemaking proceeding.

Administrations -- administrators pardon me, have regularly taken similar methodological considerations into account when assessing studies in past NAAQS reviews. EPA could further balance transparency and privacy by appropriately tailoring the transparency proposal according to the type and scope of the regulatory decision involved. For this reason, we agree with EPA that the transparency proposal should be limited to pivotal regulatory science that is involved in significant regulatory actions that result in substantial costs.

To that end we note that because Clean Air Act regulations have accounted for the vast majority of costs and benefits cited in rules over the last decade across the entire federal government, such regulations are particularly well

suited for the transparency proposal's high standard of robustness.

As this process moves forward, we encourage EPA to further detail how the transparency proposal will protect private, sensitive, and confidential information, be it personally identifiable or proprietary information, trade secrets, or other similar information. To that end, EPA should explicitly state that any final regulations arising from the transparency proposal do not support or assert authorization under the law to disclose such currently protected information, and that any claim to do so must be independently based on a statutory grant of authority from congress.

In conclusion, the transparency proposal would increase replicability and verification in the scientific process, thereby testing critical methodological assumptions and mitigating biases in key studies upon which the Agency relies in developing regulations. It recognizes that transparency can go beyond simply maximizing

disclosure to better contextualizing studies through replicability and verification.

In doing so, the public can more meaningfully take part in EPA notice and comment rulemaking processes. As EPA advances the transparency proposal, it can and should implement these sound policy goals in concert with obligations to protect private, sensitive, and confidential information.

The NAAQS Implementation Coalition appreciates EPA's efforts on the transparency proposal, as well as the opportunity to present its view on the topic.

MS. ORME-ZAVALETA: Thank you.

MR. LURIE: Hear me? Good morning. My name is Dr. Peter Lurie. I'm a physician, an epidemiologist, and now the President for Center for Science in the Public Interest. We are an independent science-based health advocacy organization with over 500,000 members.

Before I joined CSPI, I served at the FDA as an associate commissioner and in fact, for

several years I led the Agency's transparency initiative. Over the course of my career I've authored close to a dozen academic articles on the topic of transparency, and nobody ever asked me for the underlying data for any of those studies.

We at CSPI are firm advocates of scientific transparency and have had a number of projects along those lines over the years. But EPA's proposed rule is not about transparency or strengthening science. Instead, it is a wolf of pro-industry bias hiding in the sheep's clothing of transparency in science. Proposal should be withdrawn.

Transparency is not about restricting the use of sound science, as this proposal would do. Suddenly, the more transparent a government agency can be about the nature and limitations of the data underlying a decision, the better. But the failure to meet some abruptly and arbitrarily elevated standard for disclosure cannot and should not be the grounds for the summary exclusion of data that were rigorously gathered and reported.

The surest tests of any scientific transparency policy are two. One, was it generated in a transparent fashion? And two, will it actually promote the transparent rigorous science-based decision-making that it claims to? This proposal fails on both counts. Let's start with the procedural matter.

This proposal violates fundamental tenents of transparency rulemaking. EPA failed to consult with relevant stakeholders, such as science, research, or health professional associations, did not consult with other federal agencies who would be affected by this, and did not even make the proposed rule available to its own Scientific Advisory Board for review.

In addition, the proposal lacks critical citations and documentation, or even an adequate justification for why it was proposed. Rather than furnishing the evidentiary support required for administrative action, the Agency has merely adopted a legislative initiative that failed to (indiscernible) despite support from the energy,

chemical, manufacturing, and other key industries.

Moreover, despite its professed (indiscernible) to cost effectiveness in rulemaking, the proposed rule provides no cost-effectiveness analysis whatsoever. It simply blithely asserts that, quote, "EPA believes the benefits of this proposed rule justify the costs." I wish we could have gotten away with that at FDA.

But the rule would be costly indeed. Analysis of an earlier version of the legislation predicted costs of $250 million over the next few years. But even more important, the proposal does not meet its purported scientific goals and will instead undermine the scientific basis for decision-making at EPA.

Since its inception, EPA has developed rules with demonstrable efficacy in protecting the public by relying in large part upon the kinds of data that EPA would now preclude from consideration. Some of EPA's greatest public health accomplishments, such as eliminating lead and gasoline, classifying second-hand smoke as a

cause of cancer were based on the kinds of data that would be discarded under the proposal. Such data are widely used in rulemaking proceedings by other U.S. government agencies and around the world. And I can say, at FDA, we would not have had the rules that we ultimately developed or proposed on mercury in fish, on arsenic in rice, on dental amalgam, or in sodium targets from a nutritional perspective. None of those could have been done if data of these kinds were eliminated.

In particular, it's also especially troubling that the proposal also opens the door to a reconsideration of past rules which would be utterly inappropriate under prevailing principles of administrative law. In fact, the proposal would have an effect opposite to its claimed purpose. It would address -- it would suppress important and relevant science conducted in large part by the best minds in academia and government, thereby unduly restricting the evidence available to EPA and potentially favoring data developed by industry.

Further evidence of the pro-industry orientation of this proposal is its discussion of the dose response function and the assault on linearity. Quite aside from the merits of that discussion, which I think are few, the real question is, what is this discussion doing in this proposal in the first place. It has nothing to do with transparency whatsoever, and it's simply there as a marker, in my view, of the pro-industry bias that this entire enterprise represents.

Let me close with a question with which EPA should have started. What exactly is the problem that this proposed rule seeks to fix? Where indeed is the study for which the lack of access to raw data resulted in misinterpretation or in the promulgation of an inappropriate regulatory standard?

To the contrary, the record is replete with studies that form the basis of health and life saving regulations that would now be precluded from use, and that might even provide a basis for the revocation of rules enacted in the

distant past. Thank you.

MS. HALL: Thank you. Would Speaker Number 18, Jamie Wells, and Speaker Number 19, Ami Zota, please come up to the speaker's table. And Speaker Number 20, Surbhi Sarang and Speaker Number 21, Laura Bloomer, please take a seat in the on-deck chairs. Thank you.

Please, quick reminder to speak into the mic and state your organization.

MS. WELLS: My name is Dr. Jamie Wells, J-A-M-I-E W-E-L-L-S, and I'm the Director of Medicine for the American Council on Science and Health, and I'm here on behalf of our president, Hank Campbell.

In the past, peer-reviewed journal publication ha been considered authoritative, but that has inherent weakness if they can't be replicated. Knowing the potential for error, and even misuse, replication is vital, but we recognize that that's not always possible. A safety valve for that is a higher level of scrutiny when it is not possible. Studies that

can't be replicated should at least make sense within the pattern of available data, which in the case of EPA will often include hundreds of other studies done according to federal guidelines.

However, there are also occasions where replication is not possible and new claims or outliers from the consensus of many other studies. And in those cases, they should still absolutely be used if EPA risk scientists, without breaking confidentiality, can obtain the additional information needed in order to conduct their own analysis.

EPA risk scientists are charged with protecting public health, and the American Council on Science and Health has argued since 1978 that the judgment over which epidemiology and/or toxicology data to use for risk or safety assessment should always include risk scientists. The public's interest is best served when science is replicable and consistent with other information.

On occasions, when studies cannot be

replicated, or when such studies are not consistent with other information, use of those studies depends on having access to the underlying data for independent analysis. When the underlying data are not provided, it is difficult to make a credible risk assessment, much less national rulemaking, as you know. So risk experts should be involved.

You should have received a more extensive written document as well.

MS. ORME-ZAVALETA: Thank you.

MS. ZOTA: I'm Dr. Ami Zota, that's A-M-I, last name Z-O-T-A. I am a health scientist and Professor of Environmental and Occupational Health at the George Washington University Milken Institute School of Public Health. I am also speaking as part of Project Tender. We are an alliance of scientists, health professionals, and advocates with expertise in protecting children from exposure to toxic chemicals that can contribute to neurodevelopmental problems, such as ADHD and learning disabilities.

I oppose EPA's proposed rule. The proposed rule prohibits the Agency from setting regulations that are support in part or whole that is for data that is publicly available for reanalysis or cannot be replicated.

Since the proposed rule is retroactive, it could lead to the dismantling of many important existing EPA regulations that safeguard our children and families -- children and families from toxic chemicals.

I would like to spend my time identifying some of the major problems with this rule that warrant consideration before the Agency moves forward. The scientific sources cited for the basis of this rule do not support the proposed rule. EPA did not consult with critical stakeholders in the development of this proposed rule, including scientists, health professionals, and affected communities.

EPA does not present any analysis of benefit-cost, children's environmental health risk, or environmental justice in support of the

rule which are required under executive orders 12291, 13045, and 12898. The terms, pivotal regulatory science, replication, reproducible, and research data are not defined or are problematic. The rule's requirements for specific types of defaults, test methods, dose response models, and/or analysis are not supported by current science.

The rule is counter to the mandates in the reformed Toxic Substances Control Act, or TSCA, to use the best available science and systematic reviews for chemical evaluations.

Data deidentification and masking techniques cannot ensure confidentiality and can degrade the accuracy of data for further analysis. The rule is inconsistent with medical ethics and existing legal requirements to ensure the privacy and/or confidentiality of human data.

For example, in many cases individuals' participant data cannot be made public because of confidential requirements legally mandated by institutional review boards and/or the Health

Insurance Portability and Accountability Act of 1996, or HIPAA.

In conclusion, EPA should withdraw this proposed rule immediately. EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at the federal government. Thank you.

MS. HALL: Thank you.

Would Speaker Number 20, Surbhi Sarang, and Speaker Number 21, Laura Bloomer, please come up to the speaker's table. Would Speaker Number 22, Ms. Nsedu Obot Witherspoon, and Speaker Number 23, Joanne Zurcher, please take a seat in the on-deck chairs. Thank you.

Speakers, please remember to speak into the mic and state your organization.

MS. SARANG: My name is Surbhi Sarang, spelled S-U-R-B-H-I S-A-R-A-N-G, and I'm a legal fellow at the Environmental Defense Fund.

I appreciate this opportunity to provide public testimony on the proposal and hope that everyone who wises receives an opportunity to be

heard. We urge EPA to hold hearings in additional locations to allow affected Americans in other communities who cannot travel to be here today, an opportunity to provide input as well. I'm testifying here today to raise our serious concerns of the proposed rule and to ask that the EPA withdraw the proposed rule immediate.

Communities across America rely on EPA safeguards to protect their health and wellbeing. But this rule would greatly restrict the body of scientific information that EPA draws on when setting these safeguards. Instead of being informed by all available science, in many cases EPA would be forced to operate in the dark. By obliging EPA to disregard scientific research that would otherwise alert the Agency to taking strong protective actions, this rule endangers the health of all families and communities. Had this rule been place previously, we would likely currently be facing greater exposures to air pollutants, water contaminants and toxic chemicals.

In the proposal, EPA completely ignores

the practical effects of the proposed rule and how it fundamentally conflicts with EPA's mandate to use the best available science as it develops safeguards.

Agency decisions must be informed using the best available science. Public deserves nothing less when health and safety are on the line. This value is core to EPA's mission and should be placed at the forefront.

But the proposal takes an unsupported and unprecedented leap by suggesting that this mission allows EPA to only use science where the underlying data and models can be made and are made publicly available for independent validation. Much of the data underlying scientific studies concerning human health cannot be made publicly available for legitimate privacy and confidentiality reasons. In many cases, it is impossible even to redact information in a manner that allows independent validation while respecting privacy and confidentiality.

Thus, the proposal would seriously

restrict EPA's ability to use the best available science as it sets critical safeguards. Nor does EPA explain why such restrictions on the use of science are necessary. EPA does not point to any instance in which a failure to disclose data resulted in an EPA decision or standard that lacks scientific integrity.

EPA does not explain why other means of vetting that are used by the scientific community and that protect privacy and confidentiality, such as review by EPA's independent Science Advisory Board, peer review, and corroboration through independent studies are insufficient to ensure the integrity of the science EPA relies on. And EPA does not explain why it is appropriate for an agency tasked with basing its decisions on best available science to now discard otherwise valid science simply because a disclosure is not possible.

Indeed, courts that have examined the issue have made clear that it is entirely reasonable for EPA to rely on scientific studies

which data cannot be disclosed. While EPA states in the proposal that many organizations have endorsed data disclosure as a means to increasing transparency, the reality is the proposed rule completely departs from good scientific practice. None of the organizations EPA identifies in the proposed rule have endorsed the practice of disregarding studies where data disclosure is not possible, or that have been subjected to other means of validation, or suggested that regulatory agencies should exclude such studies when using science to inform regulatory actions.

To the contrary, organizations that are deeply committed to transparent science have come forward to stress that policies to promote transparency must be developed within the scientific community and to oppose the notion of disregarding otherwise valid science, simply because the underlying data cannot be disclosed.

Indeed, EPA's own Science Advisory Board, which it failed to consult before issuing this proposal, has raised concerns similar to those we

raise here, noting that EPA provided no analysis of the impact of losing the ability to run on these studies, and that there are other ways to assess the validity of studies without access to data. Not only did EPA skip over review by the Science Advisory Board, but then EPA allowed for only a 48 (indiscernible) review process for the proposal.

This hastened process seriously calls into question the validity of the proposal. The proposal would not even increase transparency. By allowing the administrator to grant exemptions based on vague and discretionary criteria, the proposal would allow EPA to selectively apply this disclosure policy with no public record of the decision or its basis. The risk that the rule will artificially restrict and distort the scientific basis for EPA's decisions is only heightened by its many gaps.

The proposal fails to explain critical details, such as what mechanisms would be used to make data public, what the cost of the Agency and

to researchers would be, and how the peer review provision would fit into EPA's existing peer review requirements. It is not even clear how EPA would determine that a given study is publicly available in a manner sufficient for independent validation. This underscores concerns that this proposal would undermine the integrity and transparency of EPA decisions rather than enhance them.

It is also important to note that this rule was posed under former Administrator Pruitt who actively obscured transparency goals by directing the removal of scientific information from EPA's websites, refusing to publicly release his full and accurate schedule, using secret e-mail addresses, and spending tax payer money in violation of federal laws.

While Pruitt is now gone, this proposal unfortunately suffers from the same disregard for scientific integrity and transparency that infused the former administrator's tenure.

We thus call on Acting Administrator

Wheeler to recognize the redeemably flawed basis for this proposed rule and withdraw it immediately.

MS. ORME-ZAVALETA: Thank you.

MS. BLOOMER: My name is Laura Bloomer, B-L-O-O-M-E-R, and I'm a student at Harvard Law School and the Kennedy School of Government. I am interning at EDF, Environment Defense Fund this summer. I am here testifying on my own behalf.

I am the daughter of two parents who grew up near auto industry towns in Michigan. My mom was born in Flint. Her parents, my grandparents, grew up in Flint and chose to raise their four children there.

Though I'm a proud Texan, as my family moved to Houston when I was in elementary school, most of my family continues to call Michigan home. The Flint water crisis was personal for us.

My aunt, a dental hygienist, volunteered and delivered water to Fling residents after the story broke. She understood the heart wrenching fear a mother would experience when she found out

her child had been drinking contaminated water. She understood the outrage of her home community when they found out that the government they trusted did not care enough to keep their drinking water safe. She understood what it might feel like to have a fundamental safeguard, like clean water, suddenly disappear.

But the water crisis in Flint did not disappear when it left the nightly headlines. Just last week, my mom went to her favorite hotdog shop in Flint and sent me a photo of a poster from the restaurant. It was an advertisement for healthcare, aimed at mothers of children who grew up drinking contaminated water. My mom was devastated.

And though the Flint water crisis is more salient and more visible than this proposed rule, the impacts are far too similar. For decades the EPA has relied on first-rate science to establish protections for our air and water, and most importantly for our public health.

It is because of these safeguards that I

have never experienced the type of pollution my mom describes from her childhood. It is because of incredible researchers and scientific discoveries that many of our communities will never experience a water crisis like Flint is still experiencing. It is because EPA regulates lead in our drinking water, and arsenic in our drinking water, and the many other contaminants that harm our most vulnerable populations that my friends and I grew up in a healthy environment.

It is because EPA has a responsibility to seek out and utilize the best available science at every step of the way, that the next generation of children will be protected from threats to their health as well.

Yet right now, in 2018, when our science has never been more advanced, and when EPA is considering revising the Lead and Copper Rule for drinking water, EPA would choose to voluntarily ignore the best available science. This proposed rule would severely limit the studies on which EPA could rely. It would threaten the enormous amount

that EPA and engaged citizens have accomplished, and it would hamstring any progress we hope to make in the future.

This rule isn't about transparency, and it was not developed with people like my family and me in mind. For the safety of all of us and for future generations, I respectfully ask that this rule be withdrawn. Had this rule been in place decades ago, more communities might be suffering from the same threats to public health that Flint is now facing. Many of EPA's drinking water standards rely on epidemiological studies. Often these studies last decades and follow hundreds, if not thousands of patients, collecting confidential health data, as well as other personal data, like the people's addresses, ages, and genders.

For most of these studies the underlying data cannot be made public, even in redacted form, without sacrificing the participants' privacy. These studies are monumental and state of the art. These are the studies that EPA should hope to rely

on, not the type of studies the EPA should shun. These are the studies that will guarantee that communities don't suffer from the devastating impacts of dirty water and polluted air. Studies like these establish the original limits for lead, and this research continues to essential today.

This proposed rule may seem abstract, but it is anything but that. And it is extremely significant. It will have far-reaching -- far-reaching impacts on the ability of EPA to protect all of us and our families. And it could affect our most important environmental safeguards. It is extremely personal, for my mom, for my family, and for me.

I am here today to ask you to withdraw this proposed rule and recommit to EPA's mission of protecting human health and the environment. Thank you for the opportunity to speak today.

MS. Hall: Thank you. Would Speaker Number 22, Ms. Nsedu Obot Witherspoon, and Speaker Number 23, Joanne Zurcher, please come up to the speaker's table. And Speaker Number 24, Michelle

Endo and Speaker Number 25, Jenny Xie, I think, please take a seat at the on-deck chairs.

[Substitution of panel members.]

MR. ROBBINS: Good morning. I'm Chris Robbins. I'm the Acting Deputy Assistant Administrative for Management in the Office of Research and Development.

MS. ORME-ZAVALETA: Good morning.

MR. ROBBINS: Thank you.

MS. DOA: Good morning. My name is Maria Doa , I am in the Office of Research and Development.

MS. WITHERSPOON: Good morning. I'm Nsedu Obot Witherspoon. I'm the Executive Director for the Children's Environmental Health Network. My name is spelled N-S-E-D-U O, B as in boy, O-T W-I-T-H-E-R-S-P-O-O-N.

For over 26 years, the Children's Environmental Health Network, also known as CEHN, has been a national voice committed to protecting all children from the harmful effects of environmental hazards, and to promoting a

healthier environment.

CEHN educates decision makers and advocates for evidence-based child protective policies. We also ensure that those who care for children, personally or professionally, have the information they need to take the steps to reduce children's exposures to harmful toxicants.

As the Executive Director, and on behalf of CEHN, I appreciate the opportunity to provide these comments on the EPA proposed rule, "Strengthening Transparency in Regulatory Science."

CEHN is strongly opposed to the rule and is concerned that it will adversely affect EPA's ability to use the best available science in decision-making, and negatively influence existing and future protections for children's health, such as clean air, clean water, and the prevention of toxic exposures.

The exposed rule sets transparency standards that are too rigid and impossible to meet. It requires that all data used in

rulemaking be publicly made available, and allows EPA to exclude data that relies on confidential patient information. Critical studies which have led to significant advancements in protective policies, for example from the NIEHS, EPA's Children's Environmental Health, and Disease Prevention Research Centers may very well be excluded.

The scientific research that EPA uses already undergoes a long-established transparent review process, and makes available the scientific studies it relies on to inform policy. Sometimes studies contain private medical data that legally can't and should not be made public. In those cases, independent review bodies have also examined the studies and weighed in on the research. No legitimate reason exists to exclude those studies and their critical important findings.

Health based research involves people and often the collection of private information. There are no systems in place to protect this

information. The federal government must continue to protect private information about patients, and not allow this information to be made public. Otherwise, patients will not participate in these important studies.

Further, redacting personal information actually sounds easy, however, it is cumbersome and quite costly. EPA will not likely have the resources to redact personal information resulting in exclusion of critical studies.

The proposed rule would restrict EPA's ability to set regulations informed by confidential data that cannot be replicated. This is of serious concern because for many older, long-standing landmark studies, the original data sets were either not maintained, or stored in out of date formats. These could be eliminated under this proposed rule.

The proposed rule could block the use of studies on the harmful impacts of toxic exposures and pollution. Studies which were instrumental in the Clean Air Act, the Safe Drinking Water Act,

and the -- excuse me, Food Quality Protection Act, among many others. We do request that you withdraw this proposal, "Strengthening Transparency and Regulatory Science." If the proposed rule is implemented, an inevitable consequence is that children that could have been protected from chemical exposures will lose those opportunities.

Irreversible damage to children in their growth and development, loss of intelligence, behavior modifications, and overall life achievement is the future ahead, and I would hope, not the legacy that this EPA would like to preserve. Thank you very much.

MR. ROBBINS: Thank you.

MS. ZURCHER: My name is Joanne Zurcher, J-O-A-N-N-E Z-U-R-C-H-E-R, and I'm representing the National Environmental Health Association.

Good morning. Thank you for the opportunity to speak to you on behalf of the environmental health professionals from across the country who've vigorously opposed the Censoring

science rule.

My name is Joanne Zurcher, and I am the Director of Government Affairs for the National Environmental Health Association, NEHA.

Environment health is profoundly local. Simply put, it's the cleanliness of the water from the kitchen faucets. It's the safety of the food we feed our families, our friends, and ourselves. It's the air the children breath during the 1,600 hours they spend inside their schools. It's the cleanliness of our community beaches that our families are spending the summer enjoying.

When things go well, environmental health is not on the front page of the New York Times, because environmental health professionals keep us safe every single day.

NEHA has over 7,000 members. Our members anticipate, recognize, evaluate, and control hazards that are likely to cause harm, serious illness, or even death to American families. Examples include lead, radon, legionella viruses, harmful algae blooms, PFOA, PFOS, Zika viruses,

and many other natural and man-made risks. Our members possess strong science and math backgrounds. They must take over 30 units of undergraduate math and science just to sit for our exam. They have the unique ability to work with clinical and nonclinical professionals. They know and work with the regulated community. They are credentialed members of the profession, and the NEHA credential is considered the gold standard.

EPA science is the foundation for informed decision-making for our members. Our members turn to the EPA for best practices. Our members rely on EPA research to promote their community's health.

Our communities see EPA as the shelter of scientific certainty in an era of uncertainty. Our members rely on EPA expertise, whether it's continuing -- excuse me, containing mercury spills in their homes, setting standards to keep toxic chemicals out of drinking water, or cleaning up super fund sites, just to name a few of the few activities we do together. EA professionals work

closely with the EPA every step of the way.

The EPA has administered successfully, the Clean Water Act, and the Clean Air Act, and these acts should be expanded based on scientific research. The EPA should not be working to undermine scientific research. Instead, this EPA should be working to provide running water to the 630,000 American families who do not have running water in their homes.

Let's be clear, this proposed rule undermines the EPA's mission to protect human health. Now is not the time to compromise health of our nation by casting a shadow of uncertainty on the integrity of the EPA -- of EPA's research.

EPA research is globally recognized as the foundation for informed decision-making that affects every person the plant. NEHA and it's 7,000 members are in every community and territory in the nation. Every EH professional relies on EPA research to ensure constituents meet human -- meet their human potential.

The current research system works, which

at once protects the identity of every research participant, while promoting the health of every American. Health research sometimes includes sensitive data from patients, such as medical history and geographic location, which must be continued to be private and protected. Crucial volunteers will cease to come forward for scientific research if their medical history and geographic information will be made public, thus putting critical scientific research at risk. Please do not destroy a national gem, our EPA research, because you, your family, and your community deserve no less than a fully functional research system that protects and identifies research subjects while promoting the health of the nation.

NEHA and the environmental health professionals from across the United States vigorously oppose the censoring scientific rule. Thank you for this opportunity to be heard on this important topic, and please remember, do no harm.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 24, Michelle Endo, and speaker Number 25, Jenny Xie, come up to the speaker's table. And Speaker Number 26, Ann Mesnikoff, and Speaker Number 27, Roy Gamse, please take a seat at the speaker's -- well, at the on-deck chairs.

Speakers are reminded to speak into the mic and state your organization.

MS. ENDO: My name is Michelle Endo, E-N-D-O, and I'm speaking in a personal capacity, but I'm an intern at the Environmental Defense Fund.

So my name is Michelle Endo, and I'm a second-year student at Georgetown Law. I'm also a legal intern at the Environmental Defense Fund here in Washington, D.C. I'm here today to offer comments on my own behalf and to present my grave concerns with EPA's proposed rule, "Strengthening Transparency in Regulatory Science."

I'm a fourth generation Southern Californian who lived the first 18 years of my life in Northern Los Angeles County. And while I'm proud to be from the Golden State, it also

means that I grew up breathing some of the worst air pollution in the nation. Despite tremendous improvement, 70 percent of Californians live in an area with unhealthy air. As a result, I also grew to be familiar with the dangers of air pollution and the importance of health-protective regulation.

My family lives in a town that, like much of LA County, is in the United States 98th percentile for tropospheric ozone, according to EPA's own Environment Justice Screen.

Tropospheric ozone, commonly referred to as smog, is the visible layer of air pollution that gives LA sunsets their famous striped hues. Several studies have consistently reported there is a significant association between ozone pollution and premature death. According to the American Lung Association, long-term exposure to ozone pollution is also linked to developmental harm, reproductive harm, cardiovascular harm, and increased susceptibility to infections.

While I never had a snow day before

moving to D.C., like most SoCal kids, I'm very familiar with bad air days. Instead of playing outside and building snowmen, children in Southern California lose all outdoor playtime on bad air days in order to avoid the harmful effects of smog. Coughing, impaired athletic performance, eye irritation, chest pain, nausea, headaches, and respiratory congestion.

Smoggy days can also worse asthma, heart disease, bronchitis, and emphysema.

My sister and I enjoyed the early years of childhood with fewer complications relative to my neighbor peers. But before even starting high school we both had missed days of school for nose bleeds that were likely triggered by the irritating smog that settled in the valley, and because ozone forms by the interaction of sunlight with hydrocarbons and nitrogen oxides emitted from cars and trucks, bad air days tended to worse each year, our Southern California summers, broke standard heat records of years before.

Shortly after my sister joined the high

school soccer team, my family started to notice that her once limitless stamina on the field was wearing down. One particularly hot and hazy day, she had no choice but to walk off the field in the middle of the match. Clutching her chest, she struggled to breath. We later learned that she had developed asthma from LA's unhealthful smog, like many of our friends and family in the area.

It was experiences like this that motivated my decision to study environmental policy in college, and that continued to drive my legal career. Having witnessed first-hand the way in which the geography of where one lives, plays, learns, works, and grows determines one's health outcomes, I could not have chosen another path in good conscience.

When I first chose this path, over eight years ago, my hope was to strengthen the laws and regulations that did not go far enough to protect my family and our environment.

Under the Clean Air Act, EPA was required to establish and regularly update federal

standards for hazardous air pollutants, including asthma-causing particulate matter and ozone. These standards and the National Ambient Air Quality Standards or NAAQS, form the backbone of our nation's air quality protections. Although the NAAQS did not prevent my sister's asthma, they have and continue to bring about substantial improvement in our nation's air quality since their first formulation.

The EPA's proposed rule would have excluded peer review studies that form the scientific basis of NAAQS. For example, peer reviewed studies would be excluded because the underlying data and models cannot be disclosed, even in partial form. In fact, the standards would not have been issued had the proposed rule been in place when they were first enacted in the 1970s, because EPA would have tossed out the underlying studies, tying its hands from taking action in imminent public health concerns.

Without a doubt, many more Southern Californians would have had their lives altered,

or even cut short by dangerous levels of air pollution.

If adopted, the proposed rule would deprive EPA policy makers from real world evidence and studies that are vital to the EPA's review of the NAAQS into the future. Further, the proposal directly contravenes the comprehensive federal and state regulatory program congress envisioned when drafting the Clean Air Act of 1970. It reduces our public health legislation to mere declarations, as EPA would severely delayed if not rendered entirely unable to establish future standards using the best available science.

Generations before me, through legislation like the Clean Air Act, recognize that public health and environmental pollution required strong federal leadership and expert agencies like EPA. Departing from the Agency's practice of scientific review for over the last 40 years, practices aligned with national and intergovernmental bodies, like the Royal Society of Medicine, and the World Health Organization,

jeopardizes EPA's ability to utilize its expertise with high cost to people's health.

It is therefore troubling that the Agency has proposed to take this action under the guise of scientific integrity without consulting its own panel of scientific experts, the Science Advisory Board, and against the advice of leading scientific journals and organizations. It is even more troubling when considering the Agency's recent practices toward the public and the press, which have been far from transparent.

To me, it is clear the proposal's purported goal of transparency is a pretext for the Agency's attempt to shirk its statutory command. For the health of my sister, my friends, and all Americans, I urge EPA to abandon this proposed rule. Thank you.

MR. ROBBINS: Thank you.

MS. XIE: Good morning. My name is Jenny Xie, J-E-N-N-Y, last name X-I-E, and I'm a policy intern at the Environment Defense Fund, but I'm here today speaking from a personal capacity to

express my personal opposition to EPA's proposed rule, "Strengthening Transparency in Regulatory Science."

Many of the activities that I am involved in on campus involve holding the university accountable for its environmental goals that it has set. I'm currently a student at Cornell University, studying English and Environmental Sustainability Sciences.

In fact, one of the main initiatives that I am involved in calls for the University to disclose as a financial investments and fossil fuels in order to increase transparency, have accountability, and maintain integrity as it works towards its carbon neutrality. It is therefore incredibly disheartening to hear that this EPA administration is championing a proposed rule that claims to be for increased transparency, when in fact the purpose and the fact of the proposed would be to bar EPA from considering rigorous public health science and reduce the transparency of EPA's scientific analysis.

The proposed rule would require the EPA base some of its most important regulatory decisions only upon does response studies where the underlying data can be disclosed. The reality is that key scientific studies backing our nation's critical clean air safeguards which protect our health and environment are based on confidential patient data that in many cases cannot be disclosed in any form.

These rigorous peer-reviewed state of the art studies could be improperly discarded should this rule be finalized. As many scientists have noted, this would undermine and not promote the use of sound science in EPA decisions. Just because the data underlying a study isn't published does not mean that the study cannot be verified using other means.

For example, the American Cancer Society's Cancer Prevention Study II, tracked air pollution, exposure, and personal medical histories of nearly 670,000 people for more than two decades to understand the exact risk of air

pollution on death.

The study was based on private patient information that cannot be publicly disclosed, and yet the study has been subject to reanalysis and its conclusions have been upheld. And allowed under the scientific journal does response, the authors listed 16 key studies alone which supported the original conclusion of the Cancer Prevention Study 2.

Even more concerning is the fact that the proposed rule provides the administrator with broad discretion to make exception to the policy on a case-by-case basis. Former Administrator Pruitt may be out of office now, but Acting Administrator Wheeler's record as a fossil fuel lobbyist for corporations like Murray Energy leaves me and others incredibly skeptical that this rule would be applied fairly with no concrete criteria guiding decision to grant an exception.

This part of the proposal raises a serious risk that this or future administrations could selectively waive the policy to build a

distorted scientific record that is designed to reach a desired result. In fact, just a few weeks ago I was in Pennsylvania where I'm from, talking to an Uber driver. He's a father with a daughter who has asthma, and we talked about the EPA. He had worked in public service before and expressed to me how frustrated he was with the current administration, with the EPA, and how it seemed that despite the endless promises the administration has made to protect its citizens and better our lives, many of those promises were not being fulfilled.

I can't help but think how disappointed he would be if he knew that the EPA has proposed a rule which will make it more difficult for EPA to use the best science to protect the health of him and his family. Citizens are watching and aware, from parents, to scientists, to students like me who advocate for good policy on their own college campuses.

The EPA hastily shuttled this rule past even the OMB, but it must pause to hear the

concerns of the public. EPA's proposal will lead to censored science, not transparent science. Thank you for the opportunity to testify on the proposed rule today.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 26, Ann Mesnikoff, and Speaker Number 27, Roy Gamse, come up to the speaker's table. And Speaker Number 28, Jennifer Sabb (sic), and Speaker Number 29, Paul Miller, please take your seat at the on-deck chairs.

MS. MESNIKOFF: Hi. I'm Ann Mesnikoff. It's M-E-S-N-I-K-O-F-F, and A-N-N, no E.

Good morning. I'm Ann Mesnikoff. I'm the Federal Legislative Director for the Environmental Law and Policy Center.

ELPC works throughout the Great Lakes and the Midwest, protecting public health and special places under the belief that environmental protection and economic development can be achieved together.

ELPC appreciates the opportunity to

testify in opposition to EPA's proposal to censor, or otherwise constrain the science it will consider in issuing essential standards that are meant to protect public health and our environment. The Midwest and the Great Lakes region, with its industrial and agricultural heritage is impacted by environmental and public health challenges to air, land, and water, and we depend upon EPA to effectively implement environmental laws to protect the public and our environment.

There is no basis in existing bedrock environmental laws that authorizes EPA to limit science considered in rulemaking processes. EPA cites several key laws in its justification for this proposal. Nowhere in the cited statutes is there a basis for demanding access to raw data, nor does this relate sensibly to any definition of best available science. Rather, this undermines the use of best available science called for in environmental statutes, including the Clean Air Act.

Further, there is no basis for politically appointed administrators to choose which science will be considered, and which may not be. EPA should continue to apply the rigorous standards the Agency has used for decades, and that stakeholders engage in the process that is full and open with regards to science.

EPA's Science Advisory Board voted to review this action during its June 1st meeting. This proposal has also prompted, as we've heard today, vehement reaction from the scientific community. EPA's proposal is not about transparency. It is about undermining public health. The negative effects of this proposed rule on EPA's programs could be far reaching across the Midwest. Midwesterners are exposed to unhealthy levels of air pollutants, including particulates, ozone, and toxic emissions from our industries and agricultural operations.

Achieving and maintaining health air to breath remains a challenge. EPA just finalized not attainment designations for Midwest's biggest

cities. There are millions of people -- where millions of people live, work, and play. Foundational studies about the impact of air pollution to public health are essential. These studies have been reviewed numerous times. Yet, under EPA's proposal, they would be ruled out of bounds, compromising the Agency's ability to truly assess the impacts of air pollution and to set standards are a level that will protect public health as the Clean Air Act requires.

Weaker standards will mean dirtier air in our communities. The elimination of these studies would also skew the evaluation of cost and benefits, leading to less protective rules that will not be based on a true accounting of the public health costs of pollution. We're also concerned about how EPA's proposal to censor science will impact a range of other significant concerns across the Midwest and Great Lakes, from using the best available science and its review of toxic -- the toxic insecticide, chlorpyriphos, the impacts of growing problems of harmful algael

blooms in Lake Erie and other places across the Great Lakes on public health, and in setting standards for lead in water, soil, and in homes.

EPA has shown time and again that achieving cleaner air, and water, and a healthier environment go hand-in-hand with economic growth. Our children's health across the Midwest depends on EPA continuing to do its job and not let industry-driven agenda undermine its essential role. We respectfully ask EPA to withdraw this proposal. We will be submitting more detailed comments to the record. Thank you.

MR. ROBBINS: Thank you.

MR. GAMSE: I am Roy Gam -- I am Roy Gamse, G-A-M-S-E, no S on the end. Formerly EPA Deputy Assistant Administrator. Reading the comments of John Bachmann of the Environmental Protection Network. He served EPA for 33 years, was Associate Director of Science Policy and New Programs for the Office of Air Quality Planning and Standards.

John's comments. "I appreciate the

opportunity to provide the comments on the proposed rulemaking on strengthening transparency on behalf of EPN. EPN will submit the detailed written comments on the proposal later."

"This proposal would not strengthen transparency of regulations. Instead, it would preclude the assessment and use of best scientific information available as required by all major statutes administered by EPA. The process by which it was developed, the misuse of references that ultimately do not support its arguments and the lack of specifics, what EPA actually intends to do are an embarrassment to the agency."

"The new acting administration should withdraw it from consideration as soon as possible. EPA's proposal is a solution in search of a problem. A proposal asserts it's dealing with a replication crisis, but does not cite a single instance where a study used by EPA for any type of major rule was shown to be flawed due to a lack of access to the underlying data. In fact, EPA and the industry funded an independent

reanalysis of the two air pollution studies that were criticized for not releasing confidential health information, and both were successfully reproduced with the results published in 2000. Moreover, their key findings have been replicated dozens of times since then by other investigators using different health and air quality data."

"The proposal to exclude important peer reviewed studies is wholly inconsistent with scientific practice and EPA's past use of science and regulatory decisions, where studies with novel results appear, EPA's assessments have noted limitations and some cases supported reanalysis."

"EPA's science policy related assessments are, themselves, peer-reviewed by the SAB or CASAC to further ensure study evaluations consider all of the relevant scientific literature."

"As noted by the SAB workgroup, the EPA's proposal downplays valid concerns about the risks of providing access to the confidential information of subjects in epidemiology studies. The SAB group noted some of the largest most

useful health effects data sets cannot be made fully public because certain personal information of age, sex, health, and location could be used to identify participants, or because of agreements made with study participants in advance."

"EPA failed to mention various ways to assess the validity of fire epidemiology studies without access to data, nor that the rule may preclude continued use of studies published many years ago."

"The proposal includes a provision for the administrator to waive this requirement. No clear decision criteria provided to allow EPA scientists and stakeholders to understand when and how the waivers would be granted. It appears that requirement could be applied in an arbitrary and capricious manner that does not reflect sound science judgment. Critical decisions like these must be made on the basis of science, not politics. Otherwise, highly relevant studies for which data can't be publicly shared, even if published in the best peer reviewed journals and

replicated may be judged to be inherently untrustworthy."

"The rushed, mostly secret process EPA followed in developing the proposal displays a complete disinterest in transparency, much less in science. In developing this proposal EPA leadership did not provide a role for zone career science experts in crafting the proposal, never included the rule on its regulatory agenda, did not notify of consult with the SAB, much less request the review as required by law. Did not solicit the advice of the NAS on provisions that would change does response models used in risk assessment from those previously recommended by NAS, did not ask for review to solicit the views of other federal agencies that conduct research or use health effect science in developing regulations. Finally, the Agency originally only allowed a 30-day comment period on this remarkable unvetted departure from the past practice."

"In suggesting potential cost of the rule would be minimal, EPA ignored the cost to

researchers who would have to pay to set up and maintain data sharing for their previously published studies to be considered, to EPA for conducting the multiple reanalysis required in Section 30.6 of the rule, and to public health for the disbenefits of undermining existing regulations. Having done no assessment, EPA has no basis for its claim that the benefits of the rule exceed its cost. Scientists and scientific publications that EPA cites as evidence for support for this rule have rejected the proposal's preemption of existing studies based on availability of raw data. Professor John Ioannidis reacted strongly to the proposal in an editorial noting that, quote, 'If the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim.' End quote."

"Editors of four major scientific journals whose policies EPA cited as support jointly stated, quote, 'It does not strengthen

policies based on scientific evidence to limit the scientific evidence that can inform them. Excluding relevant studies simply because they don't meet rigid transparency standards will adversely affect decision-making processes.'"

"Finally, EPA should immediately withdraw this flawed proposal from consideration, given the fatal flaw of establishing unnecessary regulation for science assessment that would elevate transparency over any other criterion. We're unable to offer any suggests for improving it."

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 28, Jennifer Sabb (sic), and Speaker Number 29, Paul Miller, come up to the speaker's table. And Speaker Number 30, Matthew McKinzie and Speaker Number 31, Anne Mellinger-Bird (sic), take a seat at the on-deck chairs.

Please remember to speak into the mic and state your organization.

MS. SASS: Hello. My name is Jennifer Sass, S-A-S-S. I'm with NRDC, the Natural

Resources Defense Council.

And I'm here to talk about the concern that scientists and environment health and medical professionals have with this rule. In one of his last acts of aggression against the public before resigning, the corrupt and disgraced EPA Administrator Scott Pruitt, proposed the rule to restrict the scientific studies that EPA could rely on to set safety standards for toxic chemicals.

Ironically, the rule is called science transparency when in truth public health will be seriously harmed. That's why over 40 doctors and scientists released a letter today which was submitted to the docket, raising alarm about the rule and the harms that it would bring about.

In the letter, they say as scientists and health professionals we recognize the importance of data sharing and replicability in scientific practice and discourse. The experts are part of Project Tender, and their letter is also publicly available.

They say the proposed rule is about stiffing science used by EPA, not improving it. They all have careers devoted to protecting children and their families from exposures to neurotoxic chemicals. They say the proposal could also undercut existing safeguards. Regulations that have led to protections against toxic air pollution, lead and drinking water, and dangerous pesticides, such as chlorpyrifos.

Dr. Phil Landrigan, a globally renowned expert on childhood harm from chemical pollutants warned that if you implement this proposed rule the inevitable consequence is that chemicals with potential to damage children's brains and nervous systems will remain longer on the market, and many thousands of children born, and not yet born, who could have been protected against these chemicals, will be unnecessarily exposed. Brain damage with loss of intelligence, disruption of behavior, and diminished lifetime achievement will be the result. Is this the legacy that EPA wishes to leave for America's children?

The Economist also wrote about the rule, very bluntly in an article titled, "Swamp science: Scott Pruitt embarks on a campaign to stifle science at the EPA." In that Economist article they emphasized that the proposal rule is really about blocking information used by EPA to protect our health. The rule prohibits the Agency from setting regulations that are supported in part or whole by data that is not publicly available for reanalysis or that cannot be replicated. It will hamstring EPA's use of scientific information, which could only harm EPA's work quality and public credibility.

There are many reasons why a study cannot be made fully public or replicated. For example, the original raw data may no longer be -- exist. Or the original exposure conditions may no longer exist, such as lead exposures from leaded gasoline, and patient protection and privacy rules may prevent full disclosure of the raw data, or information. EPA already has long-established and transparent methods for evaluating data in these

situations.

This rule would block the studies used to set air pollution regulations that will have prevented more than 30,000 premature deaths by 2020, with benefits valued at 30 times the cost of the Clean Air Act, according to EPA scientists and technical experts.

The rule would also block the studies that protect children from lead poisoning in air, water, and soil, and would block the studies of harmed children that support an EPA proposed ban on the neurotoxic pesticide chlorpyrifos, which President Trump and former Administrator Pruitt have already rolled back those proposals.

This may be the most unpopular proposal from an already unpopular EPA administration to date. It is a rule that fundamentally purports to solve a problem that doesn't exist, and it should be abandoned. It cannot be fixed. Thank you.

MR. ROBBINS: Thank you.

MR. MILLER: Hello. My name is Paul Miller. It's M-I-L-L-E-R. I am Deputy Director

of the Northeast States for Coordinated Air Use Management, or NSCAUM. NSCAUM is the regional association of state air agency air quality control agencies in Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont.

My comments today reflect the majority view of NSCAUM's members, while individual members may hold some views different from the majority consensus.

In sum, we are concerned that should this proposal lead EPA to not fully consider the best available science in rulemakings, it will endanger public health and the environment.

The EPA invokes strengthening transparency as a primary driver for this proposal, but fails to describe how a perceived lack of transparency has hampered past rulemakings. It provides no examples of work, quote, "EPA has not previously implemented these policies and guidance in a robust and consistent manner," end quote, nor what are the specific

quote, "Agency culture and practices regarding data access," end quote. That requires changing.

The Agency also provides no cost analysis of this proposal. Without additional clarity from EPA we are having difficultly identifying the problem EPA seeks to address. Therefore, for the following reasons we request that EPA withdraw the proposed rule.

First, the proposal is too vague as written to provide the public with meaningful opportunity to comment. EPA solicits comments across a long list of topic areas, but fails to provide the Agency's own sufficient detail and rationale on the solicited comment areas as required by the Administrative Procedure Act.

We are left to speculate on EPA's views, and on those of other commenters that would presumably shape EPA's final rule. It is well settled law that this approach fails to provide adequate notice for informed public comment.

Second, EPA must describe how the proposed text in Sections 30.5, 30.7, and 30.9

affect current practice. Section 30.5 states that the Agency shall ensure that those response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation.

Section 30.7 states, EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions. EPA, however, does not describe what constitutes in its view, independent validation and independent peer review.

Furthermore, Section 30.5 includes qualifying language that EPA will take all reasonable efforts to make data available unless it is not possible due to other constraints, such as legal protections of privacy and confidentiality.

EPA provides no examples of where and how, in the Agency's view, past rulemaking specifically failed to make these same efforts, nor how EPA would change past practice in this context. Adding to the vagueness of Sections 30.5

and 30.7, Section 30.9 would provide the administrator with broad authority to exempt regulatory decisions from the proposed disclosure provisions on a case-by-case basis if he or she determines that compliance is impracticable. The proposed rule fails to provide specific criteria for determining when compliance is impracticable.

Lacking clear guidelines for transparent decision-making, the administrator's discretion would appear to be unbounded in application and potentially based on haphazard and non-transparent rationales.

Third, EPA has provided no meaningful cost estimate for the proposed rule. The costs are likely quite significant, however, based on a congressional budget office cost estimate of the similar congressional proposal.

In addition to lack of cost information, EPA offers no accounting of foregone benefits should a broad application of this proposal limit the use of the best available science in setting public health standards and preventing adverse

health outcomes.

In conclusion, EPA's proposal has far-reaching consequences on the future use of science by the agency. These consequences, however significant they may be, are indeterminate in light of the proposal's vagueness. The proposal fails to clearly articulate the problem EPA seeks to address, the specific proposed rule requirements, and its cost and benefits.

These are well understood and basic elements that federal agencies must include to ensure informed public comment. Given that these elements are missing from this proposed, EPA should withdraw it. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 30, Matthew McKinzie and Speaker Number 31, Anne Mellinger-Bird (sic) come to the speaker's table. Would Speaker Number 32, Erica Bardwell, and Speaker Number 33, Jennifer Reaves, take a seat at the on-deck chair.

MR. McKINZIE: Good morning. I'm Matthew

McKinzie, M-C-K-I-N-Z-I-E. I'm a nuclear physicist with the Natural Resources Defense Council, NRDC, and I'm very pleased to talk today about this proposed rule. My remarks will focus in on the radiation protection aspect of the proposed rule.

NRDC, just as background, is a national non-profit organization of scientists, lawyers, and environmental specialists. We are dedicated to protecting the public health and the environment.

NRDC has been engaged with the environmental issues surrounding nuclear energy and nuclear weapons since our founding. There's something strange about the proposed rule in that it does not use the word radiation, and it does not cite the EPA's authority under the Atomic Energy Act.

Nevertheless, the language of the proposed rule seems to clearly implicate radiation protection standards. In particular, appears to undermine the basis, a fundamental basis of

radiation protection standards, the linear no-threshold dose response model. And so that's what I'll focus on with my five minutes.

The science in radiation epidemiological studies has repeatedly demonstrated over decades that linear no-threshold dose response, LNT, provides the most reasonable description of the relation between the low dose, low radiation dose exposure, and the incidence of solid cancers that are induced by that ionizing radiation.

EPA bases its regulatory limits and nonregulatory guidelines for population exposure to low-level ionizing radiation on this linear no threshold model. EPA's radiation protection standards are based on the premise that any radiation does carries some risk, and that risk increases directly with dose.

This method of estimating risk is called LNT. For over 40 years, the LNT dose response model has been commonly utilized when developing practical and prudent guidance on ways to protect workers and members of the public from the

potential for harmful effects from radiation in that balance, with commercially justified and optimized uses of radiation. EPA derives the LNT model from reports by authoritative scientific bodies, including the National Academy of Sciences, NAS, the National Council on Radiation Protection and Measurements, NCRP, and other bodies.

The NCRP published its last commentary on the LNT issue only weeks ago, in April of 2018, reinforcing this -- the LNT as the basis for radiation protection standards.

Epidemiological studies of humans provide evidence that is critically important in establishing potentially causal associations of environmental factors with disease. NAS and other studies that EPA has long relied upon in the radiation standard setting process are epidemiological human cohort studies. EPA's proposed rule, if implemented, would limit EPA staff from basing regulatory actions on precisely these types of studies by requiring that the

underlying data of these studies should be publicly shared, fully publicly shared. This would be a nearly impossible task for the agency.

Data for some of the radiation epidemiological studies are accessible to users, with a detailed description of how a user can access the information. However, public sharing of personally identifiable information is restricted. These are profoundly important studies on radiation health effects that have been peer reviewed for decades, and the science that has emerged from them has been validated multiple times. But these are not studies where the entirety of the public data can be shared or independently replicated.

Replication of these studies is impossible as this data comes from individuals exposed to significant, acute, and protracted doses of radiation. Pruitt's proposed rule would throw out the data from the atomic bomb survivors of World War II. That's a profound, very profound thing.

Adverse consequences for EPA would affect federal guidance reports, nuclear field cycle standards and regulations, minimum amount -- minimum allowed concentrations of radiation in drinking water, soil clean up for super fund sites, radioactive waste disposals, as well as the fundamental concept of ALARA, As Low As Reasonably Achievable, in radiation protection standards.

In conclusion, I urge the EPA to abandon the proposed rule as it fundamentally calls into question basic radiation protection standards that are scientifically founded and have protected the public for many years. Thank you.

MR. ROBBINS: Thank you.

MS. MELLINGER-BIRDSONG: Hi. My name is Anne Mellinger-Birdsong, M-E-L-L-I-N-G-E-R, dash, B-I-R-D-S-O-N-G.

Thank you for allowing me to speak today. My name is Anne Mellinger-Birdsong, and I am a fellow of the American Academy of Pediatrics and a specialist in environmental public health. I have worked at city, county, state, and federal public

health agencies, and Indian health service facilities.

I'm here to speak in opposition to this proposed rule and to state that this proposed rule is unnecessary and it would harm EPA's ability to evaluate health impacts of environmental pollutants. It should not be finalized or implemented.

This proposal has wording that makes it appear noble and well-meaning, but it is a sheep in wolf's clothing. This proposal will severely hamper EPA's ability to use past and future research on health effects of human exposure to environmental chemicals and toxicants. It should be withdrawn.

Both the HIPAA and the federal regulations on human subjects research address privacy as a concern of people who participate in research. It's not as simple as redacting data such as name, birth date, medical record number, et cetera. You also have to not have data that can be used to intuit or figure out who a study

subject is. So you have a study of Town A and people who had heart attacks in July. If there is age or zip code data associated with that, the people that live in Town A could figure out, oh, that's Mr. X down the street. So it would really hamper the ability to use data, and environmental health data often has zip code and year and a lot of stuff that can be used to put together and figure out who people are.

So that's how it would work. And I just would like to say also that children have even more health protections than adults because of being smaller, and we have to be more concerned for them. And especially living human subjects of research who will continue to live, we need to be extra careful to protect their privacy. And this rule would either require data made public, or it would prohibit using a lot of data that would enable -- that would inhibit privacy protection.

So also it would decrease people's trust in participating in research if they are fearful of their personal identifiers being released or

people being able to know that they participated in a study. They may not participate, so we would have worse data for studies in the future because of this rule.

And I would like to say that children do not choose where they live, or where they go to school, or what kind of water quality their water they drink is, or the air that they breathe. It's up to we, who are adults, the adults who are their caretakers who choose where they live, and we who set policies to make these decisions to keep children healthy. And this rule would severely harm children because it will throw out a lot of data, and a lot of data that has been used to form, already, established rules.

So I ask, why was this rule proposed? It would eliminate use of scientific studies and hamper future research. The rule was completely unnecessary. We have mechanisms within scientific institutions to transfer data so it's HIPAA compliant and IRB approved, so we can verify research and reevaluate it and confirm it. We

don't need this rule and it is, again, it's a rule that's unnecessary and would hamper and harm EPA's ability to carry out its functions.

So I'm going to end with a quote by a professor from Carnegie Mellon University, Granger Morgan. He used to chair the EPA Science Advisory Board under George W. Bush. He said, "this proposed rule is an attempt by people who aren't interested in using science to find the truth to raise doubts about what, at this stage, is very clearly established and well-reviewed science."

And I urge the EPA to withdraw this proposed rule and not implement it at all.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 32, Erica Bardwell, and Speaker Number 33, Jennifer Rebeb (sic), come up to the speaker's table. And Speaker Number 34, Molly Rauch, and Speaker Number 35, Barbara Gottlieb, take a seat at the on-deck chairs.

Speakers are reminded to speak into the mic and state your organization.

MS. REAVES: Hi. My name is Jennifer Reaves. Reaves spelled R-E-A, V as in Victor, E-S. I represent Moms Clean Air Force, Maryland.

Am I supposed to speak first? Oh, okay.

My name is Jennifer Reaves. I live in Hyattsville, Maryland. Thank you for this opportunity to offer comment. As a member of Moms Clean Air Force, Maryland, I am here today to speak out in opposition to Acting Administrator Andrew Wheeler's attempts to censor science in the name of transparency.

This dangerous censoring sign plan to limit the scientific information EPA can use to identify public health threatens and future and safety of our children. This proposal will essentially require researchers to make private personal medical information public in order for the EPA to use their research in its decision-making.

This proposal also includes loop holes that would exempt industry from having to disclose details of their own studies. It is designed to

favor the fossil fuel and chemical industries, limiting EPA's ability to protect us from toxic pollution and chemicals. High quality science is crucial to understanding the risk of our families face every day, especially when it comes to air pollution and toxic chemical exposure.

This proposal means that many studies on populations, such as elderly, young people, and people of color, groups who are often suffer disproportionately from pollution would be excluded from EPA consideration because making the data public could identify and participating -- identify the participating individuals. Including this important data from consideration means that implementing this proposal could even further exuberate negative environmental impacts on these and other vulnerable communities.

This proposal puts our children's bodies on the line by censoring research, making even low levels of pollution with significant health impacts instead of cleaning up their act. Polluting industries want these kind of studies to

simply disappear.

My family and my fellow Marylanders are counting on the sound and transparent science the EPA has used for decades. And we are counting on our medical records remaining private. I strongly urge the EPA to stop this radical proposal for the health and safety of all Americans. Thank you.

MR. ROBBINS: Thank you.

MS. BARDWELL: All right. Excuse me. Thank you. My name is Erica Bardwell. Can you hear me? Okay.

I am a local registered nurse. I work at a local hospital. I'm also a member of Physicians for Social Responsibility. Thanks for taking time today.

Mr. Scott Pruitt is no longer here as EPA administrator, but it does seem that this proposal preserves the hallmark of his tenure. By that I have to say, I mean a complete lack of shame.

This proposal masquerades as an attempt to strengthen science, and by extension, public health. But this is a bald, even shameless lie.

It would actually make public health research impossible, or much, much more difficult, which obviously is the real point.

If someone can't participate in medical research without worrying that their identities or parts of their medical records are going to be rampaging around the public record, then they simply won't do it. Which again, is the point.

Basically, shameless people say that to themselves behind their scenes. But to us they say that they're really concerned about us and public transparency, but it's not true.

I saw a reference to a replication crisis. Last I heard, the replication crisis was mostly social sciences. There's not a huge replication crisis in epidemiology. Certainly not to the point where basic facts are in doubt. There is no doubt that air pollution kills people, that poison in water makes people sick, that toxic soil grows toxic food. This is not in contention. There's no replication crisis here.

So the only purpose of this rule could be

to avoid adding to the already damning weight of this existing evidence. Basically, to make it cheaper for a few people to literally poison people for profit, which is ultimately a tragedy for everybody.

I think the thinking is that sciencing debates are going to bore the public, and most other people have to work on a random Tuesday. I swapped a shift to be here, but most people don't have that option.

MS. DOA: Can you speak into the mic a little bit more?

MS. BARDWELL: Sure. Okay.

MS. DOA: That's better. Thank you.

MS. BARDWELL: So, the true public interest may not be represented here because people have to work. But if this rule is finalized, the public is going to howl once they actually feel its effects and lose the protection that they need from these studies. And I wouldn't want to be the person left holding the bag when that travesty happens.

Finally, as my grandmother used to say, what sauce is for the goose is sauce for the gander. If exposing personal information is really required to have quality medical research, I eagerly await the day this administration proposes similar restrictions on, say, pharmaceutical research. I wait for the day that Pfizer can't get approval for its nth blood sugar pill without revealing incredibly invasive information about all of its research subjects. I don't think that day is ever going to come, because protecting people or advancing science isn't really the goal.

Thanks for your time.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 34, Molly Rauch, and Speaker Number 35, Barbara Gottlieb come to the speaker's table. And Speaker Number 36, Lyndsay Alexander, and Speaker Number -- is there a Speaker Number 37 in the room? What's your name?

MS. BENDER: Laura Bender.

MS. RAUCH: Hi. I'm Molly Rauch. Name is spelled M-O-L-L-Y R-A-U-C-H. I'm Public Health Policy Director with Moms Clean Air Force. We're a national organization of more than a million moms and dads fighting air pollution and climate change for the sake of our children's health.

Thanks for this opportunity to offer comment. On behalf of our more than 1 million members, I am here today to strongly oppose the administration's attempts to censor the science used in public health decision-making. This intentionally misleading proposal is being sold by EPA leadership as an effort to increase transparency. But the facts suggest that the real motivation is simply to sweep under the rug the scientific evidence disfavored by polluting companies.

The proposal would prevent EPA from using studies that are based on personal medical data, thereby eliminating some of the most important long-term epidemiological studies, investigating the impacts of pollution on public health, and

hundreds of scientists have already spoken out against this proposal.

Indeed, this flimsy proposal was designed without adequate input from the scientific community, according to the members of EPA's own Scientific Advisory Board. It was rushed through the regulatory process. It was originally proposed with a gallingly short public comment period that suggested an intention of casting less light on the rulemaking process, not more.

For a proposal that posits a sweeping change in the health-based rulemaking that is the foundation of the EPA, it was quite the slight of hand.

As a public health expert who has been closely following EPA's rulemaking process for more than a decade, it is evident to me that this is a cynical ploy to bolster polluting industries that don't like the results of longitudinal research.

Who does this benefit? Who really benefits from this charade? I must call it a

charade. Not the families everywhere who want to breathe clean air and drink clean water. Not frontline communities dealing with multiple pollution exposures from many industrial sources. Not the millions of children in the U.S. with asthma across the country whose disease can be worsened by small changes in air quality day to day, not the elderly, not those with underlying health problems whose likelihood of being admitted to the hospital, of having a stroke, of having a heart attack, even of dying, could depend on the levels of particulate pollution in the air. It does not benefit these people.

I have a master's degree in public health. One of the most valuable things that I studied in graduate school was how to evaluate the reliability of epidemiological studies. We learn the importance of considering many different criteria in making these evaluations. Whether the raw data was available to me, personally, to review, was never grounds for automatically discounting the credibility or reliability of any

given study.

The idea that an entire library of research would be rejected wholesale, based simply on that one external criteria, represents a crude approach, to put it kindly.

We also, in grad school, learned about the iron-clad importance of treating study subjects ethically and with respect. And this is a touchstone of public health practice. All research on humans must be approved by institutional review boards, and they prioritize the privacy and consent of study subjects. There are laws about this.

When study subjects are disrespected terrible things can happen, which is why we were required to learn about things like the, "Tuskegee Study of Untreated Syphilis in African/American (sic)Men," when we were in public health school. We cannot go back to the time when the study subject was a mere pawn in someone else's game. Treating study subjects ethically requires protecting their privacy.

Finally, we studied the tactics of polluting industries and their shameful legacy of attempting undermine science, whether it was the tobacco industry or the lead industry, we learned about the deliberate, expensive, decades-long campaigns to protect corporate profits, and meanwhile people were literally dying as a result. This is an old story. We've heard it before, and we're hearing that story again. Public health professionals are trained to recognize history and call it out, which is what we are doing today.

This proposal is an excuse to hamstring researchers to weaken public health protections, and to pad the profits of polluting industries. As a public health professional, as a mother, and on behalf of the 1 million members of Moms Clean Air Force, I strongly urge the EPA to stop this proposal for the health and safety of all Americans. Thank you.

MR. TEICHMAN: Thank you.

MS. GOTTLIEB: Good morning. My name is Barbara Gottlieb, G-O-T-T-L-I-E-B. I'm the

Director for Environment and Health at Physicians for Social Responsibility.

On behalf of our 33 members, I'm here to express our opposition to the proposed rule -- "Strengthening Transparency in Regulatory Science."

The U.S. EPA plays a critical role in keeping our nation and our families safe from environmental exposures that can cause illness and death. We thank you for that - and we count on you for it. Because your role is vital to our health and well-being, the nation relies on you to formulate and enforce the most effective protections possible, based on the best available science. The medical and scientific studies that underlie the EPA's decisions must be objective, vetted, and present a full and accurate assessment of the threats to health posed by the pollutants under study.

To provide those full and accurate assessments, studies need to relate exposure levels to actual health outcomes in real human

beings, and to amass large data bases so that researchers can draw valid conclusions.

In order to have reliable data and large sample sizes, researchers frequently study the records of patients treated in hospitals. Hospital records, of course, include personal identifiers, and disclosure of those identifiers would violate privacy and confidentiality laws. Thus, the best available data for many health studies cannot be - in the literal sense -fully and openly shared.

However, to refuse to consider scientific studies simply because they include personal identifiers -- would be a great mistake, nor is it necessary. Reviewers wanting to reproduce a study in order to validate it can arrange to have confidential access to key data. Furthermore, scientists can assess the merits of published research without seeing its data by considering such published features as the study's research design, the methods used for data collection and analysis, and comparison with previous results.

In any case, to exclude credible peer-

reviewed scientific studies because the personal identifiers cannot be released under the law, is to exclude from the EPA's consideration many important and valid studies. This would greatly hamper our ability, your ability, to understand the impacts of serious, even deadly, pollutants.

I'd like to cite, as example, three studies that could be lost to consideration under the proposed rule, on a topic I haven't heard referred to today. These studies reveal statistical correlations between exposure to emissions from fracturing, or fracking, for oil and gas, and serious health outcomes.

So the first is a study by University of Pennsylvania and Columbia University researchers and published in 2015 in the journal, PLoS ONE, found that drilling and fracking activity in Pennsylvania was associated with increased rates of hospitalization for cardiology, neurology, cancer, skin conditions, and urological problems.

In communities with the most wells, the rate of cardiology hospitalizations was 27 percent

higher than in control communities with no fracking. These findings are obviously of great concern; we would not want them to be lost to the EPA as you consider regulation of fracking related emissions.

Yet because the data includes such things as patients' names, diagnoses, addresses, and zip codes, this valuable study could be, under the proposed rule, excluded from EPA consideration.

Another study conducted in Pennsylvania between 2005 and 2012, found that living near fracking operations significantly increases asthma attacks. This study was conducted by researchers at Johns Hopkins University and it was based on a study of 35,000 medical records of people with asthma. This is just the sort of study that we want EPA to base its health-protective regulations on: a robust database conducted by researchers at a respected institution and published, as this one was, in the Journal of the American Medical Association Internal Medicine.

Yet should the proposed rule be adopted,

this study could be disallowed because its 35,000 medical records cannot easily be scrubbed of personal identifiers.

Third example, a study by the Johns Hopkins Bloomberg School of Public Health and other researchers, used data from the Geisinger Health System on over 9,000 pregnant women and their over 10,000 newborns between January 2009 and January 2013. The researchers found that the pregnant women who live near active fracking operations in Pennsylvania were at a 40 percent increased risk of giving birth prematurely. Premature birth is the leading cause of infant death in this country.

So we're talking about data that indicate that fracking operations could put newborn babies at risk of death. This was a study published in the peer review journal, Epidemiology.

Our families should have the benefit of these studies and many more that might be disregarded under the proposed rule. To exclude them would be to weaken the scientific record and

undercut an accuracy and strength of EPA's regulatory process, and to endanger human health.

For that reason, Physicians for Social Responsibility opposes the proposed rule. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 36, Lyndsay Alexander, and Speaker Number 37, Laura Bender, come up to the speaker's table.

And would Speaker Number 38, Liz Borkowski, and Speaker Number 39, Janice Nolen, take your seat at the on-deck chairs.

MS. ALEXANDER: Good morning. My name is Lyndsay Alexander, A-L-E-X-A-N-D-E-R. I direct the National Health Year Campaign at the American Lung Association. I am also the mother of a thriving toddler, who like all children, deserves healthy air to breath, and safe water to drink that won't make him sick or die prematurely.

I am here to ask EPA to withdraw this proposed rule because I'm very concerned that rather than foster transparency in regulatory

science, this rule promotes a callous effort to suppress and censor the science used to inform EPA policy to the detriment of millions of Americans' health and well-being.

EPA's ability to effectively fulfill its mission and protect public health from dangers, such as air pollution, hinges on the ability of its scientists to first evaluate the best available scientific evidence of the health threats of air pollution. Recognizing that scientists' understanding of the relationship between air pollution and public health would continue to evolve, congress wisely required EPA to review the latest evidence and revise air pollution limits for six key pollutants every five years. And then to work with states to reduce pollution to meet the limit.

While more work remains, this basic approach has worked exceedingly well at reducing ambient air pollution, saving lives, and improving health by preventing asthma attacks, heart attacks, and many other negative health outcomes

from air pollution.

This proposed rule would require EPA to exclude many of the best available peer-reviewed and rigorously scrutinized studies from consideration during decision-making, such as its upcoming air quality standard reviews for ozone and particulate matter.

Excluding studies for which raw data are not available due to concerns over patient confidentiality, or which do not meet vague standard of reproducibility because studies were conducted over long periods of time, or connected to real world events beyond the control of researchers, would greatly narrow the body of evidence and the quality of the information that EPA can consider. This would undoubtedly lead to weaker protections and EPA's ability to estimate the true threats of air pollution on human health, and the benefits of reducing pollution, and thus result in weaker air pollution limits.

In 1993, researchers at Harvard University published a landmark air pollution

study, showing that particulate matter air pollution was linked to premature death. The Harvard Six Cities Study, as it is known, tracked the health of 8,111 adults, and 14,000 children in six small cities in the United States, beginning in the 1970s.

This study found that people in cities with cleaner air were living two to three years longer than those living in cities with dirtier air. Residents of Steubenville, Ohio, the city with the dirtiest air, were 26 percent more likely to die prematurely than were citizens of Portage, Wisconsin, the city with the cleanest air.

What surprised researchers was that the culprit was particulate matter, not sulfur-dioxide, as they had thought. This was a very important scientific discovery. This study, and countless others since, have helped EPA to understand that particle pollution in the air we breathe, resulting from activities such as burning coal for electricity, or diesel exhaust from vehicles, harms human health in profound ways in

communities across the nation and has paved the way for stronger air pollution limits designed to protect public health.

But the data for the Harvard Six Cities Study are not publicly available, and the study was conducted over a long period of time that make it very difficult to reproduce. Industry, and their allies in congress previously challenged the findings of this study and other similarly important studies. Instead of blocking the studies, as this proposal would do, EPA took a logical step and referred them to an independent third-party, the Health Effects Institute, for a deep dive review.

There, autonomous reviewers examined the data and developed a report that confirmed their original findings. Other research has since confirmed similar findings, including some studies that use publicly available data sets. Critically important studies, such as the Harvard Six Cities Study would likely be excluded under this proposal to the detriment of health protections. This

proposal would also affect other protections currently in place, such as limits on certain toxic air emissions from tail pipes and smoke stacks, and information on the health effects of many of these; more than 150 chemicals come from older studies built on confidential patient or private business data that cannot be made public.

This could -- this proposal could also cull the use of research that includes confidential business information or older studies that has data stored on older technology that can't be recovered, just to name two other limitations.

Thank you for the opportunity to speak today. The American Lung Association will submit more detailed written comments.

MR. ROBBINS: Thank you.

MS. BENDER: Good morning. My name is Laura Bender, L-A-U-R-A B-E-N-D-E-R, and I'm the National Director of Advocacy of the American Lung Association's Healthy Air Campaign.

The lung association's mission is to save

lives by improving lung health and preventing lung disease. And as you know, we strongly oppose EPA's so-called, "Strengthening Transparency in Regulatory Science," proposal.

Today you've heard from many representatives at the public health and medical community about the ways this proposal would undermine human health. I'd like to take a few minutes to highlight the Lung Association's concerns about the lack of transparency in EPA's work on this rule.

The administration has attempted to rush this rule forward at every turn, consistently sacrificing expert analysis and public health along the way. This is a sweeping proposal that will impact a wide range of public health safeguards, essentially affecting every future decision at EPA based on science. And yet, EPA's process in issuing it has been haphazard, rushed, and anything but transparent.

First, back in April, then Administrator Scott Pruitt, prematurely announced the proposal

while it was still undergoing interagency review at the White House Office of Management and Budget. Then, when media inquired about this discrepancy, OMB actually backdated the clearance by several days. This means that OMB only reviewed the proposal for 48 hours. That's a staggering tight timeline for such a sweeping rule.

In a similar vein, EPA initially only allowed a 30-day comment period with no public hearing. The Lung Association was among the organizations who requested 60 additional days and a hearing. We greatly appreciate the additional time and today's public hearing.

That additional time is crucial, particularly because EPA has failed to complete a regulatory impact analysis that explains the impacts of the proposal, putting the burden on commenters to do so instead.

EPA ignored another important opportunity for review when it failed to consult the Agency's own Science Advisory Board. The SAB, which

includes appointed members from this administration, voted at its May meeting to request to review the proposal.

In a letter to EPA last month, they said that they were only made aware of the rule through the press, and when it was published in the Federal Register. The SAB said unequivocally, quote, "The proposed rule merits review by the Board."

We strongly encourage the Agency to move forward with the SAB review of the proposal. To refuse their request to do so would be unprecedented and in direct contradiction of the Agency's stated claim of wanting the best science to inform its decision-making.

EPA rushed out this proposal after an inadequate review process, and it shows. The proposal falls short in several key ways. First, EPA fails to provide any evidence that the changes outlined in the rule are needed. EPA's existing approach towards science, with its detailed review and deliberation of the research, is already

transparent and has worked well for decades.

First, independent science has revealed that studies prior to publication by recognize journals, then independent and EPA staff scientists reviewed them again and question every aspect of the research in depth. And they do these reviews in wide open processes, including publication, public hearings, and comment periods.

EPA does not acknowledge the rigor of this process in its proposal. Instead, it attempts to justify this rule by claiming that the Agency is following in the footsteps of scientific journals. But last month as other commenters have noted, several scientific journals issued a joint statement highlighting their concerns with EPA's proposal and pointed out that even though many peer-reviewed publications have recently adopted transparency policies, they are still able to assess and use studies for which the underlying data cannot be made public.

Second, EPA fails to define its requirement that studies must be replicable. Does

EPA mean that the Agency couldn't consider a study that looked at health impacts of a one-time event, like a major oil spill?

The SAB also raised questions about EPA's failure to define this and other terms.

Finally, EPA did not explain how the Agency would implement the rule. The proposal offers no process for public hearing, or even consultation with the SAB over implementation. What process would EPA use to review and assess the existing research and revisions? What guidance would the administrator receive to avoid arbitrary decision-making over the fate of this research?

And where would the massive staff time and resources the EPA would need for such a massive additional workload come from? What would have to be sacrificed?

EPA's rushed process, its inadequate review, its false attempt to claim that its policy is supported by scientific journals, and its many unanswered questions about how the proposal would

work, all underscore a core problem with this rule. It would not improve the use of science of EPA. It would not make the Agency's science-based rules more transparent. It would permanently damage EPA's ability to do its job to protect the public.

On behalf of the millions of people with lung disease that we serve who will be hurt by the weaker pollution protections that would result from this proposal, we urge EPA to withdraw this rule to censor science. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 38, Liz Borkowski, and Speaker Number 39, Janice Nolen, come up to the speaker's table. And Speaker Number 40, Albert Donnay, you're already at your seat. Excellent. Also, if Speaker Number 15, Harvey Fernbach, is in the room, you can take a seat at the on-deck chairs. Last call.

MS. BORKOWSKI: Thank you for the opportunity to present comments. My name is Liz Borkowski, and I'm the Managing Director of the

Jacobs Institute of Women's Health, which is at the Milken Institute School of Public Health at the George Washington University.

The Jacobs Institute is concerned about EPA's proposed rule, "Strengthening Transparency in Regulatory Science," due to the harmful impact it would have on women's health and reproductive justice.

We urge EPA to withdraw it based both on its detrimental impacts, and on the lack of a demonstrated need for such a rule. EPA has failed to demonstrate that its current processes for considering science and regulation are inadequate. It has not provided examples of any instances in which insufficient transparency has resulted in outcomes contrary to its statutory mandates or executive orders.

Given extensive existing procedures used by EPA and the scientific community at large to ensure the quality of research, EPA has failed to make a case that additional public access to data is necessary.

The theoretical, but as yet undemonstrated benefits of EPA's proposed rule, must be weighed against the extensive and unequally distributed costs of such an approach. Failing to consider the best available evidence because the underlying data are not publicly available, would result in regulations that fail to sufficiently protect public health. The consequences would fall most severely on sensitive groups not adequately protected by current rules, which include racial and ethnic minorities, those with low socio-economic status, the elderly, and pregnant individuals and their eventual children.

My comments provide a few examples related to reproductive health. First, neurotoxicants are of particular concern to pregnant people and the parents of young children. In regulatory activities, to reduce exposure to neurotoxicants, such as lead and methyl mercury, EPA has relied on an extensive body of research. This research includes longitudinal studies of individuals who are exposed in utero or as young

children to higher levels of lead or methyl mercury than would typically occur in the U.S. today. It would not be ethical to publicly release data from these studies, and it would not be feasible, particularly for older studies that used incompatible storage media to locate all participants and obtain their permission.

EPA's use of research on lead and methyl mercury also has implications for other agencies that address these substances. For instance, the Department of Housing and Urban Development relies on EPA's renovation, repair, and painting rule in its regulation of renovators working in housing units, receiving HUD housing assistance where lead paint is present.

EPA calculated the reference dose for methyl mercury that EPA and the Food and Drug Administration used to create guidelines on fish consumption, including recommendations for pregnant and breast-feeding women.

It does not appear that EPA has undertaken the required interagency review process

to assess the implications of its rule for other agencies.

Another neurotoxicant of concern for reproductive health is the pesticide, chlorpyrifos. Researchers followed a cohort of children exposed to this pesticide before the current ban on indoor use and found lower IQ and working memory to be associated with higher levels of prenatal chlorpyrifos exposure.

In a rulemaking process regulating agricultural use of chlorpyrifos, EPA requested the underlying data from the Columbia Center for Children's Environmental Health. The response from Columbia University explained that because of the detailed sociodemographic and health-related elements their data set contains, they did not believe they could submit extensive individual-level data to EPA in a way that would ensure participants' confidentiality.

Such concerns are not uncommon with the kids of longitudinal data sets that allow identification of long-term consequences of

environmental exposures. Often, the combination of variables used in an analysis provides enough information to identify individual participants and may include sensitive information, such as diagnosis of neurodevelopmental delays.

In addition, endocrine disrupting chemicals are of great concern and reproductive health and EPA has regulated some of these, such as PCBs and PBDEs, under the Toxic Substances Control Act.

Under reformed TSCA, EPA must make decisions based on the weight of the scientific evidence, but it is not clear how it can do so if studies may be eliminated from consideration because data sets are not publicly available.

If EPA moves forward with the rule it has proposed, it will undermine science and regulatory decision-making by making it difficult and potentially impossible to consider the best available science. This will have detrimental impacts on reproductive justice, health equity, and women's health. The Jacobs Institute of

Women's Health urges EPA to withdraw this rule.

MR. ROBBINS: Thank you.

MS. NOLEN: Hi. Thank you. My name is Janice Nolen. It's J-A-N-I-C-E N-O-L-E-N, and I am the National Assistant Vice President for Policy for the American Lung Association.

The American Lung Association turns 114 years old this year. For more than a century we have fought to save lives for protecting lung health and preventing lung disease. We oppose the proposed rule.

Many years ago, in the early 1980s, my mother-in-law asked me to help her recruit participants in a major new study that they were doing. She worked for the American Cancer Society then. They were looking to create a huge database of ordinary Americans would be willing to provide them with confidential information about their health and medical experiences, and would allow them to track those for years to come.

I was so pleased that two men from my church choir in Nashville agreed to participate.

They completed the forms and other paperwork, and became two of the more than half million participants in the cancer prevention study too.

Fast-forward a decade or so and I learned that their data were now part of a landmark study, the American Cancer Society study that revealed the risks to human health from breathing air pollution that I and my colleagues at the lung association were working hard to clean up.

Their data and private health and medical information, from hundreds of thousands of others were -- from hundreds of thousands of other people, who were pointing the way, the need to clean up emissions from power plants, from diesel engines and fuels, and many other sources. I never dreamed when my mother-in-law made her first request to me that EPA scientists and other researchers would mark that study as one of two seminal studies that helped reshape our understanding of the health risks from particulate matter air pollution.

None of us then would have ever dreamed

that the information these two men provided would have helped to identify and underline the threat to human life posed by microscopic particles in the air we breathe.

Furthermore, that study and the Harvard Six Cities Study became examples, not only of ground-breaking research, but of how questions about that research can be reviewed and resolved without having to lose the entire study.

Unfortunately, that is an example that this proposal clearly fails to understand. These two studies with decades-old patient data and others in the long list of studies that found evidence of harm from industrial emissions are unique events that no one hopes to replicate, like gulf oil spills, clearly appear to be targets of this proposed rule.

Studies that have been -- long been targets of industry polluters and their allies, remains so in this proposal.

Once published, these studies raised alarms in the public health community about the

increased likelihood of premature death from particulate matter, widespread in the nation. The studies raised alarms within industry too, about the increased likelihood that their polluting sources would have to clean up their emissions. Industry kicked in messaging developed by the tobacco industry, to challenge the science using the same arguments we have in this proposal.

I have in my office, a page from a 1999 U.S. News and World Report article on the challenges to these studies that could have been written this year.

Scientists are working to become more transparent in their research. More researchers use publicly available information, but some studies cover populations that are so limited in size or specialized in their characteristics that these data could not be posted on the web for all the world to see. Anyone who has an account on Facebook should have a visceral knowledge of how important keeping confidential data confidential can be.

Meanwhile, EPA could readily review historical data and studies in ways that respect patient confidentiality and the gifts of data from people like my two choir member friends.

So far, EPA has failed to show any reason that these changes are needed in the current system. Failed in its own transparency on this issue, in fact since EPA has not sought SAB review of this, and has not provided sufficient rationale for why EPA needs this change, much less how they would this rule going forward.

We request EPA to withdraw this proposal. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 40, Albert Donnay, come to the speaker's table. And Speaker Number 41, Mona Sarfaty.

MR. DONNAY: Thank you. My name is Albert Donnay. My comments are based on experience gained from 40 years working on regulatory science as an environmental health engineer and toxicologist, as a research

scientist, public health activist, clinician, consultant, peer-reviewer for academic journals, environmental groups and government agencies at all levels, including EPA.

I'm glad I get to follow the last two speakers because I want to highlight that although EPA's proposal to "Strengthen Transparency in Regulatory Science" is needed, did not give any examples of regulations that had been undermined by a lack of such transparency.

I want to remind everyone here what's at stake and what happened the first time EPA, congress, and environmental groups had to decide whether it was okay to base regulatory standards on published scientific studies whose achieves were no longer available for review.

They got the answer right then, and I hope they'll get it right again now. It was May, 1983, 35 years ago, and the EPA was about to publish a new national ambient air quality standard for carbon monoxide based on nine studies by a distinguished cardiologist at the VA, Dr.

Aronow. When the Washington Post reported that he'd been barred by FDA a year earlier for submitting a wave of false medical experiments after he admitted, quote, "fudging his lab reports in human drug studies."

Although EPA's head of the Office of Air Quality Planning and Standards said the Agency had, quote, "No reason to believe anything was wrong with Aronow's CO studies," whose data Aronow claimed at the time, "are excellent and can't be questioned." EPA nevertheless appointed a special team of agency and outside scientists to review his work, quote, "When we read that Aronow had done some kooky things."

A month later, The Post reported the shocking results under the headline, "EPA Probe Criticizes a Study Used in Air-Quality Standard." The team had said, quote, "Could not resolve the issue of possible falsification of data because," quote, "no data were available." Aronow told them he'd discarded the archives of all of his CO studies after first storing them in his garage for

years, and offering it to EPA because they didn't want it.

The investigators noted considerable concerns about the validity of the results reported, quote, "Raw data were lost or discarded. Adequate records were not maintained, available data were of poor quality, and quality control was nonexistent."

And Aronow's published results were consistently too good to be true. They found it, quote, "Rather remarkable that in 10 years of research his papers showed," quote, "not even one missing data point." They concluded that EPA, quote, "Cannot rely on Aronow's data due to the concerns we've noted." And they recommended the Agency commission new research to attempt to replicate Aronow's findings.

Congressional hearings and the GAO investigation followed, after which Administrator Ruckelshaus agreed that EPA would not rely on any of Aronow's studies in future rulemakings, but only on studies whose archives were still

available for review.

In coordination with the California Air Resources Board and the Health Effects Institute, EPA commissioned a series of new controlled human exposure studies on CO, and since 1994, has based the CO NAAQS exclusively on just six of them, all of which published their individual results in deidentified form so they would be available for public review in perpetuity.

And it's a good thing they did since all the larger archives of these studies were eventually discarded by their authors without being offered to EPA. This history shows that EPA can and should base regulations solely on studies whose methods and data are available for review. To base regulations on studies that can't be reanalyzed is not science, and there is no need for it. Even federal rules that are based on older epi studies, like the last particulate NAAQS rule in 2013 that cited just six studies could and should be based on more recent research that better reflects current air quality.

Over 500 studies a year are now published on particulate epidemiology, and many are in high quality journals that require authors at least to make all their deidentified data and methods available to reviewers, if not to all readers from the posting of supplemental material.

Given EPA's interest in basing regulations on more transparent research, EPA should start requiring all the researches it funds, intermural and extramural, to publish their results in such journals. Hopefully this will prompt less rigorous journals that don't require the posting of supplemental material to update their policies.

In conclusion, the Aronow scandal shows EPA cannot rely exclusively on traditional peer review to detect misconduct. Aronow reviewers at 11 leading journals, as well as EPA staff and their scientific advisors on the CASAC, who also review the studies before recommending that nine be cited as the basis for the CO NAAQS. Unfortunately, despite all this publicity, none of

Aronow's studies were retracted, and the EPA has started citing them again, most recently in the 2010 integrated science assessment of the CO literature.

EPA's proposal to strengthen transparency and regulatory science could stop this from happening again, which is why I support it and encourage my colleagues to do so as well. Thank you.

MR. ROBBINS: Thank you.

MS. SARFATY: Can you hear me?

MR. ROBBINS: Yes.

MS. SARFATY: Yeah. Okay. Respected EPA panelists and fellow citizens, my name is Mona Sarfaty. I'm a physician trained in family medicine and public health. I practice primary care medicine and taught medical and public health students in three different academic medical centers for 35 years.

Today I direct a program in climate and health at George Mason University in Fairfax, Virginia. I also direct a consortium of physician

societies called the Medical Society Consortium on Climate and Health, whose 550,000 members are more than half the physicians in the United States.

The Consortium seeks to inform the public and policy makers about the health harms of climate change, and the health benefits of climate solutions. I'm submitting the formal comment of the consortium in written form in a separate document.

The EPA is proposing to change the rules that dictate what evidence must be considered as the basis for protecting the public's health. As a physician who spent a summer in Southern California during college and didn't see Mount Wilson looming in front of me for an entire week because of smog, I am incredulous.

I remember well the pain in my chest when trying to play tennis on those smoggy days. This was the early 70s, when a republican president was creating the EPA. Now, 50 years hence, tremendous evidence has accumulated that validates my symptoms and the negative effect that unhealthy

hair -- air, has on people who must breathe it.

After that summer, as a practicing physician, I took care of people with asthma and chronic lung disease who were at greater risk on bad air days. So it is shocking to me that the EPA would propose putting aside huge amounts of thoroughly reviewed evidence on the causal connections between air pollution and poor health, claiming that the basis for this conclusion was secret.

Today, I lead a consortium comprised of the country's largest medical societies whose doctor members are highly concerned about the health harms of climate change. The similarities between the current EPA willingness to disregard established science about the connection between carbon dioxide and global warming, and the willingness to disregard solid evidence about the impact of air pollution on health, are glaring.

Despite overlapping evidence from every country in the world, and the entire U.S. climate science enterprise, not to mention major federal

agencies like NOAA and NASA, the EPA leadership does not accept or recognize reality.

To all of us whose lives are dedicated to helping people get and stay healthy, there is a secret lurking in the science of air pollution and global warming. It is not what we have long-known about how burning fossil fuels creates waste products that damage and inflame our lungs. This has been validated by voluminous overlapping research studies. The secret is not that carbon emissions from burning fossil fuels are warming our climate, exacerbating the health harms of air pollution, and causing other dangers to our health, from heat waves, wild fires, pollen, and storms.

The secret is hiding in plain sight. Fighting air pollution is the greatest public health opportunity of our time. It's the greatest public health opportunity of our time.

Reducing polluting fumes and emissions from fossil fuels will rapidly improve our health and fight climate change.

When an EPA's not so secret agenda is to promote fossil fuels, two things follow. The fact that fossil fuels are the major contributor to both air pollution and global warming must be undermined or denied. And the research that documents this reality and how it harms our health must be attacked. It's not hard to see that the approach is to mislead people by wrapping these attacks in rhetoric that's alternatively scary as in secret science, and high-minded, as in transparency.

We're told that the rationale for the new proposed strengthening transparency standard is that individual and medical records included in research were secret. In fact, like all medical records, they were confidential and they remain so.

The record shows that the same argument of secrecy against scientific studies has been used by polluting industries going back many years.

Health providers know that the facts may

be scary when our health is threatened. But we also know that denying or ignoring facts blinds us to discovering and acting on the best ways to heal medical problems and protect our health. We can't let that happen. The EPA must live up to its charge and work to face facts and protect our environment and our health. With this proposed regulation, its leadership is pointing in the opposite direction. Thank you.

MR. ROBBINS: Thank you.

Okay. We're going to take a short recess now and we'll resume at noon.

[Morning session adjourned.] [On the record 12:00 p.m., Afternoon session.]

MS. RADZIKOWSKI: Good afternoon. If everyone will please take their seats? Hello, and thank you for coming. My name is Mary Ellen Radzikowski and I am in the EPA's Office of Research and Development and I'm one of the hearing officials. Joining me is Lynn Flowers, also from the Office of Research and Development and we have a number of folks: Nanishka Albaladejo, Lauren Hall and

Lesley Stobert from SC&A Inc., helping with logistics.

The purpose of today's hearing is to accept public comments on the EPA proposed rule, "Strengthening Transparency in Regulatory Science". EPA is accepting comments on all aspects of the proposed regulation. This public hearing is a formal legal proceeding and the testimonies will become part of the administrative record on which EPA will base its decision.

Public notice of this hearing was published in the Federal Register on April 30, 2018 (83 FR 18768). EPA is proposing this rule under the authority of 5 U.S.C. 301, in addition to the authorities listed in the proposed rule document dated April 30, 2018.

My role is to ensure that the EPA receives your comments in an orderly fashion. Although EPA panel members here may ask clarifying questions, the intent of the hearing is to listen to your comments, not to discuss or debate the proposal.

Now I will go through a few housekeeping items and

ground rules: Please refrain from interrupting speakers or asking questions. Shouting, noisemaking or any disruptive conduct which prevents speakers or hearing officials from being heard are not permitted. Please listen quietly so that we can hear each testimony and to ensure that the court reporter is able to record comments accurately and listeners on the phone hear the oral testimonies. For everyone's awareness, this hearing is open to the press and we may have members of the media present with us today. This event is also open to any form of recording, video, audio and photos. We ask that you not cause any disruption to those testifying or observing the hearing.

There is no formal lunch break scheduled. You may leave and return to the hearing. Please note that you will need to clear security again so please be aware of the time.

If you would like to make an oral comment at today's hearing and did not pre-register to speak, please see the hearing staff at the registration

table located right outside the doors here. If you would like to provide a written comment for the official record, you may hand-submit it to EPA staff today, or mail, fax or email your comments. See the staff at the registration table for instructions on how to do that. There is a comment box at the registration table where you can leave hardcopies of your oral testimony or written comments. All comments received will be included in the official docket. If you submit written comments, it is not necessary for you to give the same comments orally; written comments and oral testimonies will receive equal consideration by EPA in preparing its final rulemaking decision.

EPA has extended the comment period. Written comments must now be received on or before August 16, 2018. EPA will only consider comments related to the proposed rule, "Strengthening Transparency in Regulatory Science", so please refrain from making comments that are not related to this action.

EPA will not be providing responses during the hearing. Rather, EPA will prepare a written summary of the comments received that includes responses.

The summary of the Response to Comments, the document, will be available at the time EPA issues its final decision. EPA will not make a final decision until all comments submitted during the public comment period have been considered.

The hearing is being recorded by a court reporter, who will be preparing a verbatim record of this hearing.

Please speak clearly and slowly into the microphone so that the court reporter can accurately record your comments. A copy of the transcript will be placed in the docket. This hearing is also being audio streamed through Adobe Connect via the telephones.

The hearing is scheduled -- started at 8 AM this morning and is scheduled to go to 8 PM. We're in the second session: 12pm-4pm.

Public restrooms are located down both sides of

the hall. At the doors we have staff that can escort you out and back. Please note the location of the emergency exits. Please take a moment to silence your cell phones.

Speakers should have been given a sticker upon check-in that lists your assigned session. If you plan to speak and have not received a sticker, please be sure to check in at the registration table. For this session, the speaker sticker color is white, so if you have a white sticker you're registered for this session.

Speakers will be called to the speakers' table (located right over there) in pairs by their speaker number.

When it is your turn to speak, please come to the table, state and slowly spell your name for the record, and if you are appearing on behalf of someone or another organization. If you are not in the room when it is your turn to speak, I will recall you after all other speakers have made their oral comments. Each speaker will be allotted 5 minutes for remarks. Elected and

appointed government officials may be provided additional time, since they represent large groups of constituents. Speakers will be notified when their time has ended. Our timekeeping system consists of green, yellow, and red lights. When you begin to speak, the green light will come on to indicate you have your 5 minutes. The yellow light indicates that you have 1-minute left and when the red appears, your 5 minutes are over. At that moment, if needed, I will politely interrupt you and ask you to wrap-up your testimony to give others an opportunity to speak.

At this time, we are going to begin.

MS. STOBERT: If Speakers Numbers 1, Pamela Miller, and 2, Elizabeth Geltman, will come to the speakers table and Speakers 3 and 4, Patricia Koman and Alexis Adiman would go to the on-deck seating located near the stage.

MS. MILLER: Good afternoon, my name is Pamela Miller, P-A-M-E-L-A, M-I-L-L-E-R. I serve as Executive Director and provide these comments on behalf of Alaska Community Action on Toxics.

We're a nonprofit, public interest environmental health, research and advocacy organization, dedicated to protecting public health. I also serve as principle investigator of multiyear research studies involving several universities that investigate exposures and health outcomes concerning endocrine-disrupting chemicals in collaboration with Arctic indigenous communities in Alaska. I traveled the distance to Washington, D.C., from St. Lawrence Island, Alaska, in the Northern Bering Sea, two full days of travel, where we are conducting summer field research and interrupted this because EPA did not make it possible to provide remote testimony.

Through a process known as global distillation, the Arctic has become a hemispheric sink for contaminants that are carried on atmospheric and oceanic currents into the north where they concentrate in the bodies of fish, wildlife and people. Indigenous peoples of the Arctic are among the most highly exposed populations on Earth to persistent bio-cumulative and toxic chemicals

because of their reliance on traditional foods including fish and marine mammals that they use for their spiritual, cultural and physical sustenance. The communities that I work with on St. Lawrence Island also have higher exposures to chemical contaminants from military operations associated with formerly used defense sites. Our research elucidates exposure pathways, body burdens and health outcomes associated with chemicals including PCBs, PBDEs (or polybrominated diphenyl ethers) and other flame retardants and also perfluorinated substances in homes, in air, water, traditional foods and in the blood serum of the Yupik people of St. Lawrence Island. Our studies have shown elevated body burdens as well as disruption of thyroid function associated with these exposures to certain PBDEs and perfluorinated substances. We are now beginning a research study to investigate exposures to PCBs, PBDEs and currently used organophosphate flame retardants in young Yupik children, age 2 to 12, because elders and other community leaders are

concerned about possible adverse effects on children's neurodevelopment. They're concerned that chemical exposures might harm the children's abilities to learn the languages, songs and stories that are so vital for the continuance of the culture of Yupik people. Participation is dependent on the trust of confidentiality that they give to us as researchers. Our research team submits each proposal to rigorous review to the National Institute of Environmental Health Sciences. In the process of the research, we submit also to several institutional review boards for approval to collect sensitive and detailed information on health and behavior as well as spatial and demographic data in an ethical manner that protects human subjects. We have published results of our research in 11 peer-reviewed journal articles after receiving approval from the tribal leadership. These findings help inform interventions and policies to reduce burdens of toxic exposures and prevent further harm to public health. These studies are possible only because

we guarantee to protect the medical privacy of participants, again dependent on trust of the researchers. We gather detailed information about peoples' health and occupational histories, practices in their homes and communities that might relate to chemical exposures. If the proposed rule were to go into effect, studies such as these would not be considered by EPA when it makes decisions about chemicals and pollutants that are poisoning the people of the Arctic such as decisions to limit the production and use of persistent biocumulative toxics and other chemicals including those regulated under TSCA and FIFRA and in regulations that hold military and industrial polluters responsible for contamination of air, waters and lands under CERCLA, the Clean Air Act and the Clean Water Act. EPA indicates that the proposed rule is intended to strengthen transparency of EPA regulatory science; however, we find this a duplicitous claim. It would favor industry data protected as confidential business information over public peer-reviewed research.

We support the best scientific evidence to inform regulatory decisions. However, this rule would have a dangerous counter effect by limiting the science that should be used to inform decisions about public health. Furthermore, we disagree with the agency's conclusions as stated in the proposed rule document that this action does not have tribal implication as specified in the executive order and requiring government to consult with tribes. This rule would disproportionately affect vulnerable populations including American Indian and Alaska Native People and, therefore, is relevant and requires consultation.

MS. RADZIKOWSKI: Excuse me, your time is up. We need to be fair to others.

MS. MILLER: I'll wrap up to say that we urge EPA to end this rulemaking promptly and we strongly oppose the proposal. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. GELTMAN: Good afternoon. Thank you for the opportunity to comment on EPA's proposal entitled,

"Strengthening Transparency in Regulatory Science." My name is Elizabeth Glass Geltman, G-E-L-T-M-A-N. I am a Professor of Environmental Health Policy at the City University of New York -- the CUNY School of Public Health, located in Harlem. I am the author of 17 books on environmental and natural resources policy, a peer-reviewer of numerous journals and have worked on EPA-regulated matters for over 30 years. I am also the Chair Elect of the Law Section of the American Public Health Association. As a professor, I aim to advance public health by preventing people from getting sick. My efforts address reducing health impacts, and hence controlling health costs, by evaluating chemical and environmental determinants of health. Although EPA's rule aims to establish a clear policy concerning the use of dose-response data and models that underlie pivotal regulatory policy, the rule is, in fact, a continuation of the Trump administration's two for one regulatory reform policy announced in Executive Orders 13771,

13777, and 13783. The rule promises, "to change agency culture and practices regarding data access so that scientific justification for regulatory actions is truly available for validation and analysis." However, the new rule, in fact, creates new regulatory hurdles by discounting and precluding consideration of long-standing, established scientific practice. Rather than promoting the transparency of scientific information used to create environmental regulations, the rule will obscure the democratic process, slow the pace of science and progress, and potentially prevent important health data from being considered by U.S. EPA in outlying important environmental policy. Administrative procedure requires the EPA consider data submitted by the public in evaluating regulations. Let's be clear, scientific studies have always been of uneven quality. EPA has a process in place, including use of Scientific Advisory Board testimony and written and oral public notice and comment, using internal and external peer review to evaluate

data. Depending on context some studies are given greater weight than others. Some studies are disregarded entirely. It is inappropriate, however, and unlikely unlawful -- and likely to be unlawful -- under the Administrative Procedure Act. For EPA to categorically eliminate certain types of studies, and hence certain types of data, without considering context. But, even more important, eliminating studies, unless all underlying data is made public, is hazardous to human health and the environment. Longitudinal medical and epidemiological studies are often conducted over years, if not decades. Many studies require people who are study subjects to share very, very personal information, often on the legal or ethical condition that private medical information provided will be protected from public view. EPA is not, and has never been, in the regular business of replicating studies. Timing and the cuts in EPA funding make replicating studies as a condition of promulgating regulations an impossibility. EPA has presented

no scientific reason to prevent use of human health studies simply because the underlining medical records are not available for public inspection and review. One size fits all rarely works in fashion and it is even more unworkable in science and regulation. It is imperative the EPA allow consideration of all available scientific data pertinent to a proposed environmental rule or regulation including random, controlled human health trials and other epidemiological studies. Eliminating certain classes of human health studies would be like picking NFL players in the draft without allowing any scouting reports or eliminating the minor league in baseball. It doesn't make sense in sports; it makes even less sense when we're safeguarding our nation's air, water and land. For the reasons stated, I respectfully request the EPA withdraw the misleadingly-named rule entitled, "Strengthening Transparency in Regulatory Science." Thank you very much for allowing me to speak. My comments are my own. I'm happy to answer questions and I

will submit more detailed comments for the record.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker Number 5 is Alexis Andiman. Also, if Speaker Number 6 could take a seat on the on-deck seating: Sarah Kogel-Smucker. Speaker Number 3, Patricia Koman, and Speaker Number 4, Alexis Andiman.

MS. PATRICIA KOMAN: Thank you. My name is Patricia Koman, K-O-M-A-N. I'm an environmental epidemiologist at The University of Michigan School of Public Health. I'm a member of the American Public Health Association, and in my comments I'm representing myself and my colleagues at the University of California at San Francisco Program for Reproductive Health and the Environment. As a scientist who has formerly served at the U.S. EPA and has been significantly involved in analyzing science to create regulation and programs that protect the public's health from diesel and air pollution, I value the importance of open science which includes appropriate data sharing and full reporting of methods. However,

U.S. EPA's proposed rule is not consistent with the principles of open science, inappropriately codifies how science should be conducted, and codifies science policy decision in direct conflict with consensus reports from the National Academies of Sciences 2009 and often the enabling environmental statutes such as the Clean Air Act and the amended Toxic Substances Control Act. Therefore, EPA should withdraw this proposed rule immediately. Instead, EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies. The proposed rule is inconsistent with medical ethics and existing legal requirements to ensure the privacy and/or confidentiality of human subject data. The rule's requirements for specific types of test methods, defaults, dose response models and/or other analyses are not supported by current science and these provisions should be removed. The rule is counter to mandates in the amended Toxic Substances Control Act, to use the best available

science and systematic reviews for chemical evaluations. Specifically, the proposed rule inappropriately codifies particular data analysis approach such as dose response modeling that should be made based on empirical considerations. This proposed rule will lead EPA to utilize inadequate science resulting in inaccurate analysis and, consequently, inadequate public health protections. The proposed rule does not expressly address the issue of how the new procedures will be protective of public health. Alternatively, existing open science guidelines can and should be used to protect public health such as the 2013 memo from the Office of Science and Technology Policy. In addition, protocols and guidelines such as CONSORT, ARRIVE and STROBE do not require public access to all study data and will still improve the scientific basis of evaluating studies and thus promote public health goals.

I want to call your attention to especially troublesome provisions of the proposed rule which

is not consistent with current scientific practice and why this proposal should be withdrawn. For example, it is not appropriate to require the use of standardized test methods, guideline studies or so-called good laboratory practice studies. These types of studies are not designed to address health effects from low-dose exposures, complex and systematic endocrine effects, behavioral or learning effects, or metabolic changes. In addition, the so-called good laboratory practice and guideline studies are not consistently associated with higher quality research, proper study design or correct statistical analysis. Further, by dictating the model choices without empirical basis the proposed rule sets a dangerous precedent of prescribing how science should be conducted without regard to the data, or hypothesis or peer review. This is especially troublesome for dose response models. Simply using a greater number of models as the proposal preference is unlikely to improve results without considering the models' assumptions and whether

they fit the data set, the goals of the analysis, and many other issues. Therefore, giving priority to studies based on the number or range of models used is scientifically inappropriate.

Contrary to the proposed rule's statement about growing evidence of nonlinearity in concentration response functions, the body of empirical evidence points to the opposite, that for most chemicals and pollutants there is likely no safe threshold on a population level because of ongoing exposures and preexisting vulnerabilities. The rule mandates reconsidering using a linear no-threshold dose response but the National Academy of Sciences recommends exactly the opposite in considering low-dose effects. "The committee recommends that cancer and non-cancer responses be assumed to be linear as a default." Regarding other defaults, I oppose provisions that mandate reconsideration of established science-based defaults on a case by case basis. This is in direct contradiction to the National Academy of Sciences recommendations. The rule is counter to the mandates in the amended

Toxic Substances Control Act to use the best available science and systematic reviews for chemical evaluations. In contrast, this proposed rule will have EPA ignore well-conducted, relevant studies simply because all the data are not publically available and/or may not conform to the rule's invalid assumptions about good laboratory practices and guidelines, studies, and dose response modeling. This is inconsistent with modern science and the TSCA statutory mandates. Further, EPA's risk evaluation framework rules under TSCA mandate the use of systematic review methods. Well conducted systematic reviews consider the entire body of scientific evidence and the quality and strength of all relevant individual studies are considered to reach the overall conclusion.

Therefore, for these reasons, and those outlined in my full written comments, I strongly oppose this proposed regulation and recommend that EPA withdraw it immediately. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. ANDIMAN: Good afternoon, my name is Alexis Andiman, A-N-D-I-M-A-N. I am an Associate Attorney at Earthjustice, the nation's original and largest nonprofit environmental law organization. Earthjustice strongly opposes the proposed rule entitled, "Strengthening Transparency in Regulatory Science." If finalized, this rule would drastically undermine the U.S. Environmental Protection Agency's ability to protect public health and the environment through science-based regulations restricting the presence of chemicals and pollutants in our air, drinking water, food and consumer products. Under the guise of increasing transparency, the proposed rule would authorize EPA to ignore scientific studies that incorporate personal data and other information that researchers cannot practically, legally or ethically disclose. Indeed, EPA admits that the rule would preclude it from considering landmark studies assessing the health consequences including risks to children associated with exposure to particulate matter and lead. This is

unnecessary and unacceptable.
The proposed rule raises more issues than I can address during five minutes of testimony. In partnership with other environmental and public health organizations, Earthjustice plans to submit extensive written comments detailing our serious concerns about the rule's procedural and substantive defects. Today, I will focus on three key points.
First, EPA lacks authority to adopt the proposed rule. Second, the rule would directly conflict with laws that EPA is charged with implementing and enforcing. And finally, the proposed rule would harm the communities of color and low-income communities that are most in need of strong, science-based protections.
First, EPA lacks authority to issue the proposed rule: It is axiomatic that administrative agencies may act only pursuant to authority delegated to them by Congress. The Administrative Procedure Act requires that each notice of proposed rulemaking reference the legal authority

under which the rule is proposed. EPA failed to identify any meaningful authority for the proposed rule at issue today. In announcing the rule, EPA cited provisions of numerous environmental laws but virtually every provision cited authorizes or directs EPA to undertake research, not to impose unfounded limitations on the research it will take into account. EPA also cited provisions that authorize it to promulgate rules necessary to achieve the goals of these environmental statutes, but ignoring credible scientific evidence is neither necessary nor consistent with the statutes enacted to protect public health and the environment.

Second, the proposed rule directly conflicts with numerous laws. Multiple statutes require EPA to ground its decisions in credible science. For instance, the Safe Drinking Water Act directs EPA to rely on the best available, peer-reviewed science and the best available public health information. The Toxic Substances Control Act similarly mandates that EPA consider all

reasonably available information and act in a manner consistent with the best available science. At no point do these statutes suggest that the quality of a scientific study depends on the public's ability to access the underlying data. Indeed, as the EPA previously determined, and as the U.S. Court of Appeals for the D.C. Circuit agreed requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary.

Finally, the proposed rule would harm the communities that are most in need of strong, science-based protections. Decades of scientific research have established that communities of color and low-income communities are disproportionately likely to experience exposure to chemicals and pollutants. This research is also critical to establishing regulatory safeguards that will protect these communities and their environment. Nonetheless, the proposed rule would preclude EPA from considering this research simply because it incorporates personal health

information and other non-public data. As a result, the rule would eliminate an important means of understanding and beginning to resolve the harms suffered by over-burdened communities and that's what perpetuates the environmental injustices these communities already face. Earthjustice urges EPA to withdraw the proposed rule without delay. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker Number 5, Alexis Andiman, is already seated at the table. She's speaking on behalf of Devon Hall. If speaker Number 6, Sarah Kogel-Smucker would come to the speaking table. If we could have Speaker Number 7, John Doherty and Speaker Number 8, Tricia Sheehan, come to the on-deck seating. Speaker 5.

MS. ANDIMAN: Good afternoon. I am reading testimony on behalf of Devon Hall. D-E-V-O-N, H-A-L-L, who was unable to make it today. My name is Devon Hall. I am the Cofounder and Program Manager at the Rural Empowerment Association for Community Health, also known as REACH. On behalf

of REACH and the community we serve, I urge the U.S. Environmental Protection Agency to withdraw its proposed rule entitled, "Strengthening Transparency in Regulatory Science." I cofounded REACH in 2002 to address social, economic and environmental inequities in and around Duplin County, North Carolina. Our primary focus is protecting our community from pollution caused by industrial animal operations. North Carolina is a leading producer of swine and poultry. There are nearly 2-1/2 million hogs and pigs and more than 16 million chickens and turkeys in Duplin County alone. Together, these animals generate well over 2 billion gallons of wet waste and more than 190,000 pounds of dirty litter each year. This waste produces an overpowering odor and pollutes our well water, rivers and streams. REACH uses scientific research as a tool to educate and empower our community. Common sense tells you that it's not healthy to breathe air that smells bad enough to make you gag and that makes your nose run and your eyes water. I began to work as

a citizen scientist in 2004 because I wanted to understand exactly what I was breathing and how it was likely to affect my body so that I could better protect myself and help my neighbors protect themselves. So far, I have coauthored nine published studies documenting the threats that under-regulated industrial animal operations pose to community health. For example, I contributed to a study showing that kids who attend school downwind of industrial hog operations are exposed to relatively high levels of hydrogen sulfide, putting them at greater risk of symptoms like difficulty breathing and impaired lung function. I also worked on a study finding that children of people who work in industrial hog operations are more likely to carry dangerous, antibiotic-resistant bacteria on their bodies, even though those children likely never set foot in industrial hog operations themselves. REACH has no interest in putting anybody out of business, but we believe it is possible for industrial animal operations to be more

environmentally friendly and more community friendly. It is not enough for us to talk about our symptoms and our diminished quality of life. No matter what we say there will always be some people who think we are just complaining or making things up. My neighbors and I want to be part of the science so that we can gather proof about what we're living with on a daily basis. We hope that policy makers will listen to that science which reflects the experiences of real people and begin to make some changes. If adopted the proposed rule would prevent EPA from considering the scientific studies that REACH helps to conduct. We cannot make all of our data publically available because we cannot risk compromising the confidentiality of the people who contribute to our work. Because we live in a rural community it would be relatively easy to identify study participants based on de-identified information like age, sex, occupation and number in households, even if the participants' names were redacted. Simply put, people would not

participate in our studies if they knew that the identifying information they shared could become publically available. Even if EPA were to expand on its vague promise to protect confidentiality, I would not trust the government to deliver. Once, I called the North Carolina Department of Environmental Quality to report a permit violation at an industrial animal operation and, even though I asked to remain anonymous, I received a call back directly from the operator I had complained about. The government apologized to me later, but the damage was done. My anonymity had been violated and I felt violated as a result.

On another occasion, the North Carolina Pork Council tried to obtain the identities of study participants from Dr. Steve Wing, a researcher who worked closely with our community. Dr. Wing worked hard to protect our trust, but I know that the legal problems he experienced deterred other researchers from studying the health effects of industrial animal operations. EPA's proposed rule might also deter researchers from partnering with

communities like ours to study public health impacts because it would dramatically reduce the influence of those studies in agency rulemaking. Contributing to research about a polluting industry is a lot like acting as a police informant. You're providing information that could help to make everyone more safe, but you are putting yourself at risk, too. People who work at industrial animal operations would lose their jobs if their employers knew they were participating in a scientific study. And losing your job is not the only risk. I have been spoken to hard by powerful people who do not like the work I do. And I know people who have been physically and verbally threatened by industry representatives. EPA has investigated this issue and in January 2017, it expressed grave concerns about the intimidation we have experienced.

I'll wrap up quickly. My first priority is to the people I serve. I will never do anything to violate their trust or put them in danger. If EPA cares about keeping people safe, it should

withdraw the proposed rule immediately and instead take steps to support community-based research. Thank you.

MS. KOGEL-SMUCKER: Good afternoon, my name is Sarah Kogel-Smucker, Special Assistant Attorney General at the Office of the Attorney General for the District of Columbia. I am commenting on behalf of Karl A. Racine, the Attorney General for the District of Columbia. EPA's proposed rule, "Strengthening Transparency in Regulatory Science," is a solution in search of a problem. Instead of strengthening ways in which EPA can benefit from advances in scientific studies, the proposed rule limits EPA's access to important studies and hampers the development of regulations needed to protect the public health and welfare of the residents of the District of Columbia and the nation. The proposed rule should be withdrawn. In these comments, I will briefly address why the proposed rule limits the use of valid, peer-reviewed scientific studies, violates several environmental statutes and lacks sufficient

details to be appropriately evaluated and implemented.

First, the proposed rule impedes EPA's decision-making by creating burdensome, and potentially impossible, barriers to the use of certain scientific studies needed to determine the impacts of pollutants and toxic materials on air quality, water quality and human health. The proposed rule requires that EPA's significant regulatory decisions be justified only by studies based on dose response data and models that area available to the public. This requirement limits EPA's ability to rely on otherwise peer-reviewed scientifically valid studies that do not or cannot make their data publically available because of confidentiality concerns. For example, EPA used the landmark Harvard Six Cities study demonstrating a dramatic link between premature mortality and air pollution as part of its justification for key clean air regulation. The study has been rigorously independently peer reviewed but the subjects were promised

confidentiality and the data is not public. Studies with confidential data can still be appropriately peer reviewed through the use of confidentiality agreements and subject to rigorous scientific scrutiny over their methods and conclusions. Where cost-effective and appropriate use of open or publically available data should be encouraged. EPA, however, should not provide blanket limits on the use of studies that cannot be made public because they contain confidential health or business information. Scrubbing studies of such information may be impossible while still keeping the study reproducible. The proposed rule may also have important implications for rules subject to periodic update like the Clean Air Act, NAAQS, if EPA can no longer use the same or similar methods that were used to support the existing rules.

Second, the proposed rule violates several environmental statutes because it hinders EPA's ability to rely on best available science or most up to date information as they require. The Clean

Air Act, Clean Water Act, Safe Drinking Water Act, Toxic Substances Control Act, and Emergency Planning and Community Right-to-Know Act all require certain decisions or regulatory criteria be based on the most up-to-date science. These criteria are described as best available science, latest scientific knowledge and best available public health information. The proposed rule would illegally limit EPA's ability to rely on best available science in violation of these statutes.

The nearly 700,000 residents of the District of Columbia rely on EPA to protect their health and environment. While air quality in the District has improved over the last several decades, many residents who face disproportionate exposure risks because of where they live or work still face risks to their health from air pollution. For example, the American Lung Association's "2018 State of the Air (sic)" report gave the District a failing grade for the period from 2014 to 2016 because of the number of days that the air was

unhealthy for vulnerable populations due to high levels of ozone. The District's vulnerable populations, including the estimated 10,415 children in the District with asthma, are entitled to protection from unhealthy air. Because people of color and children living in poverty disproportionately suffer from childhood asthma, environmental justice demands that EPA continue to use advances in scientific research to improve air quality through appropriate regulation. EPA should not be artificially hampered in this duty just because the data or models from a high-quality, peer-reviewed study are not publically available.

Lastly, the proposed regulations are too vague to be meaningfully evaluated and successfully implemented. For example, it is unclear whether Section 30.7 requires EPA to conduct its own peer review of all pivotal regulatory science and, if so, whether EPA has the capacity or capability to perform those reviews. Likewise, the exemption process does not provide sufficient standards to

ensure that the administrator made consistent determinations. For these reasons, the proposed rule should be withdrawn. Subsequent EPA transparency initiatives, if any, should be based on consultation with the National Academy of Sciences and should not restrict EPA's ability to rely on the universe of best available science when promulgating regulations. Thank you for the opportunity to comment today.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Speaker Number 7, John Doherty, and Speaker Number 8, Trisha Sheehan, would come to the speaker's table. Speaker Number 9, James Duffy, and Speaker Number 10, Erika Rosen, if you'd go to the on-deck seating.

MR. DOHERTY: As a retired EPA toxicologist I know the firsthand frustrations of having to deal with epidemiological reports. However, I believe that epidemiological reports are valuable but more, critical, initial review is needed. Today, I hope to present a path forward. The animal studies that I've reviewed are required to support the

registration of pesticides follow very strict quality assurance, good laboratory practices and ethics and reporting standards. Multiple layers of primary and secondary reviewers are identified and assigned to review documents to assure quality assurance and transparency. Every force, however, has a mixed bag of standards to my experience for QLT, quality assurance ethics in reporting. They are often accepted at their face value without documentation of independent review. There is no way to verify the procedures or results presented and the EPA reviewers are not identified. This is very unfair to the public. Historically, I would like to mention two situations where more critical initial evaluation would have prevented social and medical problems. The first is the report on the Kallikak family published in 1912 by Henry Goddard. The book was the foundation of eugenics and was well received at first, but very serious social consequences resulted. However, closer examination revealed that much of the interviewing reflected the biases of the interviewers. Goddard

later regretted publication of this book. The other is associated with vaccinations and autism that could not be verified. The publisher retracted the original publication; however, within the past two years there is an increase in measles in Minnesota because people feared autism from vaccinations. When the concept of disparity in the views of animal versus epidemiological studies, and the need to provide a more critical initial review the EPA posed, I am proposing an epidemiology peer review consult with the goal of creating a transparent document reflecting a thorough review be established at EPA. The Council will consist of six independent subcommittee and relevant experts as follows: First would be an ethics subcommittee. All aspects of assuring the personal safety and identities of the individuals on the study would be protected. Second is an end-point evaluation. The relevant experts knowledgeable in cancer and rural behavioral, or whatever the condition is, they would discuss the factors like how many

people are really needed in a cohort to make a decision. Identify what is known about that particular condition environmental factors or chemicals are known to cause it. The other -- is self-explanatory. Exposure evaluation, statistic evaluation, analytical chemistry and animal toxicity and structure activity correlations. Each subcommittee will articulate why additional data are or are not needed. The Council will consist of qualified individuals from the EPA, FDA or other agencies' consultants as needed. The Council will have considered the reports of the six independent subcommittees and make their recommendations especially with regard to additional data needed to support a transparent regulatory decision.

The report of the Council -- the final report of the Council, will append each of the six subcommittee reports as well as any dissenting opinions. The Council owns the decisions and since all responsible individuals will be identified, the report is thus transparent. Thus

AP may further review the Council report. In conclusion, controversies associated with epidemiologic reports may not be eliminated by the Council, but the Council should contribute to minimizing these controversies. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. SHEEHAN: Good afternoon, my name is Trisha Sheehan, S-H-E-E-H-A-N, and I'm representing Moms Clean Air Force. I traveled here today from my home in New Jersey. I'm the National Field Manager for Moms Clean Air Force. We are an organization of over 1 million members from across the country who are fighting every day to protect the health and safety of their children from toxic chemicals, air pollution and dangerous climate change. I am also a mom to three young boys and last week my family and I joined Democratic House Leader, Nancy Pelosi, to share our own story of how my family was impacted from a toxic chemical accident and today I'm here to speak out in opposition to Acting Administrator Andrew Wheeler's attempts to censor science in the name

of transparency. Limiting the scientific information the EPA can use to identify public health threats and protect us from pollution is reckless and dangerous. Not only does this proposal compel EPA to subject high-quality research to extreme unnecessary and untenable levels of disclosure, but it also includes loopholes that would allow the administration to exempt industry from having to disclose details of their own studies. American families depend on the EPA and high-quality science to protect families like mine from the impacts of air pollution and toxic chemicals. This proposal puts that protection in jeopardy, placing the health of our children at risk. This proposal is misleading. It would require the EPA to only consider those studies that use public data. This would prevent the EPA from using studies that are based on personal medical data, eliminating some of the most important long-term epidemiological studies that investigate the impacts of pollution on public health. This proposal would

significantly limit the research and data the EPA can use to make informed policy decisions under major public health and environmental laws including the Clean Air Act, the Safe Drinking Water Act and the Toxic Substances Control Act. This proposal means that many studies on populations such as the elderly, children and people of color, groups who often suffer disproportionately from pollution, would be excluded from EPA consideration because making the data public could identify the participating individuals. Excluding this important data from consideration means that implementing the proposal could even further exacerbate negative environmental impacts on these and other vulnerable communities. As a mom who has witnessed her children's health deteriorate due to polluted air they were breathing, I know personally what it's like to rely on scientific studies whose data informed us during that horrifying time. On behalf of my family and Moms Clean Air Force's one million members, I strongly

urge the EPA to withdraw this dangerous proposal for the health and safety of our children. Thank you.

MS. STOBERT: Speaker 9, James Duffy, and Speaker 10, Erika Rosen, if you would come to the speaker's table. Speaker 11, Gretchman Goldman, and Speaker 12, Maggie Flaherty, if you would come to the on-deck seating.

MR. DUFFY: Good afternoon, my name is J. Duffy. I am an Associate Attorney with Clean Air Task Force. CATF seeks to help safeguard against the worst impacts of climate change by working to categorize the rapid global development and deployment of low carbon energy and other climate-protecting technologies through research and analysis and public advocacy leadership. EPA's proposal at best is a solution in search of a problem. The Agency has failed to identify a need for further review of the already extensively peer-reviewed public health and environmental science it uses in its decision-making, nor has it made the case the underlying health data must be

made more public than current statutes and practices allow. The only thing transparent about the proposal is that is an attempt to undermine EPA's ability to use the best available science by placing arbitrary limits on the ability to consider these studies.

As a professor who has cited multiple times the proposal recently stated, if this proposal is finalized, science will be practically eliminated from all decision-making processes so that public health and environmental regulation would then depend on opinion and whim. Banning the use of fully peer-reviewed studies because their underlying data must be kept confidential would eliminate the consideration of vital information in critical public health-making decisions. This is not only unnecessary, it also represents a significant shift in decades-long policy without any justification. As the D.C. Circuit has held when considering this exact question, requiring agencies to obtain and publicize the data underlying the studies on which they rely would be

impractical and it would be unnecessary. Congress has clearly spoken, moreover, mandating that the agencies must consider all relevant science. It is well understood, and it has been for decades, that many of the most important public health studies are those based on actual patient information. Because that information must be kept highly confidential and because making even some of the patients' details public would allow them to be identified, the information must be kept private. But that does not mean that these studies can't be, or haven't been, verified. For example, the Harvard Six Cities Study linking fine particulate matter and mortality has been exhaustively reanalyzed by independent institutions, including by the researchers under the auspices of the Health Effects Institute. This reanalysis confirmed the study's essential findings while keeping confidential the underlying data. There are already several ways in which the public can access the studies that EPA uses and in some cases their underlying data without the

release of confidential information, including through the Freedom of Information Act which provides an avenue to request raw data, including a process to ensure that sensitive data is protected. The proposal puts the EPA in the untenable position of either violating its mandate to consider all relevant science or violating confidentiality laws. Additionally, the proposal is impermissibly scatter-shot, it's vague, it's confusing, it's insufficiently formed to allow for meaningful comment. It seems more like a request for ideas about how to discredit the best available science than for how to make it more accessible. For example, the proposal claims that it is consistent with the Data Quality Act and HIPAA as well as various executive orders, but each of these contain checks on the release of confidential information. In fact, the longstanding OMB guidelines stemming from the Data Quality Act recognizes peer review as the per se marker of objectivity and the Harvard Six Cities Study reanalysis set the gold standard for

reproducibility.
Finally, in violation of Executive Order 12866, the proposal fails to perform any analysis regarding the impact this rulemaking could have on the environment, public health or science generally -- or even on what it would cost to implement. Because the Agency does not have authority to undertake this effort, and because it would undermine the consideration of relevant science in its public health and environmental rulemaking, it should be abandoned. Thank you.
MS. RADZIKOWSKI: Thank you. I'd like to remind speakers to please speak into the microphone.
MS. ROSEN: Good afternoon, this testimony is on behalf of Lynn Goldman. She is a pediatrician and an epidemiologist and has been Dean of the Milken Institute School of Public Health at the George Washington University since 2010 and former Assistant Administrator for Toxic Substances at the US Environmental Protection Agency. My name is Erika Rosen and I am delivering this oral testimony on her behalf. Her full written

comments will be submitted for the record. This proposal suffers from lack of involvement of the scientific community, either within or outside of the EPA. No clear justification is given for why it is needed. The proposed rule is a dramatic departure from how the EPA and other US regulatory agencies, as well as similar agencies internationally, use science for the development of dose response assessments. It ignores a number of adverse downstream consequences including: risking disclosure of personal information of people volunteering for human subjects' research; delaying EPA decision. making; exacting unknown but probably considerable costs to the research community and to the EPA; and making best available science unavailable to the EPA. It creates no regulatory authority or any other mechanism for the EPA to compel submission of data from academic scientists and industry, other than those that already are accessible under the Information Quality Act of 2001, nor a mechanism for access to industry data claimed as

Confidential Business Information. It creates an unfortunate precedent for EPA in the creation of science policy by rulemaking. The proposal ignores the "systematic review" methods for review of evidence that have been developed, refined and improved over a number of years in the context of IRIS, pesticides, toxics, and priority air pollutants. The application of such methods has been reviewed and improved upon by the National Academy of Sciences and the National Toxicology Program. Of note is no authoritative body of experts has ever recommended requiring "raw data" in order to perform or review dose response assessments.

Risk assessment activities at EPA are extensive and its programs are performing more than 1,000 risk assessments per year. The proposal does not consider the costs, the significant time and paperwork burdens, and major regulatory delays that will occur when EPA is waiting for data to be made publically available, which may not ever happen.

For years, both Congress and successive administrations have required the EPA to use the best science for its decisions. Directing EPA scientists to exclude key studies is not consistent with good scientific practice and is contrary to years of effort to improve the base underpinning EPA's decisions.

The proposal misrepresents the recommendations of prior expert reviews such as the so.called NAS "Silver Book" and the Bi.Partisan Commission review. It is oblivious to NAS conclusions that thresholds of chemical exposure for chemical effects are the exception rather than the rule. Single studies are used to inform risk assessors of the possible shape of dose response curves. Instead, EPA evaluates all of the scientific information to gain a biological understanding of the "mode of action". When data do not prove mode of action, EPA often applies default assumptions such as low dose linearity for carcinogens, and certain noncancer effects that have no practically identifiable thresholds.

This proposed rule for the first time opens the door to EPA's scientific practices being determined by regulators, and not scientists. This is a rush down a slippery slope that would replace a scientific process with a political one and would freeze the science in procedures that certainly will not be scientifically defensible in the future. This is a breach of the fundamental notion of separating risk assessment from risk management.

I strongly urge the EPA administrator: (1) not to use the Agency's regulatory authority to prescribe specific risk assessment processes; and (2) not undertake changes in EPA's science policies without leadership from EPA scientists and full engagement of the science community. What is at stake is no less than the credibility of the Agency with the American public and public confidence in the integrity of EPA's science and decisions.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker 11, Gretchen Goldman, and

Speaker 12, Maggie Flaherty, if you would come to the stage. Speaker 13, Adam Finkel, and Speaker 14, Augusta Wilson, if you'll come to the on-deck seating.

MS. GOLDMAN: my name is Gretchen Goldman, G-R-E-T-C-H-E-N, G-O-L-D-M-A-N. I'm the Research Director at the Center for Science and Democracy at the Union of Concerned Scientists, and I'm also a mom. As a scientist, I'm deeply troubled by this proposal. As a mom, I'm alarmed by it, and the risks that it poses to my children and others. The EPA's mission is to protect public health but this proposal does the opposite. This proposal needlessly restricts the science that EPA can use to make decisions about all of our families' health. Many crucial scientific studies that rely on public health data, intellectual property, confidential business information and other scientific information that may not be publically acceptable would be unavailable to EPA experts under this proposal. As a result, the EPA will be prevented from making rules that protect people

using the best available science. There is no reason for such a rule. The EPA already follows a rigorous, science-based process for determining when and how studies are used in its decisions. I've seen this first-hand when the EPA contacted me about my own scientific research. The Agency needed to obtain results data from my peer-reviewed studies looking at ambient air pollution exposure in time series' epidemiologic studies. I can attest to the fact that the EPA already ensures it is using reliable and robust scientific information to make decisions. When my son was born he spent five days in the neonatal intensive care unit because of a respiratory problem and when I took him home I knew it would be important for me to make sure that he could breathe clean air. I can't protect him from the air outside always but the EPA can. When my children breathe outside I need to know that the air is healthy. When my children play in the grass I need to know that there aren't harmful pesticides in it. When my children drink from their sippy cups, they need

to know -- I need to know that the water is safe. How can EPA scientists protect my family and others if they can't use the best available science?

I urge you to withdraw this proposal and instead focus on EPA's mission of ensuring safe water, air and land for people across the country. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. FLAHERTY: Good afternoon and thank you for the opportunity to speak today. My name is Maggie Flaherty, F-L-A-H-E-R-T-Y, and I would like to express my strong opposition to the proposed, "Strengthening Transparency in Regulatory Science" rule. I would first like to emphasize that this rule proposed during Scott Pruitt's time as administrator of the EPA is a purely political decision. It is modeled after past efforts from the tobacco and fossil fuel industries for similar policies that prevent the use of science that reveals the harmful human health impacts of such industries. This proposed rule is not about

legitimate transparency; it is about making it harder for the EPA to make decisions based on the best available science. Under this rule studies that rely on personal health data, confidential business information, intellectual property, or studies whose data is no longer available would be excluded from the EPA's consideration when making decisions regarding regulations. When it comes to regulating things such as air pollution, water pollution and toxic substances, some of the most vital scientific information comes from studies of respiratory illnesses, cardiovascular diseases, and premature deaths, all of which rely on personal health data. If such vital studies are excluded because of this arbitrary rule, the EPA would be lacking critical public health information when making decisions that directly impact our health and environment.

If EPA is truly worried about transparency in science they would listen to the voices of the numerous scientists who have come out in opposition to this proposed rule and who have,

additionally, suggested other ways of introducing transparency. Instead of focusing on disclosure of data that can contain confidential and private information, a rule that truly increased transparency in science would focus on funding disclosure. Despite how strict the peer review process is, people should be able to know who is funding a study. This rule proposed by the EPA does not address the issue of funding transparency at all. According to an article in the Journal of the American Medical Association if all of the EPA's proposed changes to environmental policies since the election of President Trump go into effect, the result would be at least 80,000 unnecessary deaths per decade. This assessment is based on numerous scientific studies that would most likely be excluded by this rule. The EPA should not exclude studies that demonstrate the true health costs of their actions and remember their true mission of protecting our public health and the environment. I therefore urge the EPA to withdraw this proposed rule. Thank you.

MS. RADZIKOWSKI: Thank you.
MS. STOBERT: If Speaker 13, Adam Finkel, and Speaker 14, Augusta Wilson, will come to the speakers' table. Speaker 15, David Coursen, and Speaker 16, Abigail Omojola would come to the on-deck seating.
MR. FINKEL: Thank you. I appreciate the opportunity to comment as a former chief regulatory official at OSHA and a former member of the EPA Science Advisory Board and Board of Scientific Counselors. I support a wide spectrum of efforts to improve the transparency of the inputs to and the outputs of risk assessment and cost-benefit analysis, especially if they involve a more honest disclosure of uncertainty and variability. I will submit a recent paper I wrote with George Gray in this regard. But this proposal decreases transparency and reliability in three ways: It fails to identify a legitimate problem; it ignores closely related and glaring actual problems with regulatory analysis; and it promotes remedies that add noise while decreasing

signal.

First, the central dogma of regulatory policy since 1993, and most enthusiastically touted by this administration, holds that no regulation can be proposed absent a real problem to be solved, like market failure. Here, there is no failure of the scientific market and hence no need for a disruptive set of hurdles. By its own policies it developed to constrain its own regulatory excess, EPA should demonstrate, and not just with an anecdote or two, the crisis justifying the need for this proposal, or else should scrap it. I note that of the five URLs the EPA provides in Footnote 12 to document its claim that there is a "replication crisis," two of the links are broken and the other three discuss psychology and clinical trials. The end points in epidemiology, toxicology and exposure studies are simply not as subjective as psychology experiments are. There have been some problems found with clinical trials but the unmeasured variability is likely much more important with respect to whether a drug will cure

and weather a pollutant will harm. Most importantly, the EPA has cited no studies giving even guesstimate of what percentage of environmental science studies might be in need of replication or reanalysis and, of course, some of the shrill prior claims of error others have noted in the Six Cities Study have turned out to be fallacious. Surely EPA does not intend that most epi studies or bio-assays need to actually be replicated. Some epi studies can be redone but surely not natural experiments we never want to repeat such as the atomic bomb survivors study or the changes in air pollution during groundings right after 911. Lifetime animal bio-assays already use multiple doses, species and sexes and they are expensive and take years to complete. Why would we waste time and money duplicating them? And so, what if someone did try another species and got a lower potency estimate or didn't get positive results? Would we allow a rat or mouse carcinogen in unlimited quantities because it might not also be an aardvark carcinogen? I

don't think so. So, EPA probably means reanalyze, not replicate, and it should say so. But then EPA presents no evidence that anyone is hindering anyone else from reanalyzing anything. Any bio-acid that the EPA would use would already have individual tumor data and exposures and could be reanalyzed with any model that anyone wanted. Ditto for epi studies. But what would a reanalysis program actually do other than be costly and invite delay? What if someone reanalyzed a health study and got a different answer? One that suggests the first study had exaggerated the harm. In such a case the second study would be right and the first wrong only if both of these conditions were true. First, the difference in the results was not already acknowledged or contained within the uncertainties in each answer. If somebody claimed that banning a chemical would save between 500 and 1000 lives across the country, EPA chose to estimate it at an expected value of 750; another study that said 550 would not be different from the first study at

all. And secondly, the first study would have to be not just different, but wrong. Anybody can take the same data and botch the risk analysis of it making seem like they have a better answer. Just like there are potential problems with an analysis that doesn't control for some variable, it can be a mistake to control for a variable that shouldn't be included.

In short, EPA should never refuse to look at a study just because someone could reanalyze it but hasn't, has done so and gotten a different but not a better answer, or has done so, didn't like what it saw, and suppressed the results while claiming the original study still needs to be reanalyzed. Secondly, there is a crisis in regulatory analysis and EPA is completely ignoring it for reasons that are obvious to me. It's the economists' analysis of the costs of regulation and the values of benefits that are flawed, opaque and in need of reanalysis. Every criticism leveled at this proposal ought to first be applied to regulatory economics. They are obviously as pivotal as

estimates of risk. Regulatory cost estimates are notoriously biased high and they are surrounded by more uncertainty than surrounding risk estimates, but unlike risk estimates, cost estimates are rarely, if ever, presented with uncertainties and are sometimes even of the wrong side. In my written comments I'll give two examples. I have a paper newly published with Brandon Johnson. We looked at more than 1000 estimates, the value of a statistical life, certainly the most pivotal quantity in all of risk regulation derived from hundreds of studies. Only 40% of those studies gave any information about the ranges or standard deviations of the individual VSL values. So, no one can reanalyze that work to see what higher or lower values of the VSL are also compatible with the data. And perhaps the most well-known so-called study of the costs of regulation is the series of reports from Mark and Nichole Crane suggesting that regulations "cost the U.S. nearly two trillion dollars a year."

MS. RADZIKOWSKI: Excuse me, sir, we are out of

time.

MR. FINKEL: I'm sorry?

MS. FLOWERS: We are out of time, in fairness to others.

MR. FINKEL: I'm sorry, I didn't realize. The third one is about defaults and I will submit those, but EPA is a protection Agency, not a prediction Agency. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. WILSON: Good afternoon, my name is Augusta Wilson, and I am here representing the Climate Science Legal Defense Fund. The first name is spelled A-U-G-U-S-T-A. I appreciate the opportunity to speak to you today and the Climate Science Legal Defense Fund will file more detailed written comments in the online docket for this proposed rulemaking. CSLDF is a nonprofit organization whose mission is to protect the scientific endeavor. In this capacity, we work closely with scientists at government agencies and at research institutions, so we have particular insight into how attempts to silence science

negatively impact both researchers on an individual level and the conduct of scientific research as a whole. There are numerous reasons why EPA should not proceed with this rule. In the time I have today I will focus on a few of the most important from the perspective of protecting the integrity of the scientific endeavor. First, studies that involve human subjects, particularly those investigating the human health impacts of exposure to environmental pollutants, are among the most relevant to EPA's core mission. In order to conduct such studies, scientists need participants willing to allow researchers access to their confidential health information. If enacted as currently proposed, this rule would make it much more difficult for scientists to credibly promise study subjects that their patient information will remain confidential. This could have deeply concerning, chilling effects on the conduct of important human health studies. Privacy concerns could influence what science gets done and what science does not get done. Lines of

scientific inquiry that would have been pursued may not be. The quality of data may be poorer than it otherwise would have been. Furthermore, the justification for this rule to the extent it exists seems to be based on the false premise that scientific studies cannot be adequately evaluated or reproduced unless all of their underlying data are made public. This is simply not the case. On the contrary, the reviewers can evaluate the merits of studies even when they rely on data that cannot be made publically available. This is because part of a scientist's core, fundamental training is the ability to assess research based on the strength of the experimental design and the precision with which experimental methods and analyses are described. In addition, when necessary and appropriate, reviewers, as well as other researchers seeking to reproduce or extend scientific analysis, can have confidential access to key data in conformity with privacy requirements.

That said, the scientific community has certainly

recognized that recent technological developments allow for significant improvements in data sharing and reproducibility and that such improvements can benefit science. There are numerous scientific societies, journals, and other organizations, as well as individual researchers, who are actively engaged in a dialogue about how to improve transparency while protecting scientists and taking into account issues like patient confidentiality and proprietary business information. If EPA is genuinely concerned about these issues, it should engage deeply in this discussion and with the scientists who are having it and should move forward only in concert with them. As written, this rule which EPA professes is intended to strengthen science will ultimately do significant damage to it and to the United States' ability to lead the world in research. EPA should not promulgate such a rule. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Speaker 15, David Coursen, and Speaker 16, Abigail Omojola, would come to the

speakers' table. Speaker 17, Alan Lockwood, and Speaker 18, Elizabeth Woolford, if you would come to the on-deck seating.

MR. COURSEN: Good afternoon. My name is David Coursen, C-O-U-R-S-E-N, and I'm here on behalf of the Environmental Protection Network, a nonprofit organization of EPA alums working to protect the Agency's progress toward clean air, water, land and climate protection. There are so many things wrong with this proposal that it's easy to downplay the most important one: The harm it will do to peoples' health and the environment. The proposal hides this in a fog of ambiguous language, meaningless generalities and vague platitudes about the value of transparency. It requires EPA to wear a blindfold when it is developing major rules by ignoring what relevant and reliable science tells us about health risks any time the raw supporting data is not publically available. Transparency is important, but it is not part of the Environmental Protection Agency's mission and certainly cannot be the basis for a

one-size-fits-all litmus test for when the Agency must ignore what science tells us about the risks of pollution.

The laws governing EPA programs require it to consider all of the available scientific information in deciding how to protect peoples' health and the environment. Ignoring such information would be both arbitrary and unlawful. EPA rulemaking has always relied on the best available science, a principal the proposal gives lip service even as it outlines a scheme to prevent the EPA from using even the best available science if it is not "transparent." The proposal would put even the most persuasive and useful science off limits subject only to a vague and standardless exemption process. The proposal does not show that the EPA's existing practices have produced bad environmental outcomes or that increasing so-called transparency will lead to better outcomes. Those are not things the proposal seems to care about. There is no legal or environmental basis for the proposed

restriction and, not surprisingly, the proposal fails to mention that EPA's statutes do not allow the Agency to ignore available information about the risks of pollution. Inevitably, restricting the science EPA considers in rulemaking will produce less informed and less protective decisions. In effect, the proposal sacrifices relevant and reliable scientific information, a cornerstone of effective environmental protection on the altar of so-called transparency. A proposal to ignore science when all of the supporting data is not public would preclude using even recent studies that are subject to confidentiality agreements or legal restrictions on disclosure. It also will certainly and deliberately exclude older studies where the data is no longer available, even if their findings are widely accepted as authoritative and form the basis for EPA regulations that have proven effective in protecting peoples' health for many years.

The proposal is evasive about its targets using

footnote language only a lawyer could understand to identify two seminal air pollution studies that it excludes and says nothing at all about what other important studies it would ban. Written comments via the Environmental Protection network will spell out the policies that proposes many legal and policy defects in detail. The proposal is brief and cursory and provides far too little information to meet the legal requirement to alert the public to its substance and basis. It would prohibit EPA from considering important science in rulemaking even though the laws governing EPA's use of science require it casting a wide net. It sheds little light on how the proposal would work and no light at all on its environmental consequences. Instead of explaining how EPA will implement and interpret the rule, it largely throws these questions to the public. It doesn't show a need for any rule much less an absolute rule that sweeps across eight statutes. It claims its approach is consistent with a host of policies and studies but what Environmental Protection

Agency looked at them it found almost no support for the proposal and in some cases the authors have objected to the use of their studies and it posed the proposal. In sum, there is neither a legal basis nor a need for this rule. It would require the EPA violate explicit statutory provisions and unlawfully shifts the basis for deciding what science to use in rulemaking away from the statutory goals of reliability and environmental protection to so-called transparency, a term not found in the relevant EPA statutory provisions. It is too full of undefined or ambiguous terms to create a workable legal frame work. In other words, the proposal is unintelligible, unlawful and unworkable. EPA, I respectfully request that EPA withdraw it.

MS. RADZIKOWSKI: Thank you.

MS. OMOJOLA: Good afternoon, my name is Abigail Omojola, O-M-O-J-O-L-A, and I am here on behalf of Breast Cancer Prevention Partners to speak in strong opposition to the proposed rule and to urge the EPA to withdraw it immediately.

Breast Cancer Prevention Partners is a national organization committed to preventing breast cancer by eliminating exposures to chemicals and radiation that have been linked to an increased risk of the disease. We take great care and pride in ensuring that all of our public education, programs and policy advocacy are based on a strong foundation of peer-reviewed science.

Contrary to its stated intent, the proposed rule under consideration today would not serve to provide the public with greater "confidence in and understanding of" EPA's regulatory decisions. Rather, it would deeply undermine the ability of the EPA to use all the best available science in its regulatory decisions, which, in turn, will negatively impact public health. In fact, it is hard not to come to the conclusion that the proposed rule is a strategy to disregard many studies that have shown negative impacts of chemical exposures on public health.

Breast cancer is a disease with complex causation and often a long latency period. Only about 10% of

breast cancer diagnoses can be attributed solely to genetics. Breast cancer risk is a web of interactions between environmental exposures, genetics and lifestyle characteristics. Much of the data showing the connection between unsafe chemical exposures and breast cancer risk comes from laboratory studies. However, epidemiological studies, and in particular longitudinal studies, provide unique insights and important corroboration of these findings.

The proposed rule's requirement that underlying data must be made public before the EPA can consider a study in agency decision-making will have the practical impact of eliminating many of these critical studies from the regulatory process. Epidemiological studies involve the collection of extensive and detailed individual health data and researchers have an ethical obligation to protect the confidentiality of that data. The elimination of these studies will result in less scientifically sound conclusions and, most importantly, the public health benefits they would

provide.
An example of the kind of study this proposed rule could eliminate from the EPA's regulatory process is the National Institute of Environmental Health Sciences' Sister Study. From 2003 to 2009, the Sister Study enrolled 50,000 women whose sisters had breast cancer. Those women will be followed for a minimum of 10 years to study how genes and the environment interact to impact the risk of developing breast cancer, leading to a greater understanding of ways to prevent both breast cancer and other diseases. It does not serve the public interest to hinder the EPA's ability to use this type of research in their regulatory decisions.
This proposed rule will not only undermine the use of previously conducted epidemiological studies; it will also damage the ability of researchers to conduct future studies. Recruitment of study participants will be severely undermined if people fear their personal information may be made publically available. This is particularly true

for vulnerable marginalized communities that are both disproportionately exposed to toxic chemicals and have historical reasons to distrust researchers. Yet, it is the exposures experienced by these communities, and the resulting health effects, that we most need to understand and address.

The integrity of scientific methodology is thoroughly reviewed at many points in the processes of designing, conducting and publishing scientific research already. There is the competitive grant process; Institutional Review Board requirements; peer-review prior to publication; the expertise and judgment of career EPA scientists when considering the strength and relevance of studies included in EPA decisions; and finally review of those decisions and the underlying science by EPA's Science Advisory Board; all provide more than sufficient opportunities to assess the soundness of scientific studies. This proposed rule is not only damaging, it is unnecessary.

On behalf of the 1 in 8 women who will be diagnosed in their lifetime and the 40,000 lives that are lost each year in the U.S. to breast cancer, the EPA has an obligation to take action to prevent this devastating disease. This proposal takes a hard step away from that goal.
Thank you for the opportunity to provide this public comment urging the EPA to withdraw this misguided and damaging proposed rule.
MS. RADZIKOWSKI: Thank you.
MS. STOBERT: If Speaker 17, Alan Lockwood, and Speaker 18, Elizabeth Woolford will take seats at the speaking table. If Number 19, Paul Allwood, and Speaker 20, John Stine, would take seats at the on-deck seating.
Mr. LOCKWOOD: Good afternoon, my name is Alan Lockwood, A-L-A-N, L-O-C-K-W-O-O-D. Thank you for this opportunity to speak on behalf of Physicians for Social Responsibility. I am a board-certified neurologist and an elected fellow of the American Neurological Association and the American Academy of Neurology, and Professor Emeritus of Neurology

at the University at Buffalo. PSR is a 501(c)(3) scientific and educational organization headquartered in Washington DC with over 30,000 physicians, medical students, and others across the country. Our mission is to protect human life from the gravest threats to health and survival. We submit this testimony in strong opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." The proposed rule would change the standards for the inclusion of studies used by the Agency and lead to the abolition or weakening of virtually all protections under the purview of the Agency. Under the misleading veil of "transparency," the proposed rule could force investigators to invade the confidentiality of research participants and make confidential and private data open to all. A similar concern was voiced by the current Scientific Advisory Board, writing, "there are also sensitive situations where public access may infringe on legitimate confidentiality and privacy interests ..." The rule could replace evidence-

based decision-making with arbitrary determinations based on political considerations. Peer-reviewed research has led to important gains in health. The Clean Air Act protects us from air pollution and is arguably the most health-protective law in effect. I have written extensively about this in The Silent Epidemic. Peer-reviewed studies link air pollutants with leading causes of death in the United States including heart disease, stroke, and respiratory diseases. Additional studies link particulates to Alzheimer's disease and Type II Diabetes. Seminal studies include the Harvard Six Cities Study that involved 8,111 adults followed for between 14 and 16 years showing a clear link between pollution and mortality. The Women's Health Initiative study involving 65,893 post-menopausal women that demonstrated a link between particulates, and cardiovascular disease and stroke mortality. I attended closely to the study of 1,705 neurologist-confirmed strokes showing that a transient increase in small particles was

associated with a statistically significant increase in strokes even though levels were within limits "generally considered safe" by the EPA. A congressionally mandated report prepared by the EPA projected that by 2020 Clean Air Act provisions would save two trillion dollars per year in adverse health impacts. Many savings will positively impact the budgets of state and federal agencies at a time of ballooning deficits.

EPA rules provide significant protection for the developing brains of children by establishing limits on lead. Lead impairs brain development and has adverse effects on behavior and cognition. Other data link arsenic levels in drinking water to Type II diabetes and cancer.

Natural gas production, particularly "fracking" harms health due to human proximity to wells, pumping stations, and contamination of water supplies and contributes to climate change.

Protecting the privacy of research participants is a keystone of biomedical research and one with which I have had years of personal experience as a

member then chairman of the Buffalo VA Institutional Review Board. Peer-reviewed journals require authors to affirm their adherence to federal privacy protections as a pre-condition for publication. This standard should not be abolished. PSR's mission is to "to protect human life from the gravest threats to health and survival." To protect the scientific integrity of the EPA and protect health, we oppose the deceptively named proposal, "Strengthening Transparency in Regulatory Science." Thank you.

MS. RADZIKOWSKI: Thank you.

MS. WOOLFORD: My name is Elizabeth Woolford and I am an undergraduate student at Wesley University and an intern with the National Parks Conservation Association. My comments are my own. Today, I would like to express my strong opposition for the proposed rule titled, “Strengthening Transparency in Regulatory Science.” This rule would have sweeping impacts on the ability for the EPA to consult public health studies, as almost all utilized data from medical records that are

protected from public scrutiny. Their proposal would force the Agency to disregard such studies unless scientists reveal their participants' private medical information. Scientists conducting public health research would then be left with two unacceptable options: To break confidentiality agreements in order to disclose the personal health records of their subjects; or not to have their studies consulted by policy makers at all. As a result, some of the most significant research from the past decade, for example studies linking air pollution to premature deaths and measuring human exposure to pesticides would be left completely unavailable to the Agency. I would like to emphasize that data of a sensitive nature does not imply inherent unreliability, rather this kind of information is essential to achieve an accurate understanding about how human health is impacted by chemicals, chemical compounds and other substances. Such an understanding is necessary for the EPA to fulfill its mission to protect public health and protect

the environment with the creation of effective regulations under the Clean Air Act, Clean Water Act, CERCLA, and other cornerstone environmental laws.

This proposal is based on a false premise about data quality and acceptability. There is no reason why one cannot protect the confidentiality of subjects and at the same time use information about them. This rule questions the integrity of the scientists and doctors conducting public health studies by implying that these professionals may have biased their subjects to achieve a particular outcome. However, it is evident that peer review already protects against for such bias.

For these reasons, one must consider how this proposal fails to achieve the requirements of OMB's Information Quality Act. It is clear that this proposal is overkill and would unnecessarily exclude scientific studies simply because they do not meet an unrealistic transparency standard. This would all be to the detriment of public and

environmental health.
In addition, this rule would create a blatantly political and dangerous double standard by eliminating the use of studies that follow confidential health guidelines while allowing polluting industries to keep their data under wraps. That alarming imbalance would skew regulation inherently favoring polluters over those impacted by their pollution.
Furthermore, this proposed rule would cross Agency lines and interfering with informed policy making and undermining the safeguards that protect millions of people, our public lands, and the space and places we call home. EPA's scientific research and related policies influences the decisions of other agencies charged with protecting our health and environment. For example, the National Parks Service needs access to the best available science to inform decisions that protect parks' air, land, water, wildlife and people. If EPA goes forward in placing unreasonable limits on the scientific record, the

National Parks Service and similar agencies will be unable to protect public health and the environment to the extent they otherwise could. As a young person, this proposal leaves me frightened. Within a decade I will be part of the generation that inherits the responsibility for this nation. If adopted, the negative implications of this rule will not be short-lived and could forever change the safeguards that EPA is supposed to develop to protect public health and our environment. In the many more decades of life I have in front of me, I intend to finish my education in this country, I intend to raise a family in this country, I intend to enjoy public lands and outdoor spaces in this country, and I intend to breathe this country's air and drink this country's water and eat this country's food. I hope to do so knowing that the regulatory body charged with keeping my body and environment safe has made decisions based on nothing less than the best scientific information there is. For these reasons, I urge the EPA to abandon this dangerous

and misguided proposal. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker Numbers 19 and 20, Paul Allwood and John Stine, if you would take seats up here. And Speaker Number 21, Virginia Ruiz, and Speaker 22, Karen Mongoven, if you would take seats the on-deck seating.

MR. ALLWOOD: Good afternoon, my name is Paul Allwood. I am Assistant Commissioner of Health Protection at the Minnesota Department of Public Health. Commissioner Stine is with me and we're going to do this joint testimony. Commissioner Stine will go first.

MR. STINE: Thank you. As Commissioner of the Minnesota Department of Health, Mr. Allwood is the Assistant Commissioner there, and as Commissioner of the Minnesota Pollution Control Agency, my name is John Link Stine, S-T-I-N-E. We are appointees of Minnesota's Governor, Mark Dayton. We are deeply disappointed in and troubled by this proposed rule, "Strengthening Transparency in Regulatory Science." We have traveled 1100 miles

from our home in Minnesota to be here today to speak against this rule. On May 15, 2018, our two state agencies commented against this rule in a letter from Commissioner Malcolm of the Health Department and myself. Our testimony today expands upon those comments and provides specific examples from Minnesota that show why this arbitrary and non-ethical rule must not be adopted.

MR. ALLWOOD: The first example is that the State of Minnesota is dealing with a massive area of contamination with PFAS chemicals, otherwise known as PFCs. The contamination came from 3M Manufacturing and disposal sites that contaminated groundwater on a very massive scale impacting over 150,000 residents. Minnesota's Department of Health conducted bio-monitoring studies of over 200 people living in those impacted communities to be able to understand their exposure and their potential health implications. Those studies help Minnesota derive health protected values under state law and furthermore also help the state of

Minnesota reach a settlement with 3M Company of over 890 million dollars. Now, without these studies and without these data we would not have been able to be successful in our litigation with 3M Company and residents of the communities that were impacted by this pollution would have had to foot this bill.

Now, these studies are only possible because we provided absolute guarantees to the participants that their data would be protected and that we would assure its confidentiality. The proposed rule will make it unlikely that public health data such as this -- and you heard it from other testifiers -- would be available for states to use, but even more so for the EPA to use in its decision-making. This is to be avoided.

MR. STINE: Our second example is the 2015 study and report that our agencies jointly released "Life and Breath". We released that report regarding the health impacts of air pollution in the Twin Cities Metropolitan Area of Minneapolis and St. Paul. The study used public health data

and mathematical modeling software developed by the U.S. EPA. EPA's modeling software is based on published, peer-reviewed scientific studies of the relationship between human health and air pollution. The study confirmed air pollution leads to increased disease and death in our population. Every year about 2000 premature deaths, 400 hospitalizations and 600 emergency room visits occur in the Twin Cities Metropolitan Area that are caused by fine particle or ground-level ozone exposure. In fact, the study found that fine particle air pollution and ground-level ozone was a causal factor for some deaths and hospital visits for lung and heart conditions. The implications of the proposed rule are that under this rule's requirement for the use of public data, future public health data on which studies like our "Life and Breath" were based would not be available. Public health data and research relies on citizen confidence in confidentiality of their personal information. We believe the rule would lead to an over-reliance

on animal studies and toxicological data which cannot estimate disease burden as well as population health data and studies. The proposed rule would lead to weaker environmental regulations, more air pollution, greater levels of heart and lung disease and death. As a result, health care costs will increase. Asthma already costs the United States 56 billion dollars annually and the incidence of asthma is increasing. The rule language under Part 30.8 requires that EPA implement the rule in a manner that minimizes cost. Ironically, the rule will lower the cost to EPA and environmental polluters. A fundamental principal of our environmental protection law is that polluters pay. The plain truth is that your rule does not address the increased costs that come with relaxed regulations. In fact, the polluters will pay less and costs will shift onto the public in health insurance. With that I'll kick it to Mr. Allwood.

MR. ALLWOOD: So, to conclude, to say that state as public officials we are responsible for

protecting the health of our state population, it's really important for us to be assured that EPA is going to use the best science in its regulatory decision-making. This rule severely brings that into question and we would like you to know that we are looking at this as an urgent matter that requires the EPA's attention and would urge that time be taken to suspend and slow the process of adopting this rule so that a full and complete review can be done. Thank you.

MR. STINE: Thank you.

MS. RADZIKOWSKI: Thank you both.

MS. STOBERT: Speaker 21, Virginia Ruiz, and Speaker 22, Karen Mongoven, if you would come to the speakers' table. Speaker 23, Steve Milloy, and Speaker 24, Steve Milloy for John Dunn, if you would have seats at the on-deck seating?

MS. RUIZ: Good afternoon, my name is Virginia Ruiz. I am the Director of Occupational and Environmental Health at Farmworker Justice, an organization devoted to working with migrant and seasonal farmworkers to improve their living and

working conditions. On behalf of my colleagues at Farmworker Justice and the farmworkers that we represent, I strongly urge the U.S. EPA to withdraw its proposed rule, "Strengthening Transparency in Regulatory Science." If finalized, this rule would endanger farmworkers and other vulnerable people across the country. We oppose EPA's proposed rule for three reasons: First the rule would prohibit EPA from considering credible scientific evidence about the dangers farmworkers face including exposure to pesticides and other chemicals. Second, the rule would deter farmworkers themselves from participating in future scientific studies. Third, the rule would make it more difficult for Farmworker Justice to obtain the research we need to advance our mission. With respect to the first point, the proposed rule would prohibit EPA from considering credible scientific evidence about the dangers that farmworkers face. As EPA's own Science Advisory Board acknowledged, there are many reasons why researchers and study participants

might choose to keep data confidential, and many of these reasons have no bearing on the credibility of a scientific study. For instance, because farmworkers are often migratory, moving for work across domestic and international borders, researchers may be unable to locate farmworkers they last encountered as study participants years ago, and thus unable to renegotiate privacy agreements struck at the time the research was conducted. Farmworkers themselves may also have legitimate reasons for wanting to preserve their privacy. For example, some research shows that farmworkers face an increased risk of exposure to chemicals that impair fetal development resulting in lower IQ scores, an outcome associated with significant social stigma. We already suffer from the dearth of scientific evidence and information about occupational and environmental health risks that farmworkers face. EPA should base its regulatory decisions on the credibility of scientific evidence and not on arbitrary factors like the

public availability of research data. With respect to the second point, the proposed rule would deter farmworkers from participating in future scientific studies. Farmworkers are extremely vulnerable members of our society and it's unlikely they would agree to participate in scientific research without an iron clad guarantee that their identities would be kept confidential. Farmworkers value their privacy for a number of reasons including an undocumented or other tenuous immigration status and insecure employment. Farmworkers whose identities are exposed would risk retaliation from their employers ranging from termination to deportation. As a result the proposed rule would present farmworkers with a false dilemma. They could choose to participate in research studies that might eventually yield better regulatory protections at great personal risk, or they could choose to protect their privacy by refusing to participate in research studies, thus forgoing badly needed protections, also at great personal cost. EPA should not

present farmworkers with such a choice. Finally, the rule would frustrate Farmworker Justice's ability to achieve our mission. We rely on credible scientific evidence to educate farmworkers, policy makers and the public at large about the risks farmworkers face. Much of this evidence comes in the form of epidemiological studies that the proposed rule would categorically exclude from consideration unless the underlying data were made publically available. If EPA's proposed rule were to result in fewer scientific studies focusing on farmworkers, as seems inevitable, we would lack information we need to carry out this important aspect of our mission. It would severely undercut our ability to effectively advocate for farmworker health and safety.

Accordingly, we urge EPA to protect farmworkers and other vulnerable communities by withdrawing the proposed rule without delay.

MS. RADZIKOWSKI: Thank you.

MS. MONGOVEN: Good afternoon, I'm Karen Mongoven;

K-A-R-E-N, M-O-N-G-O-V-E-N, Senior Staff Assistant at NACAA, National Association of Clean Air Agencies, and I appreciate the opportunity to testify today on behalf of NACAA. NACAA recommends that EPA withdraw this proposed rule. In our view the proposal would likely undermine the very objectives that it's supposed to promote. In particular, we believe it would hinder EPA's use of best available science and environmental regulations and it would likely diminish, rather than improve, public confidence in the integrity of EPA's scientific decision-making. Reliance on best available science is a fundamental requirement of the Clean Air Act and other environmental statutes the EPA administers. Indeed, science-based decision-making is at the very core of our shared mission as air regulators to protect public health and the environment from the harmful effects of air pollution. There is a long-term trend toward increased transparency in science including toward providing greater public access to underlying data and

analytical techniques after scientific studies are published. We think this trend is a laudable one, but complete public access to underlying data is not always possible, especially in the case of the epidemiological studies based on private health data that must remain confidential. Transparency concerns must not override EPA's obligation to consider the full range of peer-reviewed, sound, scientific research that is available and relevant to its regulatory decisions.

Full public access to underlying data and models is not necessary to assure the validity of scientific studies. Rather, the most effective assurance is the process of peer review itself, a process to which the vast majority of scientific information on which EPA relies has already been subject. When the results of a scientific study are submitted for publication, the uncertainties, assumptions, parameters and theories utilized by the scientists are laid out in the publication. Peer review analyzes all of these components to establish validity. The process of peer review

has been rigorously developed over centuries. If EPA believes the peer review process is flawed, it should explain exactly why it believes the process is inadequate and how this proposal specifically addresses those inadequacies. If adopted, the proposed rule could serve to bar EPA's consideration of relevant scientific literature and the establishment of air regulations to protect public health and the environment resulting in serious adverse effects on the nation's air program.

In a footnote in the proposal, EPA cites two D.C. Circuit cases that upheld the Agency's reliance on confidential data in setting health-based air quality standards for lead and fine particulate matter. In that footnote, EPA states that it is "proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions." The clear implication is that EPA will discard rigorously vetted scientific literature in the service of greater transparency. This would be an

abdication of EPA's legal obligations and stated intention to rely on the best available science. NACAA is also concerned with a provision that would require EPA to conduct its own "independent peer review of scientific studies underlying significant regulatory decisions." The EPA included no details about how this provision would be implemented and moreover the proposal failed to acknowledge the EPA already has institutional mechanisms to review and vet scientific information through panels of scientific experts including a Science Advisory Board and its Clean Air Scientific Advisory Committee. EPA does not explain why scientific literature that has already undergone peer review and been vetted by EPA's science advisory panel should be subjected to an additional layer of peer review. We do recognize that the proposal would allow the EPA administrator to grant exemptions to the rule's requirements on a case by case basis if he or she determines that "it is not feasible to make underlying data publically available or to conduct

an independent peer review of scientific studies." However, the rule does not include any criteria for how the administrator would make such a determination. We believe this provision would have the effect of interjecting the appearance of politics into what should be a fair and unbiased assessment. It's an opportunity for arbitrary decision-making and it is insufficient to protect against the exclusion of relevant valid scientific studies.

EPA requested comments on whether the proposal should be applied retroactively or retrospectively should they decide to adopt it. We believe the rule should not be applied retrospectively. To do otherwise would create significant regulatory uncertainty by calling into question existing standards as well as prevent state implementation plans and other decisions that are based on those standards.

In conclusion, NACAA respectfully requests that EPA withdraw the proposed rule. If the Agency does intend to update its approach to transparency

and reproducibility it should do so in consultation with the National Academy of Sciences and in the spirit of cooperative federalism EPA should also consult from the earliest stages with the state and local agencies that are responsible for implementing our nation's environmental laws. NACAA appreciates the opportunity to provide the testimony I offered today and we also intent to submit written comments to further elaborate on the concerns I discussed here. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Steve Malloy, Speakers 23 and 24 would come to the speaker's table. Speaker 25, Meredith McCormick, and Speaker 26, Olivia Bartlett if you would go to the on-deck seating.

MR. MILLOY: Good afternoon, my name is Steve Milloy. I publish JunkScience.com.. I am making my comments here on behalf of myself and also Dr. John Dale Dunn, who is an emergency room physician in Texas. We are here to support the proposed transparency initiative. Science transparency in EPA is long past overdue. When I first started

working on EPA issues in 1990, the main controversy with EPA science was the use of science policy and default assumptions, like linear no-threshold model of carcinogenesis. The problem wasn't necessarily the use of science policy default assumptions, the problem was, rather, the EPA's failure to disclose the nature of those default assumptions in regulatory actions. In other words, what part of the regulatory actions was science, what part was guesswork and what was politics? When I first reported on this problem from the Department of Energy in 1994, the Clinton administration tried to censor my report but they failed. But I didn't and many others didn't. So here we are, many years later, making progress on this important issue.

More recently, the major problem with EPA science has been what has become known as secret science. Since the 1990's EPA grantees like Harvard's Doug Dockery and Brigham Young University's Arden Pope, have refused to make available to the public the

raw data used in their epidemiologic studies, and this is true despite the fact that these studies were cited by EPA as the principle scientific basis for major air quality rules like those that constituted the Obama administration's war on coal.

Worse, prior EPA administrations actually aided and abetted Dockery and Pope hiding their data from public review. In 1996 and 1997 the Clinton administration refused a request of Congress. In the 2000's things got so bad Congress actually had to subpoena the Obama EPA for the data and they refused to provide it.

I can only conclude that this is because independent review of the Harvard Six Cities and the American Cancer Society line of studies would prove them to be highly problematic, embarrassing and even fraudulent. Desperate to defend the indefensible, supporters of Dockery and Pope have wrongly maintained that making the data in question public would violate medical and personal privacy rights. Nothing could be further from the

truth. For the most part, data is electronic. Scrubbed files with key data needed for independent review can easily be made available. No one -- no one -- is interested in any personal or medical data. It has no value to anyone. The State of California has made such data files available for use for many years. I know. I have obtained this data -- over 2 million death certificates to be precise -- and with it enabled research to be published that completely debunks the secret science of Dockery and Pope. Fear of exposure of their research as faulty, if not fake, is why Dockery and Pope are so scared of producing their data for independent review. To make these comments current, up to date, efforts have been made this month to obtain the Dockery and Pope data but they continue to keep their data secret. Given that the Dockery and Pope research and related PM2.5 research has been funded by taxpayers to the tune of more than 600 million dollars and then this research is used to regulate the public costing untold billions more dollars

without providing any public health or environmental benefits, the conspiratorial hiding of this secret data is more akin to crime than science.

If EPA wants to regulate, that is fine, but the basis of the regulations and the reason for the regulations must be clearly laid out so there could be full and fair debate. Harvard's Doug Dockery and Brigham Young's Arden Pope don't want independent scientists to check their work for some reason. Dockery and Pope supporters may offer whatever excuses they like but we all know what the reality is: Fear of exposure. Thanks to the Trump administration the days of secret science are coming to an end. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker 25 and Speaker 26, Meredith McCormack and Olivia Bartlett are now onstage. If Speaker 27, Dan Byers, and Speaker 28, Antonia Herzog, would come to the on-deck seating.

MS. McCORMACK: Meredith McCormack, M-E-R-E-D-I-T-H, M-c-C-O-R-M-A-C-K. My name is Meredith

McCormack and I'm a pulmonary critical care physician at Johns Hopkins University where I care for patients and I also investigate the effects of air pollution on lung health in cohort studies of children and adults. I serve on the American Thoracic Society Environmental Health Policy Committee and I'm speaking today on behalf of the ATS, the American Thoracic Society.

The ATS is extremely concerned about the proposed EPA policy. In short, we believe this policy is not in the best interests of our profession, the patients that we serve, or the public health. The focus on transparency is highly reminiscent of the rhetoric used by tobacco lawyers decades ago. As revealed in tobacco industry documents, in 1996 a tobacco industry lawyer drafted a plan for tobacco giant, R.J. Reynolds, to combat research that documented the health effects of second-hand smoke. A tobacco industry lawyer described a plan to construct explicit procedural hurdles the Agency must follow. The memo used the same terms of transparency, sound science and calls for

reproducible science, the language that the EPA is now using in its proposed policy. While the guidance provided in that memo was intended to undermine research studies that documented the adverse effects of second-hand smoke, the recommendations provide a road map for any industry seeking to undermine science that could lead to greater regulation. While concerning, it is no accident that EPA is proposing policy once touted by tobacco industry lawyers. By proposing this policy, EPA is literally taking a page out of tobacco industry's playbook to undermine the legitimate role that science plays in public policy formation.

The ATS supports transparency in upholding scientific rigor but the approach proposed in this rule is flawed. The proposed policy would require all science and biomedical research used by the Agency in major regulatory actions to have its raw data and health records made publically available under the guise of allowing third party analysis to confirm the results of the research. This

artificial standard cannot be met without forcing the release of confidential patient information and is in direct conflict with the mandates of our institutional review boards and updated privacy laws.

As a physician, no doctor or medical society would advocate ignoring large portions of the medical literature because the underlying data were not in the public domain. Medical guidelines are based on the best available evidence: Evidence that emerges from multiple peer reviewed publications, not a single study. The medical field is rapidly moving towards increasing transparency but this cannot be applied retroactively. Is the best available science only the subset of studies whose data are available for analysis by the public? That is not the case for medical research studies and is certainly not the case for studies of environmental health effects.

EPA's new transparency standard introduces a more severe standard than the FDA uses to make decisions about the approval of drugs or that

Medicare uses to decide which treatments to cover. As a doctor I would do my patients a disservice if I ignore the best available evidence to guide my clinical decision-making. The proposed rule will allow the EPA to ignore the best scientific evidence in future decision-making about health effects of the air that we breathe and the water that we drink. The Transparency Rule fails to recognize the power of replication, a key criteria for defining the strength of scientific evidence. Replication refers to the fact that consistent findings from studies in different populations in different places strengthens the likelihood of an effect. The proposed rule would create a context for the EPA administrator to have the discretion to disregard studies that have provided the strongest scientific evidence underlying the dramatic health effects and dramatic improvements in air quality in the U.S. -- improvements that have led to measurable health benefits to our children, our patients and the general public. For the EPA to use these studies will patients

forego their confidential information? Or will the EPA now ignore the evidence from dozens of studies that have replicated findings that pollution is associated with increased risks of premature death. The Transparency Rule is unnecessary as there are processes in place to rigorously review the scientific integrity of the studies that are used in regulatory science.

In short, we fully concur with the statement from the editors of several leading scientific journals that the merits of studies relying on data that cannot be made publically available can still be judged. It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them.

In summary, this policy is issued in bad faith, is bad for science and bad for patients and bad for public health. The ATS strongly urges the Agency to withdraw this ill-conceived policy proposal.

Thank you.

MS. RADZIKOWSKI:

MS. BARTLETT: I'm Olivia Bartlett. B-A-R-T-L-E-

T-T. I'm from Bethesda, Maryland and I represent the 1200 members of Do the Most Good, Montgomery County. I am a retired PhD health scientist. For 15 years I conducted research involving human subjects and also served as a peer reviewer for both grant applications and research papers submitted for publication. For the next 30 years I oversaw the scientific peer review of thousands of applications for funding of a wide variety of health science studies including the women's health study that was mentioned by a previous speaker, so I'm very familiar with the scientific research and publication process and the rules regarding protection of human subjects. I also have asthma, as do my son and my grandson, so I am also very familiar with the impact of soot and smog in the air on the ability to breathe. EPA's mission is to protect health and the environment. I strongly oppose EPA's so-called Transparency Rule since it will restrict the scientific studies that EPA can use to carry out that mission and to set safety standards for toxic

chemicals and pollutants in the air we all breathe and the water we all drink. The proposed rule was given an appealing title but it's just a politically motivated attempt to undermine decades of progress in protecting human health from hazards, particularly small particulate pollutants in the environment, while allowing soot-producing industries off the hook. The proposed rule is seriously flawed in several important ways. First, it reflects former EPA Administrator Pruitt's woefully inadequate understanding of scientific research methods, the nature of the long-term large-scale epidemiologic studies necessary to gather the kinds of data needed to determine toxicity of a pollutant and the rigor of peer review of both research grant applications and publications. Peer reviewers carefully scrutinize the methods that will be used to collect and analyze the data before a research study is ever funded. Additional peer reviewers and different ones scrutinize the data collection and analysis methods and whether the data supports

the conclusions, again prior to publication. Studies with flaws in design, data collection or data analysis don't make it into reputable journals. The proposed rule also seriously underestimates the burden and the consequences of making all raw data publically available. Most research funding agencies and journals now have policies that require researchers to make their data available to other scientists for reanalysis, validation and meta-analyses after publication and this has already been mentioned by previous speakers. However, many studies involve sensitive and personal data that could identify individual subjects even if the subject's name and address are redacted, so releasing these data sets to the public would violate patient confidentiality rules. The proposed rule may also violate the requirements of the Clean Air Act and Clean Water Act and other standard acts already mentioned to use criteria that accurately reflect the latest scientific knowledge, the best available science and inclusive analysis of all

available studies in assessing potential effects on public health. Furthermore, the proposed rule would create an unacceptable double standard for industry-sponsored and academic research by allowing companies to shield their confidential business data, thus corporate secret science would be okay but data sets that expose individual subjects' identities would have to be made public or would be excluded from consideration in rulemaking. This ill-conceived proposed rule has been condemned by hundreds of scientists, all but one of the previous speakers today, and numerous scientific societies across health and environmental fields. Editors of prestigious journals have denounced the proposed rule and stated excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes. The bipartisan policy center, the bipartisan environmental protection network represented earlier by a speaker, the Attorney Generals of seven states and D.C. who was here earlier and

EPA's own Science Advisory Board have also denounced the proposed rule. Rather than increasing transparency, the proposed rule will hamstring EPA, eliminate some of the best science available to inform standards under the National Ambient Air Quality Standards program and jeopardize both the environment and public health by making it more difficult to adopt rules that protect public health and the environment in the future. EPA's long-standing process using data from peer-reviewed science, EPA in-house scientists and the EPA Science Advisory Board works well and mirrors the processes of other science-based agencies. The system isn't broken and doesn't need to be fixed. If EPA wants to accomplish its mission, the proposed rule should be withdrawn immediately and should not affect any rulemaking going forward or any of the studies used in periodic reanalysis of existing rules. Thank you for allowing me to comment.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker 27, Dan Byers, and Speaker

28, Antonia Herzog, if you would take seats on the stage. Speaker 29, Tess Dermbach, and Speaker 30, Mary Angly, if you would take seats in the on-deck seating.

MR. BYERS: Good afternoon. My name is Dan Byers. The U.S. Chamber of Commerce strongly supports the intent of the proposed rule and applauds EPA for addressing a long-standing problem inherent in much of its regulatory decision-making processes. While the Agency's proposed reforms are clearly controversial they are grounded in a universally-accepted democratic principle: Citizens have a right to the data and information that are used in the development of public policy. This spirit of openness with respect to the regulatory process is found throughout government. It is enshrined in statute and countless federal directives and EPA memos reinforce the principle and detailed guidance for implementing it. It is also supported by experts of all political stripes. In 2012, congressional testimony, President Obama's Science Advisor, Dr. John Holdren, unequivocally

endorsed this idea, stating that: "Absolutely the data on which regulatory decisions and other decisions are based should be made available to the committee and should be made public. The Chair of EPA's Science Advisory Board during the Obama administration subsequently echoed this sentiment. Unfortunately, while this principle is generally accepted, EPA has not followed it consistently in practice. In fact, for many years EPA has relied upon non-public data to justify its aggressive regulatory agenda. The most egregious, but certainly not the only, example of this involves two controversial studies undertaken in the 1980s that suggest a linkage between certain types of particulate matter and health outcomes. The data associated with these decades-old studies has never been made public but EPA nonetheless has used them to monetize regulatory benefit claims that dominate the communications and regulatory marketing associated with nearly all of its major rules. It's also worth pointing out here that, separate from the studies themselves, EPA's

benefit monetization is highly subjective and controversial in and of itself. For example, in 2009 the Agency modified its assumptions in a manner that resulted in a quadrupling of purported benefits without any change to the underlying data and information used to monetize it. We hope that these sorts of subjective and questionable practices will be addressed since the Agency concurrently examines the development of regulatory cost-benefit analyses. The scale of EPA's practice in this respect is mind boggling. Data compiled by the U.S. Chamber found that between 2000 and 2016, EPA issued 62 rules claiming a total of 923 billion dollars in regulatory benefits. Incredibly 898 billion of these benefits, or 97%, were monetized based on the non-public data associated with PM2.5. In fact, these benefits comprise nearly 80% of all regulatory benefits across the entire federal government. Even though the vast majority of these rules were not intended to address PM2.5, and even though the vast majority of their

corresponding claim benefits came from areas of the country already deemed safe and in compliance with the standard, the Agency repeatedly touted these figures to build public support for its regulations. It's one thing to be cavalier about transparency principles when their application has little or no import to public policy. The federal rules that impact millions of people and billions of dollars should be held to a higher standard. For these reasons, we applaud EPA's effort to establish and meet a higher standard and we commend the Agency for doing so through the formal public comment and rulemaking process rather than simply instituting a new policy. As EPA makes clear throughout the rule, these changes will require considerable effort and cooperation, and despite suggestions otherwise, the proposal clearly states that its aim is not to exclude science but rather to ensure: "That over time more of the data and models underlying the science that informs regulatory decisions is available to the public for validation." And, to more broadly

quote: "Change Agency culture and practices regarding data access." The outcome will not just lead to better public policy, it will improve the integrity of the rulemaking process and in doing so increase public trust in, and support for, EPA itself. Whether you agree with the administration's regulatory approach or not, that is a good thing. With that fundamental background in mind I will close by calling attention to six high-level areas that warrant emphasis and attention as the Agency works to finalize the rule. These are elaborated on in my written comments.

1) Protect sensitive information;

2) Formally coordinate with other agencies working to address similar regulatory transparency challenges;

3) Develop further guidance and processes for employing the administrator's exemption authority under the rule;

4) Consider alternative approaches to balancing trade-offs between goals related to

transparency and maximizing the quantity and quality of information relied upon. For example this could include assigning greater decision-making weight to publically available data while still allowing for the consideration of nontransparent data;

5) Where possible, work to protect and de-identify sensitive information to allow for its continued use in regulatory decision-making, and;

6) Ensure that relevant transparency information is incorporated into public communications and marketing materials associated with regulatory initiatives. Thank you for your time and consideration today.

[Substitution of panel members.]

MS. HUBBARD: Thank you.

MS. HERZOG: Hello, my name is Antonia Herzog, H-E-R-Z-O-G, and I am a scientist with a doctorate in Physics. I am particularly concerned about preserving the scientific integrity of the EPA. I work in the Environment and Health Program at Physicians for Social Responsibility, a nonprofit

organization here in D.C. with chapters in multiple states across the country and over thirty thousand members and activists around the country. Our mission is to protect human life from the gravest threats to health and survival; we number environmental pollution among those key threats. PSR would like to express its strong opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." This proposed rule could arbitrarily exclude many important scientific studies-including thousands of public health and epidemiological studies that the Agency uses to make informed policy decisions regarding major public health and environmental laws. While it pretends to be about "transparency", the policy actually will limit the Agency's ability to use the best available science thereby weakening protections for public health and the environment. In essence it could censor and block much of the peer reviewed scientific research that has allowed us to address many serious environmental health threats over the decades.

EPA's proposed rule would place crippling restrictions on the use of data the Agency would accept in the rulemaking process by ultimately requiring investigators to divulge personal information about the participants in research studies. Scientific studies that failed to meet this criterion would not be acceptable to the Agency. At present, this kind of information must be kept confidential according to the generally accepted rules that govern the conduct of research that must be adhered to by agencies of the federal government and institutions that receive federal funds. A particular example that is concerning to me and is particularly relevant today where it's so hot outside and the air quality is questionable, is the Clean Air Act, a bedrock environmental law that protects us from dangerous air pollutants. It is such a critical health protection that would be endangered under this proposed rule because it relies on a longitudinal epidemiologic study of thousands of individuals. This includes the National Ambient Air Quality

Standards (NAAQS) in the Clean Air Act. These standards address six major classes of common air pollutants, including standards for fine particles {PM2.5), and these are the backbone of the U.S. air quality management system.

The Clean Air Act specifies that new or revised NAAQS be based on scientific criteria that "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." EPA has relied largely on community epidemiology and controlled human studies in establishing the specific pollutant levels and averaging times for NAAQS. If these studies were excluded by the EPA restrictions it would greatly reduce the availability of information that has proved to be significant in assessing the consistency and coherence of the evidence upon which the standards are based and would certainly weaken the scientific basis for maintaining or strengthening

those current standards. If the proposed rule is approved, we could lose the Clean Air Act's sweeping improvements to the air we breathe that we've benefited from over the last several decades thereby putting thousands of lives that are saved each year at risk, because EPA will no longer be able to use key scientific research.

PSR's mission is very similar to EPA's stated mission "to protect human health and the environment." To accomplish these objectives, we must protect the scientific integrity of the EPA. Physicians for Social Responsibility thus, strongly opposes the EPA's deceptively named proposal, "Strengthening Transparency in Regulatory Science." Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 29, Tess Dernbach, and Speaker 30, Mary Angly. If you come to the speakers' table. Is Mary Angly in the room? Okay, we'll come back to her at the end.

MS. DERNBACH: My name is Tess Dernbach, T-E-S-S,

D-E-R-N-B-A-C-H. I am a third-year law student at Columbia Law School and a legal intern at Earthjustice, speaking on behalf of Earthjustice. EPA's proposed rule, "Strengthening Transparency in Regulatory Science," requires a choice between breaching medical privacy or ignoring data for rulemaking decisions altogether. Breaching a patient's medical confidentiality can have severe and wide-ranging consequences for patients' lives and livelihoods. Various groups have often tried to access patient data for retaliatory purposes. For example, when pork industry associates tried to access the identities of individuals who had participated in a study by the University of North Carolina Professor Steve Wing, about the harmful health impacts of hog farming, or when the Department of Justice tried to access names of women who had late term abortions for use in litigation challenging the Partial Birth Abortion Ban Act. Employees' health information can be and is used against them by employers as an excuse for termination or other poor treatment. Moreover,

when the medical confidentiality of research participants is breached, people are deterred from participating in research altogether. Medical confidentiality is a necessary element of modern medicine. Patients must feel safe telling their doctors the most intimate details of their lives. The expectation of confidentiality fosters openness and trust between doctors and patients and is crucial to the delivery of medicine and conducting clinical research. Courts recognize, too, the importance of medical confidentiality and privacy. In 1928, Justice Brandeis described the right of privacy as: "The most comprehensive of rights and the right most valued by civilized men." At least five circuit courts have recognized an individual's constitutional interest in or right to the privacy of their medical information. In Farnsworth v Procter and Gamble in the 11th Circuit, the court recognized that: "Even without an express guarantee of confidentiality, there is still an expectation, not unjustified, that when highly personal and

potential embarrassing information is given for the sake of medical information it will remain private." This right to medical privacy can extend to beyond publication of medical data to situations where medical information is available to those without a legitimate interest in it. See, for example, Tucson Women's Clinic v Eden in the 9th Circuit, where the court observed that even if safeguards against public disclosure were adequate, the lack of safeguards against release of information to government employees who have no need for the information could create a violation of the right to privacy.

The EPA claims, vaguely, that confidential data will be protected by redaction or de-identification. However, these mechanisms are entirely inadequate to maintain patient confidentiality. Latanya Sweeney, a Harvard Professor of Government and Technology, found in her study simple demographics often identify people uniquely that she was able to identify 87% of people in the United States with only their

gender, zip code and birth date. She has also found particular problems in patient confidentiality de-identification observing that in many healthcare data sets there will be unique data about people that can be used to identify them even when they are not explicitly identified in the data set. Sweeney found that even without identifying data in health data sets: "The remaining data can be used to re-identify individuals by linking or matching the data to other databases or by looking at unique characteristics found in the fields and records of the database itself."

Paul Ohm from the Georgetown Law School found in his pivotal work: Broken Promises of Privacy: Responding to the Surprising Failure of Anonymization, that using traditional, personally identifiable information focused anonymization techniques, any data that is even minutely useful can never be perfectly anonymous. These studies seriously undermine government claims that de-identifying data will provide adequate privacy for

patient data contained within research studies. Because of these reasons and those given before me, I strongly urge EPA to revoke the proposed rule immediately. Thank you.

MS. HUBBARD: Thank you.

MS. ANGLY: Hello, my name is Mary Angly and I'm interning for the organization Physicians for Social Responsibility and I've come to speak against the proposed rule, "Strengthening Transparency in Regulatory Science." Medical studies, clinical reports, and real-world field studies all include data and information that cannot be made public without violating confidentiality in patient protection laws. The proposed rule implies that these studies are not transparent because researchers necessarily suppress names and other identifying information about patients whose health information is relevant to study findings. Releasing individual participants' data to the public would violate confidentiality requirements legally mandated by the IRB and/or by HIPAA. By restricting these

studies, the proposed rule would essentially force the EPA to base many of its regulatory decisions on industry-sponsored studies and this rule could have huge environmental and public health implications. Despite a supposed scientific process, the funding source for a study can have significant implications on study findings. For example, in a review of research into the health effects of EPA an evaluation of 115 relevant studies was conducted in 2009. The review found that 94% of the publically funded studies found that chemicals have harmful effects whereas none of the industry-backed studies found these same findings. This is a huge disparity that cannot have occurred due to chance alone. Successful regulatory policies can have huge and quantifiable effects on exposure levels in human health. Biannually, the CDC collects data recording the blood and urine levels of 265 chemicals in people across the country. Longitudinal data can be used to visualize falling exposure levels and thus not measure the impact of a policy. For instance,

following the 1970's era lead regulations, 2009 blood lead levels were 8% of 1980 levels, which is a compelling example of a successful public benefit that occurred as a result of regulatory efforts. This is especially important when one considers that the detrimental effects of lead exposure are well known and well documented. Lead exposures leading to a blood concentration of 1 mcg/dL are correlated with an IQ loss of about 0.2 points. Each IQ point is estimated to raise worker productivity about 2%. Moral arguments aside, when considered from a population perspective, lead regulation has had huge economic benefits. A review of the EPA's archives shows that much of the original clinical research that formed the EPA's decision to regulate lead would have contained private health information. Under the proposed rule many of these studies would not have been able to be taken into consideration which is why it's so important that these studies are allowed to regulate future chemicals. Although lead specifically, and its health effects

are well known and well documented, my fear is that the future regulation of dangerous chemicals will be prevented due to the restrictive nature of this rule. Barring the use of major health studies under the veil of transparency will have huge and detrimental effects on the breadth and validity of the sources the EPA is able to consider when making regulatory decisions. Dangerous chemicals will not be able to be adequately regulated if the scientific processes are stymied.

I urge you to consider the health of this country when deciding whether or not to implement this rule. If the health implications are not enough to prevent the enactment, please consider the economic implications. The cornerstone of a healthy and productive population is a healthy environment. This rule would pose a serious barrier to the EPA's ability to effectively regulate. The power of landmark laws defined to protect human health such as the Clean Air Act, Safe Drinking Water Act, and Toxic Substances

Control Act, could be significantly undermined if this rule comes to fruition. Thank you for your time.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 31, Brenda Munive, and Speaker 32, George Thurston, if you would come to the speakers' table. Speaker 33, Brittany Meyer, and Speaker 34, Adam Spanier, if you would come to the on-deck seating.

MS. MUNIVE: Good afternoon. My name is Brenda Munive and I am currently interning with the nonprofit organization called Physicians for Social Responsibility. I am a recent graduate of the University of California, Santa Barbara, with degrees in Environmental Studies and Communication. I am testifying today to voice my opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." I believe that scientific transparency is critical. Scientists, policy makers, and the public alike must all be able to trust and rely upon the scientific evidence that shapes our

society and the extent of human knowledge. However, I believe the EPA's proposed rule instead represents a serious misunderstanding of the institution of science. Furthermore, I believe that the proposed rule risks unnecessarily excluding valid scientific evidence from informing EPA policy, and therefore harms our fellow Americans through the creation of ineffective policies. The nature of the scientific field is unique. While most professions are motivated by political, economic or societal interests, scientists are motivated by seeking truth. Scientists perform research with the sole objective of uncovering the reality of how our world operates and gain status and recognition by succeeding in that goal. Top scientists are granted tenure or the assurance they cannot be fired from their position for whatever reason. Tenure guarantees scientists that they will not lose their position even if their research points to facts that are controversial or at odds with the current political societal climate. For these

reasons, ideally, they are not suspect to the same biases as most of the public. To prove this point it is helpful to look at the four norms of scientists as explained by renowned sociologist, Robert Merton. These are: Universalism, or the idea that truth applies to all regardless of belief; communalism -- the fact that all scientific knowledge belongs to the public; disinterestedness -- the fact that scientists are not concerned with the outcome of the research, only that it is factual; and organized skepticism or the tendency to be doubtful of any research to ensuring the deep truth. These norms describe the ideal foundation on which scientists and their research operate. Because of communalism, we can be confident that scientific research is as open as possible. Being intentionally secretive violates this ideal, so critical data must be accurately presented. This norm does not mean that all data is presented, however. Minute details, such as the identities of the subjects, are usually withheld in research studies of all

types to protect privacy and ensure participation -- or, encourage participation. It is important to emphasize that these omissions do not diminish the quality or the outcome of the research, but are made in the interest of the well-being of the participants. Because of this intrusiveness, the public can be confident that scientific research is virtually free of any bias favoring one agenda, and because of organized skepticism, scientific research is subjected to heavy review and fact checking before it is published in a scientific journal, so the public can be confident that published research is factually sound. Of course, there are exceptions to these ideals. For example, the norm of disinterestedness could be jeopardized if a scientist is hired by an outside party such as a company or noted member of the industry. The outside party introduces a monetary benefit and a desired outcome for the research, putting unconventional pressure on the scientist to fulfill the desires of whoever hires them. If the EPA's proposed rule is enacted, industry

funded research could comprise a disproportionate amount of what informs EPA policies, giving the industry, and not the scientific community, a large degree of input in shaping environmental protections.

Based on this knowledge, the proposed EPA rule is unnecessary. Mandating that underlying data be made public in order for scientific research to be utilized in informing EPA policies, attempts to increase transparency but fails to recognize that scientists already take thorough and exhaustive steps to assure their published research is unbiased, truthful and as transparent as possible. Research that does not meet these standards is rejected by the scientific community. The rule would restrict valid scientific data, particularly within health research where patient confidentiality mandates that identifying information remain anonymous. The result would be ineffective and harmful policies that could allow for practices and chemicals that genuinely harm our nation to remain rampant and unregulated.

This outcome would benefit no one and runs contrary to the EPA's mission of protecting public health and the environment. Furthermore, a healthy economy depends on healthy communities. For these reasons, I implore the EPA to reconsider enacting this rule. Thank you for this opportunity to present my testimony.

MS. HUBBARD: Thank you.

MR. THURSTON: Good afternoon, I'm George Thurston. I'm a professor at the New York University School of Medicine. Today I'm here representing the International Society for Environmental Epidemiology, the ISEE, which includes researchers who study environmental causes of ill health including ambient air pollution subject to the National Ambient Air Quality Standards, or NAAQS, promulgated by the EPA, as well as its standards for heavy metals, pesticides, drinking water and other environmental contaminants. As such, our members have supplied a substantial part of the research that is the basis of those standards. We strongly oppose the

implementation of EPA's proposed changes to the way that studies are considered in setting such standards. Based on an incorrect interpretation of transparency and replication in science, the proposed rule would deprive policy makers of the real-world epidemiological evidence based on real exposures of real people that have been, and will continue to be, vital for future considerations of EPA's health-based standards. I especially want to highlight for you the manuscript that I wrote 20 years ago entitled, "Band-Aiding the Release of Health Research Data: Issues and Implications," and the article is already posted on EPA's SAB web page. This article considered a similar proposal that was made in July of 1997 as an amendment to the U.S. House Appropriations Bill without any hearings. The problems I raised at that time are directly relevant to today's transparency proposal.

First, the increased potential for compromise of medical record confidentiality. As you've heard before today in a time of big data it's all too

easy to crack any de-identification process, especially when lots of publically available spatial and environmental data are matched to people in the study as they are in the studies that EPA considers. The solving of the Golden State Killer case, for example, is one example where a combination of two separate databases allowed de-identification of an individual. Second a loss of researchers' intellectual property. This can involve lost publications and academic career derailment. Third, the imposition of a government unfunded mandate. The USOMB has estimated that a similar law considered in the Congress, but that was never passed by the Senate, could cost the government up to 250 million dollars per year. There would also be the data prep costs to the scientists and their institutions.

Fourth, damage to future scientific research. When people no longer wish to enroll for fear that their medical data will be released, new scientific studies could be inhibited. Fifth, the

proposed rule will allow the EPA to ignore large portions of the scientific literature in decisions that are supposed to protect public health. In cases where key studies are excluded from the evaluation of environmental issue because of an inability to release study participants' private health records, the EPA may then ignore key scientific studies. This would diminish the evidence supporting protective health studies, potentially allowing the EPA to conclude that there's insufficient evidence to support proper health protective standards.

Sixth, the abuse of research data to undermine science credibility. This problem is likely the most dangerous aspect of this proposal. Past documented examples of abuse by consultants to a vested interest resulted when the state of Georgia set up an open records law and the R.J. Reynolds Company used it to obtain research data to attack study findings that the use of cartoon characters, such as Joe Camel, in tobacco advertising influenced children's product recognition. That

research was later validated in other studies but the damage was done and the physician involved left research for private practice. Thus, this data release approach has already been tried in the past and shown to be too easily abused by vested interests. There is also a tobacco connection to today's proposal. Just before the 1997 open data amendment was presented to the House, there was a December 1996 memo from the consultant of the tobacco industry, from Christopher Horner, laying out a similar strategy to address federal agency science with respect to second-hand smoke including a now familiar call for science transparency.

Finally, there's no need for this rule. Independent validation has already been conducted by groups such as the Health Effects Institute for air pollution studies, such as for the ACS and the Six Cities studies. Indeed, these are the studies mentioned by an earlier speaker, I believe it was Steven (sic) Milloy, and he incorrectly said that they were never released, they would never release

their data, and in fact they did release it. So, his testimony was incorrect. And whoever it was, I think it was Steven (sic) Milloy, but anyway, earlier speaker who said that Pope and Dockery had not released their data. They have done so and, in fact, it's an excellent example of how the system works. So, finally just to say such independent evaluations could easily be applied again to any new cases of concern for data validation without the above-noted risks. Thus, this dangerous rule seeks to needlessly solve a purported problem that just doesn't exist. Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 33, Brittany Meyer, and Speaker 34, Adam Spanier, if you would come to the speakers' table. Speaker 35, Sean Moulton, and Speaker 36, Andrew Bergman, if you would come to the on-deck seating.

MS. MEYER: Hi. My name is Brittany Meyer and I am the Associate Director of Public Policy at the Michael J. Fox Foundation for Parkinson's

Research. I am here on behalf of the nearly one million people with Parkinson's disease in the United States who rely on the Environmental Protection Agency to safeguard their health and inform them about potential hazards in the environment.

For over the past ten years, we've learned a lot about the mechanisms of Parkinson's disease and now know that the condition is caused by both genetic and environmental factors. It is now very clear that when coupled with a genetic risk factor, exposure to several chemicals, most notably solvents and certain pesticides, can trigger the disease. Just eight weeks ago, a study out of Canada suggested that low-level exposure to pesticides disrupts cells in a way that mimics the effects of mutations known to cause Parkinson's. More research is needed to fully understand the mechanisms at work and how to prevent them.

Many of the studies used to identify risk factors for Parkinson's disease are investigated via large population-based epidemiology studies and will be

impacted by EPA's proposal. I am going to highlight one clear example- though along with my health and science colleagues here today, we can provide hundreds of examples of studies that could be impacted.

A 2009 study used GPS to estimate participants' well-water contamination exposure from agricultural pesticides. The results showed that consuming well water from a private well located in an area with historical pesticide use resulted in an increased risk of Parkinson's disease. Due to the nature of wells - typically serving a relatively limited number of people within a very small radius - the detail needed to perform the study renders proper de-identification impossible. All one needs to know is that a certain person lives near a particular well along with a demographic detail such as their age, gender, race, etc., and privacy is at great risk. Data from studies like this cannot be de-identified to the degree needed to protect patient's identification while still providing the

amount of specificity needed to help a scientist trying to replicate the results. Obtaining consent is not a solution. Some people make the choice to not disclose their Parkinson's diagnosis for a variety of reasons including privacy concerns, fear of prejudice or retaliation at work, and others. It is simply unreasonable to put people in the position of outing their diagnosis or to decline to participate in a study that could someday find a cure for their condition. Additionally, people who are willing to sign away their privacy and those who are not are different in ways we cannot predict or control for in study analysis.

The Michael J. Fox Foundation believes in open, reliable, and replicable science. We fund approximately 90 million dollars in research per year and hold our funded scientists to the highest standards. Our contracts require science studies to be peer reviewed and most require data to be as available as possible while protecting precious health data. We echo the call of our fellow public

health groups here today and the nearly seventy public health, science, academic, and medical groups who signed on to a joint statement calling for the rule to be abandoned for the sake of science and for our health. Thank you.

MS. HUBBARD: Thank you.

MR. SPANIER: Good afternoon, my name is Adam Spanier, S-P-A-N-I-E-R. I am a pediatrician and Associate Professor in the Department of Pediatrics at the University of Maryland School of Medicine. I'm also a member of the American Academy of Pediatrics, Council on Environmental Health Executive Committee. I'm here today on behalf of the American Academy of Pediatrics. The AAP strongly objects to EPA's proposed rule, "Strengthening Transparency in Regulatory Science." The proposal will require EPA to ignore the best available, peer-reviewed scientific evidence on pediatric and reproductive environmental health, may violate patient confidentiality, and could dampen scientific processes by creating barriers to the use of

quality research in EPA science. Children and pregnant women are disproportionately affected by environmental pollutants and changes. Between 1990 and 2010, the Clean Air Act prevented over 160,000 premature deaths, 54,000 cases of chronic bronchitis, 130,000 acute myocardial infarctions, 1.7 million asthma exacerbations, 3.2 million lost school days and 13 million lost work days. Landmark academic studies guided EPA to implement policies leading to these dramatically positive outcomes. However, EPA's proposed rule will no longer allow EPA scientists to use much of the scientific evidence that's brought on these life-saving regulatory changes.

Scientific studies used by EPA to make regulatory changes are already rigorously examined prior to being published in peer-reviewed scientific journals. Scientists not associated with the research study must review the study design to ensure that it is scientifically sound before the study can be published. Many of the studies that inform EPA policy to protect the health of

children and pregnant women are based on IRB approved studies of the health of human subjects that require data confidentiality. Such studies involve observing the longitudinal effects on reproductive and child health from exposures to lead, particulate matter and other toxic substances. Replicating such investigations for the purpose of providing open access data for EPA to use would be morally unacceptable as it would require exposing children to lead, ozone and other damaging pollution. It would also not be ethical to exempt the study participants from data confidentiality protections. By requiring reproducibility the rule may also exclude many landmark public health studies that were so scientifically rigorous and resource-intensive that they could not be reproduced, such as the Framingham Heart Study, a 70-year-long cardiovascular epidemiologic study. Requiring reproducibility may also exclude studies done after landmark ecologic events such as oil spills and natural disasters. This rule does not improve

the scientific merit of the studies used for EPA policies, and, instead, creates significant barriers to EPA's assessment of past, current and future scientific work. This proposed rule contravenes EPA's mission to ensure that American pregnant women, children and families have clean air, land and water, and the AAP strongly urges you to not move forward with it. Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 35, Sean Moulton, and Speaker 36, Andrew Bergman, if you'll come to the speakers table. Before they speak I wanted to note that the time is now 2:39 and Speakers 35 and 36 are the last two speakers here to speak during the afternoon session. So, at this time if there's any speakers currently registered for the evening session but would like to speak now, if you would go to the registration desk we can get you a speaker number. Go ahead.

MR. MOULTON: Good afternoon, my name is Sean Moulton, Senior Policy Analyst at the Project On Government Oversight, a national nonprofit,

nonpartisan, government accountability organization. Thank you for the opportunity to speak this afternoon. I'm here to express my organization's strong objections to the proposed rule, "Strengthening Transparency in Regulatory Science," and urge the Agency to withdraw it. In the proposed rule the Agency notes that the best available science must serve as the foundation for EPA's regulatory actions. It is hard to argue with that fundamental principle, but this policy won't make scientific information better, nor more available. Instead, the new rule will often mean the best available science is off limits to the Agency, create delays in rulemaking and result in greater litigation.

I'd like to focus primarily on the rulemaking process and first raise serious concerns about the insufficient development process that produced this rule, a rule that fundamentally changes what information can and cannot be used in future rulemakings is a major undertaking and requires a great deal of certainty and evidence, yet this

proposal offers no clear explanation of the precise problem, no supporting evidence, no studies establishing that EPA has an information problem, nor citations that the proposed standard has been successfully used before or that EPA understands what its impact will be on the regulatory process when implemented. Even if the Agency truly believes there is some deficiency in its information policies and procedures, this proposed rule is premature. The starting point should be conducting studies of the issue to better understand the scope of the problem, if there is one, and the best way to improve transparency of regulatory science. The Agency should allow the Science Advisory Board to fully investigate and offer specific recommendations before moving forward with any proposed rule. There are any number of steps that the EPA should be completing before rushing into a formal rulemaking. The incomplete foundations for this rule reveal themselves in the vague language and unclear standards. The rule does not specify how

the new standards will be implemented, what mechanisms will be made available to allow publishing of more detailed data. More importantly the rule doesn't address how it will fit into the legal requirements the Agency has under the Administrative Procedure Act or other environmental laws.

The proposed rule is being done at EPA's discretion with no statutory authority backing it up. So, should this policy come into conflict with statutory requirements under existing law, those laws take precedent, and laws governing rulemaking have a number of requirements that this proposed rule would be in conflict with. The Administrative Procedure Act makes clear that an Agency cannot engage in arbitrary, capricious actions or decisions in its rulemaking; while the Agency has authority in its given area, that authority is not absolute. The Agency must have clear and strong justifications for its actions. Given the lack of supporting evidence for this policy or a statutory requirement from Congress,

EPA will be hard pressed to prove that this untested standard is not arbitrary. Even if the rule isn't immediately dismissed under the APA, the EPA's requirements under other laws, such as the Clean Air Act, that it consider all available, or best available, science in rulemaking and this policy would be in direct conflict with those. If the Agency seeks to apply this new standard in areas ungoverned by such statutory requirements, it will result in a confusing patchwork of standards where a study may be available for consideration under a Clean Air Act rule or a TSCA rule, but that same study would not be considerable in another rule.

I wanted to note in a case before the U.S. Court of Appeals for D.C. around the availability of air quality data study information, the court addressed this very issue, stating that, "If the EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant

scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment." Placing large portions of scientific research off limits simply goes against common sense. EPA should be able to use any and all available information to produce the best, most up-to-date rules. If a study is unreliable or flawed in some way, then the Agency can decide that based solely on that study's merits, and sometimes even flawed or partial studies can offer important insights that the EPA should benefit from.

We strongly urge EPA to withdraw this rule. Thank you very much for your time.

MS. HUBBARD: Thank you.

MR. BERGMAN: I'm Andrew Bergman, and I'm speaking today as the Special Environmental Advisor at the Project On Government Oversight, but I'm also currently a Ph.D. student in applied physics at Harvard University.

While the proposed "Strengthening Transparency in Regulatory Science" rule uses the words

"transparency" and "reproducibility" to project lofty goals, it's real effect will be to undermine the way that the EPA is able to rely on and even-handedly assess scientific studies for use in the rulemaking process. I'm here today to urge EPA to withdraw this rule. My colleague, Sean Moulton, has just addressed how the proposed rule conflicts with the EPA's regulatory process, and the statutory requirements underlying that process, but the rule will also have a direct impact on how the EPA approaches science.

The rule fails to properly address its two key considerations that will have a major impact on how it is implemented. First, the rule states that data relied on in making regulations must be made publically available, but it doesn't suggest a mechanism for how personally identifiable information or confidential business information would be handled.

This is an incredibly important issue, as so many studies that EPA uses rely on this type of confidential data. Yet it's reasonable to conclude

from the rule that, if it goes into effect, the EPA will no longer be able to use most longitudinal human health studies to craft public safeguards, even though those studies have been conducted by reputable researchers at academic institutions, and peer reviewed to ensure validity. Instead, they will be left with industry studies that more often use animal test subjects, which don't have any personal privacy concerns.

Second, while the rule refers to replicability of scientific findings, the background information supporting the rule focuses on scientific studies' reproducibility, which has a wholly different meaning in a scientific context. But because the rule itself says it must be possible to "replicate" studies' findings, we should assume that the rule intends the strongest possible meaning: that it must genuinely be possible to conduct all studies used in rulemaking again, from scratch, and obtain the same findings.

The Agency uses many studies, however, such as

those that link leaded gasoline to brain damage in children or a study that found a link between fine particulate air pollution and premature deaths, that examine dangerous real-world exposures and cannot, of course, be safely repeated. Just because they can't, or shouldn't, be repeated, however, doesn't mean we should ignore the vital insights they provide. The knowledge we have gained from these tragedies can and should be used to help safeguard the public in the future. Without knowing the details of how these two provisions, central to the rule, will be implemented, commenters can't even begin to assess the wide-ranging outcomes of this rule. We can conclude that the result will be that large swaths of studies will be arbitrarily ruled out for use in future rulemakings.

The rule's constraints on the use of scientific studies mean that even the use of studies that don't end up being haphazardly tossed out by this rule will be hindered substantially. The CBO found that a policy very similar to the proposed rule,

when it was proposed as legislation, would significantly reduce the number of studies that EPA is able to rely on when issuing and proposing rules without a substantial input of funding--a major loss when Agency scientists already have the tools to conduct thorough assessments of studies they rely on.

The rule also puts the Agency in a position where it's forced to serve as an independent reviewer of all scientific data underlying studies it uses, which will again hamstring Agency scientists who have limited resources. When the EPA was sued over air quality standards for particulate matter and ozone during the George W. Bush administration, the U.S. Court of Appeals for the District of Columbia Circuit said a requirement to make public underlying data for the key studies used in rulemaking would be "impractical and unnecessary." The three-judge panel said: "If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying

them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment ..." Essentially, the judges concluded that a policy like the proposed rule wouldn't serve the Agency's purposes at all. Instead of arbitrarily slicing out broad types of studies from being cited in rulemaking, why not continue to give Agency scientists the ability, as they have had for decades, to comprehensively assess and compare the scientific evidence presented in a study and give weight to each study as a result of careful deliberation?

If the EPA wants to address the accessibility of scientific studies and data, an important issue to scientists as well as members of the public, it should acknowledge that those efforts, which might include building a new public-facing platform or carefully considering certain types of standards, will amount to a years-long process and will require an enormous investment of Agency time and funding. That type of proposal shouldn't be made

in a brief proposed rule and should only be made if extensive studies demonstrate that there is a real need for an update to how scientific studies are used in Agency rulemaking.

The proposed, "Strengthening Transparency in Regulatory Science" rule, instead, gestures toward an unsubstantiated set of concerns. It's hard to conclude that its purpose is to do anything other than undermine Agency scientists' ability to use scientific studies and data to craft regulations, under EPA's statutory mandates, that protect public health. For this reason, I urge you again to withdraw the rule. Thank you for your time and for the opportunity to comment on this important proposal.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 37a, Emma Glidesgame, and Speaker 38a, Jyotsna Pandey if you would come to the speakers' table. Speaker 39a, Patricia Cohen speaking on behalf of Tracy Woodruff, if you would come to the on-deck seating.

MS. GLIDESGAME: Good afternoon. My name is Emma

Gildesgame, G-I-L-D-E-S-G-A-M-E. I'm a Master of Environmental Management student at the Yale School of Forestry and Environmental Studies, and an intern with the National Parks Conservation Association. My comments today are my own. I'm here to express my strong opposition to the proposed, "Strengthening Transparency in Regulatory Science" rule, that would censor science and threaten the health of all Americans. Last week, many of us in D.C. awoke to alerts warning of potential contamination in our water system. We were told to boil water before drinking or brushing our teeth or to avoid tap water altogether. For those few days, stores sold out of bottle water, Starbucks stopped selling coffee, and public pool splash pads and water fountains went dry. In the face of an urgent public health risk we did not censor the science that told us that contamination in our water is a threat. To know that clean water is important we didn't need the health records of every person who participated in landmark studies that helped us

understand the effects of contaminated water on our bodies and brains. The science is real. It's not secret, it's been repeated. It's been peer reviewed, analyzed and reaffirmed by generations of experts.

Just as the residents of D.C. took precautionary actions to protect ourselves and our loved ones in the face of a potential public health threat, the EPA must be allowed to use the best available scientific data to accurately assess environmental and public health threats to protect all Americans. The Clean Air Act, Clean Water Act, Safe Drinking Water Act and other historic laws that helped the United States become a leader in environmental protection recognized something that we forget far too often: Human health is environmental health. They are one in the same. Pollutants in the air travel hundreds of miles to become pollutants in our lungs. Contaminated soils grow contaminated food. Toxic river water becomes toxic drinking water. At the same time, clean air builds stronger kids. Healthy rivers,

lakes and watersheds build healthy communities. Good environmental and public health policies rely on a strong backbone of good science. The proposed rule would eliminate many credible, respected, long-standing, peer-reviewed, scientific studies from EPA consideration because they rely on confidential health information which cannot be made public. This proposal allows politically appointed regulators to pick and choose which studies they want to consider and would force scientists to choose between their ethical obligation to protect their subjects' privacy and the obligation to contribute knowledge to apply to regulatory science. Using good science to make strong policy has made America great for decades. The EPA and other agencies have kept countless Americans healthier, safer and more prosperous by using science to inform conservative, proactive protections for human health and the environment. We have protected historic and cultural monuments like the Jefferson Memorial, Statue of Liberty and even the Capitol

Building from the corrosive power of acid rain. We have reduced smog and air pollution in national parks like Great Smoky Mountains, Joshua Tree and Yosemite. We have improved water quality from the Great Lakes to the Everglades. Thanks to the EPA, my peers and I were born into an era of healthier air, cleaner rivers, and safer drinking water than our parents. I hope that someday my children can say the same, and that is why today I am joining thousands of scientists and public health professionals all over the country in speaking out against this rule and asking you to stop it in its tracks. We are all counting on you to listen to the sound and transparent science the EPA has used for decades and we are counting on our medical records remaining private. I strongly urge the EPA to stop this radical proposal for the health and safety of all Americans. Thank you.

MS. HUBBARD: Thank you.

MS. PANDEY: Good afternoon, my name is Jyotsna Pandey, and I'm the Quality Manager for the American Institute of Biological Sciences. My

organization appreciates the opportunity to comment on the EPA proposed rule, "Strengthening Transparency in Regulatory Science." We thank EPA for extending the initial 30-day public comment period and scheduling this public hearing on the proposed rule. We support the objective of increased transparency in the rulemaking process. But, the proposed rule is inadequately defined and thus itself lacks transparency and appropriate public protections. We request the EPA rescind the proposed rule and initiate an open process for gathering the information required to more thoroughly articulate the proposed rule. Any proposal to increase transparency in the regulatory process must not arbitrarily exclude important scientific information from the decision-making process, nor can personal information about individuals, such as genetic information or health status be sacrificed. A failure to protect these data will hinder future scientific investigations of people who refuse to participate in recent studies if they are not

confident that their most personal information is protected. Importantly, scientific journals take steps to protect personal information. They are not aware of any secure way to mask or protect personally identifiable information in the public domain and therefore think that any rule requiring this information be made public is needlessly risky. These data are important, however, to informing the decision-making process and should not be excluded for rulemaking processes because they are not publically disclosed.

As far as this request for comment, EPA has solicited input and measures to "provide protected access to identifiable and sensitive data." This is a significant issue and one that EPA should fully understand prior to moving forward with any new rule. Time and expertise are required to identify and properly evaluate the feasibility, cost and effectiveness of potential actions. It is unlikely that EPA can effectively gather and evaluate this information in the time prescribed by the proposed rule. We recommend that EPA

initiate a formal request for public comment on this issue alone and use what it learns to help inform and guide any potential future rule on transparency.

High-quality, curated and vetted mega data are generally required for someone else to appropriately reanalyze or use data such as those that could be made available by the proposed rule. The proposal is silent on meta data standards and practices. This is a significant challenge and another major problem with the proposed rule. We support EPA's goal of conducting independent peer reviews of the science and data used to inform regulatory decisions but thinks the section lacks adequate specificity. Who will conduct and manage the peer review process? Will these reviews be managed by the Office of Research and Development or by the various regulatory offices within EPA? Does EPA have appropriate staffing, expertise and resources to manage these peer reviews? We recommend that EPA partner with scientific organizations and professional communities to

administer and manage these reviews. Such outsourcing and partnerships will help to ensure that EPA gains access to independent and highly qualified experts and to promote greater public confidence in the independence of these peer reviews. This kind of process for managing peer review will also allow EPA to more cost effectively, nimbly and rapidly conduct reviews as it will not require EPA to substantially increase staffing for the remaining reviews. Such a process would also provide EPA with greater capacity to conduct reviews on time skills that do not needlessly delay regulatory and rulemaking schedules. After reviewing this proposed rule the AIBS respectfully urges EPA to rescind the current proposal. We ask that EPA initiate a new transparent and interactive process with the scientific, public health and environmental management communities, as well as other appropriate stakeholders, to identify responsible and viable approaches for promoting greater understanding of the science and data used to

inform EPA decision-making. Thank you for your consideration of our request.

MS. HUBBARD: Thank you.

MS. STOBERT: Patricia Koman, if you'd come to the speakers' table.

MS. KOMAN: Good afternoon. My name is Patricia Koman, spelled K-O-M-A-N. I am speaking on behalf of Dr. Tracy Woodruff, W-O-O-D-R-U-F-F. Dr. Woodruff is a professor in the Department of OB/GYN and the Director of the Program on Reproductive Health and the Environment at the University of California, San Francisco. Dr. Woodruff is a PI, or Principle Investigator, for a Children's Environmental Health Center and she, along with 15 other principle investigators of other Children's Centers, have submitted comments to the EPA about this proposed rule in writing. They are concerned that the proposed rule will adversely affect EPA's ability to use science in decision-making and ultimately negatively influence protections for children's health. Research from Children's Centers contribute

significantly to the foundation of science that informs and supports the Agency's ability to protect the public health. The National Academy of Sciences highlighted that Children's Centers have led to an improved understanding of the environmental impacts on child health and development. Children's Centers research identified the critical contributions of environmental exposures to asthma, obesity, ADHD, cancer, autism and other childhood illnesses. This research has led to new direction, treatment and prevention strategies for these diseases including informing EPA standards for cleaner air which has improved the quality of life for children. Collectively, we have research data from thousands of participants across the country, including some of our most vulnerable populations, children and women in communities of color. To not use or consider studies that do not comply with the proposed rule is inconsistent with scientific principles and evidence-based policy and this would put the public's health at risk

from toxic chemicals. Institutional review boards require that we protect the privacy and confidentiality of our participants, but institutional review boards' requirements conflict with this rule's mandate to publically reveal individual level data. Data masking, coding and de-identification techniques have limitations, because re-identification of participants is still possible. We are especially concerned that the rule inappropriately codifies specific data analysis approaches such as dose response modeling and other scientific decisions that should be made on the basis of scientific judgment and empirical considerations. This will hinder scientific inquiry and lead to inaccurate results. As scientists, we value open science but the mandates laid out in this rule will not improve data sharing, replicability or transparency. Instead, implementation of this rule, especially retroactively, could lead to EPA excluding numerous relevant studies from policy decisions to the ultimate detriment of children's health. We

urge EPA not to move forward with this proposed rule.

Finally, I want to comment about this public hearing and its lack of access to all stakeholders. By not providing the ability to make comments remotely or virtually, EPA limits the public comments to those that have the financial resources to travel to Washington D.C. and limits the participation of populations that are going to be most affected by this rulemaking. This undermines civic engagement and conflicts with the principles of a fair democracy. This is not a technical issue, as U.S. EPA has made virtual public comment in the past.

Finally, we urge EPA not to move forward with this proposed rule. Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: It's now 3:02 p.m. This was our last speaker for this session that we know of. We are going to repeat the request that if there is any speaker that has registered but is registered for the evening session, if you'd like to speak

now go to the registration desk and you will receive a speaker number for this session. We're going to wait a few minutes and see if there's anybody that decides to speak now. Otherwise, we will break until the 4:00 session starts.

MS. HUBBARD: And if I could just make a quick announcement, we do have a member of Congress who is on his way to speak who should be here shortly, so we won't go into recess quite yet, so if everyone could just remain in their seats if you're interested in hearing him speak, otherwise feel free to go on and head on out and then we'll go into recess after that.

MS. STOBERT: Sorry, Peter Ferrara, speaker 40a, if you would come to the speakers' table?

MR. FERRARA: Good afternoon. My name is Peter Ferrara, that's F-as in Frank, E-R-R-A-R-A. I'm the Senior Fellow for Legal Affairs at the Heartland Institute. We submitted our comments during the comment period online in response to the notice for public comment in rulemaking posted on April 30, 2018. EPA proposes the rule I am

commenting on intending the strengthen the transparency and integrity of EPA regulatory science. The proposed rule provides that EPA should ensure that the data and models underlying scientific studies pivotal to EPA regulations are publically available in a manner sufficient for independent validation, especially concerning regulations for which the public is likely to bear the cost of compliance. We applaud this proposed rule and find that governing statutes and executive orders, not to mention the basics of the scientific method, authorize the proposed rule and indeed have long required it. In not following the proposed rule in the past, EPA has been flouting the governing statutes and executive orders, departing from the scientific method and abusing its authority. The proposed rule provides that for science pivotal to significant regulatory action, EPA will ensure that the data and models underlying the science are publically available in a manner sufficient for validation and analysis. This new policy is needed because EPA admits to

having not previously implemented these policies and guidance in a world-best, robust and consistent manner.

Examples where EPA previously has fallen short include the public health research used to implement and defend the PM2.5 particulate matter standards, the corporate average fuel economy standards, the ozone standards and carbon dioxide standards. EPA's admitted reliance on secret science occurs at a time when the publications Nature, PLoS, Science, The Economist and other report half or more of published research on public health issues cannot be replicated. This replication crisis is genuine and even more broad and critical than the sources cited by the EPA for this proposed rule are willing to admit. A scientific publishing industry has been created by lavish government funding of politically directed research. Examples of this include supposedly scientific studies finding human impact on the climate or an association between ozone and climate. It may take generations before the

effects of this corruption can be overcome. The root cause of EPA science malfunction has been corruption of EPA's peer review process. Peer review for the EPA has become power review with insiders typically armed with millions of dollars in government funding acting to censor and exclude scientists who disagree with the reigning political agenda. That perverts the whole point of peer review, turning it into a tool used to shut out anyone who disagrees, instead of a process forcing scientists to defend their work against critics. The more widespread replication crisis is proof that this disease has affected most of the world's leading science journals and even its National Academies of Sciences. One scientific finding that has been suppressed by the corruption of peer review was just singled out by EPA in its call for comments, is evidence of non-linearity in the concentration response function for many pollutants. The entire regulatory model is precariously perched on an invalid assumption of linearity and the resulting scientific crisis

continuing to build must now be openly faced, removed and regulations based on such science malfunction, or even outright corruption, must be revised and repealed entirely. EPA's new policy of scientific integrity and transparency should be applied to computer climate models that currently prevail in EPA's funded published and cited climate science. The continued use of default models, not consideration of alternatives or model uncertainty create a false scientific justification for EPA actions, policies and regulatory burdens.

So, we applaud this new proposed rule and encourage the EPA to implement it rapidly.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 41a, Liz Hitchcock, and Speaker 42a, Benjamin Kirby, if you would come to the speakers' table.

MS. HITCHCOCK: Good afternoon, my name is Liz Hitchcock, and I direct Safer Chemicals Healthy Families. We lead a coalition of hundreds of local, state and national groups. This variety of

groups of labor, consumer, parents, educators, scientists, health care providers, health-affected and others shares the concern about the growing recognition of the links between our exposures to toxic chemicals and the increases in cancers and other chronic illnesses and in learning and developmental disabilities, and we share a commitment to reducing and eliminating exposures to toxic chemicals in our homes, our places of work, and the products that we use every day. I thank the Agency for responding to the large number of public comments that objected to the length of the initial comment period by extending it and for scheduling this hearing.

Safer Chemicals Healthy Families joins a long day of voices in opposition to this proposal. Many of our coalition partners and a number of respected scientists have offered strong cases for withdrawing the proposal already today and I thank those speakers for their comments and will try to keep my own comments brief.

The proposed rule is irreparably flawed and

misconceived. In the name of transparency it will prove needlessly burdensome, requiring unnecessary and costly procedures of EPA scientists that are counter to the Agency's longstanding application to base public health decisions on the best available science. Under this proposal without a guarantee of full public access, the study will be considered unreliable and will play no role in assessing a chemical's health effects on human health. This ignores the many ways in which the scientific community, regulators and the public have traditionally determined the quality and relevance of study results. It also disregards the way that hard-working EPA science professionals have taken seriously their charge to use the best available science in their decision-making. Safer Chemicals Healthy Families played a key role in the reform of the Toxic Substances Control Act which requires that EPA use the best available science in the review and management of toxic chemicals. As EPA begins to review the tens of thousands of chemicals already on the market we

are concerned that they be able to take into consideration all information that is reasonably available. For the fence line communities that have been harmed by their exposures to chemicals, for the families who have lost loved ones to asbestos-related diseases, for the firefighters exposed to a soup of toxics as they protect our communities, and to children who are born pre-polluted by a range of industrial chemicals, the stakes are high for these evaluations. EPA scientists working on risk and hazard assessments collect and review thousands of studies. Published reports of these studies typically do not include all the underlying data. This proposal would add the burdensome requirement in such cases that EPA contact the researcher, determine the nature and extent of the underlying data, and put in place a mechanism for the public to access the data. Many before me have called this proposal a solution in search of a problem, but it bears repeating. In proposing this rule EPA leaders have painted a stark picture of EPA

reliance on so-called secret science developed behind closed doors, but is this really so? EPA science assessments generally include an exhaustive and critical review of relevant studies and a full explanation of how they are being interpreted. Extensive information about each study is typically part of the public record, even if all underlying data may not be included. EPA assessments are normally subject to public comment and independent peer review and members of the regulatory community are free at any time to replicate studies they deem flawed or to independently seek access to underlying data and reanalyze them. In short, the so-called problem that the proposed rule seeks to fix is largely fiction.

In conclusion, EPA should withdraw this proposed rule. The public health stakes are just too high. Thank you.

MS. HUBBARD: Thank you.

MR. KIRBY: My name is Ben Kirby. I'm an environmental engineer with a doctorate and

master's degree in environmental engineering from Virginia Tech and George Mason University respectively. I'm representing Hall and Associates, and environmental consulting firm in Washington D.C. We support the application of this rule to EPA's environmental impact analyses, particularly TMDLs, or Total Maximum Daily Loads, and NPDES or National Pollutant and Discharge Elimination permits under the Clean Water Act. These legally binding permits include ethylene limits for wastewater treatment facilities for pollutants such as lead, mercury or phosphorus. Slight alterations in these permit limits can cost a single wastewater facility tens of millions of dollars, the cost of which is passed on to individual local rate bearers. These permit limits are supposed to be derived in a manner similar to dose-response relationships as mentioned in the rule where, for example, a lower level of the pollutant in the discharge will result in a measurable increase in receiving water quality working with health. However, we have

dealt with instances throughout the country where environmental agencies have based regulations on publically unavailable data, outdated science or faulty science, even in the face of data or studies which indicate stringent permit limits imposed by these agencies are not anticipated to result in any quantifiable environmental or human health benefit despite the cost. We hope that this rule would remedy these shortcomings. We also strongly support the use of independent expert peer reviews as an additional level of review for fiscal regulatory science. Our firm has been involved in independent peer reviews of various Clean Water Act related EPA regulations which have concluded that the technical basis for EPA's regulations and permit limits were scientifically indefensible. Had no peer reviews occurred, these regulations would have imposed hundreds of millions of dollars of wastewater treatment costs to rate bearers with no anticipated benefit. As a science-based Agency applying science-based statutes it is critical to

both receiving water quality and rate payers throughout the country that these permits and regulations are based on sound science and not speculation.

In this regard, we support application of EPA's proposed rule to Clean Water Act regulations.

Thank you for the opportunity to come.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker A, Dan Lipinski, you are now invited to speak at either the table or the podium.

MR. LIPINSKI: Good afternoon, I'm Congressman Dan Lipinski of the Third District of Illinois. I'm here to ask the EPA to rescind the proposed rule. The origins of the rule are in the 2014 House Bill called, the Secret Science Reform Act, which I voted against in that year and again in 2015, and when it was reintroduced as the Honest Act in 2017. The goal of these bills and of the proposed rule, contrary to its name, is to limit availability of science to inform regulatory decision-making. I'm disappointed to see the

Trump administration circumventing the will of Congress, attempting to administratively implement policies that cannot pass through the Legislature. On June 7th of this year, I joined 102 of my colleagues from both political parties in sending a letter to then Administrator Pruitt urging him to withdraw the proposed rule. My comments today build on that earlier commentary and expand on my opposition to this misguided policy.

EPA's admission, as it appears on the Agency website, is to protect public health and the environment and to ensure that national efforts to reduce environmental risks are based on the best available scientific information. The proposed rule works in direct opposition to that mission by requiring that the data underlying the scientific studies used in informed regulatory actions are available to the public. The proposed rule will exclude vast quantities of valuable research including that based on personal health data, confidential business information, and even older studies whose authors or data sets are no longer

available. In some cases, the rule will require the exclusion of the best available scientific information. To make matters worse, this rule would grant the administrator wide latitude to exclude studies from its provisions, enabling him or her to cherry pick studies in order to affect the outcome on the rulemaking process. There is no basis in any of the statutes under which EPA operates for giving an administrator such broad authority to choose which science is used in rulemaking.

Let me give an example of how the proposed rule could affect a future EPA rulemaking. EPA is planning to update its lead and copper rule in the near future the rule that limits the levels of these metals in drinking water. This update cannot come soon enough. We all know about the drinking water crisis in Flint, Michigan. Chicago and Washington D.C., as well as many other cities around the country, are finding troubling levels of lead in drinking water right now. Most of what we know about the health effects of lead exposure

comes from older studies of children with high levels of lead in their blood. Yet these studies may be excluded from consideration, both because their data are not publically available and because it would be unethical to replicate them. As a result, it is possible that an Agency could conclude that there is no evidence that lead is bad for you and, therefore, does not need to be updated. This would be a tremendous mistake. I have spent my career in Congress working to enable science-based decision-making in government. The proposed rule represents a significant step backward and I urge the Agency, in the strongest terms possible, to rescind it. Thank you.

MS. STOBERT: Speaker 43a, Mahealani Daniels. If you'd come to the speakers table.

MS. DANIELS: Good afternoon. My name is Mahealani Daniels and I'll spell that M-A-H-E-A-L-A-N-I, D-A-N-I-E-L-S. I would just like to thank you for allowing me the opportunity to share my comments in opposition to the EPA's new policy on so-called transparency. The EPA must utilize

the best available science to inform its actions in the creation of environmental and public health laws. Judicial precedents establish that the best available science is all existing scientist evidence relevant to the decision. In further supporting these precedents, the EPA's own regulations state that the best available science would be information that the EPA possesses or could reasonably generate, obtain or synthesize, whether or not that be information that is confidential business information that is protected from public discourse. While increasing transparency and ending an era of secrete science are two statements that publically resonate as appealing advances, when digging deeper it is clear that the EPA's implementation of these standards would do just the opposite and would actually violate judicial precedent as well as the Agency's own regulations. A majority of confidential health data can't be used with the EPA's new standards of transparency, thus limiting the scientific evidence they could use to inform

studies and standards. Since personal health data informs the production of environmental laws that protect public health, it's exceptionally important that the EPA continues to use it. For example, a recent study released by MIT demonstrates that 200,000 early deaths occur every year in the United States as a result of air pollution. Utilizing data on patients' health is not only necessary to establish the aforementioned research, but is also necessary when the EPA goes to set standards on environmental and pollution regulations that affect the lives and health of millions of Americans. I am hopeful that just as a majority of Americans are guided by their own personal values to abide by the laws established by our government, the EPA will too decide to function under judicial precedents and be guided by its principle to utilize the best available science. And with that, I thank you so much for your time.

MS. STOBERT: Thank you. I believe that was the last speaker for this session, so we will recess

now and resume the hearing at 4:00 p.m. Thank you.

[Off the record 3:26 p.m.]

[On the record 4:00 p.m., Evening session. Substitution of panel members.]

MR. RODAN: Okay, so welcome back at 4:00. Let us commence session three of this public hearing. Hello and thank you for coming. This public hearing is now in session. My name is Bruce Rodan and I am in EPA's Office of Research and Development. I will be one of the hearing officials of this two-hour period. Lou D'Amico, also from the Office of Research and Development will be joining me. We also have Nanishka, Lauren and Lesley from SC&A Incorporated helping with logistics.

The purpose of today's hearing is to accept public comments on the EPA proposed rule, "Strengthening Transparency in Regulatory Science." EPA is accepting comments on all aspects of the proposed regulation. This public hearing is a formal legal proceeding and the testimonies will become part of

the administrative record on which EPA will base its decision. Public notice of this hearing was published in the Federal Register on April 30, 2018 (83 FR 18768). EPA is proposing this rule under authority of 5 U.S. Code 301 in addition to the authorities listed in the proposed rule document dated April 30, 2018.

My role is to ensure that the EPA received your comments in an orderly fashion. Although EPA panel members may ask clarifying questions the intent of this hearing is to listen to your comments, not to discuss or debate the proposal.

Now for a few housekeeping items and ground rules. Please refrain from interrupting speakers or asking questions. Shouting and noisemaking or any disruptive conduct which prevents speakers or hearing officials from being heard are not permitted. Please listen quietly so that we can hear each testimony and to ensure that the court reporter is able to record comments accurately and listeners on the phone hear the oral testimonies.

For everyone's awareness, this hearing is open to

the press and we may have members of the media present with us today. This event is also open to any form of recording, video, audio and photos. We ask that you not cause any disruption to those testifying or observing the hearing. There was no formal lunch break scheduled. You may leave and return to the hearing. Please note that you will need to clear security again, so please be aware of time and the rain outside. If you'd like to make an oral comment in today's hearing and did not pre-register to speak, please see the hearing staff at the registration table positioned at the entrance of the room. If you would like to provide a written comment to the official record, you may hand submit it to the EPA staff today or mail, fax or email your comment. See staff at the registration table for instructions on how to submit written comments. There is a comment box at the registration table where you can leave hard copies of your oral testimony or written comments. All comments received will be included in the official docket. If you submit written comments

it is not necessary for you to give the same comments orally. Written comments and oral testimonies will receive equal consideration by EPA in preparing the final rulemaking decision. EPA has extended the comment period. Written comments must have been received on or before August 16, 2018. EPA will only consider comments related to the proposed rule, "Strengthening Transparency in Regulatory Science," so please refrain from making comments that are not related to this action. EPA will not provide responses during the hearing, rather EPA will prepare a written summary of the comments received that includes responses. The Response to Comments, RTC, document will be available at the time EPA issues its final decision. EPA will not make a final decision until all comments submitted during the public comment period have been considered. The hearing is being recorded by a court reporter who will be preparing a verbatim record of the hearing. Please speak clearly and slowly into the microphone so that the court reporter can record

your comments accurately. A copy of the transcript will be placed in the docket. The hearing is also being audio streamed through Adobe Connect and via phone lines.

The hearing is scheduled from 8:00 a.m. to 8:00 p.m., or one hour after the last registered speaker has spoken, whichever is earlier, and is divided into three sessions: 8:00 a.m. to 12:00 p.m., 12:00 p.m. to 4:00 p.m., and this session 4:00 p.m. to 8:00 p.m. Public restrooms are located down both sides of the hall and we have staff to escort you. Please note the location of the emergency exits.

Please take a moment to silence your cell phone (I've done that). Speakers should have been given a sticker upon check-in that lists your assigned session. If you plan to speak and have not received a sticker, please be sure to check in at the registration table. For the current 4:00 p.m. to 8:00 p.m. session, the speaker sticker collar is blue. Speakers will be called to the speakers' table located directly across from the EPA panel

members' table in pairs by their speaker number. When it is your turn to speak, please come up to the table and watch your step. State and slowly spell your name for the record, and if you are appearing on behalf of someone or an organization. If you are not in the room when it is your turn to speak I will recall you after all other speakers have made their oral comments. Each speaker will be allotted five minutes for remarks. Elected and appointed government officials may be provided additional time since they represent large groups of constituents. Speakers will be notified when their time has ended. Our timekeeping system or speaker timer consists of green, yellow and red lights. When you begin to speak, the green light will come on to indicate you have five minutes to speak. The yellow light indicates that you have one-minute left to speak. When the red light appears your five minutes are over. At that moment, if needed, I will politely interrupt you and ask you to wrap up your testimony. So, let's begin.

Speakers Numbers 1 and 2 in the afternoon session, please come forward and take a seat at the speakers' table. We will start with Speaker Number 1. Again, please speak directly into the microphone and state and spell your name for the record.

MR. SHIPPS: Thank you for this opportunity to provide public comments on EPA's proposed rule, "Strengthening Transparency in Regulatory Science." My name is Karl Shipps. That's spelled K-A-R-L, S-H-I-P-P-S. I live in New Carleton, Maryland, and I'm speaking as an individual. I am not employed by EPA or an EPA contractor, I am simply a very concerned person. I am a Navy submarine veteran, a grandfather, and have a master's degree in applied physics from the Johns Hopkins University. Because my time is limited I will confine my remarks today to three observations about the proposed rule and two recommendations.

My first observation is this: The proposed rule is based on a faulty premise, namely that only

studies whose underlying data are publically available sufficient to support replication should be considered by EPA as it develops regulations governing clean air, clean water and exposure to toxic substances and pesticides. The rule's premise, which was also the premise of the Secret Science Reform Act and the Honest Act, cannot stand. There are valid peer-reviewed studies that should be included in EPA's regulatory work even though their underlying data sets cannot be released to the public. Two of the most widely known are the Harvard School of Health's Six Cities Study, and the American Cancer Society's Cancer Prevention Study II. Those studies were revalidated by the Health Effects Institute in July of 2000 using an independent oversight board and a competitively selected analysis team. They remain valuable today. Since the proposed rule is based on a faulty premise, I recommend that it be withdrawn. A new rule addressing concerns about reproducibility and replicability should be developed in public with participation by the

scientific community, the environmental community and industry. The rule developers should avail themselves of the results of the ongoing reproducibility and replicability study being conducted by the National Academies of Sciences. That study will report in December 2018. Perhaps the EPA will not take my recommendation to withdraw the proposed rule. In that event, my second observation is germane. My second observation is that the EPA administrator is given extraordinary powers under Section 30.9 of the proposed rule for new EPA regulations or for regulations undergoing periodic update, the administrator could waive or not waive the provisions of the rule. This puts potentially thousands of studies underpinning EPA's regulations at risk of being discarded out of hand at the administrator's whim. The result would not be the best science and it would reduce public confidence in EPA rulemaking, not increase it. Based on that prospect, I recommend what the Texas Commission on Environmental Quality recommended,

namely to give governing authority for granting exceptions to the proposed data Transparency Rule, as well as the oversight of raw data collection, storage and access, to an external entity or entities to ensure independence and objectivity. You can see Docket comment EPA-HQ-OA-2018-0259-2426.

My final observation is that the scientific community was not consulted as the proposed rule was prepared. Even EPA's own Science Advisory Board was not consulted, learning about the rule only through press accounts and publication in the Federal Register. The joint statement on the EPA proposed rule and public availability of data in the 30 April edition of Science disagrees with the proposed rule. EPA should heed the concerns being voiced by the scientific community. Thank you for your attention.

MS. WHITE: Good afternoon. My name is Dr. White, W-H-I-T-E, on behalf of the American Chemistry Council's Formaldehyde Panel. I appreciate the opportunity to provide feedback on EPA's proposed

rulemaking. Utilization of transparent, objective and modern scientific approaches to draw conclusions regarding human health risks is critical to developing sound regulatory decisions. Throughout the EPA the application of scientific information to underpin regulatory activities has often been inconsistent and unclear, leading to concerns regarding how the Agency incorporates the best available science, evaluates the quality of that science, and applies 21st century knowledge concerning cause and effect. The panel has regularly met with EPA scientists related to the IRIS program regarding its subjective use of available science and resistance to moving away from default linear low-dose extrapolations, even when published scientific data support other modeling alternatives, including threshold-based approaches. This stance has often led to the generation of EPA values that are below natural background levels and not indicative of human health risks associated with real world exposures. Perhaps the most telling example can be found in

the case of formaldehyde, where a draft IRIS assessment sets values suggesting that human breath could pose a cancer risk. Formaldehyde has been the subject of scientific study for years and large bodies of evidence show that the levels of formaldehyde most people encounter on a daily basis do not cause adverse health effects, a conclusion reached by several international agencies using alternative models other than a default linear modeling approach. The evidence demonstrates the biological implausibility of any relationship between formaldehyde and leukemia, a threshold mode of action for any potential adverse health effects, and the importance of mode of action information for understanding potential impacts. We are encouraged by the Agency's proposed rule's recognition that there is growing empirical evidence of nonlinearity and that the use of default models without consideration of alternatives can obscure the scientific justification for EPA actions. This acknowledgement by EPA is especially relevant to

formaldehyde given the several decades of published literature illustrating preserved thresholds for both noncancerous and cancerous status.

In addition to the significant research and the development of a biologically-based dose response model for formaldehyde that also integrates the available science and provides results inconsistent with default linear dose response modeling approaches typically apply for carcinogenic end points. The importance of using nonlinear and biologically based dose response modeling, when the published data supports it, cannot be overstated. In this review of a 2010 draft IRIS formaldehyde assessment, the National Academy of Sciences noted the development of several models to evaluate the risks associated with formaldehyde exposure and recommended that alternatives to EPA's default linear low-dose extrapolation approach be considered.

In addition to incorporating modern scientific knowledge, we also recognize the importance of

adequate transparency in data access and ensuring regulatory decisions are based on high quality and reproducible data. For more than a decade, the panel has conducted scientific research engaged directly with EPA's IRIS program to understand the scientific information being relied on to draw conclusions regarding potential for health effects. The panel has experienced considerable difficulty in understanding what data is being relied on and how the Agency has ensured the highest quality and most relevant science is informing its decisions. Importantly, in multiple instances, sometimes after years of requests, once the underlying data was made available, it was found to have significant methodological and quality issues. In several cases, the findings, when reevaluated, did not support the original study's conclusions. The issues identified were not minor and highlight the need for greater transparency and for EPA to have a mechanism in place to evaluate the quality and reproducibility of the data being relied upon for decisions.

One notable example involved over six years of repeated requests to access all the relevant data from a National Cancer Institute study which was relied upon by the IRIS program to draw conclusions regarding formaldehyde and leukemia. The data were requested from NCI for the purpose of validating the author's conclusions and the evaluation of that underlying data found that changes reported by the study authors were not exposure dependent and they did not follow their own stated protocol. As demonstrated by formaldehyde example, when the data access is limited and modern scientific approaches aren't used to move away from default assumptions, the results can be conclusions that lack scientific rigor and potentially provide the public with an inaccurate picture about everyday chemicals which have been used safely for years.

I hope that you find these comments useful and I will provide a detailed set of comments by the August deadline.

MR. RODAN: Thank you. I believe we have another

speaker.
MS. HALL: Right, I don't have any details on that yet.
MR. RODAN: What?
MS. HALL: I don't have any details on who it is or -- standby. Speaker 3, Walter Tsou, please come up to the speakers' table.
MR. RODAN: Around the far side. Take care of the wire. I think you provided a copy at the front desk, we'll take it here. Watch out for the cord there, we don't want you falling over. Okay, so, we went through some long instructions. You have five minutes.
MR. TSOU: Okay. I'll be less. My name is Dr. Walter Tsou. I serve as Executive Director of Philadelphia Physicians for Social Responsibility and a past president of the American Public Health Association. Thank you for this opportunity to testify on "Strengthening Transparency in Regulatory Science". As many of my colleagues have noted today, while the goal of transparency in how studies are conducted, and the ability to

reproduce scientific results are important, it can offer a politically motivated administration a convenient excuse for eliminating or ignoring scientific studies that may go against the wishes of a powerful industry group. All one has to do is demand that the data sets be handed over for "further scrutiny" or demand that the study be repeated before basing a regulation on the study in question.

The very nature of longitudinal public health studies where health and toxins intersect are, by design, large, expensive and require years or sometimes decades before results are found. Sample sizes can often number in the tens of thousands to millions of data points and may need to be collected over many years before a statistically significant finding is identified. For example, Curry, et al studied in Pennsylvania babies who lived within 1 kilometer of active fracking wells. She had to review over 1.1 million birth records before demonstrating the relationship between living close to gas wells and low birth weight

babies. Because these studies are so big, they are often too expensive to repeat. In our state of Pennsylvania, scientific research on fracking is actively stymied or suppressed. In a state where billions are made on gas drilling, only one part time contractor at the Health Department collects data on health complaints from fracking. Those who do have health complaints have to sign non-disclosure agreements and not cooperate with any research in order to get lifesaving water to drink. This I consider extortion and this practice is common in the industry in order to suppress any health studies on the dangers of fracking. If the transparency regulation was in place, all health studies on fracking would be simply not considered because the research could not be conducted due to non-disclosure agreements.

Today there is no reputable scientist that doesn't believe in the harmful effects of smoking. The health studies on smoking were 15 years in the making before the Surgeon General released his landmark 1964 report and except for a handful of

EPA administrators, there is no reputable scientist who doesn't believe that climate change is real and is man-made. The studies on climate change and health have been known since Exxon wrote about it in 1977. If these transparency rules were in place when the EPA was founded, smoking would still be in airplanes and no one would have heard of "greenhouse gases" or "global warming", the greatest threat to our planet's existence.

Since the founding of the EPA, independent scientific research has been the foundational basis of your mission. Science is the cross before the corporate devil. This Transparency Rule would destroy the confidential nature of research and make the burden of conducting research more difficult and expensive. Finally, the real purpose of these rules is to reverse regulations on industries who have been harmful to public health. We should let science speak for itself and speak the truth and the EPA should hear from all scientific studies, not just the ones the industry

wants you to listen to. Thank you for your time.
MR. RODAN: Thank you very much. So, do we have any other registered speakers waiting? So we'll have a short recess and we have a one hour clock ticking. The time now is 4:22.
[Off the record 4:22 p.m.]
[On the record 4:40 p.m.]
MR. RODAN: We are hereby reconvening this public hearing. Come up to the -- go to the right there, there's some steps.
MS. HALL: Speaker Number 4, Mark Mitchell.
MR. BRUCE RODAN: Thank you, you'll have five minutes of time and you'll get a green light for the first four, an orange light and then a red light when the five minutes is up.
MR. MITCHELL: Okay, thank you. Thank you for this hearing. My name is Mark Mitchell. I'm a public health trained environmental health physician. I am testifying on behalf of the National Medical Association which represents the interests of more than 30,000 African-American physicians and our patients. We are a member

society of the Medical Society Consortium on Climate and Health.

I got into environmental health because I was concerned about the health effects of environment on public health. As a public health official, I saw that a lot of the diseases that are common, particularly those that are common in communities of color, are associated with the environment. We are opposed to the misnamed proposed new rule on "Strengthening Transparency in Regulatory Science." The proposed rule prohibits the Agency from setting regulations that are supported in part or in whole by data that is not publically available for reanalysis or that cannot be replicated. This rule, if enacted would limit the consideration of perfectly good science in the EPA regulatory process. What's more, it's retroactive so the current regulations that are based on previous studies that can no longer be replicated for ethical or other reasons, could then be voided. As physicians, we are particularly concerned about our legal and ethical obligation

to protect patient privacy under the Health Insurance Portability and Accountability Act of 1996, otherwise known as HIPAA. We believe that patient health data should be considered in EPA regulations because it's necessary to consider the health effects of environmental exposures in order to protect human health, and that we should also be able to guarantee patient privacy that should be protected.

Currently, we do this in research publications through the peer review process. The peer review process has worked well to ensure an adequate level of transparency while allowing science to advance unencumbered. We do not need to reduce the health protection that environmental regulations provide in the name of so-called "transparency." Thank you for this opportunity to testify.

MR. RODAN: Thank you. So, we'll go into another short recess, or maybe an hour, at 4:44. Thank you.

[Off the record 4:44 p.m.]

[Off the record 5:44 p.m.]

MR. RODAN: It's 5:44. I'll read the closing statement. Thank you for taking the time today to share your comments on the EPA proposed rule. The time is now 5:45 p.m. No additional members of the public have registered or are waiting to speak. Therefore, this hearing is now officially closed. Thank you.

[Off the record 5:45 p.m.]

Whereupon, the above-entitled matter is concluded.

CERTIFICATE OF SHORTHAND REPORTER - NOTARY PUBLIC

I, NaCorey Nichols, the officer before whom the foregoing deposition was taken, do hereby certify that the foregoing transcript is a true and correct record of the testimony given; that the witness was duly sworn by me; that said testimony was taken by me electronically and thereafter reduced to typewriting under my direction; and that I am neither counsel for, related to, nor employed by any of the parties to this case, and have no interest, financial or otherwise, in its outcome.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my notarial seal this 30th day of July, 2018.

My commission expires:

October 14, 2021

NOTARY PUBLIC IN AND FOR THE DISTRICT OF COLUMBIA

CERTIFICATE OF SHORTHAND REPORTER - NOTARY PUBLIC

I, Gary Euell, the officer before whom the foregoing deposition was taken, do hereby certify that the foregoing transcript is a true and correct record of the testimony given; that the witness was duly sworn by me; that said testimony was taken by me electronically and thereafter reduced to typewriting under my direction; and that I am neither counsel for, related to, nor employed by any of the parties to this case, and have no interest, financial or otherwise, in its outcome.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my notarial seal this 30th day of July, 2018.

Ms. LESLEY STOBERT, SC&A INC.

P R O C E E D I N G S

MS. ORME-ZAVALETA: So I want to say hello, and I want to thank you all for coming. We are now calling this public hearing into session. My name is Jennifer Orme-Zevaleta, and I'm with EPA's Office of Research and Development, and I'll be one of the hearing officials today.

Kevin Teichman is also with me from the Office of Research and Development, and we also have some contract staff, Nanishka , Lauren, and Lesley from SC&A Incorporated, who will be helping with the logistics.

The purpose of today's hearing is to accept public comments on EPA's proposed rule, "Strengthening the Transparency in Regulatory Science."

EPA is accepting comments on all aspects of the proposed regulation. This public hearing is a formal legal proceeding, and the testimonies will become part of the administrative record on which EPA will base its decision.

Public notice of this hearing was

published in the Federal Register on April 30, 2018 (83 FR 18768), and EPA is proposing this rule under the authority of 5 U.S.C 301, in addition to the authorities that were listed in the proposed rule document dated April 30th of 2018.

So my role today is to ensure that EPA receives your comments in an orderly fashion, and then -- although EPA panel members here may ask clarifying questions, the intent of this hearing is to hear from you and to listen to your comments and not to discuss or debate the proposal.

So now, for a few housekeeping and ground rules. Please refrain from interrupting speakers or asking questions, shouting, noise making, or any disruptive conduct which prevents speakers or hearing officials from being heard are not permitted. Please listen quietly so that we can hear each testimony and to ensure that the court reporter is able to record comments accurately, and listeners on the phone can hear the oral testimonies.

For everyone's awareness, the hearing is

open to the press and we may have members of the media present with us today. This event is also open to any form of recording, video, audio, and photos. We ask that you not cause any disruption to those who are testifying or observing the hearing.

There is no formal lunch break, so you may leave for lunch and return to the hearing, but just be advised that you'll need to clear security again if you do that.

If you would like to make an oral comment on today's hearing and did not preregister to speak, please see the hearing staff just outside here at the door at the registration table, and they'll be able to sign you up.

If you would like to provide written comments to the official record, you may hand-submit it to EPA staff today, or mail it, fax it, or e-mail it, your comment. So see the staff at the registration table for instructions on how to submit written comments.

There is a comment box at the

registration table where you can leave hard copies of your oral testimony, or written copies. All comments received will be included in the official docket.

If you submit written comments, it is not necessary for you to give the same comments orally. Written comments and oral testimonies will receive equal consideration by EPA in preparing the final rulemaking decision.

EPA has extended the comment period and written comments must now be received on or before August 16th of 2018. So EPA will only consider comments related to the proposed rule, "Strengthening Transparency in Regulatory Science," so please refrain from making any other comments that are not related to this action.

EPA will not provide responses during the hearing, rather EPA will prepare a written summary of comments received that include responses. The Response to Comments document will be available at the time EPA issues its final decision. EPA will not make a final decision until all comments

submitted during the public comment period have been considered.

The hearing is being recorded by a court reporter who will be preparing a verbatim record of this hearing, so please speak clearly and slowly into the microphone so that the court reporter can record your comments accurately. A copy of the transcript will be placed in the docket. And this hearing is also being audio streamed through Adobe Connect and via phone lines.

The hearing is scheduled from 8:00 a.m. to 8:00 p.m., or one hour after the last registered speaker has spoken, whichever is earlier. And it's divided into three sessions. 8:00 a.m. to 12:00 p.m., 12:00 to 4:00, and 4:00 to 8:00.

Public restrooms are located on both sides down the hall, men's to the left, women's to the right, and we will have staff escort you so that you're able to get through the security point and be able to come back. And please note the

location of emergency exits, primarily as you come in and you know, out where you entered this morning will be the main emergency exit for you.

So please take a moment to silence your cell phones. Speakers should have been given a sticker on entry that lists your assigned session, and if you plan to speak and have not received a sticker, please go back to the registration table so they can give you one.

For this session, the 8:00 a.m. to 12:00 p.m. session, the speaker sticker color is neon green so we can see you. Speakers will be called to the speaker's table, which is located right across from us, and will be coming up in pairs to that speaker's table. When it's your turn to speak, please come up to the table. Watch your step as you come up the steps over there, and state and spell your name slowly so that we can have that for the record. And if you are appearing on behalf of someone else or some organization, be sure to clear that -- make that clear as well. If you are not in the room when

it's your turn to speak, I will call you after all other speakers have made their oral arguments.

Each speaker is allotted five minutes for remarks, elected and appointed government officials may be provided additional time since they are representing large groups of constituents. Speakers will be notified when their time is ended. We have a time keeping system just over here. It runs by the yellow -- green, yellow, and red-light system. So when you begin to speak the green light will come on and you have five minutes. When you have one-minute left to speak you'll see a yellow light. And then when the red light appears, your time is up. At that moment I will ask you to wrap up your comments so that we can make room for the next speaker to come forward.

Speakers Numbers 1 and 2, if you could go ahead and please come on up and take your seat at the speaker's table. We will start with Speaker Number 1. And again, if I could ask you to please speak directly into the microphone and state and

spell your name for the record.

And if I could ask, Speakers 3 and 4, if you could just stand at the steps so that you'll be ready, and we'll be able to keep this moving. So, Speaker Number 1.

MR. STEICHEN: Good morning. My name is Ted Steichen, and it's S-T-E-I-C-H-E-N, and I am representing the American Petroleum Industry.

API is the only national trade association -- boy, it's not very bright here. Sorry. The American Petroleum Institute is the only national trade association with all facets of the oil and natural gas industry which supports 10.3 million U.S. speakers (sic).

Sorry. I'm having a little trouble this morning.

All right. So, supports 10.3 million U.S. jobs and nearly 8 percent of the U.S. economy. Our 620 corporate members from large integrative oil companies to small independent companies comprise all segments of the industry. API members are producers, refiners, suppliers,

retailers, pipe line operators, and marine transporters as well as service supply companies supporting most of the national energy.

The members of API are dedicated to continuous improvement in compatibility with their operations with the environment, while environmentally, economically developing energy resources, supplying high-quality products and services to consumers.

Our members recognize the responsibility to work with the public, the government, and others to develop and use natural resources in an environmentally sound manner that protects the health and safety of employees and the public.

API supports the use of sound science for a critical component of public policy, to the extent possible and consistent with the protections of other compelling interests, such as privacy, trade secrets, intellectual property, and other confidentiality protections, data and analysis used in establishing or evaluating environmental health, welfare and economic impacts

should be transparent and reproducible and available as early as possible in the rulemaking process.

Transparency and reproducibility should be able to underly -- also be underlying data and information such as environmental and economic impact data and models that are utilized in protecting and predicting the costs, benefits, market impacts, and environmental effects of specific regulations.

API members are aware that there are obstacles to full transparency and reproducibility, and are committed to working with other stakeholders in developing practices and maximize science transparency while preserving existing confidential strictures.

The EPA -- as the EPA goes forward with this rulemaking, API recommends the following principles be followed. Openness to science and related findings underpinning the laws, regulations, standards, and guidance documents. Reproducibility of research and associated

findings, including fully annotated data, methodologies, model inputs, code and other critical information that support the conclusions of research. All of these should be available to the public.

The inclusion of clear requirements to ensure that the data underline the decision-making are publicly available in a manner sufficient for independent validation as much as practicable. Privacy concerns are important, but advances in encryption technology and blinding of data may make it possible to enhance transparency while ensure privacy as necessary to comply with the law.

Protection for confidential business information used in the regulatory process and supporting actions should also be taken into account, explicitly addressing and highlighting uncertainties in data, models, and analysis when utilizing those studies in decision-making. Broad application of these principles to inform the use of policy for setting scientific, economic, and

environment impact requirements and models that are designed to protect health and environment, engaging stakeholders as early as possible in the decision-making process to ensure application of data transparency principles for studies to be included, and to address how those studies have not been reproduced or are not reproducible will be considered in the process, application of these principles as early as possible in the pre-rule making stage, as technical support documents are prepared.

In closing, as described above, API supports the use of sound transparent science and public policy making, and we plan to submit written comments to the docket.

MS. ORME-ZAVALETA: Thank you.

MS. FELD: Good morning. My name is Jodi Feld, J-O-D-I F-E-L-D, and I'm the Chief Scientist in the New York City office of the New York State Attorney General's Environmental Protection Bureau.

On behalf of New York Attorney General,

Barbara Underwood, I thank you for the opportunity to speak before you today. The Office strongly opposes EPA's proposed rule to limit the use of science in agency rulemakings. The proposed rule was developed without any input from the scientific community and has been widely criticized by the scientific and public health communities. It is vague, poorly reasoned, and violates fundamental legal requirements for a valid rulemaking.

Most importantly, while the proposed rule has the stated purpose of strengthening the foundation of EPA's regulatory actions, it would have the opposite effect. It would exclude relevant probative scientific studies, models, and other information from EPA decision-making that have been validated by peer review, simply because the underlying data are not available to the public. The proposed rule broadly and squarely conflicts with core EPA statutory duties. It violates the very federal laws that EPA is required to uphold by limiting EPA's access to the

most current, best available, and generally accepted science that these laws mandate be used by EPA in developing new rules and standards. Quite simply, it is bad science.

It departs abruptly from the best practices of the scientific community and disregards both well-established reasons why public sharing of all study data is not possible or necessary, and why studies relying on such data demand consideration in agency decision-making.

The result of the proposed rule would be to profoundly weaken EPA's science-based regulatory decision-making, and ultimately its protection of public health in the environment in New York and elsewhere across the nation. We urge EPA to abandon this damaging and misguided effort. It appears that the proposed rule was developed with a total absence of independent scientific input. The proposal offers no rationale for the premise that only studies for which the underlying data are publicly available can be used for decision-making, nor any evidence that EPA's

current approach to selecting studies for decision-making is resulting in scientifically unsound decision-making, or is somehow overly protective of public health and the environment. Hence, at its core, the proposed rule is a solution in search of a problem.

Requiring that study data be publicly available as a prerequisite to its consideration by EPA would be an abrupt and unprecedented break from well-established best practices of the scientific community. The scientific community recognizes what the proposed rule ignores, that there are often very good reasons why some research data simply cannot be fully available to the public, such as the protection of personal privacy and confidentiality.

Within the scientific community the validity of research is judged on multiple grounds, including how well studies are designed, how clearly data are collected, how carefully analysis are performed and described, and how thoroughly findings of related studies are cited.

In other words, within the scientific community studies are validated through rigorous expert peer review. They are not summarily judged and valid and discarded simply because all underlying data cannot be fully shared.

Perhaps the strongest indicator that the proposed rule is flawed as a matter of science is the overwhelmingly negative reception it has received from the scientific community. We are not aware of a single major independent scientific organization that has expressed support for the proposed rule, while many have urged EPA to stop and reconsider the proposal.

Contrary to EPA's position, the proposed rule would certainly hurt states. EPA standards and regulations are a fundamental important to states and actions that affect these standards and regulations directly affect us. In fact, many states, environmental laws, and regulations explicitly adopt EPA standards. By undermining the basis of EPA standards and regulations, the proposed rule would likely have direct damaging

impacts on New York and other states' abilities to protect the health and environment of their residents. These impacts will be felt most historically by our most vulnerable populations, the young, the elderly, and the sick, and those living in communities that have borne a disproportionate share of environmental hazards, including communities of color and low-income communities.

From a legal perspective, the proposed rule fails to meet the most fundamental requirements for a valid rulemaking. It is exceedingly vague, creating many more questions than it answers. For example, exactly how, when, and to what the rule will be applied is entirely unclear. And critical information such as its actual cost is entirely missing.

In May, the New York Attorney General, joined by seven other attorneys general, wrote to then, Administrator Pruitt, expressing strong opposition to the proposed rule and calling for it to be withdrawn. Today, the State of New York

renews our call to Acting Administrator Wheeler to withdraw the proposed rule.

I thank you for your time and for providing me with an opportunity to speak on this important matter.

MS. LAUREN HALL: Thank you. If we could have Speakers 3 and 4 come to the table, and then 5 and 6 on-deck?

MR. SUSSMAN: Good morning. My name is Bob Sussman, and I am a former EPA official in the Clinton and Obama --

MS. HALL: Could you bring your microphone --

MR. SUSSMAN: -- administrations --

MS. HALL: Yes, thank you.

MR. SUSSMAN: -- and now a consultant and an attorney.

I'm here today representing Safer Chemicals, Healthy Families, which leads a coalition of 450 organizations and businesses united by a common concern about toxic chemicals in our homes, places of work, and products we use

every day.

I believe that the EPA proposal we are discussing today is flawed and misconceived. In the name of transparency, it will burden EPA scientists with unnecessary and costly procedures that run counter to the Agency's long-standing obligation to base public health decisions on the best available science.

The premise of the proposal is that unless EPA can guarantee full public access to a study's underlying data, the study must be deemed unreliable and should play no role in assessing a pollutant or chemical's effects on public health. This premise ignores the many ways in which the scientific community, regulators, and the public have traditionally determined the quality and relevance of scientific evidence.

Study reports typically explain the protocols use to gather data, the methods used for data analysis, the doses or exposure concentrations at which effects were and were not observed, the nature, severity, and incidence of

such effects, and any unusual occurrences that may affect interpretation of the results.

This information plays an important role in the peer review process, informing the judgment of independent reviewers as to whether a study is worthy of publication in the scientific literature. Agency reviewers likewise consider these indicators of reliability in deciding how much weight a study deserves in making judgments about hazard and risk.

In principle, no one disputes the benefits of improving access to underlying data. The goals of open science have received support from several organizations in leading scientific journals and research institutions. These voluntary efforts, however, do not justify the unprecedented step of requiring EPA to guarantee access to the underlying data for every study it may use for decision-making, and to forfeit the ability to consider a study if this requirement has not been met.

EPA scientists working on risk and hazard

assessments collect and review thousands of studies. Published reports of these studies typically do not include all underlying data. In such cases, EPA would need to contact the researcher, ascertain the nature and extent of underlying data, and put in place a mechanism for the public to access the data.

Even with diligent efforts by EPA, there are many reasons why disclosure of data sufficient to replicate a study may be impossible. The EPA proposal duly notes these obstacles to study replication and provides that exemptions may be granted on a case-by-case basis. But an exemption process will add to the considerable cost and effort required to implement the proposed rule and will undoubtedly result in disputes and even litigation over whether exemptions are justified. Is the damage it will inflict on the quality and timeliness of EPA scientists justified by the benefits of the proposed rule?

EPA leaders have painted a bleak picture of EPA reliance on quote, "secret science"

developed behind, quote, "closed doors," based on data that has, quote, "been withheld from the American people."

This is not the reality that I experienced in my several years at EPA. I saw a very different reality. I saw EPA science assessments providing an exhaustive and critical review of relevant studies, and a full explanation of how they're being interpreted. I saw extensive information about each study being placed in the public record. I saw public comment and peer review of all EPA assessments. And of course, as part of public comment, members of the regulatory community had an opportunity at any time to replicate studies they deemed flawed.

In short, the problem that the proposed rule seeks to fix is imaginary. In conclusion, the Agency's leadership needs to fundamentally rethink the proposed rule. The stakes for EPA science and the protection of public health are simply too high to finalize a proposal which is deeply problematic and unnecessary. Thank you.

MS. ORME-ZAVALETA: Thank you.

DR. ROSENBERG: Good morning. I am Dr. Andrew Rosenberg, R-O-S-E-N-B-E-R-G. I'm the Director of the Center for Science and Democracy at the Union of Concerned Scientists. And we advocate for the role of science and public policy.

I'm here today to ask that you rescind this proposed rule because it would only restrict EPA's ability to use the best available science to fulfill its mission of protecting public health and the environment, while doing nothing to improve transparency and decision-making.

First and foremost, the proposal is fatally flawed because it provides almost no justification of analysis of the impacts of the proposed change in policy. There is no cost-benefit analysis of the rule with respect to the agency, and external researches, nor how it would affect EPA's mission and critical work.

Additionally, the proposal would affect -- effectively prevent the EPA from using many

kinds of scientific studies vital to its decision-making. This includes, but it is not limited to studies that rely on personal health data, confidential business information, intellectual property, or older studies where authors and data sources may not be accessible.

Without the ability to use this scientific information EPA would be unable to meet its mission and statutory obligations. This proposal would make it significantly harder for EPA to use the best available science to protect the public, including from harmful emissions of hazardous air pollutants, particulate matter and ozone, exposure to dangerous chemicals and commerce, drinking water contaminated with toxic chemicals, such as PFAS or lead.

Further, CBO has calculated that such restrictions would substantially increase costs and burdens to an agency that is already experiencing budget cuts, reorganizations and understaffing, thus undermining the ability of EPA to make decisions based on science.

The proposed rule could also prevent the Agency from addressing the impacts of dangerous chemicals at low concentrations where direct measurements are very difficult. This would have the effect of leaving Americans unprotected, even when there was clear indication of harm to human health.

I have over 30 years of experience in government service, academia, and non-profit leadership. I've offered -- authored or reviewed hundreds of peer-reviewed scientific papers. As part of my government service I worked as a scientist and in a policy position at a regulatory agency, and universities as a faculty member and dean. I understand how agencies use science in policy making, how research at universities is conducted, and how these entities incorporate best practices of transparency into their scientific work. As a frequent peer reviewer, I do not review the raw data for studies, since that would tell me little. I review the research questions, the methods that summarize data, the results and

conclusions in order to assess the quality of the work. EPA's proposed rule would do nothing to improve transparency for scientists, policy makers, or the public.

Crafting the rule without consulting with the scientific community is a fatal error for this proposal. Even the Agency's own Science Advisory Board has noted the need to consult with scientists in any further development of this proposal.

A further fatal flaw is that the proposed rule would replace scientific evidence with political judgment. The rule would grant the EPA administrator broad authority to exclude individual studies or entire decisions from being subject to its provisions. Decisions on which science is to rely on should be made by the Agency's scientific experts based on established criteria for best available science.

Five minutes is not enough time to cover all the problems with this proposal. At best, this proposed rule is a misguided attempt at

transparency. At worst, it is a back-door attempt to prevent EPA from protecting public health. UCS supports real transparency reforms. We support scientific integrity policies that prevent political interference in scientific analysis and reporting. We do not believe researchers should be put in the absurd position of choosing between protecting study participant privacy or informing the EPA's effort to protect public health and safety.

On behalf of the Union of Concerned Scientists, and I have 500,000 supporters, I urge the EPA not to move forward with this rulemaking and to continue to allow agency scientists and policy analysts to use the best science available to inform their work. Thank you very much.

MS. HALL: Thank you. Would Paul Tonko and Suzanne Bonamici please approach the speaker's table. Speakers A and B, respectively. And Speakers 5, Daniel Greenbaum, and 6, Jennifer McPartland, please take your seats at the on-deck circle.

MR. TONKO: Good morning.

MS. ORME-ZAVALETA: Good morning.

MR. TONKO: Can I begin? Okay. Thank you. Good morning and thank you for the opportunity to address the panel.

I am Congressman Paul Tonko. I represent the 20th Congressional District of New York State, more specifically the Capital Region and Mohawk Valley, an area rich in environmental stewardship.

As the Energy and Commerce, Environment Subcommittee ranking member, I have come here today to express grave concerns about the Environment Protection Agency's proposed rule published on April 30th of 2018, entitled "Strengthening Transparency in Regulatory Science."

This proposal would severely limit the types of research that EPA could take into account when developing policies. It has been cloaked in arguments about transparency. But let's all admit here that this emperor has no clothes. This has nothing to do with transparency. It is a thinly

veiled campaign to limit serious and highly credible scientific research that supports critical regulatory action.

This administration has used this bad faith argument about transparency to say that the many studies, including many epidemiological studies that rely on private, personal, medical data should be excluded entirely from EPA rulemaking. Why would a science-driver public agency undertake such a radical departure from existing and widely accepted scientific standards? I have yet to hear a credible answer to this question that is not rooted in favors to industry polluters.

The current political leadership at EPA has shown a pattern of bad faith in pushing policies that undermine this Agency's -- EPA's mission, and the public trust.

Today's proposal and its false claims about transparency are consistent with that pattern; a fact that was put on full display when the administration realized its broad approach

would hurt regulated industries too, since many EPA chemical reviews rely upon confidential business information. To get around this, the rule would give the EPA administrator complete discretion to exempt studies, especially or essentially guaranteeing that political interests will always matter more than science. That's why I refer to this policy as selective science.

This proposed rule would be used to erode landmark achievements in public health and environmental safety. For example, we know the Clean Power Plan would have led to reductions in pollution that were predicted to prevent some 3,600 premature deaths, 19,000 asthma attacks in children, and 300,000 missed school and work days each year. Many of these health benefits were partially determined by landmark clean air studies like the Harvard Six Cities Study.

Opponents of Clean Air Act protections would like nothing more than to see such landmark public health findings excluded from EPA reviews. I'm not here speaking alone. Nearly 1,000

scientists in many leading scientific organizations are united in vocally opposing this policy. Countless everyday Americans stand with us too, with many more listening in and watching for news to see if anyone in a position to do something about this will finally admit the obvious; this is not about transparency. This is not about protecting human health or our environment. This emperor, again, has no clothes.

This rule would limit the scientific research available to EPA policy makers as they draft public protections and environmental guidelines. I implore EPA to put science and public interest ahead of political and special interests, and withdraw this rule, ill-conceived, that's based on -- its negative impacts on science and public health. A very discouraging and concerning proposal. And I just felt compelled to come here today and vehemently speak against it.

MS. ORME-ZAVALETA: Thank you, sir.

MS. BONAMICI: Thank you. Good morning.

MS. ORME-ZAVALETA: Good morning.

MS. BONAMICI: And thank you to Acting Administrator Wheeler and Director Sinks. I am Suzanne Bonamici. I represent the First Congressional District of the State of Oregon. I serve on the House Committee on Science, Space, and Technology, where I am the ranking Democrat on the Subcommittee on Environment. I appreciate the opportunity to testify before you today.

I am opposed to the Environmental Protection Agency's proposed rule titled, "Strengthening Transparency in Regulatory Science." The proposed rule would impede, if not eradicate the EPA's ability to protect Americans from significant risks to human health and to the environment by limiting the scope of research that the EPA could consider in making decisions.

The proposed rule perpetuates the incorrect notion that the science the EPA relies on is somehow hidden. It is not. This misconception is based on conflating the meaning of secret and confidential. None of the information used by the EPA is secret. Some of

the information may be confidential if, for example, it includes the personal health information of individuals who participated in a study.

As a cornerstone of its regulatory process, the EPA relies on peer-reviewed science. The EPA already publicly discloses studies that support regulatory action. The proposed rule simply attempts to block access to good science. Much of the science that is used to inform regulatory actions is developed outside of the agency. Scientific studies often include personal information and other confidential data. Because this data is legally protected from disclosure, the EPA would be forced to ignore valuable information discovered during their research, because it contains confidential information. This would have chilling consequences for the EPA and for every person who benefits from clean air and clean water.

It is also deeply troubling that the proposed rule is inconsistent with the Agency's

statutory obligation to use the best available science as required in the Toxic Substances Control Act, Safe Drinking Water Act, and Clean Water Act. The proposed rule would preclude the use of a range of scientific research that has long been used to safeguard the public.

There is also tremendous uncertainty whether the proposed rule would retroactively apply to existing standards and regulations. Retroactive application would severely undermine existing public health and environmental protections that keep the public safe and healthy.

Transparency is a laudable goal, and it could be accomplished through collaboration with, and input from the scientific community. It is noteworthy that thousands of scientists and many leading scientific originations also propose this proposed rule. If the proposed rule is implemented it is possible, or even likely, that scientists, organizations, and research institutions will be less inclined to participate in EPA funded research because of the risk of

improperly disclosing personal information. It may also be more challenging for researchers to recruit participants for their studies because of the fear that personal data could be shared.

Over the last few years, the House Committee on Science, Space, and Technology has considered several iterations of legislation that have many similarities to the proposed rule. I have been a vocal opponent of these bills for the reasons I just stated.

I also want to note that despite repeated efforts by the majority, the so-called secret science legislation has not passed both chambers. Congress has the sole constitutional authority to legislate, and this proposed rule is an administrative attempt to circumvent the legislative process. I strongly urge you to withdraw this proposed rule. It will undermine scientific integrity, jeopardize bedrock public health and environmental standards, and endanger the EPA's ability to protect the American people, which is its mission.

Thank you for the consideration of my testimony.

MS. ORME-ZAVALETA: Thank you both for coming.

MR. TONKO: Our pleasure.

MS. HALL: Would Daniel Greenbaum, Speaker Number 5 and Speaker Number 6, Jennifer McPartland, please approach the speaker's table. And would Speaker Number 7, David Michaels and Speaker Number 8, Paul Billings, please take a seat in the on-deck circle.

MR. GREENBAUM: Let there be light. And there was light.

My name is Daniel Greenbaum. That's green, like the color, B-A-U-M. I'm the President of the Health Effects Institute, and I'm very pleased on behalf of the Health Effects Institute to provide these brief oral comments today. We are preparing and will submit much more detailed written comments.

As many in this audience know, HEI has a longstanding commitment to the principles being --

attempting to be addressed by this proposal, producing science of the highest integrity and quality with special attention to issues of reproducibility and transparency.

This includes rigorous research and statistical design, subject to competition, continuous oversight, data quality assurance audits, and more, extensive efforts that test all findings against a wide range of different statistical techniques and assumptions, intensive and independent peer review with all results published, and an active data access policy which for nearly 20 years has been working to ensure access to underlying data for all HEI funded studies.

In our view, reproducibility is a critical challenge for science. Can the results of an important study be reproduced? However, in our view the most effective way to test reproducibility and the validity of science is not necessarily to simply reproduce the same results in the same data sets. Rather it is most

important to answer the question, "Are the results consistent when tested in other independent studies?" For example, studies that use new and different data sets not affiliated with the original studies. Studies that have different investigators applying the same and/or alternative statistical techniques. And studies that test the sensitivity of the results against a wide range of possible other explanations like smoking or socioeconomic status.

In a limited number of cases where there are not comparable studies, it may be useful to gain access to the original study data and analytic codes to allow for independent evaluation. Can the original results be replicated, and are they robust to a wide range of alternative assumptions, models, and potential confounders? This is, of course, exactly what the Health Effects Institute did when we conduced an independent rigorous reanalysis of the Harvard Six Cities and American Cancer Society studies. And I've attached and will submit the summary

description of that reanalysis from HEI's final report.

This approach can and did provide comprehensive assurance of the quality, integrity, and validity of the original results. However, this is a highly cost-intensive and time-consuming endeavor, which should only be applied in cases where there are only one or just a few studies in a particular arena.

HEI also agrees with the continued need to enhance transparency and data access, but would note that these issues are not new. We've had our own data access policy for over 20 years, and have been -- and they've been addressed now for over 15 yeas by administrations from both parties, and by the scientific community. This is -- it included guidelines for the Information Quality Act adopted by OIRA in 2002, numerous actions by the scientific community and journals to enhance access, and most recently the requirements for enhanced data access across the federal government promulgated by OSTP in February 2013.

We would strongly urge EPA to review the progress already made under these several major initiatives and to carefully consider whether or not there are additional efforts that could further enhance transparency and to do so before proceeding with a final ruling.

Finally, access to private medical information is essential to conducting high quality and reproducible air quality and health research. There are of course longstanding federal rules for protecting the privacy of individual medical information of the subjects of studies. And gaining access to data from older studies may be difficult, but given the privacy commitments that were made to study subjects in the past.

However, there are today, several means to make such data available to investigators with appropriate privacy protections. Medicare makes it available, federal research data centers make it available, and many investigators already have been taking advantage of these.

Although it is possible, as some have suggested, to create a depersonalized data set by stripping all personal identifiers, such as address, date of birth, et cetera, it's not possible to conduct a high-quality air pollution and health study without knowing the location of those being studied. I.e., Where do they live and what are the sources and levels of their air pollution exposure? So it can't be simply put on a disk and handed out.

Thank you for this opportunity to testify. We look forward to submitting our detailed written comments, and would welcome the opportunity to further assist EPA in these efforts to ensure that the widest array of science is available for decisions.

MS. ORME-ZAVALETA: Thank you.

MS. McPARTLAND: Good morning. My name is Jennifer McPartland, M-C-P-A-R-T-L-A-N-D, and I'm a Senior Scientist at Environment Defense Fund.

EPA's proposed rule represents a

disregard for the Agency's core mission, protection of human health and the environment. Under the guise of transparency, EPA's proposal handcuffs the Agency's use of best available science in violation of many of its statutes. If finalized, the rule will erode critical public health protections, and with them, the scientific integrity and public trust of the agency.

EPA's censored science proposal would prohibit EPA's use of critical scientific studies in developing regulatory requirements unless all the data underlying the studies have been made public. As the authors of this proposal know well, this unnecessary and unworkable standard would effectively bar the Agency from using high-quality scientific research in studying public health safeguards.

The data underlying many scientific studies are not publicly available and cannot be made publicly available. For example, research involving human subjects often rely on medical or other personal information; information that

researchers cannot make public.

Additionally, advances in data science have made it increasingly more challenging to effectively deidentify study subjects and protect their privacy. In other instances, studies may have been published decades ago and the underlying data are no longer available. It is exactly these types of studies that EPA and other authorities use to protect people from harmful environmental exposures like lead, formaldehyde, methylene chloride, benzyne, arsenic, and perchlorate, just to name a few. It is the science generated by our most prestigious scientific institutions. It is the knowledge we rely on to ensure our water is safe to drink, our air is safe to breath, and our land is safe for our children to play.

Beyond jeopardizing critical public health protections, the proposed rule completely disregards established effectiveness mechanisms used to vet scientific research including peer-review, data sharing agreements, and consensus in findings across multiple studies. Indeed, EPA

provides no explanation or justification, showing that this proposal would improve upon these established mechanisms.

The proposed rule also raises several troubling concepts that are contrary to scientific best practices and chemical assessment, as discussed extensively in the Seminole National Academy's report, *Science and Decisions*.

Specifically, the proposed rule ignores the report's conclusions that thresholds of effect for chemical exposures are the exception rather than the rule, given by a logical and exposure variability across the population. The rule also seeks to demote the use of health protective defaults and risk assessment, again at odds with the recommendations of the National Academies.

Additionally, the proposal gives more value to studies in employ of a variety of dose response models, an approach that can be misleading. Multiple bad analysis does not make a study more credible.

More broadly, the proposed rule seeks to

codify scientific practices and irregulation. It is a consistently frowned upon approach given the continuously evolving nature of science. EPA's development of the proposal also represents a total disregard for process. The Agency sidestepped review by its external Scientific Advisory Board, which has now voiced serious concerns about the proposal and has recommended that it undergo full SAB review before possible finalization.

The White House OMB review of the proposal was also quite dubious, involving a revision to the original date its review had been completed to seemingly align with the fact that former Administrator Pruitt had signed the proposed rule a day prior. The final OMB review process took course over just a few days, an impossible amount of time for any legitimate interagency review of the complex scientific issues at stake in this rulemaking, even though they have implications for all other federal agencies that rely on sound science.

Not surprisingly, the proposed rule does not grapple with the challenging steps necessary for legitimate effort to support greater data availability. It does not consider the digital infrastructure that would be required to make underlying study data publicly available in a secure manner, nor the resources needed for researchers in the Agency to use and maintain such a system.

Indeed, the congressional budget office estimated that a similar piece of legislation would cost millions of dollars. Americans need and expect the EPA to use the best available science. Right now, Americans across the country are drinking water contaminated with per- and polyfluoroalkyl substances, or PFASs.

In May, EPA publicly committed to initiating steps to regulate two of the most well-studied, PFOA and PFOS, toxic substances linked to cancer, thyroid effects, and reproductive harm. Some of the best available data on PFOA comes from the C8 Health Project, which involved a community-

wide assessment of 69,000 residents living around Parkersburg, West Virginia, who had been exposed to PFOA for decades. Studies resulting from the project will be critical to EPA as it takes steps to address PFOA and PFOS, yet the censored science proposal would make it difficult, if not impossible for EPA to rely on those studies.

EPA's censored science proposal serves the interest of polluters, not the public. It is designed to undermine EPA's use of critical research, EDF supports, meaning full transparency and science, and the ongoing efforts in the scientific community provide that transparency. But this proposal is not about transparency. It is about rolling back public health protections and environmental protections.

EDF strongly recommends that EPA withdraw the proposed rule. Thank you.

MS. HALL: Thank you. Would Speaker Number 7, David Michaels, and Speaker Number 8, Paul Billings, please approach the speaker's table. And Speaker Number 9, Gary Timm, and

Speaker Number 10, Tyler Smith, please take a seat in the on-deck chairs.

MR. MICHAELS: Good morning. My name is David Michaels, M-I-C-H-A-E-L-S. I'm an epidemiologist and Professor of Environmental and Occupational Health at the George Washington University School of Public Health. I'm also submitting a longer set of comments, copies of which I have available.

From 2009 to January 2017, I served as Assistant Secretary of Labor for OSHA, the longest serving in OSHA's history. From 1998 to 2001, I was Assistant Secretary of Energy for Environment, Safety, and Health, charged with protecting the workers, community, residents, and environment in and around the nation's nuclear weapons complex.

As a scientist who has been deeply involved in promulgating regulations that protect the public's safety, health, and environment, I recognize the importance of open science and using the best available science. However, the proposed rule does not accomplish these goals. Instead, it

would make it more difficult for EPA to use scientific findings to protect public health. I have no doubt it would result in more people made sick by pollution or toxic chemicals that would have been prevented in the absence of this new regulation.

This cynical approach proposed by EPA can be best described as weaponized transparency. Decades ago, when studies started to show that smoking killed not only smokers, but also their non-smoking spouses, the tobacco industry recognized the government would use this evidence to reduce smoking. In response, the tobacco industry demanded access to the raw data of these studies.

Big tobacco turned transparency, an important scientific principal, into a weapon. The strategy worked for tobacco for years, helping to delay regulation and increase the death toll from smoking related illness. Since then, polluters and manufacturers of deadly products have followed big tobacco's playbook. First

supporting legislation, and then when that was unsuccessful, this proposed rule.

If promulgated, this regulation would permit the EPA administrator to deny the Agency use of findings of any study unless the raw data and other related materials are provided to the Agency and posted on the Agency's website. There are no constraints on the administrator. She or he is not required to provide any rationale for rejecting a study because the underlying information is not publicly available.

The underlying justification for this quote/unquote, "transparency proposal," is a caricature of how science really works. It is not sound science. It is something that sounds like science, but isn't.

While in theory, most studies could be reproduced, they rarely are because it's a waste of resources. The scientific enterprise involves approaching the same question in different ways to determine if the results support each other. Reanalyzing the same study over and over is little

different from checking on a surprising newspaper article by buying additional copies of the same newspaper to see if it says the same thing.

Under the provisions of the Administrative Procedures Act, the EPA administrator does not have the authority to refuse to consider any comments submitted to the agency. If he or she thinks it's not valid, inaccurate, or inapplicable, she or he must explain why. Under the EPA submissions, including scientific studies, cannot arbitrarily or capriciously be discarded because the underlying data are not provided.

When I was an OSHA administrator, we wanted to protect the integrity of the science used in setting regulations, so we explored asking for conflict of interest disclosures, similar to those requested by every leading scientific and medical journal.

Our legal experts determined that we could request this disclosure, but we could not reject submissions that failed to include them.

This is a comparable situation; rejecting submitted studies because the underlying data are not available is prohibited under the EPA.

Furthermore, many of the EPA's authorizing laws require the Agency to use the best science. For example, the Clean Air Act mandates that air quality criteria accurately reflect the latest scientific knowledge. In the past the EPA has considered all available studies in issuing these criteria without consideration of the availability of the underlying data. Promulgation of this proposed rule would be a violation of these provisions of the Clean Air Act.

When the loss similar to this NPRM was first considered by congress, the EPA told the Congressional Budget Office that it estimated the cost of gathering, redacting, and posting the data on the public website, at $250,000,000 annually. The cost estimate made by the current administration for a substantially similar law dropped to $1 million a year from $250,000,000 a

year, because in the candid shocking words of the CBO, EPA officials explained this approach would significantly reduce the number of studies the Agency relies on when issuing or proposing covered actions.

In summary, by turning scientific transparency into a virtual weapon, the EPA will inflict severe damage to the nation's scientific enterprise. It will undermine the credibility and application of scientific evidence and impose costs and impediments that will discourage scientists from undertaking studies of great importance. Limiting the EPA's use of scientific evidence in the name of increased transparency will impede its ability to protect the health, safety, and environment of the nation. This proposal must be withdrawn.

MS. ORME-ZAVALETA: Thank you.

MR. BILLINGS: Good morning. I am Paul Billings, B-I-L-L-I-N-G-S, National Senior Vice President Public Policy at the American Lung Association. The American Lung Association is the

nation's oldest voluntary health agency. Our volunteer leaders take great pride in that our work is always grounded in the best available science. The American Lung Association opposes this rule and we urge the EPA to withdraw it.

Make no mistake, this proposal is not an effort to strengthen transparency or improve regulatory science. As I will discuss, this proposal is an effort to exclude important studies whose conclusions, especially studies that shows particulate air pollution causes premature death, are inconvenient. Together with the efforts to discount or exclude benefits from pollution reductions, this is a coordinated effort to ignore the science that is inconvenient to EPA's agenda to roll back regulations that reduce air pollution and save lives.

The EPA Science Advisory Board has asked to review the rule under the authority vested in it by the Environmental Research, Development and Demonstration Authorization Act. The SAB sent a letter to the EPA administrator, raising many of

the same scientific issues of confidentiality, feasibility, and the need for a clearer definition of crucial concepts, such as replication and validation. We urge the EPA to fully consult with the SAB before moving forward with this rule.

After the SAB review is complete, EPA should either withdraw the proposal, or provide an additional opportunity for public comment based on that SAB review.

We are disappointed that the EPA has made this proposal. This is not a new fight. It started in the early 1990s, when the tobacco industry tried to undermine the science that supported EPA's landmark risk assessment that showed that second-hand smoke kills. The tobacco industry and its allies lost a decade-long fight about whether or not second-hand smoke causes lung cancer, heart disease, asthma attacks, and other adverse health effects.

We know many of the details the tobacco industry's efforts, because -- as a result of the landmark tobacco litigation, nearly 90 million

pages of tobacco industry documents are housed at the University of California, San Francisco, Truth Tobacco Industry Documents library. Now we know the truth.

Within this archive are documents that show how PR firms, lawyers, and front groups attempted to undermine the credibility of EPA science. The documents show the tobacco industry launched this effort in the name of sound science that not only attacked the second-hand smoke risk assessment, but EPA's efforts to protect the public from ozone air pollution, radon, pesticides, and more. Remember, in 2006, the big tobacco companies were found guilty of civil racketeering for their decades-long conspiracy to defraud the public about the health risks associated with smoking.

The attack on science continued throughout the 90s, when EPA set the first standard for fine particulate matter. The PM2.5 standard. That national ambient air quality standard has saved thousands of lives. This was a

concerted effort by industry and the tobacco industry and their allies, and make no mistake, tobacco industry did not only focus on second-hand smoke. They attacked all of EPA's science. The other polluters came along for the ride and now we're leading that effort.

There was a concerted effort to undermine the Six Cities Study, and the American Cancer Society study. To address the questions being raised, and we just heard from the Health Effects Institute, the HEI, while protecting patient confidentiality, conducted an independent review of the data and these studies. The HEI reaffirmed the results from those studies. These landmark studies were key to informing the rules that cut PM2.5 pollution over the past two decades. Thousands of people are alive, and millions are breathing easier because of those efforts.

These studies depend on patient participation. Protecting patient confidentiality must be paramount and is key to recruiting study participants. This proposal will censor science,

will exclude important well-done peer-reviewed studies that are informing EPA actions, or will threaten that patient confidentiality. This is an unacceptable choice. EPA must use the best science, with within established frameworks, and not limit access to the best science to inform regulatory decisions. We urge the EPA to withdraw this proposal. Thank you very much.

MS. HALL: Thank you, both.

Would Speaker Number 9, Gary Timm, and Speaker Number 10, Tyler Smith, please come up to the speaker's table. Would Speaker Number 11, Eugenia Economos, and Speaker Number 12, Anne LeHuray, please take your seat in the on-deck chairs.

MR. TIMM: Good morning. My name is Gary Timm, G-A-R-Y T-I-M-M. I worked at EPA for 38 years and retired in 2011.

I was Chief of the Chemical Testing Branch in the Office of Pollution, Prevention, and Toxics for 10 of those years. The Chemical Testing Branch is responsible for implementing the

testing provisions of Section 4 of the Toxic Substances Control Act.

Today, my remarks will focus on three things. Our studies traditionally used in support of regulation, and vis-à-vis, the proposed transparency policy, it's interaction with TSCA Section 4, and its interaction with our obligations to accept studies conducted in accordance with OECD test guidelines.

Let us be clear, if EPA had adopted this data transparency limitation and past risk assessments, EPA would not have been able to take many of its historic actions to protect children, families, and the environment. No reduction or elimination of the exposure to children to lead and paint, gasoline and drinking water, no air quality standards for particulate matter and other air pollutants, and the list goes on and on.

The proposed policy would affect assessments that will soon be carried out under TSCA Section 6. TSCA gives EPA the authority to regulate the manufacture, processing, distribution

and commerce, use, and disposal of chemicals. The problem formulation documents, which set forth EPA's approach for assessing the first 10 chemicals under the amended TSCA are open for public comment now.

How these chemicals are assessed will be the model for future assessments. The proposed policy would in fact make it impossible for EPA to consider the full array of well-conducted and peer reviewed scientific studies of the health and environmental effects of pollution. It would bias the body of information in favor of industry supplied studies, since they would all have the means to provide the underlying data.

Assessment of all relevant scientific information is essential in making sound judgments about protecting human health and the environment. And it is a legal requirement in all major environmental legislation.

TSCA also contains provisions to require chemical manufactures to test the chemicals that they manufacture and process. To require industry

to test chemicals under Section 4, EPA must make a set of legal findings. It is the data inadequacy finding that we are interested in today, for it is the nexus between TSCA Section 4, and the proposed transparency policy.

To make this finding, EPA conducts a thorough literature search and usually issues a rule to require studies that have not been published to be submitted to the agency. Typically, the bulk of information considered, however, is studies published in the peer reviewed scientific journals. Despite being accepted by the scientific community, these studies do not meet the transparency requirements of the published rule, since it requires that all raw underlying data and the models used to analyze the data supporting their study are available for public review.

Thus, if the Transparency Rule were in effect, under TSCA Section 4's second finding, EPA would have to judge studies from peer reviewed journals as inadequate. Ignoring this large

category of information would cost industry hundreds of millions of dollars to repeat perfectly good scientifically acceptable studies, which the public would ultimately pay for through higher prices. And it would significant delay, or in some cases preclude assessment and regulation of risks to human health and environment.

Another aspect not discussed in the proposed transparency policy is the obligation of the U.S. to accept data generated in accordance with the Mutual Acceptance of Data treaty. The U.S. and other Organizations for Economic Co-operation and Development member countries realize that differences in testing requirements on countries, meant that companies would in some cases have to retest a chemical in order to market it in other areas. This was needlessly costly and resulted in a delay in obtaining information needed for regulatory assessment.

As a result, the OECD member nations agreed to accept, for regulatory purposes, data generated in accordance with the OECD test

guidelines. Submission of underlying data is not a requirement of the Mutual Acceptance of Data treaty. Therefore, the proposed policy which requires underlying data to be made available to be used for risk assessments would run counter to our obligations under the Mutual Acceptance of Data treaty.

In short, the proposed policy is a trojan horse. I can only conclude that this proposal constitutes fraud, as it is deceptive. Waste, rejecting perfectly valid studies and abuse, for it is arbitrary and capricious.

Thank you for giving me the opportunity to provide comments this morning.

MS. ORME-ZAVALETA: Thank you.

MR. SMITH: Good morning. My name is Tyler Smith. I'm a staff scientist at Earthjustice. We are the largest non-profit environmental law organization in the country.

EPA's proposed rule is an attack on the science used to protect children's health. Simply put, it would weaken risk assessments for

chemicals that harm kids. These chemicals include organophosphate pesticides like chlorpyrifos, which EPA scientists long ago concluded present grave risks to children.

Earthjustice therefore urges the Agency to reconsider its approach and withdraw the proposal immediate. Under the Food Quality Protection Act, EPA is required to abide by an additional safety factor of 10 when setting the level of exposure to a pesticide that may harm infants and children. It is well established that children are more susceptible to the toxicity caused by pesticide exposure than adults. The law therefore requires that EPA take this into account and ensure that the most vulnerable among us are protected.

Under the statute, EPA may decide to apply a different safety factor if, and only if it concludes on the basis of reliable data that such margin will be safe for infants and children. The most reliable data, including epidemiological studies conducted in three different perspective

cohorts clearly establish that prenatal exposure to chlorpyrifos and other organophosphates, harms the developing nervous system. This exposure reduces IQ, and it increases the risk of developmental disorders, such as ADHD.

All of this science was peer reviewed prior to publication, and EPA scientists and the independent experts who serve on the FIFRA Scientific Advisory Panel reviewed it extensively and repeatedly over many years. Accordingly, chlorpyrifos risk assessments conducted in 2014, and again in 2016, included the required safety factor, and both assessments found that exposures exceeded the identified levels of concern.

Accordingly, the EPA proposed banning all uses of chlorpyrifos on food in 2015. But last year, political appointees at the Agency disregarded this science and announced that the Agency would not finalize the proposed ban. EPA now may wait years to reconsider. And it appears that the same political appointees who disregarded the science, now want to weaken the chlorpyrifos

risk assessments in advance of their next review.

Indeed, the pesticide industry responded to EPA's conclusions on chlorpyrifos by proposing novel requirements that are strikingly similar to what the Agency now proposes to do for all science. CropLife America, an industry trade association, asked EPA to quote, "Require access to raw data as a prerequisite to relying on any study to support regulatory decisions," unquote. And Dow AgroSciences, which manufactures chlorpyrifos, also complained in comments that the Agency is not quote, "Secured and shared the raw data underlying the epidemiology studies," unquote.

Now EPA did seek a study -- or, I'm sorry, did seek data from a study conducted at Columbia University. However, Columbia determined that it could not provide all of the requested data without violating its obligations to the mothers and children who had participated in the research.

Notably, EPA did not respond to these

concerns by refusing to consider the Columbia study. Rather, scientists from the Agency and Columbia met to discuss the study in greater detail, and the University produced extensive supplemental analysis in response to agency questions.

Furthermore, Columbia offered to make all of the data available to agency scientists for analysis in a secured facility on Columbia's campus. Now these efforts suggest there are numerous alternatives to the rigid requirements the proposed rule would impose on the use of science and agency rulemaking.

As epidemiologic studies of chlorpyrifos support retaining the safety factor to protect infants and children, EPA may believe that such studies fall within the vague definition of dose response data and models contained in the rule. If so, EPA may believe that the continued efforts by Columbia to protect the hundreds of mothers and children who participated in its research preclude the use of these data because they cannot be made

publicly available.

EPA may believe this precludes the use of other epidemiologic studies as well. As a result, this proposal could be used to avoid protecting infants, children, and others from exposure to chlorpyrifos and more than two dozen other organophosphate pesticides. It is simply outrageous that EPA, an agency charged with utilizing science to protect public health, would do the bidding of the pesticide industry it regulates, and try to circumvent its own scientific conclusions by choosing to ignore the best available science.

I urge the Agency to reconsider this proposal and withdraw this deeply flawed rule. Thank you.

MS. HALL: Thank you. Would Speaker Number 11, Eugenia Economos, and Speaker Number 12, Anne LeHuray, approach the speaker's table. And Speaker Number 13, Diana Van Vleet and Speaker Number 14, John Auerbach, please take a seat in the on-deck chairs.

The speakers are reminded to please speak into the mic, and also state who you're speaking for. Thank you.

MS. ECONOMOS: Hi. I am Eugenia Economos, E-U-G-E-N-I-A E-C-O-N-O-M-O-S. I am with the Farmworker Association of Florida. We are a grassroots farmworker organization that's over 35 years old. I say that because it's important to understand that our organization was co-founded by a man who was a farmworker himself. Our staff are almost all former farmworkers. Our board of directors are farmworkers. They're from farmworker families. And I'm here on behalf of our communities who are mostly African/American, Hattian, and Hispanic farmworkers who harvest the food that feed all the rest of us, the food that we eat is harvested by farmworkers in the field who are exposed regularly to pesticides. And I'm here on their behalf.

Our organization is very involved in pesticide health and safety, and in doing that we have participated in community based participatory

research projects, including a four-year project with Emory University that we did. It was funded by NIOSH, and in that study, we looked at farmworkers and in the nursery industry that did ornamental plants in Central Florida, and farmworkers in the fernery industry, which are also ornamental plants.

And we looked at the reproductive health effects of occupational exposures, including occupational exposure to pesticides. We are well-trusted in the community because we are based in our communities and because we are of, by, and for the farmworker communities. And we're able to do these studies because we have the trust of our community members.

In that study with Emory University, we did surveys with 260 women of reproductive age. One of the things we looked at was -- we additionally did urine samples on 100 women, including women that were pregnant, looking at levels of organophosphate pesticides and the pesticide, mancozeb, in their urine.

One of the reasons we chose mancozeb, because that is a fungicide that was implicated in birth defects that happened in Omokollee, Florida in 2004 and 2015, and we wanted to look at the levels of the pesticide in the urine of the women that we studied.

The results of that study showed very high levels of organophosphate pesticides and mancozeb in the urine of the women that we studied, much higher than the NHANES national averages.

We used that information in order to both develop a training for the women about how to protect themselves from pesticides. But we also used that information to write up a paper about -- because mancozeb is coming up for re-review, and we think it's very important to understand the levels that we found of the mancozeb in the urine.

I say that because we would not be able to do that study if we did not have the trust of the people. And we had that trust because we ensured their confidentiality. We would not be

able to do this if there was any sense at all that their confidentiality could be compromised. You're talking about people who are minorities. Many of them are immigrants. They're already under attack in their communities for many other reasons, and if we could not assure their confidentiality, we would not have participation.

I have people come to me all the time with different complaints from their work environments. And it's heartbreaking to me when people come to me and talk about being exposed to pesticides, and then they're afraid to make a report because they're afraid of losing their job, or they're afraid of retaliation.

We would -- we cannot, we would not, we would never engage in studies if we could not ensure that our people, our community would be protected from any kind of revelation of their identities or of their information. So that's why we are opposed to this proposed rule. We're also concerned about that epidemiological data is really important to look at synergistic and

cumulative effects of pesticide exposure, and you cannot find that without doing epidemiological studies. So we are also concerned that we're -- I'm sorry. We're also looking at the body burden of pesticides in the farmworkers that we study, and farmworkers are exposed to multiple different kinds of pesticides. And if you're not looking at epidemiological studies to look at that, then you are ignoring an important role of science in the farmworker community.

I am saying that, I am sitting here, and I just want you to know that even though I'm sitting here, behind me are tens of thousands of farmworkers in Florida and around the country, and I'm here on their behalf. And on their behalf, I'm asking you to reject this rule. Thank you.

MS. ORME-ZAVALETA: Thank you.

MS. LeHURAY: Good morning. My name is Anne LeHuray, L-E-H-U-R-A-Y. And that's Anne, with an E. And I am here as the Executive Director of the Pavement Coatings Technology Council, also I'll call it PCTC.

PCTC, their members manufacture products that are used in pavement maintenance programs to extend the useful life of an asphalt parking lot, for example. Airport surfaces, and the like.

Our members are almost exclusively small family-owned businesses, and their customers, who we also represent, are virtually 100 percent small family -- small and maybe even say micro family owned businesses.

So at PCTC, we strongly support the concept of what EPA is proposing in the "Strengthening Transparency in Regulatory Science" rule, however we urge EPA to go beyond what it has proposed with a goal of improving on EPA's current procedures which lack any meaningful remedies when the Agency relies on science that has been shown to be unreproducible.

The Council supports the efforts of the Agency to ensure that scientific studies, data, and models on which it relies in developing regulations, guidance, and policies are sufficiently transparent. Doing so helps ensure

that others can attempt to reproduce the results in which the Agency bases its regulation, guidance, and policies.

However, the council believes the proposed rule does not go far enough. PCTC has witnessed first-hand the distortions and bad public policy that can result from what has been called in other venues, secret science, by which we mean, science that has been shown not to be reproducible.

And EPA has contributed to this problem. They were not the source of the unproducible science, but they've contributed to the problem by using that unreproducible science, because to use the Agency's words, it is fit for purpose. Meaning, we suppose, that it suits the Agency's desire to regulate, even if the science says that the regulation is unwarranted.

So PCTC's experience causes it to be concerned that the Agency proposes to restrict its increased focus on transparency to only dose response data and models, to only final

regulations, and to only pivotal studies as narrowly defined the proposed rule.

We would note that worldwide scientists and science organizations have recognized the crucial rule of transparency to the very crux of the scientific enterprise, which is, science has to be falsifiable. That means that it has to be reproducible.

At a minimum, the Agency should be as concerned as the publishers of peer reviewed science journals, that all the science it considers is possibly key or pivotal to a right to a regulatory purpose, any regulatory purpose meets the standard of transparency.

EPA's role is to translate and distill research results into regulations, guidance, and policies that have significant impacts in the real world. It is therefore the obligation of EPA to ensure that it uses the best available science, which by definition includes science that has been shown to be reproducible on any issue of any important EPA policy making.

Now to promote the idea of use of reproducible science and transparency, and an understanding in all agency actions, PCTC has two specific recommendations. One is that it gives preference to studies, not just when industry submits a study as part of let's say registering a pesticide, this requires that that study has to follow GLP, Good Laboratory Procedures -- Good Laboratory Practices.

GLP is a formal program. It relies on, like OECD, guidance, methods, test methods. But there's also a thing called the Spirit of OECD, which simply means following good standard scientific practice.

So we recommend and go into detail in our written comments about that the GLP should be given preference in all science that all -- that EPA considers in any of its policy making decisions. And we also have a specific recommendation about how the Office of the Science Advisor should consider combining the roles of the information quality function at EPA, and the

Office of Scientific Integrity, and I thank you very much for your attention and we expand on this in our written comments.

MS. HALL: Thank you very much.

Would Speaker Number 13, Diana Van Vleet, and Speaker Number 14, John Auerbach, please come up to the speaker's table. And Speaker Numbers 15, Harvey Fernbach, and 16, Joseph Stanko, please take a seat on the on-deck chairs.

MS. VAN VLEET: Hello. My name is Diana Van Vleet, D-I-A-N-A, Van Vleet, V-A-N V-L-E-E-T. I work for the American Lung Association, but I am sharing comments on behalf of Health Care Without Harm today.

As the organization leading the global movement for sustainable healthcare, Health Care Without Harm strongly opposes the proposed rule, "Strengthening Transparency in Regulatory Science." The rule would impede the Agency from upholding its mission to protect human health and the environment by limiting the use of scientific research.

It was the EPA's conclusions regarding the human health impacts of dioxin that lead the formation of our organization in 1996. Since then, we have led the charge to transition the U.S. healthcare sector away from medical waste incineration, the leading source of dioxin pollution.

In the United Sates, more than 5,000 medical waste incinerators were in operation in the mid-90s. Today, fewer than 16 medical waste incinerators remain. This work would not have been possible without the EPA relying on sound science to make determinations about the toxicity of dioxin pollution for human health.

Currently, Health Care Without Harm works with hospitals and health systems to transition to renewable energy and to prepare for the impacts of climate change. We look to the EPA to heed the science regarding the human health effects of fossil fuels and climate change when making decisions so that our hospitals are in the best position to protect their patients.

By artificially limiting the research it considers when making decisions, the EPA would endanger health and put lives at risk. We urge the EPA not to adopt this proposed rule.

MS. ORME-ZAVALETA: Thank you.

MR. AUERBACH: Good morning.

MS. ORME-ZAVALETA: Good morning.

MR. AUERBACH: My name is John, that's spelled A-U-E-R-B-A-C-H.

I am a public health practitioner. I've been a leader in the public health field for about 30 years. I was a city health commissioner, a state health commissioner, and an official at the Centers for Disease Control, and currently I am the President and Chief Executive Officer of Trust for America's Health, or TFAH.

TFAH is a non-profit, non-partisan public health and science-based organization that promotes optimal health for every person and community, and makes the prevention of illness and injury a national priority.

TFAH has been focused on issues like

clean air and clean water, because they are fundamental to ensuring that all Americans have the opportunity to live long and healthy lives. This is particularly crucial since we know that unhealthy air or contaminated drinking water disproportionately affect some of our more vulnerable subpopulations, including children, older adults, and lower income Americans who are more likely to include racial and ethnic minorities.

As a component of our mission to promote health we issue a series of reports every year that examine some of our nation's most pressing health issues, and we rely heavily on all available research and evidence to develop recommendations for decision makers on how they can most effectively respond to improve health.

For example, in 2011, TFAH and the Environmental Defense Fund released a report that analyzed the savings and health care spending associated with four different EPA regulations. In so doing, we relied on the EPA's own regulatory

impact analysis that measured reduced mortality, reduced incident of chronic bronchitis, reduced incident of heart attack, and decreased hospital emissions and emergency room visits. These studies estimated that nearly half a million lives could be saved by these four EPA standards alone.

Because of the importance of having access to such scientific data in order to protect the public's health, we oppose the "Strengthening Transparency and Regulatory Science" proposed rule. Research and evidence is the foundation of EPA's policies and has been necessary for success of laws like the Clean Air Act and improving and in saving lives from the dangers of air pollution.

Congress intentionally directed EPA to consider peer reviewed research under the Clean Air Act, and mandates regular reviews of the science to ensure that EPA is reviewing and considering the most up to date science. We believe that the proposal would prevent EPA from using the best science to inform decision-making, and the result would be weaker standards at the

expense of American's health. For example, the proposal would exclude several landmark air quality studies from the evidence base that EPA is permitted to consider, largely on the basis that these studies include confidential patient information that would make them less transparent under the constructs of the proposed rule.

The practical result would be weaker air pollution standards, despite the fact that the science behind these studies is pointing us in the opposite direction. The current methodology and system for review is sound, reliable, and has operated effectively for years. And that's why we have joined with the American Lung Association, the American Academy of Pediatrics, the American Public Health Association, and over 70 additional public health, medical, and academic organizations in opposing this regulation, this proposal.

As a long-term public health practitioner and the President of TFAH, I remain committed to ensuring that federal health policy and practices are guided by the evidence in a transparent and

accountable manner. EPA and other federal agencies should be no exception. We at TFAH look forward to working with congress, with the EPA and others, as we continue to advocate for policies and practices that uphold these principles and protect and promote the health of every American. Thank you very much.

MS. HALL: Thank you very much. If I could ask those that are in the room to please refrain from talking. There's a lot of whispering and it's distracting. If you do need to have a conversation, please step outside the room. Thank you.

Would Speaker Number 15, Harvey Fernbach and Speaker Number 16, Joseph Stanko, please approach the speaker's table. And Speaker Number 17, Peter Lurie and Speaker Number 18, Jamie Wells, please take a seat in the on-deck chairs.

What speaker number are you?

MR. STANKO: Sixteen.

MS. HALL: So, do we have Speaker Number 15? Harvey Fernbach?

[No audible response.]

MS. HALL: Okay, so we'll move ahead.

[Discussion off the record.]

MS. HALL: Number 17, Peter Lurie, would you like to take a seat up here? And then Speaker Number 19, Ami Zota, please take a seat in the on-deck chairs. Thank you.

MR. STANKO: Thank you. My name is Joseph Stanko, S-T-A-N-K-O. Thank you for the opportunity to address EPA's proposal entitled, "Strengthening Transparency in Regulatory Science." My name is Joseph Stanko, and I am counsel to the NAAQS Implementation Coalition.

The Coalition is comprised of trade associations, companies, and other entities who confront challenges in permitting and operating manufacturing and other facilities under increasingly stringent National Ambient Air Quality Standards.

Our members --

MS. ORME-ZAVALETA: If we could ask you to move the microphone a little bit more in front.

MR. STANKO: Sure.

MS. ORME-ZAVALETA: No, the other way. There you go.

MR. STANKO: All right.

MS. ORME-ZAVALETA: Thank you.

MR. STANKO: Our members, and the companies they represent have a proven record of working with states and regional EPA offices on implementing emissions reduction strategies to attain NAAQS.

However, increasingly more stringent NAAQS have caused demonstration requirements for Clean Air Act permits to exceed the limits of current tools and policies for NAAQS implementation. This makes it increasingly more difficult for companies to attain the approvals needed for new state of the art projects that create jobs and bring much-needed tax revenue to local communities.

Without a transparent NAAQS process, underlying studies lack robust external review, leading to standards that may not provide

objective public benefit. In certain cases, increasingly stringent standards have pushed NAAQS to concentrations at or near background levels, beyond the feasible limits of implementation. While inaccurate assumptions in both setting and implementing NAAQS could be more readily absorbed under prior less stringent NAAQS levels, recent more stringent standards have eroded such tolerances.

Addressing this new reality starts with an inherently forward-looking NAAQS review process that assesses science and policy in a rigorous and holistic manner. The transparency proposal fosters such an open-source approach to pivotal regulatory science, one that enables the public to more meaningfully comment on the science underlying NAAQS review. This can foster a more effective NAAQS implementation that still meets the Clean Air Act's mandate to protect public health.

While we support the principles behind the transparency proposal, its sound policy goals

should be balanced with legal and ethical obligations to protect private, sensitive, and confidential information. As the transparency proposal is implemented, efforts must be made to address protected health information under the Health Insurance Portability and Accountability Act, or HIPAA.

Disclosure limitations also exist for proprietary information and trade secrets. We agree with EPA that dose response data and models should be exempt from public review as necessary to protect private, sensitive, and confidential information. However, we believe that EPA can protect such information while still seeking maximum possible transparency.

As the transparency proposal notes, many generally acceptable techniques exist to deidentify personally identifiable information. Where such deidentification is not possible, EPA could facilitate review of sensitive data sets by a diverse group of experts subject to HIPAA compliant nondisclosure agreements.

If all other options to expand review have been exhausted, EPA could decide that a study could not be subject to outside review and verification, and consider the study accordingly without excluding it from a rulemaking proceeding.

Administrations -- administrators pardon me, have regularly taken similar methodological considerations into account when assessing studies in past NAAQS reviews. EPA could further balance transparency and privacy by appropriately tailoring the transparency proposal according to the type and scope of the regulatory decision involved. For this reason, we agree with EPA that the transparency proposal should be limited to pivotal regulatory science that is involved in significant regulatory actions that result in substantial costs.

To that end we note that because Clean Air Act regulations have accounted for the vast majority of costs and benefits cited in rules over the last decade across the entire federal government, such regulations are particularly well

suited for the transparency proposal's high standard of robustness.

As this process moves forward, we encourage EPA to further detail how the transparency proposal will protect private, sensitive, and confidential information, be it personally identifiable or proprietary information, trade secrets, or other similar information. To that end, EPA should explicitly state that any final regulations arising from the transparency proposal do not support or assert authorization under the law to disclose such currently protected information, and that any claim to do so must be independently based on a statutory grant of authority from congress.

In conclusion, the transparency proposal would increase replicability and verification in the scientific process, thereby testing critical methodological assumptions and mitigating biases in key studies upon which the Agency relies in developing regulations. It recognizes that transparency can go beyond simply maximizing

disclosure to better contextualizing studies through replicability and verification.

In doing so, the public can more meaningfully take part in EPA notice and comment rulemaking processes. As EPA advances the transparency proposal, it can and should implement these sound policy goals in concert with obligations to protect private, sensitive, and confidential information.

The NAAQS Implementation Coalition appreciates EPA's efforts on the transparency proposal, as well as the opportunity to present its view on the topic.

MS. ORME-ZAVALETA: Thank you.

MR. LURIE: Hear me? Good morning. My name is Dr. Peter Lurie. I'm a physician, an epidemiologist, and now the President for Center for Science in the Public Interest. We are an independent science-based health advocacy organization with over 500,000 members.

Before I joined CSPI, I served at the FDA as an associate commissioner and in fact, for

several years I led the Agency's transparency initiative. Over the course of my career I've authored close to a dozen academic articles on the topic of transparency, and nobody ever asked me for the underlying data for any of those studies.

We at CSPI are firm advocates of scientific transparency and have had a number of projects along those lines over the years. But EPA's proposed rule is not about transparency or strengthening science. Instead, it is a wolf of pro-industry bias hiding in the sheep's clothing of transparency in science. Proposal should be withdrawn.

Transparency is not about restricting the use of sound science, as this proposal would do. Suddenly, the more transparent a government agency can be about the nature and limitations of the data underlying a decision, the better. But the failure to meet some abruptly and arbitrarily elevated standard for disclosure cannot and should not be the grounds for the summary exclusion of data that were rigorously gathered and reported.

The surest tests of any scientific transparency policy are two. One, was it generated in a transparent fashion? And two, will it actually promote the transparent rigorous science-based decision-making that it claims to? This proposal fails on both counts. Let's start with the procedural matter.

This proposal violates fundamental tenents of transparency rulemaking. EPA failed to consult with relevant stakeholders, such as science, research, or health professional associations, did not consult with other federal agencies who would be affected by this, and did not even make the proposed rule available to its own Scientific Advisory Board for review.

In addition, the proposal lacks critical citations and documentation, or even an adequate justification for why it was proposed. Rather than furnishing the evidentiary support required for administrative action, the Agency has merely adopted a legislative initiative that failed to (indiscernible) despite support from the energy,

chemical, manufacturing, and other key industries.

Moreover, despite its professed (indiscernible) to cost effectiveness in rulemaking, the proposed rule provides no cost-effectiveness analysis whatsoever. It simply blithely asserts that, quote, "EPA believes the benefits of this proposed rule justify the costs." I wish we could have gotten away with that at FDA.

But the rule would be costly indeed. Analysis of an earlier version of the legislation predicted costs of $250 million over the next few years. But even more important, the proposal does not meet its purported scientific goals and will instead undermine the scientific basis for decision-making at EPA.

Since its inception, EPA has developed rules with demonstrable efficacy in protecting the public by relying in large part upon the kinds of data that EPA would now preclude from consideration. Some of EPA's greatest public health accomplishments, such as eliminating lead and gasoline, classifying second-hand smoke as a

cause of cancer were based on the kinds of data that would be discarded under the proposal. Such data are widely used in rulemaking proceedings by other U.S. government agencies and around the world. And I can say, at FDA, we would not have had the rules that we ultimately developed or proposed on mercury in fish, on arsenic in rice, on dental amalgam, or in sodium targets from a nutritional perspective. None of those could have been done if data of these kinds were eliminated.

In particular, it's also especially troubling that the proposal also opens the door to a reconsideration of past rules which would be utterly inappropriate under prevailing principles of administrative law. In fact, the proposal would have an effect opposite to its claimed purpose. It would address -- it would suppress important and relevant science conducted in large part by the best minds in academia and government, thereby unduly restricting the evidence available to EPA and potentially favoring data developed by industry.

Further evidence of the pro-industry orientation of this proposal is its discussion of the dose response function and the assault on linearity. Quite aside from the merits of that discussion, which I think are few, the real question is, what is this discussion doing in this proposal in the first place. It has nothing to do with transparency whatsoever, and it's simply there as a marker, in my view, of the pro-industry bias that this entire enterprise represents.

Let me close with a question with which EPA should have started. What exactly is the problem that this proposed rule seeks to fix? Where indeed is the study for which the lack of access to raw data resulted in misinterpretation or in the promulgation of an inappropriate regulatory standard?

To the contrary, the record is replete with studies that form the basis of health and life saving regulations that would now be precluded from use, and that might even provide a basis for the revocation of rules enacted in the

distant past. Thank you.

MS. HALL: Thank you. Would Speaker Number 18, Jamie Wells, and Speaker Number 19, Ami Zota, please come up to the speaker's table. And Speaker Number 20, Surbhi Sarang and Speaker Number 21, Laura Bloomer, please take a seat in the on-deck chairs. Thank you.

Please, quick reminder to speak into the mic and state your organization.

MS. WELLS: My name is Dr. Jamie Wells, J-A-M-I-E W-E-L-L-S, and I'm the Director of Medicine for the American Council on Science and Health, and I'm here on behalf of our president, Hank Campbell.

In the past, peer-reviewed journal publication ha been considered authoritative, but that has inherent weakness if they can't be replicated. Knowing the potential for error, and even misuse, replication is vital, but we recognize that that's not always possible. A safety valve for that is a higher level of scrutiny when it is not possible. Studies that

can't be replicated should at least make sense within the pattern of available data, which in the case of EPA will often include hundreds of other studies done according to federal guidelines.

However, there are also occasions where replication is not possible and new claims or outliers from the consensus of many other studies. And in those cases, they should still absolutely be used if EPA risk scientists, without breaking confidentiality, can obtain the additional information needed in order to conduct their own analysis.

EPA risk scientists are charged with protecting public health, and the American Council on Science and Health has argued since 1978 that the judgment over which epidemiology and/or toxicology data to use for risk or safety assessment should always include risk scientists. The public's interest is best served when science is replicable and consistent with other information.

On occasions, when studies cannot be

replicated, or when such studies are not consistent with other information, use of those studies depends on having access to the underlying data for independent analysis. When the underlying data are not provided, it is difficult to make a credible risk assessment, much less national rulemaking, as you know. So risk experts should be involved.

You should have received a more extensive written document as well.

MS. ORME-ZAVALETA: Thank you.

MS. ZOTA: I'm Dr. Ami Zota, that's A-M-I, last name Z-O-T-A. I am a health scientist and Professor of Environmental and Occupational Health at the George Washington University Milken Institute School of Public Health. I am also speaking as part of Project Tender. We are an alliance of scientists, health professionals, and advocates with expertise in protecting children from exposure to toxic chemicals that can contribute to neurodevelopmental problems, such as ADHD and learning disabilities.

I oppose EPA's proposed rule. The proposed rule prohibits the Agency from setting regulations that are support in part or whole that is for data that is publicly available for reanalysis or cannot be replicated.

Since the proposed rule is retroactive, it could lead to the dismantling of many important existing EPA regulations that safeguard our children and families -- children and families from toxic chemicals.

I would like to spend my time identifying some of the major problems with this rule that warrant consideration before the Agency moves forward. The scientific sources cited for the basis of this rule do not support the proposed rule. EPA did not consult with critical stakeholders in the development of this proposed rule, including scientists, health professionals, and affected communities.

EPA does not present any analysis of benefit-cost, children's environmental health risk, or environmental justice in support of the

rule which are required under executive orders 12291, 13045, and 12898. The terms, pivotal regulatory science, replication, reproducible, and research data are not defined or are problematic. The rule's requirements for specific types of defaults, test methods, dose response models, and/or analysis are not supported by current science.

The rule is counter to the mandates in the reformed Toxic Substances Control Act, or TSCA, to use the best available science and systematic reviews for chemical evaluations.

Data deidentification and masking techniques cannot ensure confidentiality and can degrade the accuracy of data for further analysis. The rule is inconsistent with medical ethics and existing legal requirements to ensure the privacy and/or confidentiality of human data.

For example, in many cases individuals' participant data cannot be made public because of confidential requirements legally mandated by institutional review boards and/or the Health

Insurance Portability and Accountability Act of 1996, or HIPAA.

In conclusion, EPA should withdraw this proposed rule immediately. EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at the federal government. Thank you.

MS. HALL: Thank you.

Would Speaker Number 20, Surbhi Sarang, and Speaker Number 21, Laura Bloomer, please come up to the speaker's table. Would Speaker Number 22, Ms. Nsedu Obot Witherspoon, and Speaker Number 23, Joanne Zurcher, please take a seat in the on-deck chairs. Thank you.

Speakers, please remember to speak into the mic and state your organization.

MS. SARANG: My name is Surbhi Sarang, spelled S-U-R-B-H-I S-A-R-A-N-G, and I'm a legal fellow at the Environmental Defense Fund.

I appreciate this opportunity to provide public testimony on the proposal and hope that everyone who wises receives an opportunity to be

heard. We urge EPA to hold hearings in additional locations to allow affected Americans in other communities who cannot travel to be here today, an opportunity to provide input as well. I'm testifying here today to raise our serious concerns of the proposed rule and to ask that the EPA withdraw the proposed rule immediate.

Communities across America rely on EPA safeguards to protect their health and wellbeing. But this rule would greatly restrict the body of scientific information that EPA draws on when setting these safeguards. Instead of being informed by all available science, in many cases EPA would be forced to operate in the dark. By obliging EPA to disregard scientific research that would otherwise alert the Agency to taking strong protective actions, this rule endangers the health of all families and communities. Had this rule been place previously, we would likely currently be facing greater exposures to air pollutants, water contaminants and toxic chemicals.

In the proposal, EPA completely ignores

the practical effects of the proposed rule and how it fundamentally conflicts with EPA's mandate to use the best available science as it develops safeguards.

Agency decisions must be informed using the best available science. Public deserves nothing less when health and safety are on the line. This value is core to EPA's mission and should be placed at the forefront.

But the proposal takes an unsupported and unprecedented leap by suggesting that this mission allows EPA to only use science where the underlying data and models can be made and are made publicly available for independent validation. Much of the data underlying scientific studies concerning human health cannot be made publicly available for legitimate privacy and confidentiality reasons. In many cases, it is impossible even to redact information in a manner that allows independent validation while respecting privacy and confidentiality.

Thus, the proposal would seriously

restrict EPA's ability to use the best available science as it sets critical safeguards. Nor does EPA explain why such restrictions on the use of science are necessary. EPA does not point to any instance in which a failure to disclose data resulted in an EPA decision or standard that lacks scientific integrity.

EPA does not explain why other means of vetting that are used by the scientific community and that protect privacy and confidentiality, such as review by EPA's independent Science Advisory Board, peer review, and corroboration through independent studies are insufficient to ensure the integrity of the science EPA relies on. And EPA does not explain why it is appropriate for an agency tasked with basing its decisions on best available science to now discard otherwise valid science simply because a disclosure is not possible.

Indeed, courts that have examined the issue have made clear that it is entirely reasonable for EPA to rely on scientific studies

which data cannot be disclosed. While EPA states in the proposal that many organizations have endorsed data disclosure as a means to increasing transparency, the reality is the proposed rule completely departs from good scientific practice. None of the organizations EPA identifies in the proposed rule have endorsed the practice of disregarding studies where data disclosure is not possible, or that have been subjected to other means of validation, or suggested that regulatory agencies should exclude such studies when using science to inform regulatory actions.

To the contrary, organizations that are deeply committed to transparent science have come forward to stress that policies to promote transparency must be developed within the scientific community and to oppose the notion of disregarding otherwise valid science, simply because the underlying data cannot be disclosed.

Indeed, EPA's own Science Advisory Board, which it failed to consult before issuing this proposal, has raised concerns similar to those we

raise here, noting that EPA provided no analysis of the impact of losing the ability to run on these studies, and that there are other ways to assess the validity of studies without access to data. Not only did EPA skip over review by the Science Advisory Board, but then EPA allowed for only a 48 (indiscernible) review process for the proposal.

This hastened process seriously calls into question the validity of the proposal. The proposal would not even increase transparency. By allowing the administrator to grant exemptions based on vague and discretionary criteria, the proposal would allow EPA to selectively apply this disclosure policy with no public record of the decision or its basis. The risk that the rule will artificially restrict and distort the scientific basis for EPA's decisions is only heightened by its many gaps.

The proposal fails to explain critical details, such as what mechanisms would be used to make data public, what the cost of the Agency and

to researchers would be, and how the peer review provision would fit into EPA's existing peer review requirements. It is not even clear how EPA would determine that a given study is publicly available in a manner sufficient for independent validation. This underscores concerns that this proposal would undermine the integrity and transparency of EPA decisions rather than enhance them.

It is also important to note that this rule was posed under former Administrator Pruitt who actively obscured transparency goals by directing the removal of scientific information from EPA's websites, refusing to publicly release his full and accurate schedule, using secret e-mail addresses, and spending tax payer money in violation of federal laws.

While Pruitt is now gone, this proposal unfortunately suffers from the same disregard for scientific integrity and transparency that infused the former administrator's tenure.

We thus call on Acting Administrator

Wheeler to recognize the redeemably flawed basis for this proposed rule and withdraw it immediately.

MS. ORME-ZAVALETA: Thank you.

MS. BLOOMER: My name is Laura Bloomer, B-L-O-O-M-E-R, and I'm a student at Harvard Law School and the Kennedy School of Government. I am interning at EDF, Environment Defense Fund this summer. I am here testifying on my own behalf.

I am the daughter of two parents who grew up near auto industry towns in Michigan. My mom was born in Flint. Her parents, my grandparents, grew up in Flint and chose to raise their four children there.

Though I'm a proud Texan, as my family moved to Houston when I was in elementary school, most of my family continues to call Michigan home. The Flint water crisis was personal for us.

My aunt, a dental hygienist, volunteered and delivered water to Fling residents after the story broke. She understood the heart wrenching fear a mother would experience when she found out

her child had been drinking contaminated water. She understood the outrage of her home community when they found out that the government they trusted did not care enough to keep their drinking water safe. She understood what it might feel like to have a fundamental safeguard, like clean water, suddenly disappear.

But the water crisis in Flint did not disappear when it left the nightly headlines. Just last week, my mom went to her favorite hotdog shop in Flint and sent me a photo of a poster from the restaurant. It was an advertisement for healthcare, aimed at mothers of children who grew up drinking contaminated water. My mom was devastated.

And though the Flint water crisis is more salient and more visible than this proposed rule, the impacts are far too similar. For decades the EPA has relied on first-rate science to establish protections for our air and water, and most importantly for our public health.

It is because of these safeguards that I

have never experienced the type of pollution my mom describes from her childhood. It is because of incredible researchers and scientific discoveries that many of our communities will never experience a water crisis like Flint is still experiencing. It is because EPA regulates lead in our drinking water, and arsenic in our drinking water, and the many other contaminants that harm our most vulnerable populations that my friends and I grew up in a healthy environment.

It is because EPA has a responsibility to seek out and utilize the best available science at every step of the way, that the next generation of children will be protected from threats to their health as well.

Yet right now, in 2018, when our science has never been more advanced, and when EPA is considering revising the Lead and Copper Rule for drinking water, EPA would choose to voluntarily ignore the best available science. This proposed rule would severely limit the studies on which EPA could rely. It would threaten the enormous amount

that EPA and engaged citizens have accomplished, and it would hamstring any progress we hope to make in the future.

This rule isn't about transparency, and it was not developed with people like my family and me in mind. For the safety of all of us and for future generations, I respectfully ask that this rule be withdrawn. Had this rule been in place decades ago, more communities might be suffering from the same threats to public health that Flint is now facing. Many of EPA's drinking water standards rely on epidemiological studies. Often these studies last decades and follow hundreds, if not thousands of patients, collecting confidential health data, as well as other personal data, like the people's addresses, ages, and genders.

For most of these studies the underlying data cannot be made public, even in redacted form, without sacrificing the participants' privacy. These studies are monumental and state of the art. These are the studies that EPA should hope to rely

on, not the type of studies the EPA should shun. These are the studies that will guarantee that communities don't suffer from the devastating impacts of dirty water and polluted air. Studies like these establish the original limits for lead, and this research continues to essential today.

This proposed rule may seem abstract, but it is anything but that. And it is extremely significant. It will have far-reaching -- far-reaching impacts on the ability of EPA to protect all of us and our families. And it could affect our most important environmental safeguards. It is extremely personal, for my mom, for my family, and for me.

I am here today to ask you to withdraw this proposed rule and recommit to EPA's mission of protecting human health and the environment. Thank you for the opportunity to speak today.

MS. Hall: Thank you. Would Speaker Number 22, Ms. Nsedu Obot Witherspoon, and Speaker Number 23, Joanne Zurcher, please come up to the speaker's table. And Speaker Number 24, Michelle

Endo and Speaker Number 25, Jenny Xie, I think, please take a seat at the on-deck chairs.

[Substitution of panel members.]

MR. ROBBINS: Good morning. I'm Chris Robbins. I'm the Acting Deputy Assistant Administrative for Management in the Office of Research and Development.

MS. ORME-ZAVALETA: Good morning.

MR. ROBBINS: Thank you.

MS. DOA: Good morning. My name is Maria Doa , I am in the Office of Research and Development.

MS. WITHERSPOON: Good morning. I'm Nsedu Obot Witherspoon. I'm the Executive Director for the Children's Environmental Health Network. My name is spelled N-S-E-D-U O, B as in boy, O-T W-I-T-H-E-R-S-P-O-O-N.

For over 26 years, the Children's Environmental Health Network, also known as CEHN, has been a national voice committed to protecting all children from the harmful effects of environmental hazards, and to promoting a

healthier environment.

CEHN educates decision makers and advocates for evidence-based child protective policies. We also ensure that those who care for children, personally or professionally, have the information they need to take the steps to reduce children's exposures to harmful toxicants.

As the Executive Director, and on behalf of CEHN, I appreciate the opportunity to provide these comments on the EPA proposed rule, "Strengthening Transparency in Regulatory Science."

CEHN is strongly opposed to the rule and is concerned that it will adversely affect EPA's ability to use the best available science in decision-making, and negatively influence existing and future protections for children's health, such as clean air, clean water, and the prevention of toxic exposures.

The exposed rule sets transparency standards that are too rigid and impossible to meet. It requires that all data used in

rulemaking be publicly made available, and allows EPA to exclude data that relies on confidential patient information. Critical studies which have led to significant advancements in protective policies, for example from the NIEHS, EPA's Children's Environmental Health, and Disease Prevention Research Centers may very well be excluded.

The scientific research that EPA uses already undergoes a long-established transparent review process, and makes available the scientific studies it relies on to inform policy. Sometimes studies contain private medical data that legally can't and should not be made public. In those cases, independent review bodies have also examined the studies and weighed in on the research. No legitimate reason exists to exclude those studies and their critical important findings.

Health based research involves people and often the collection of private information. There are no systems in place to protect this

information. The federal government must continue to protect private information about patients, and not allow this information to be made public. Otherwise, patients will not participate in these important studies.

Further, redacting personal information actually sounds easy, however, it is cumbersome and quite costly. EPA will not likely have the resources to redact personal information resulting in exclusion of critical studies.

The proposed rule would restrict EPA's ability to set regulations informed by confidential data that cannot be replicated. This is of serious concern because for many older, long-standing landmark studies, the original data sets were either not maintained, or stored in out of date formats. These could be eliminated under this proposed rule.

The proposed rule could block the use of studies on the harmful impacts of toxic exposures and pollution. Studies which were instrumental in the Clean Air Act, the Safe Drinking Water Act,

and the -- excuse me, Food Quality Protection Act, among many others. We do request that you withdraw this proposal, "Strengthening Transparency and Regulatory Science." If the proposed rule is implemented, an inevitable consequence is that children that could have been protected from chemical exposures will lose those opportunities.

Irreversible damage to children in their growth and development, loss of intelligence, behavior modifications, and overall life achievement is the future ahead, and I would hope, not the legacy that this EPA would like to preserve. Thank you very much.

MR. ROBBINS: Thank you.

MS. ZURCHER: My name is Joanne Zurcher, J-O-A-N-N-E Z-U-R-C-H-E-R, and I'm representing the National Environmental Health Association.

Good morning. Thank you for the opportunity to speak to you on behalf of the environmental health professionals from across the country who've vigorously opposed the Censoring

science rule.

My name is Joanne Zurcher, and I am the Director of Government Affairs for the National Environmental Health Association, NEHA.

Environment health is profoundly local. Simply put, it's the cleanliness of the water from the kitchen faucets. It's the safety of the food we feed our families, our friends, and ourselves. It's the air the children breath during the 1,600 hours they spend inside their schools. It's the cleanliness of our community beaches that our families are spending the summer enjoying.

When things go well, environmental health is not on the front page of the *New York Times*, because environmental health professionals keep us safe every single day.

NEHA has over 7,000 members. Our members anticipate, recognize, evaluate, and control hazards that are likely to cause harm, serious illness, or even death to American families. Examples include lead, radon, legionella viruses, harmful algae blooms, PFOA, PFOS, Zika viruses,

and many other natural and man-made risks. Our members possess strong science and math backgrounds. They must take over 30 units of undergraduate math and science just to sit for our exam. They have the unique ability to work with clinical and nonclinical professionals. They know and work with the regulated community. They are credentialed members of the profession, and the NEHA credential is considered the gold standard.

EPA science is the foundation for informed decision-making for our members. Our members turn to the EPA for best practices. Our members rely on EPA research to promote their community's health.

Our communities see EPA as the shelter of scientific certainty in an era of uncertainty. Our members rely on EPA expertise, whether it's continuing -- excuse me, containing mercury spills in their homes, setting standards to keep toxic chemicals out of drinking water, or cleaning up super fund sites, just to name a few of the few activities we do together. EA professionals work

closely with the EPA every step of the way.

The EPA has administered successfully, the Clean Water Act, and the Clean Air Act, and these acts should be expanded based on scientific research. The EPA should not be working to undermine scientific research. Instead, this EPA should be working to provide running water to the 630,000 American families who do not have running water in their homes.

Let's be clear, this proposed rule undermines the EPA's mission to protect human health. Now is not the time to compromise health of our nation by casting a shadow of uncertainty on the integrity of the EPA -- of EPA's research.

EPA research is globally recognized as the foundation for informed decision-making that affects every person the plant. NEHA and it's 7,000 members are in every community and territory in the nation. Every EH professional relies on EPA research to ensure constituents meet human -- meet their human potential.

The current research system works, which

at once protects the identity of every research participant, while promoting the health of every American. Health research sometimes includes sensitive data from patients, such as medical history and geographic location, which must be continued to be private and protected. Crucial volunteers will cease to come forward for scientific research if their medical history and geographic information will be made public, thus putting critical scientific research at risk. Please do not destroy a national gem, our EPA research, because you, your family, and your community deserve no less than a fully functional research system that protects and identifies research subjects while promoting the health of the nation.

NEHA and the environmental health professionals from across the United States vigorously oppose the censoring scientific rule. Thank you for this opportunity to be heard on this important topic, and please remember, do no harm.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 24, Michelle Endo, and speaker Number 25, Jenny Xie, come up to the speaker's table. And Speaker Number 26, Ann Mesnikoff, and Speaker Number 27, Roy Gamse, please take a seat at the speaker's -- well, at the on-deck chairs.

Speakers are reminded to speak into the mic and state your organization.

MS. ENDO: My name is Michelle Endo, E-N-D-O, and I'm speaking in a personal capacity, but I'm an intern at the Environmental Defense Fund.

So my name is Michelle Endo, and I'm a second-year student at Georgetown Law. I'm also a legal intern at the Environmental Defense Fund here in Washington, D.C. I'm here today to offer comments on my own behalf and to present my grave concerns with EPA's proposed rule, "Strengthening Transparency in Regulatory Science."

I'm a fourth generation Southern Californian who lived the first 18 years of my life in Northern Los Angeles County. And while I'm proud to be from the Golden State, it also

means that I grew up breathing some of the worst air pollution in the nation. Despite tremendous improvement, 70 percent of Californians live in an area with unhealthy air. As a result, I also grew to be familiar with the dangers of air pollution and the importance of health-protective regulation.

My family lives in a town that, like much of LA County, is in the United States 98th percentile for tropospheric ozone, according to EPA's own Environment Justice Screen.

Tropospheric ozone, commonly referred to as smog, is the visible layer of air pollution that gives LA sunsets their famous striped hues. Several studies have consistently reported there is a significant association between ozone pollution and premature death. According to the American Lung Association, long-term exposure to ozone pollution is also linked to developmental harm, reproductive harm, cardiovascular harm, and increased susceptibility to infections.

While I never had a snow day before

moving to D.C., like most SoCal kids, I'm very familiar with bad air days. Instead of playing outside and building snowmen, children in Southern California lose all outdoor playtime on bad air days in order to avoid the harmful effects of smog. Coughing, impaired athletic performance, eye irritation, chest pain, nausea, headaches, and respiratory congestion.

Smoggy days can also worse asthma, heart disease, bronchitis, and emphysema.

My sister and I enjoyed the early years of childhood with fewer complications relative to my neighbor peers. But before even starting high school we both had missed days of school for nose bleeds that were likely triggered by the irritating smog that settled in the valley, and because ozone forms by the interaction of sunlight with hydrocarbons and nitrogen oxides emitted from cars and trucks, bad air days tended to worse each year, our Southern California summers, broke standard heat records of years before.

Shortly after my sister joined the high

school soccer team, my family started to notice that her once limitless stamina on the field was wearing down. One particularly hot and hazy day, she had no choice but to walk off the field in the middle of the match. Clutching her chest, she struggled to breath. We later learned that she had developed asthma from LA's unhealthful smog, like many of our friends and family in the area.

It was experiences like this that motivated my decision to study environmental policy in college, and that continued to drive my legal career. Having witnessed first-hand the way in which the geography of where one lives, plays, learns, works, and grows determines one's health outcomes, I could not have chosen another path in good conscience.

When I first chose this path, over eight years ago, my hope was to strengthen the laws and regulations that did not go far enough to protect my family and our environment.

Under the Clean Air Act, EPA was required to establish and regularly update federal

standards for hazardous air pollutants, including asthma-causing particulate matter and ozone. These standards and the National Ambient Air Quality Standards or NAAQS, form the backbone of our nation's air quality protections. Although the NAAQS did not prevent my sister's asthma, they have and continue to bring about substantial improvement in our nation's air quality since their first formulation.

The EPA's proposed rule would have excluded peer review studies that form the scientific basis of NAAQS. For example, peer reviewed studies would be excluded because the underlying data and models cannot be disclosed, even in partial form. In fact, the standards would not have been issued had the proposed rule been in place when they were first enacted in the 1970s, because EPA would have tossed out the underlying studies, tying its hands from taking action in imminent public health concerns.

Without a doubt, many more Southern Californians would have had their lives altered,

or even cut short by dangerous levels of air pollution.

If adopted, the proposed rule would deprive EPA policy makers from real world evidence and studies that are vital to the EPA's review of the NAAQS into the future. Further, the proposal directly contravenes the comprehensive federal and state regulatory program congress envisioned when drafting the Clean Air Act of 1970. It reduces our public health legislation to mere declarations, as EPA would severely delayed if not rendered entirely unable to establish future standards using the best available science.

Generations before me, through legislation like the Clean Air Act, recognize that public health and environmental pollution required strong federal leadership and expert agencies like EPA. Departing from the Agency's practice of scientific review for over the last 40 years, practices aligned with national and intergovernmental bodies, like the Royal Society of Medicine, and the World Health Organization,

jeopardizes EPA's ability to utilize its expertise with high cost to people's health.

It is therefore troubling that the Agency has proposed to take this action under the guise of scientific integrity without consulting its own panel of scientific experts, the Science Advisory Board, and against the advice of leading scientific journals and organizations. It is even more troubling when considering the Agency's recent practices toward the public and the press, which have been far from transparent.

To me, it is clear the proposal's purported goal of transparency is a pretext for the Agency's attempt to shirk its statutory command. For the health of my sister, my friends, and all Americans, I urge EPA to abandon this proposed rule. Thank you.

MR. ROBBINS: Thank you.

MS. XIE: Good morning. My name is Jenny Xie, J-E-N-N-Y, last name X-I-E, and I'm a policy intern at the Environment Defense Fund, but I'm here today speaking from a personal capacity to

express my personal opposition to EPA's proposed rule, "Strengthening Transparency in Regulatory Science."

Many of the activities that I am involved in on campus involve holding the university accountable for its environmental goals that it has set. I'm currently a student at Cornell University, studying English and Environmental Sustainability Sciences.

In fact, one of the main initiatives that I am involved in calls for the University to disclose as a financial investments and fossil fuels in order to increase transparency, have accountability, and maintain integrity as it works towards its carbon neutrality. It is therefore incredibly disheartening to hear that this EPA administration is championing a proposed rule that claims to be for increased transparency, when in fact the purpose and the fact of the proposed would be to bar EPA from considering rigorous public health science and reduce the transparency of EPA's scientific analysis.

The proposed rule would require the EPA base some of its most important regulatory decisions only upon does response studies where the underlying data can be disclosed. The reality is that key scientific studies backing our nation's critical clean air safeguards which protect our health and environment are based on confidential patient data that in many cases cannot be disclosed in any form.

These rigorous peer-reviewed state of the art studies could be improperly discarded should this rule be finalized. As many scientists have noted, this would undermine and not promote the use of sound science in EPA decisions. Just because the data underlying a study isn't published does not mean that the study cannot be verified using other means.

For example, the American Cancer Society's Cancer Prevention Study II, tracked air pollution, exposure, and personal medical histories of nearly 670,000 people for more than two decades to understand the exact risk of air

pollution on death.

The study was based on private patient information that cannot be publicly disclosed, and yet the study has been subject to reanalysis and its conclusions have been upheld. And allowed under the scientific journal does response, the authors listed 16 key studies alone which supported the original conclusion of the Cancer Prevention Study 2.

Even more concerning is the fact that the proposed rule provides the administrator with broad discretion to make exception to the policy on a case-by-case basis. Former Administrator Pruitt may be out of office now, but Acting Administrator Wheeler's record as a fossil fuel lobbyist for corporations like Murray Energy leaves me and others incredibly skeptical that this rule would be applied fairly with no concrete criteria guiding decision to grant an exception.

This part of the proposal raises a serious risk that this or future administrations could selectively waive the policy to build a

distorted scientific record that is designed to reach a desired result. In fact, just a few weeks ago I was in Pennsylvania where I'm from, talking to an Uber driver. He's a father with a daughter who has asthma, and we talked about the EPA. He had worked in public service before and expressed to me how frustrated he was with the current administration, with the EPA, and how it seemed that despite the endless promises the administration has made to protect its citizens and better our lives, many of those promises were not being fulfilled.

I can't help but think how disappointed he would be if he knew that the EPA has proposed a rule which will make it more difficult for EPA to use the best science to protect the health of him and his family. Citizens are watching and aware, from parents, to scientists, to students like me who advocate for good policy on their own college campuses.

The EPA hastily shuttled this rule past even the OMB, but it must pause to hear the

concerns of the public. EPA's proposal will lead to censored science, not transparent science. Thank you for the opportunity to testify on the proposed rule today.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 26, Ann Mesnikoff, and Speaker Number 27, Roy Gamse, come up to the speaker's table. And Speaker Number 28, Jennifer Sabb (sic), and Speaker Number 29, Paul Miller, please take your seat at the on-deck chairs.

MS. MESNIKOFF: Hi. I'm Ann Mesnikoff. It's M-E-S-N-I-K-O-F-F, and A-N-N, no E.

Good morning. I'm Ann Mesnikoff. I'm the Federal Legislative Director for the Environmental Law and Policy Center.

ELPC works throughout the Great Lakes and the Midwest, protecting public health and special places under the belief that environmental protection and economic development can be achieved together.

ELPC appreciates the opportunity to

testify in opposition to EPA's proposal to censor, or otherwise constrain the science it will consider in issuing essential standards that are meant to protect public health and our environment. The Midwest and the Great Lakes region, with its industrial and agricultural heritage is impacted by environmental and public health challenges to air, land, and water, and we depend upon EPA to effectively implement environmental laws to protect the public and our environment.

There is no basis in existing bedrock environmental laws that authorizes EPA to limit science considered in rulemaking processes. EPA cites several key laws in its justification for this proposal. Nowhere in the cited statutes is there a basis for demanding access to raw data, nor does this relate sensibly to any definition of best available science. Rather, this undermines the use of best available science called for in environmental statutes, including the Clean Air Act.

Further, there is no basis for politically appointed administrators to choose which science will be considered, and which may not be. EPA should continue to apply the rigorous standards the Agency has used for decades, and that stakeholders engage in the process that is full and open with regards to science.

EPA's Science Advisory Board voted to review this action during its June 1st meeting. This proposal has also prompted, as we've heard today, vehement reaction from the scientific community. EPA's proposal is not about transparency. It is about undermining public health. The negative effects of this proposed rule on EPA's programs could be far reaching across the Midwest. Midwesterners are exposed to unhealthy levels of air pollutants, including particulates, ozone, and toxic emissions from our industries and agricultural operations.

Achieving and maintaining health air to breath remains a challenge. EPA just finalized not attainment designations for Midwest's biggest

cities. There are millions of people -- where millions of people live, work, and play. Foundational studies about the impact of air pollution to public health are essential. These studies have been reviewed numerous times. Yet, under EPA's proposal, they would be ruled out of bounds, compromising the Agency's ability to truly assess the impacts of air pollution and to set standards are a level that will protect public health as the Clean Air Act requires.

Weaker standards will mean dirtier air in our communities. The elimination of these studies would also skew the evaluation of cost and benefits, leading to less protective rules that will not be based on a true accounting of the public health costs of pollution. We're also concerned about how EPA's proposal to censor science will impact a range of other significant concerns across the Midwest and Great Lakes, from using the best available science and its review of toxic -- the toxic insecticide, chlorpyriphos, the impacts of growing problems of harmful algael

blooms in Lake Erie and other places across the Great Lakes on public health, and in setting standards for lead in water, soil, and in homes.

EPA has shown time and again that achieving cleaner air, and water, and a healthier environment go hand-in-hand with economic growth. Our children's health across the Midwest depends on EPA continuing to do its job and not let industry-driven agenda undermine its essential role. We respectfully ask EPA to withdraw this proposal. We will be submitting more detailed comments to the record. Thank you.

MR. ROBBINS: Thank you.

MR. GAMSE: I am Roy Gam -- I am Roy Gamse, G-A-M-S-E, no S on the end. Formerly EPA Deputy Assistant Administrator. Reading the comments of John Bachmann of the Environmental Protection Network. He served EPA for 33 years, was Associate Director of Science Policy and New Programs for the Office of Air Quality Planning and Standards.

John's comments. "I appreciate the

opportunity to provide the comments on the proposed rulemaking on strengthening transparency on behalf of EPN. EPN will submit the detailed written comments on the proposal later."

"This proposal would not strengthen transparency of regulations. Instead, it would preclude the assessment and use of best scientific information available as required by all major statutes administered by EPA. The process by which it was developed, the misuse of references that ultimately do not support its arguments and the lack of specifics, what EPA actually intends to do are an embarrassment to the agency."

"The new acting administration should withdraw it from consideration as soon as possible. EPA's proposal is a solution in search of a problem. A proposal asserts it's dealing with a replication crisis, but does not cite a single instance where a study used by EPA for any type of major rule was shown to be flawed due to a lack of access to the underlying data. In fact, EPA and the industry funded an independent

reanalysis of the two air pollution studies that were criticized for not releasing confidential health information, and both were successfully reproduced with the results published in 2000. Moreover, their key findings have been replicated dozens of times since then by other investigators using different health and air quality data."

"The proposal to exclude important peer reviewed studies is wholly inconsistent with scientific practice and EPA's past use of science and regulatory decisions, where studies with novel results appear, EPA's assessments have noted limitations and some cases supported reanalysis."

"EPA's science policy related assessments are, themselves, peer-reviewed by the SAB or CASAC to further ensure study evaluations consider all of the relevant scientific literature."

"As noted by the SAB workgroup, the EPA's proposal downplays valid concerns about the risks of providing access to the confidential information of subjects in epidemiology studies. The SAB group noted some of the largest most

useful health effects data sets cannot be made fully public because certain personal information of age, sex, health, and location could be used to identify participants, or because of agreements made with study participants in advance."

"EPA failed to mention various ways to assess the validity of fire epidemiology studies without access to data, nor that the rule may preclude continued use of studies published many years ago."

"The proposal includes a provision for the administrator to waive this requirement. No clear decision criteria provided to allow EPA scientists and stakeholders to understand when and how the waivers would be granted. It appears that requirement could be applied in an arbitrary and capricious manner that does not reflect sound science judgment. Critical decisions like these must be made on the basis of science, not politics. Otherwise, highly relevant studies for which data can't be publicly shared, even if published in the best peer reviewed journals and

replicated may be judged to be inherently untrustworthy."

"The rushed, mostly secret process EPA followed in developing the proposal displays a complete disinterest in transparency, much less in science. In developing this proposal EPA leadership did not provide a role for zone career science experts in crafting the proposal, never included the rule on its regulatory agenda, did not notify of consult with the SAB, much less request the review as required by law. Did not solicit the advice of the NAS on provisions that would change does response models used in risk assessment from those previously recommended by NAS, did not ask for review to solicit the views of other federal agencies that conduct research or use health effect science in developing regulations. Finally, the Agency originally only allowed a 30-day comment period on this remarkable unvetted departure from the past practice."

"In suggesting potential cost of the rule would be minimal, EPA ignored the cost to

researchers who would have to pay to set up and maintain data sharing for their previously published studies to be considered, to EPA for conducting the multiple reanalysis required in Section 30.6 of the rule, and to public health for the disbenefits of undermining existing regulations. Having done no assessment, EPA has no basis for its claim that the benefits of the rule exceed its cost. Scientists and scientific publications that EPA cites as evidence for support for this rule have rejected the proposal's preemption of existing studies based on availability of raw data. Professor John Ioannidis reacted strongly to the proposal in an editorial noting that, quote, 'If the proposed rule is approved, science will be practically eliminated from all decision-making processes. Regulation would then depend uniquely on opinion and whim.' End quote."

"Editors of four major scientific journals whose policies EPA cited as support jointly stated, quote, 'It does not strengthen

policies based on scientific evidence to limit the scientific evidence that can inform them. Excluding relevant studies simply because they don't meet rigid transparency standards will adversely affect decision-making processes.'"

"Finally, EPA should immediately withdraw this flawed proposal from consideration, given the fatal flaw of establishing unnecessary regulation for science assessment that would elevate transparency over any other criterion. We're unable to offer any suggests for improving it."

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 28, Jennifer Sabb (sic), and Speaker Number 29, Paul Miller, come up to the speaker's table. And Speaker Number 30, Matthew McKinzie and Speaker Number 31, Anne Mellinger-Bird (sic), take a seat at the on-deck chairs.

Please remember to speak into the mic and state your organization.

MS. SASS: Hello. My name is Jennifer Sass, S-A-S-S. I'm with NRDC, the Natural

Resources Defense Council.

And I'm here to talk about the concern that scientists and environment health and medical professionals have with this rule. In one of his last acts of aggression against the public before resigning, the corrupt and disgraced EPA Administrator Scott Pruitt, proposed the rule to restrict the scientific studies that EPA could rely on to set safety standards for toxic chemicals.

Ironically, the rule is called science transparency when in truth public health will be seriously harmed. That's why over 40 doctors and scientists released a letter today which was submitted to the docket, raising alarm about the rule and the harms that it would bring about.

In the letter, they say as scientists and health professionals we recognize the importance of data sharing and replicability in scientific practice and discourse. The experts are part of Project Tender, and their letter is also publicly available.

They say the proposed rule is about stiffing science used by EPA, not improving it. They all have careers devoted to protecting children and their families from exposures to neurotoxic chemicals. They say the proposal could also undercut existing safeguards. Regulations that have led to protections against toxic air pollution, lead and drinking water, and dangerous pesticides, such as chlorpyrifos.

Dr. Phil Landrigan, a globally renowned expert on childhood harm from chemical pollutants warned that if you implement this proposed rule the inevitable consequence is that chemicals with potential to damage children's brains and nervous systems will remain longer on the market, and many thousands of children born, and not yet born, who could have been protected against these chemicals, will be unnecessarily exposed. Brain damage with loss of intelligence, disruption of behavior, and diminished lifetime achievement will be the result. Is this the legacy that EPA wishes to leave for America's children?

The Economist also wrote about the rule, very bluntly in an article titled, "Swamp science: Scott Pruitt embarks on a campaign to stifle science at the EPA." In that *Economist* article they emphasized that the proposal rule is really about blocking information used by EPA to protect our health. The rule prohibits the Agency from setting regulations that are supported in part or whole by data that is not publicly available for reanalysis or that cannot be replicated. It will hamstring EPA's use of scientific information, which could only harm EPA's work quality and public credibility.

There are many reasons why a study cannot be made fully public or replicated. For example, the original raw data may no longer be -- exist. Or the original exposure conditions may no longer exist, such as lead exposures from leaded gasoline, and patient protection and privacy rules may prevent full disclosure of the raw data, or information. EPA already has long-established and transparent methods for evaluating data in these

situations.

This rule would block the studies used to set air pollution regulations that will have prevented more than 30,000 premature deaths by 2020, with benefits valued at 30 times the cost of the Clean Air Act, according to EPA scientists and technical experts.

The rule would also block the studies that protect children from lead poisoning in air, water, and soil, and would block the studies of harmed children that support an EPA proposed ban on the neurotoxic pesticide chlorpyrifos, which President Trump and former Administrator Pruitt have already rolled back those proposals.

This may be the most unpopular proposal from an already unpopular EPA administration to date. It is a rule that fundamentally purports to solve a problem that doesn't exist, and it should be abandoned. It cannot be fixed. Thank you.

MR. ROBBINS: Thank you.

MR. MILLER: Hello. My name is Paul Miller. It's M-I-L-L-E-R. I am Deputy Director

of the Northeast States for Coordinated Air Use Management, or NSCAUM. NSCAUM is the regional association of state air agency air quality control agencies in Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Rhode Island, and Vermont.

My comments today reflect the majority view of NSCAUM's members, while individual members may hold some views different from the majority consensus.

In sum, we are concerned that should this proposal lead EPA to not fully consider the best available science in rulemakings, it will endanger public health and the environment.

The EPA invokes strengthening transparency as a primary driver for this proposal, but fails to describe how a perceived lack of transparency has hampered past rulemakings. It provides no examples of work, quote, "EPA has not previously implemented these policies and guidance in a robust and consistent manner," end quote, nor what are the specific

quote, "Agency culture and practices regarding data access," end quote. That requires changing.

The Agency also provides no cost analysis of this proposal. Without additional clarity from EPA we are having difficultly identifying the problem EPA seeks to address. Therefore, for the following reasons we request that EPA withdraw the proposed rule.

First, the proposal is too vague as written to provide the public with meaningful opportunity to comment. EPA solicits comments across a long list of topic areas, but fails to provide the Agency's own sufficient detail and rationale on the solicited comment areas as required by the Administrative Procedure Act.

We are left to speculate on EPA's views, and on those of other commenters that would presumably shape EPA's final rule. It is well settled law that this approach fails to provide adequate notice for informed public comment.

Second, EPA must describe how the proposed text in Sections 30.5, 30.7, and 30.9

affect current practice. Section 30.5 states that the Agency shall ensure that those response data and models underlying pivotal regulatory science are publicly available in a manner sufficient for independent validation.

Section 30.7 states, EPA shall conduct independent peer review on all pivotal regulatory science used to justify regulatory decisions. EPA, however, does not describe what constitutes in its view, independent validation and independent peer review.

Furthermore, Section 30.5 includes qualifying language that EPA will take all reasonable efforts to make data available unless it is not possible due to other constraints, such as legal protections of privacy and confidentiality.

EPA provides no examples of where and how, in the Agency's view, past rulemaking specifically failed to make these same efforts, nor how EPA would change past practice in this context. Adding to the vagueness of Sections 30.5

and 30.7, Section 30.9 would provide the administrator with broad authority to exempt regulatory decisions from the proposed disclosure provisions on a case-by-case basis if he or she determines that compliance is impracticable. The proposed rule fails to provide specific criteria for determining when compliance is impracticable.

Lacking clear guidelines for transparent decision-making, the administrator's discretion would appear to be unbounded in application and potentially based on haphazard and non-transparent rationales.

Third, EPA has provided no meaningful cost estimate for the proposed rule. The costs are likely quite significant, however, based on a congressional budget office cost estimate of the similar congressional proposal.

In addition to lack of cost information, EPA offers no accounting of foregone benefits should a broad application of this proposal limit the use of the best available science in setting public health standards and preventing adverse

health outcomes.

In conclusion, EPA's proposal has far-reaching consequences on the future use of science by the agency. These consequences, however significant they may be, are indeterminate in light of the proposal's vagueness. The proposal fails to clearly articulate the problem EPA seeks to address, the specific proposed rule requirements, and its cost and benefits.

These are well understood and basic elements that federal agencies must include to ensure informed public comment. Given that these elements are missing from this proposed, EPA should withdraw it. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 30, Matthew McKinzie and Speaker Number 31, Anne Mellinger-Bird (sic) come to the speaker's table. Would Speaker Number 32, Erica Bardwell, and Speaker Number 33, Jennifer Reaves, take a seat at the on-deck chair.

MR. McKINZIE: Good morning. I'm Matthew

McKinzie, M-C-K-I-N-Z-I-E. I'm a nuclear physicist with the Natural Resources Defense Council, NRDC, and I'm very pleased to talk today about this proposed rule. My remarks will focus in on the radiation protection aspect of the proposed rule.

NRDC, just as background, is a national non-profit organization of scientists, lawyers, and environmental specialists. We are dedicated to protecting the public health and the environment.

NRDC has been engaged with the environmental issues surrounding nuclear energy and nuclear weapons since our founding. There's something strange about the proposed rule in that it does not use the word radiation, and it does not cite the EPA's authority under the Atomic Energy Act.

Nevertheless, the language of the proposed rule seems to clearly implicate radiation protection standards. In particular, appears to undermine the basis, a fundamental basis of

radiation protection standards, the linear no-threshold dose response model. And so that's what I'll focus on with my five minutes.

The science in radiation epidemiological studies has repeatedly demonstrated over decades that linear no-threshold dose response, LNT, provides the most reasonable description of the relation between the low dose, low radiation dose exposure, and the incidence of solid cancers that are induced by that ionizing radiation.

EPA bases its regulatory limits and nonregulatory guidelines for population exposure to low-level ionizing radiation on this linear no threshold model. EPA's radiation protection standards are based on the premise that any radiation does carries some risk, and that risk increases directly with dose.

This method of estimating risk is called LNT. For over 40 years, the LNT dose response model has been commonly utilized when developing practical and prudent guidance on ways to protect workers and members of the public from the

potential for harmful effects from radiation in that balance, with commercially justified and optimized uses of radiation. EPA derives the LNT model from reports by authoritative scientific bodies, including the National Academy of Sciences, NAS, the National Council on Radiation Protection and Measurements, NCRP, and other bodies.

The NCRP published its last commentary on the LNT issue only weeks ago, in April of 2018, reinforcing this -- the LNT as the basis for radiation protection standards.

Epidemiological studies of humans provide evidence that is critically important in establishing potentially causal associations of environmental factors with disease. NAS and other studies that EPA has long relied upon in the radiation standard setting process are epidemiological human cohort studies. EPA's proposed rule, if implemented, would limit EPA staff from basing regulatory actions on precisely these types of studies by requiring that the

underlying data of these studies should be publicly shared, fully publicly shared. This would be a nearly impossible task for the agency.

Data for some of the radiation epidemiological studies are accessible to users, with a detailed description of how a user can access the information. However, public sharing of personally identifiable information is restricted. These are profoundly important studies on radiation health effects that have been peer reviewed for decades, and the science that has emerged from them has been validated multiple times. But these are not studies where the entirety of the public data can be shared or independently replicated.

Replication of these studies is impossible as this data comes from individuals exposed to significant, acute, and protracted doses of radiation. Pruitt's proposed rule would throw out the data from the atomic bomb survivors of World War II. That's a profound, very profound thing.

Adverse consequences for EPA would affect federal guidance reports, nuclear field cycle standards and regulations, minimum amount -- minimum allowed concentrations of radiation in drinking water, soil clean up for super fund sites, radioactive waste disposals, as well as the fundamental concept of ALARA, As Low As Reasonably Achievable, in radiation protection standards.

In conclusion, I urge the EPA to abandon the proposed rule as it fundamentally calls into question basic radiation protection standards that are scientifically founded and have protected the public for many years. Thank you.

MR. ROBBINS: Thank you.

MS. MELLINGER-BIRDSONG: Hi. My name is Anne Mellinger-Birdsong, M-E-L-L-I-N-G-E-R, dash, B-I-R-D-S-O-N-G.

Thank you for allowing me to speak today. My name is Anne Mellinger-Birdsong, and I am a fellow of the American Academy of Pediatrics and a specialist in environmental public health. I have worked at city, county, state, and federal public

health agencies, and Indian health service facilities.

I'm here to speak in opposition to this proposed rule and to state that this proposed rule is unnecessary and it would harm EPA's ability to evaluate health impacts of environmental pollutants. It should not be finalized or implemented.

This proposal has wording that makes it appear noble and well-meaning, but it is a sheep in wolf's clothing. This proposal will severely hamper EPA's ability to use past and future research on health effects of human exposure to environmental chemicals and toxicants. It should be withdrawn.

Both the HIPAA and the federal regulations on human subjects research address privacy as a concern of people who participate in research. It's not as simple as redacting data such as name, birth date, medical record number, et cetera. You also have to not have data that can be used to intuit or figure out who a study

subject is. So you have a study of Town A and people who had heart attacks in July. If there is age or zip code data associated with that, the people that live in Town A could figure out, oh, that's Mr. X down the street. So it would really hamper the ability to use data, and environmental health data often has zip code and year and a lot of stuff that can be used to put together and figure out who people are.

So that's how it would work. And I just would like to say also that children have even more health protections than adults because of being smaller, and we have to be more concerned for them. And especially living human subjects of research who will continue to live, we need to be extra careful to protect their privacy. And this rule would either require data made public, or it would prohibit using a lot of data that would enable -- that would inhibit privacy protection.

So also it would decrease people's trust in participating in research if they are fearful of their personal identifiers being released or

people being able to know that they participated in a study. They may not participate, so we would have worse data for studies in the future because of this rule.

And I would like to say that children do not choose where they live, or where they go to school, or what kind of water quality their water they drink is, or the air that they breathe. It's up to we, who are adults, the adults who are their caretakers who choose where they live, and we who set policies to make these decisions to keep children healthy. And this rule would severely harm children because it will throw out a lot of data, and a lot of data that has been used to form, already, established rules.

So I ask, why was this rule proposed? It would eliminate use of scientific studies and hamper future research. The rule was completely unnecessary. We have mechanisms within scientific institutions to transfer data so it's HIPAA compliant and IRB approved, so we can verify research and reevaluate it and confirm it. We

don't need this rule and it is, again, it's a rule that's unnecessary and would hamper and harm EPA's ability to carry out its functions.

So I'm going to end with a quote by a professor from Carnegie Mellon University, Granger Morgan. He used to chair the EPA Science Advisory Board under George W. Bush. He said, "this proposed rule is an attempt by people who aren't interested in using science to find the truth to raise doubts about what, at this stage, is very clearly established and well-reviewed science."

And I urge the EPA to withdraw this proposed rule and not implement it at all.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 32, Erica Bardwell, and Speaker Number 33, Jennifer Rebeb (sic), come up to the speaker's table. And Speaker Number 34, Molly Rauch, and Speaker Number 35, Barbara Gottlieb, take a seat at the on-deck chairs.

Speakers are reminded to speak into the mic and state your organization.

MS. REAVES: Hi. My name is Jennifer Reaves. Reaves spelled R-E-A, V as in Victor, E-S. I represent Moms Clean Air Force, Maryland.

Am I supposed to speak first? Oh, okay.

My name is Jennifer Reaves. I live in Hyattsville, Maryland. Thank you for this opportunity to offer comment. As a member of Moms Clean Air Force, Maryland, I am here today to speak out in opposition to Acting Administrator Andrew Wheeler's attempts to censor science in the name of transparency.

This dangerous censoring sign plan to limit the scientific information EPA can use to identify public health threatens and future and safety of our children. This proposal will essentially require researchers to make private personal medical information public in order for the EPA to use their research in its decision-making.

This proposal also includes loop holes that would exempt industry from having to disclose details of their own studies. It is designed to

favor the fossil fuel and chemical industries, limiting EPA's ability to protect us from toxic pollution and chemicals. High quality science is crucial to understanding the risk of our families face every day, especially when it comes to air pollution and toxic chemical exposure.

This proposal means that many studies on populations, such as elderly, young people, and people of color, groups who are often suffer disproportionately from pollution would be excluded from EPA consideration because making the data public could identify and participating -- identify the participating individuals. Including this important data from consideration means that implementing this proposal could even further exuberate negative environmental impacts on these and other vulnerable communities.

This proposal puts our children's bodies on the line by censoring research, making even low levels of pollution with significant health impacts instead of cleaning up their act. Polluting industries want these kind of studies to

simply disappear.

My family and my fellow Marylanders are counting on the sound and transparent science the EPA has used for decades. And we are counting on our medical records remaining private. I strongly urge the EPA to stop this radical proposal for the health and safety of all Americans. Thank you.

MR. ROBBINS: Thank you.

MS. BARDWELL: All right. Excuse me. Thank you. My name is Erica Bardwell. Can you hear me? Okay.

I am a local registered nurse. I work at a local hospital. I'm also a member of Physicians for Social Responsibility. Thanks for taking time today.

Mr. Scott Pruitt is no longer here as EPA administrator, but it does seem that this proposal preserves the hallmark of his tenure. By that I have to say, I mean a complete lack of shame.

This proposal masquerades as an attempt to strengthen science, and by extension, public health. But this is a bald, even shameless lie.

It would actually make public health research impossible, or much, much more difficult, which obviously is the real point.

If someone can't participate in medical research without worrying that their identities or parts of their medical records are going to be rampaging around the public record, then they simply won't do it. Which again, is the point.

Basically, shameless people say that to themselves behind their scenes. But to us they say that they're really concerned about us and public transparency, but it's not true.

I saw a reference to a replication crisis. Last I heard, the replication crisis was mostly social sciences. There's not a huge replication crisis in epidemiology. Certainly not to the point where basic facts are in doubt. There is no doubt that air pollution kills people, that poison in water makes people sick, that toxic soil grows toxic food. This is not in contention. There's no replication crisis here.

So the only purpose of this rule could be

to avoid adding to the already damning weight of this existing evidence. Basically, to make it cheaper for a few people to literally poison people for profit, which is ultimately a tragedy for everybody.

I think the thinking is that sciencing debates are going to bore the public, and most other people have to work on a random Tuesday. I swapped a shift to be here, but most people don't have that option.

MS. DOA: Can you speak into the mic a little bit more?

MS. BARDWELL: Sure. Okay.

MS. DOA: That's better. Thank you.

MS. BARDWELL: So, the true public interest may not be represented here because people have to work. But if this rule is finalized, the public is going to howl once they actually feel its effects and lose the protection that they need from these studies. And I wouldn't want to be the person left holding the bag when that travesty happens.

Finally, as my grandmother used to say, what sauce is for the goose is sauce for the gander. If exposing personal information is really required to have quality medical research, I eagerly await the day this administration proposes similar restrictions on, say, pharmaceutical research. I wait for the day that Pfizer can't get approval for its nth blood sugar pill without revealing incredibly invasive information about all of its research subjects. I don't think that day is ever going to come, because protecting people or advancing science isn't really the goal.

Thanks for your time.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 34, Molly Rauch, and Speaker Number 35, Barbara Gottlieb come to the speaker's table. And Speaker Number 36, Lyndsay Alexander, and Speaker Number -- is there a Speaker Number 37 in the room? What's your name?

MS. BENDER: Laura Bender.

MS. RAUCH: Hi. I'm Molly Rauch. Name is spelled M-O-L-L-Y R-A-U-C-H. I'm Public Health Policy Director with Moms Clean Air Force. We're a national organization of more than a million moms and dads fighting air pollution and climate change for the sake of our children's health.

Thanks for this opportunity to offer comment. On behalf of our more than 1 million members, I am here today to strongly oppose the administration's attempts to censor the science used in public health decision-making. This intentionally misleading proposal is being sold by EPA leadership as an effort to increase transparency. But the facts suggest that the real motivation is simply to sweep under the rug the scientific evidence disfavored by polluting companies.

The proposal would prevent EPA from using studies that are based on personal medical data, thereby eliminating some of the most important long-term epidemiological studies, investigating the impacts of pollution on public health, and

hundreds of scientists have already spoken out against this proposal.

Indeed, this flimsy proposal was designed without adequate input from the scientific community, according to the members of EPA's own Scientific Advisory Board. It was rushed through the regulatory process. It was originally proposed with a gallingly short public comment period that suggested an intention of casting less light on the rulemaking process, not more.

For a proposal that posits a sweeping change in the health-based rulemaking that is the foundation of the EPA, it was quite the slight of hand.

As a public health expert who has been closely following EPA's rulemaking process for more than a decade, it is evident to me that this is a cynical ploy to bolster polluting industries that don't like the results of longitudinal research.

Who does this benefit? Who really benefits from this charade? I must call it a

charade. Not the families everywhere who want to breathe clean air and drink clean water. Not frontline communities dealing with multiple pollution exposures from many industrial sources. Not the millions of children in the U.S. with asthma across the country whose disease can be worsened by small changes in air quality day to day, not the elderly, not those with underlying health problems whose likelihood of being admitted to the hospital, of having a stroke, of having a heart attack, even of dying, could depend on the levels of particulate pollution in the air. It does not benefit these people.

I have a master's degree in public health. One of the most valuable things that I studied in graduate school was how to evaluate the reliability of epidemiological studies. We learn the importance of considering many different criteria in making these evaluations. Whether the raw data was available to me, personally, to review, was never grounds for automatically discounting the credibility or reliability of any

given study.

The idea that an entire library of research would be rejected wholesale, based simply on that one external criteria, represents a crude approach, to put it kindly.

We also, in grad school, learned about the iron-clad importance of treating study subjects ethically and with respect. And this is a touchstone of public health practice. All research on humans must be approved by institutional review boards, and they prioritize the privacy and consent of study subjects. There are laws about this.

When study subjects are disrespected terrible things can happen, which is why we were required to learn about things like the, "Tuskegee Study of Untreated Syphilis in African/American (sic)Men," when we were in public health school. We cannot go back to the time when the study subject was a mere pawn in someone else's game. Treating study subjects ethically requires protecting their privacy.

Finally, we studied the tactics of polluting industries and their shameful legacy of attempting undermine science, whether it was the tobacco industry or the lead industry, we learned about the deliberate, expensive, decades-long campaigns to protect corporate profits, and meanwhile people were literally dying as a result. This is an old story. We've heard it before, and we're hearing that story again. Public health professionals are trained to recognize history and call it out, which is what we are doing today.

This proposal is an excuse to hamstring researchers to weaken public health protections, and to pad the profits of polluting industries. As a public health professional, as a mother, and on behalf of the 1 million members of Moms Clean Air Force, I strongly urge the EPA to stop this proposal for the health and safety of all Americans. Thank you.

MR. TEICHMAN: Thank you.

MS. GOTTLIEB: Good morning. My name is Barbara Gottlieb, G-O-T-T-L-I-E-B. I'm the

Director for Environment and Health at Physicians for Social Responsibility.

On behalf of our 33 members, I'm here to express our opposition to the proposed rule -- "Strengthening Transparency in Regulatory Science."

The U.S. EPA plays a critical role in keeping our nation and our families safe from environmental exposures that can cause illness and death. We thank you for that - and we count on you for it. Because your role is vital to our health and well-being, the nation relies on you to formulate and enforce the most effective protections possible, based on the best available science. The medical and scientific studies that underlie the EPA's decisions must be objective, vetted, and present a full and accurate assessment of the threats to health posed by the pollutants under study.

To provide those full and accurate assessments, studies need to relate exposure levels to actual health outcomes in real human

beings, and to amass large data bases so that researchers can draw valid conclusions.

In order to have reliable data and large sample sizes, researchers frequently study the records of patients treated in hospitals. Hospital records, of course, include personal identifiers, and disclosure of those identifiers would violate privacy and confidentiality laws. Thus, the best available data for many health studies cannot be - in the literal sense -fully and openly shared.

However, to refuse to consider scientific studies simply because they include personal identifiers -- would be a great mistake, nor is it necessary. Reviewers wanting to reproduce a study in order to validate it can arrange to have confidential access to key data. Furthermore, scientists can assess the merits of published research without seeing its data by considering such published features as the study's research design, the methods used for data collection and analysis, and comparison with previous results.

In any case, to exclude credible peer-

reviewed scientific studies because the personal identifiers cannot be released under the law, is to exclude from the EPA's consideration many important and valid studies. This would greatly hamper our ability, your ability, to understand the impacts of serious, even deadly, pollutants.

I'd like to cite, as example, three studies that could be lost to consideration under the proposed rule, on a topic I haven't heard referred to today. These studies reveal statistical correlations between exposure to emissions from fracturing, or fracking, for oil and gas, and serious health outcomes.

So the first is a study by University of Pennsylvania and Columbia University researchers and published in 2015 in the journal, *PLoS ONE*, found that drilling and fracking activity in Pennsylvania was associated with increased rates of hospitalization for cardiology, neurology, cancer, skin conditions, and urological problems.

In communities with the most wells, the rate of cardiology hospitalizations was 27 percent

higher than in control communities with no fracking. These findings are obviously of great concern; we would not want them to be lost to the EPA as you consider regulation of fracking related emissions.

Yet because the data includes such things as patients' names, diagnoses, addresses, and zip codes, this valuable study could be, under the proposed rule, excluded from EPA consideration.

Another study conducted in Pennsylvania between 2005 and 2012, found that living near fracking operations significantly increases asthma attacks. This study was conducted by researchers at Johns Hopkins University and it was based on a study of 35,000 medical records of people with asthma. This is just the sort of study that we want EPA to base its health-protective regulations on: a robust database conducted by researchers at a respected institution and published, as this one was, in the *Journal of the American Medical Association Internal Medicine.*

Yet should the proposed rule be adopted,

this study could be disallowed because its 35,000 medical records cannot easily be scrubbed of personal identifiers.

Third example, a study by the Johns Hopkins Bloomberg School of Public Health and other researchers, used data from the Geisinger Health System on over 9,000 pregnant women and their over 10,000 newborns between January 2009 and January 2013. The researchers found that the pregnant women who live near active fracking operations in Pennsylvania were at a 40 percent increased risk of giving birth prematurely. Premature birth is the leading cause of infant death in this country.

So we're talking about data that indicate that fracking operations could put newborn babies at risk of death. This was a study published in the peer review journal, *Epidemiology*.

Our families should have the benefit of these studies and many more that might be disregarded under the proposed rule. To exclude them would be to weaken the scientific record and

undercut an accuracy and strength of EPA's regulatory process, and to endanger human health.

For that reason, Physicians for Social Responsibility opposes the proposed rule. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 36, Lyndsay Alexander, and Speaker Number 37, Laura Bender, come up to the speaker's table.

And would Speaker Number 38, Liz Borkowski, and Speaker Number 39, Janice Nolen, take your seat at the on-deck chairs.

MS. ALEXANDER: Good morning. My name is Lyndsay Alexander, A-L-E-X-A-N-D-E-R. I direct the National Health Year Campaign at the American Lung Association. I am also the mother of a thriving toddler, who like all children, deserves healthy air to breath, and safe water to drink that won't make him sick or die prematurely.

I am here to ask EPA to withdraw this proposed rule because I'm very concerned that rather than foster transparency in regulatory

science, this rule promotes a callous effort to suppress and censor the science used to inform EPA policy to the detriment of millions of Americans' health and well-being.

EPA's ability to effectively fulfill its mission and protect public health from dangers, such as air pollution, hinges on the ability of its scientists to first evaluate the best available scientific evidence of the health threats of air pollution. Recognizing that scientists' understanding of the relationship between air pollution and public health would continue to evolve, congress wisely required EPA to review the latest evidence and revise air pollution limits for six key pollutants every five years. And then to work with states to reduce pollution to meet the limit.

While more work remains, this basic approach has worked exceedingly well at reducing ambient air pollution, saving lives, and improving health by preventing asthma attacks, heart attacks, and many other negative health outcomes

from air pollution.

This proposed rule would require EPA to exclude many of the best available peer-reviewed and rigorously scrutinized studies from consideration during decision-making, such as its upcoming air quality standard reviews for ozone and particulate matter.

Excluding studies for which raw data are not available due to concerns over patient confidentiality, or which do not meet vague standard of reproducibility because studies were conducted over long periods of time, or connected to real world events beyond the control of researchers, would greatly narrow the body of evidence and the quality of the information that EPA can consider. This would undoubtedly lead to weaker protections and EPA's ability to estimate the true threats of air pollution on human health, and the benefits of reducing pollution, and thus result in weaker air pollution limits.

In 1993, researchers at Harvard University published a landmark air pollution

study, showing that particulate matter air pollution was linked to premature death. The Harvard Six Cities Study, as it is known, tracked the health of 8,111 adults, and 14,000 children in six small cities in the United States, beginning in the 1970s.

This study found that people in cities with cleaner air were living two to three years longer than those living in cities with dirtier air. Residents of Steubenville, Ohio, the city with the dirtiest air, were 26 percent more likely to die prematurely than were citizens of Portage, Wisconsin, the city with the cleanest air.

What surprised researchers was that the culprit was particulate matter, not sulfur-dioxide, as they had thought. This was a very important scientific discovery. This study, and countless others since, have helped EPA to understand that particle pollution in the air we breathe, resulting from activities such as burning coal for electricity, or diesel exhaust from vehicles, harms human health in profound ways in

communities across the nation and has paved the way for stronger air pollution limits designed to protect public health.

But the data for the Harvard Six Cities Study are not publicly available, and the study was conducted over a long period of time that make it very difficult to reproduce. Industry, and their allies in congress previously challenged the findings of this study and other similarly important studies. Instead of blocking the studies, as this proposal would do, EPA took a logical step and referred them to an independent third-party, the Health Effects Institute, for a deep dive review.

There, autonomous reviewers examined the data and developed a report that confirmed their original findings. Other research has since confirmed similar findings, including some studies that use publicly available data sets. Critically important studies, such as the Harvard Six Cities Study would likely be excluded under this proposal to the detriment of health protections. This

proposal would also affect other protections currently in place, such as limits on certain toxic air emissions from tail pipes and smoke stacks, and information on the health effects of many of these; more than 150 chemicals come from older studies built on confidential patient or private business data that cannot be made public.

This could -- this proposal could also cull the use of research that includes confidential business information or older studies that has data stored on older technology that can't be recovered, just to name two other limitations.

Thank you for the opportunity to speak today. The American Lung Association will submit more detailed written comments.

MR. ROBBINS: Thank you.

MS. BENDER: Good morning. My name is Laura Bender, L-A-U-R-A B-E-N-D-E-R, and I'm the National Director of Advocacy of the American Lung Association's Healthy Air Campaign.

The lung association's mission is to save

lives by improving lung health and preventing lung disease. And as you know, we strongly oppose EPA's so-called, "Strengthening Transparency in Regulatory Science," proposal.

Today you've heard from many representatives at the public health and medical community about the ways this proposal would undermine human health. I'd like to take a few minutes to highlight the Lung Association's concerns about the lack of transparency in EPA's work on this rule.

The administration has attempted to rush this rule forward at every turn, consistently sacrificing expert analysis and public health along the way. This is a sweeping proposal that will impact a wide range of public health safeguards, essentially affecting every future decision at EPA based on science. And yet, EPA's process in issuing it has been haphazard, rushed, and anything but transparent.

First, back in April, then Administrator Scott Pruitt, prematurely announced the proposal

while it was still undergoing interagency review at the White House Office of Management and Budget. Then, when media inquired about this discrepancy, OMB actually backdated the clearance by several days. This means that OMB only reviewed the proposal for 48 hours. That's a staggering tight timeline for such a sweeping rule.

In a similar vein, EPA initially only allowed a 30-day comment period with no public hearing. The Lung Association was among the organizations who requested 60 additional days and a hearing. We greatly appreciate the additional time and today's public hearing.

That additional time is crucial, particularly because EPA has failed to complete a regulatory impact analysis that explains the impacts of the proposal, putting the burden on commenters to do so instead.

EPA ignored another important opportunity for review when it failed to consult the Agency's own Science Advisory Board. The SAB, which

includes appointed members from this administration, voted at its May meeting to request to review the proposal.

In a letter to EPA last month, they said that they were only made aware of the rule through the press, and when it was published in the Federal Register. The SAB said unequivocally, quote, "The proposed rule merits review by the Board."

We strongly encourage the Agency to move forward with the SAB review of the proposal. To refuse their request to do so would be unprecedented and in direct contradiction of the Agency's stated claim of wanting the best science to inform its decision-making.

EPA rushed out this proposal after an inadequate review process, and it shows. The proposal falls short in several key ways. First, EPA fails to provide any evidence that the changes outlined in the rule are needed. EPA's existing approach towards science, with its detailed review and deliberation of the research, is already

transparent and has worked well for decades.

First, independent science has revealed that studies prior to publication by recognize journals, then independent and EPA staff scientists reviewed them again and question every aspect of the research in depth. And they do these reviews in wide open processes, including publication, public hearings, and comment periods.

EPA does not acknowledge the rigor of this process in its proposal. Instead, it attempts to justify this rule by claiming that the Agency is following in the footsteps of scientific journals. But last month as other commenters have noted, several scientific journals issued a joint statement highlighting their concerns with EPA's proposal and pointed out that even though many peer-reviewed publications have recently adopted transparency policies, they are still able to assess and use studies for which the underlying data cannot be made public.

Second, EPA fails to define its requirement that studies must be replicable. Does

EPA mean that the Agency couldn't consider a study that looked at health impacts of a one-time event, like a major oil spill?

The SAB also raised questions about EPA's failure to define this and other terms.

Finally, EPA did not explain how the Agency would implement the rule. The proposal offers no process for public hearing, or even consultation with the SAB over implementation. What process would EPA use to review and assess the existing research and revisions? What guidance would the administrator receive to avoid arbitrary decision-making over the fate of this research?

And where would the massive staff time and resources the EPA would need for such a massive additional workload come from? What would have to be sacrificed?

EPA's rushed process, its inadequate review, its false attempt to claim that its policy is supported by scientific journals, and its many unanswered questions about how the proposal would

work, all underscore a core problem with this rule. It would not improve the use of science of EPA. It would not make the Agency's science-based rules more transparent. It would permanently damage EPA's ability to do its job to protect the public.

On behalf of the millions of people with lung disease that we serve who will be hurt by the weaker pollution protections that would result from this proposal, we urge EPA to withdraw this rule to censor science. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 38, Liz Borkowski, and Speaker Number 39, Janice Nolen, come up to the speaker's table. And Speaker Number 40, Albert Donnay, you're already at your seat. Excellent. Also, if Speaker Number 15, Harvey Fernbach, is in the room, you can take a seat at the on-deck chairs. Last call.

MS. BORKOWSKI: Thank you for the opportunity to present comments. My name is Liz Borkowski, and I'm the Managing Director of the

Jacobs Institute of Women's Health, which is at the Milken Institute School of Public Health at the George Washington University.

The Jacobs Institute is concerned about EPA's proposed rule, "Strengthening Transparency in Regulatory Science," due to the harmful impact it would have on women's health and reproductive justice.

We urge EPA to withdraw it based both on its detrimental impacts, and on the lack of a demonstrated need for such a rule. EPA has failed to demonstrate that its current processes for considering science and regulation are inadequate. It has not provided examples of any instances in which insufficient transparency has resulted in outcomes contrary to its statutory mandates or executive orders.

Given extensive existing procedures used by EPA and the scientific community at large to ensure the quality of research, EPA has failed to make a case that additional public access to data is necessary.

The theoretical, but as yet undemonstrated benefits of EPA's proposed rule, must be weighed against the extensive and unequally distributed costs of such an approach. Failing to consider the best available evidence because the underlying data are not publicly available, would result in regulations that fail to sufficiently protect public health. The consequences would fall most severely on sensitive groups not adequately protected by current rules, which include racial and ethnic minorities, those with low socio-economic status, the elderly, and pregnant individuals and their eventual children.

My comments provide a few examples related to reproductive health. First, neurotoxicants are of particular concern to pregnant people and the parents of young children. In regulatory activities, to reduce exposure to neurotoxicants, such as lead and methyl mercury, EPA has relied on an extensive body of research. This research includes longitudinal studies of individuals who are exposed in utero or as young

children to higher levels of lead or methyl mercury than would typically occur in the U.S. today. It would not be ethical to publicly release data from these studies, and it would not be feasible, particularly for older studies that used incompatible storage media to locate all participants and obtain their permission.

EPA's use of research on lead and methyl mercury also has implications for other agencies that address these substances. For instance, the Department of Housing and Urban Development relies on EPA's renovation, repair, and painting rule in its regulation of renovators working in housing units, receiving HUD housing assistance where lead paint is present.

EPA calculated the reference dose for methyl mercury that EPA and the Food and Drug Administration used to create guidelines on fish consumption, including recommendations for pregnant and breast-feeding women.

It does not appear that EPA has undertaken the required interagency review process

to assess the implications of its rule for other agencies.

Another neurotoxicant of concern for reproductive health is the pesticide, chlorpyrifos. Researchers followed a cohort of children exposed to this pesticide before the current ban on indoor use and found lower IQ and working memory to be associated with higher levels of prenatal chlorpyrifos exposure.

In a rulemaking process regulating agricultural use of chlorpyrifos, EPA requested the underlying data from the Columbia Center for Children's Environmental Health. The response from Columbia University explained that because of the detailed sociodemographic and health-related elements their data set contains, they did not believe they could submit extensive individual-level data to EPA in a way that would ensure participants' confidentiality.

Such concerns are not uncommon with the kids of longitudinal data sets that allow identification of long-term consequences of

environmental exposures. Often, the combination of variables used in an analysis provides enough information to identify individual participants and may include sensitive information, such as diagnosis of neurodevelopmental delays.

In addition, endocrine disrupting chemicals are of great concern and reproductive health and EPA has regulated some of these, such as PCBs and PBDEs, under the Toxic Substances Control Act.

Under reformed TSCA, EPA must make decisions based on the weight of the scientific evidence, but it is not clear how it can do so if studies may be eliminated from consideration because data sets are not publicly available.

If EPA moves forward with the rule it has proposed, it will undermine science and regulatory decision-making by making it difficult and potentially impossible to consider the best available science. This will have detrimental impacts on reproductive justice, health equity, and women's health. The Jacobs Institute of

Women's Health urges EPA to withdraw this rule.

MR. ROBBINS: Thank you.

MS. NOLEN: Hi. Thank you. My name is Janice Nolen. It's J-A-N-I-C-E N-O-L-E-N, and I am the National Assistant Vice President for Policy for the American Lung Association.

The American Lung Association turns 114 years old this year. For more than a century we have fought to save lives for protecting lung health and preventing lung disease. We oppose the proposed rule.

Many years ago, in the early 1980s, my mother-in-law asked me to help her recruit participants in a major new study that they were doing. She worked for the American Cancer Society then. They were looking to create a huge database of ordinary Americans would be willing to provide them with confidential information about their health and medical experiences, and would allow them to track those for years to come.

I was so pleased that two men from my church choir in Nashville agreed to participate.

They completed the forms and other paperwork, and became two of the more than half million participants in the cancer prevention study too.

Fast-forward a decade or so and I learned that their data were now part of a landmark study, the American Cancer Society study that revealed the risks to human health from breathing air pollution that I and my colleagues at the lung association were working hard to clean up.

Their data and private health and medical information, from hundreds of thousands of others were -- from hundreds of thousands of other people, who were pointing the way, the need to clean up emissions from power plants, from diesel engines and fuels, and many other sources. I never dreamed when my mother-in-law made her first request to me that EPA scientists and other researchers would mark that study as one of two seminal studies that helped reshape our understanding of the health risks from particulate matter air pollution.

None of us then would have ever dreamed

that the information these two men provided would have helped to identify and underline the threat to human life posed by microscopic particles in the air we breathe.

Furthermore, that study and the Harvard Six Cities Study became examples, not only of ground-breaking research, but of how questions about that research can be reviewed and resolved without having to lose the entire study.

Unfortunately, that is an example that this proposal clearly fails to understand. These two studies with decades-old patient data and others in the long list of studies that found evidence of harm from industrial emissions are unique events that no one hopes to replicate, like gulf oil spills, clearly appear to be targets of this proposed rule.

Studies that have been -- long been targets of industry polluters and their allies, remains so in this proposal.

Once published, these studies raised alarms in the public health community about the

increased likelihood of premature death from particulate matter, widespread in the nation. The studies raised alarms within industry too, about the increased likelihood that their polluting sources would have to clean up their emissions. Industry kicked in messaging developed by the tobacco industry, to challenge the science using the same arguments we have in this proposal.

I have in my office, a page from a 1999 *U.S. News* and *World Report* article on the challenges to these studies that could have been written this year.

Scientists are working to become more transparent in their research. More researchers use publicly available information, but some studies cover populations that are so limited in size or specialized in their characteristics that these data could not be posted on the web for all the world to see. Anyone who has an account on Facebook should have a visceral knowledge of how important keeping confidential data confidential can be.

Meanwhile, EPA could readily review historical data and studies in ways that respect patient confidentiality and the gifts of data from people like my two choir member friends.

So far, EPA has failed to show any reason that these changes are needed in the current system. Failed in its own transparency on this issue, in fact since EPA has not sought SAB review of this, and has not provided sufficient rationale for why EPA needs this change, much less how they would this rule going forward.

We request EPA to withdraw this proposal. Thank you.

MR. ROBBINS: Thank you.

MS. HALL: Would Speaker Number 40, Albert Donnay, come to the speaker's table. And Speaker Number 41, Mona Sarfaty.

MR. DONNAY: Thank you. My name is Albert Donnay. My comments are based on experience gained from 40 years working on regulatory science as an environmental health engineer and toxicologist, as a research

scientist, public health activist, clinician, consultant, peer-reviewer for academic journals, environmental groups and government agencies at all levels, including EPA.

I'm glad I get to follow the last two speakers because I want to highlight that although EPA's proposal to "Strengthen Transparency in Regulatory Science" is needed, did not give any examples of regulations that had been undermined by a lack of such transparency.

I want to remind everyone here what's at stake and what happened the first time EPA, congress, and environmental groups had to decide whether it was okay to base regulatory standards on published scientific studies whose achieves were no longer available for review.

They got the answer right then, and I hope they'll get it right again now. It was May, 1983, 35 years ago, and the EPA was about to publish a new national ambient air quality standard for carbon monoxide based on nine studies by a distinguished cardiologist at the VA, Dr.

Aronow. When the *Washington Post* reported that he'd been barred by FDA a year earlier for submitting a wave of false medical experiments after he admitted, quote, "fudging his lab reports in human drug studies."

Although EPA's head of the Office of Air Quality Planning and Standards said the Agency had, quote, "No reason to believe anything was wrong with Aronow's CO studies," whose data Aronow claimed at the time, "are excellent and can't be questioned." EPA nevertheless appointed a special team of agency and outside scientists to review his work, quote, "When we read that Aronow had done some kooky things."

A month later, *The Post* reported the shocking results under the headline, "EPA Probe Criticizes a Study Used in Air-Quality Standard." The team had said, quote, "Could not resolve the issue of possible falsification of data because," quote, "no data were available." Aronow told them he'd discarded the archives of all of his CO studies after first storing them in his garage for

years, and offering it to EPA because they didn't want it.

The investigators noted considerable concerns about the validity of the results reported, quote, "Raw data were lost or discarded. Adequate records were not maintained, available data were of poor quality, and quality control was nonexistent."

And Aronow's published results were consistently too good to be true. They found it, quote, "Rather remarkable that in 10 years of research his papers showed," quote, "not even one missing data point." They concluded that EPA, quote, "Cannot rely on Aronow's data due to the concerns we've noted." And they recommended the Agency commission new research to attempt to replicate Aronow's findings.

Congressional hearings and the GAO investigation followed, after which Administrator Ruckelshaus agreed that EPA would not rely on any of Aronow's studies in future rulemakings, but only on studies whose archives were still

available for review.

In coordination with the California Air Resources Board and the Health Effects Institute, EPA commissioned a series of new controlled human exposure studies on CO, and since 1994, has based the CO NAAQS exclusively on just six of them, all of which published their individual results in deidentified form so they would be available for public review in perpetuity.

And it's a good thing they did since all the larger archives of these studies were eventually discarded by their authors without being offered to EPA. This history shows that EPA can and should base regulations solely on studies whose methods and data are available for review. To base regulations on studies that can't be reanalyzed is not science, and there is no need for it. Even federal rules that are based on older epi studies, like the last particulate NAAQS rule in 2013 that cited just six studies could and should be based on more recent research that better reflects current air quality.

Over 500 studies a year are now published on particulate epidemiology, and many are in high quality journals that require authors at least to make all their deidentified data and methods available to reviewers, if not to all readers from the posting of supplemental material.

Given EPA's interest in basing regulations on more transparent research, EPA should start requiring all the researches it funds, intermural and extramural, to publish their results in such journals. Hopefully this will prompt less rigorous journals that don't require the posting of supplemental material to update their policies.

In conclusion, the Aronow scandal shows EPA cannot rely exclusively on traditional peer review to detect misconduct. Aronow reviewers at 11 leading journals, as well as EPA staff and their scientific advisors on the CASAC, who also review the studies before recommending that nine be cited as the basis for the CO NAAQS. Unfortunately, despite all this publicity, none of

Aronow's studies were retracted, and the EPA has started citing them again, most recently in the 2010 integrated science assessment of the CO literature.

EPA's proposal to strengthen transparency and regulatory science could stop this from happening again, which is why I support it and encourage my colleagues to do so as well. Thank you.

MR. ROBBINS: Thank you.

MS. SARFATY: Can you hear me?

MR. ROBBINS: Yes.

MS. SARFATY: Yeah. Okay. Respected EPA panelists and fellow citizens, my name is Mona Sarfaty. I'm a physician trained in family medicine and public health. I practice primary care medicine and taught medical and public health students in three different academic medical centers for 35 years.

Today I direct a program in climate and health at George Mason University in Fairfax, Virginia. I also direct a consortium of physician

societies called the Medical Society Consortium on Climate and Health, whose 550,000 members are more than half the physicians in the United States.

The Consortium seeks to inform the public and policy makers about the health harms of climate change, and the health benefits of climate solutions. I'm submitting the formal comment of the consortium in written form in a separate document.

The EPA is proposing to change the rules that dictate what evidence must be considered as the basis for protecting the public's health. As a physician who spent a summer in Southern California during college and didn't see Mount Wilson looming in front of me for an entire week because of smog, I am incredulous.

I remember well the pain in my chest when trying to play tennis on those smoggy days. This was the early 70s, when a republican president was creating the EPA. Now, 50 years hence, tremendous evidence has accumulated that validates my symptoms and the negative effect that unhealthy

hair -- air, has on people who must breathe it.

After that summer, as a practicing physician, I took care of people with asthma and chronic lung disease who were at greater risk on bad air days. So it is shocking to me that the EPA would propose putting aside huge amounts of thoroughly reviewed evidence on the causal connections between air pollution and poor health, claiming that the basis for this conclusion was secret.

Today, I lead a consortium comprised of the country's largest medical societies whose doctor members are highly concerned about the health harms of climate change. The similarities between the current EPA willingness to disregard established science about the connection between carbon dioxide and global warming, and the willingness to disregard solid evidence about the impact of air pollution on health, are glaring.

Despite overlapping evidence from every country in the world, and the entire U.S. climate science enterprise, not to mention major federal

agencies like NOAA and NASA, the EPA leadership does not accept or recognize reality.

To all of us whose lives are dedicated to helping people get and stay healthy, there is a secret lurking in the science of air pollution and global warming. It is not what we have long-known about how burning fossil fuels creates waste products that damage and inflame our lungs. This has been validated by voluminous overlapping research studies. The secret is not that carbon emissions from burning fossil fuels are warming our climate, exacerbating the health harms of air pollution, and causing other dangers to our health, from heat waves, wild fires, pollen, and storms.

The secret is hiding in plain sight. Fighting air pollution is the greatest public health opportunity of our time. It's the greatest public health opportunity of our time.

Reducing polluting fumes and emissions from fossil fuels will rapidly improve our health and fight climate change.

When an EPA's not so secret agenda is to promote fossil fuels, two things follow. The fact that fossil fuels are the major contributor to both air pollution and global warming must be undermined or denied. And the research that documents this reality and how it harms our health must be attacked. It's not hard to see that the approach is to mislead people by wrapping these attacks in rhetoric that's alternatively scary as in secret science, and high-minded, as in transparency.

We're told that the rationale for the new proposed strengthening transparency standard is that individual and medical records included in research were secret. In fact, like all medical records, they were confidential and they remain so.

The record shows that the same argument of secrecy against scientific studies has been used by polluting industries going back many years.

Health providers know that the facts may

be scary when our health is threatened. But we also know that denying or ignoring facts blinds us to discovering and acting on the best ways to heal medical problems and protect our health. We can't let that happen. The EPA must live up to its charge and work to face facts and protect our environment and our health. With this proposed regulation, its leadership is pointing in the opposite direction. Thank you.

MR. ROBBINS: Thank you.

Okay. We're going to take a short recess now and we'll resume at noon.

[Morning session adjourned.] [On the record 12:00 p.m., Afternoon session.]

MS. RADZIKOWSKI: Good afternoon. If everyone will please take their seats? Hello, and thank you for coming. My name is Mary Ellen Radzikowski and I am in the EPA's Office of Research and Development and I'm one of the hearing officials. Joining me is Lynn Flowers, also from the Office of Research and Development and we have a number of folks: Nanishka Albaladejo, Lauren Hall and

Lesley Stobert from SC&A Inc., helping with logistics.

The purpose of today's hearing is to accept public comments on the EPA proposed rule, "Strengthening Transparency in Regulatory Science". EPA is accepting comments on all aspects of the proposed regulation. This public hearing is a formal legal proceeding and the testimonies will become part of the administrative record on which EPA will base its decision.

Public notice of this hearing was published in the Federal Register on April 30, 2018 (83 FR 18768). EPA is proposing this rule under the authority of 5 U.S.C. 301, in addition to the authorities listed in the proposed rule document dated April 30, 2018.

My role is to ensure that the EPA receives your comments in an orderly fashion. Although EPA panel members here may ask clarifying questions, the intent of the hearing is to listen to your comments, not to discuss or debate the proposal.

Now I will go through a few housekeeping items and

ground rules: Please refrain from interrupting speakers or asking questions. Shouting, noisemaking or any disruptive conduct which prevents speakers or hearing officials from being heard are not permitted. Please listen quietly so that we can hear each testimony and to ensure that the court reporter is able to record comments accurately and listeners on the phone hear the oral testimonies. For everyone's awareness, this hearing is open to the press and we may have members of the media present with us today. This event is also open to any form of recording, video, audio and photos. We ask that you not cause any disruption to those testifying or observing the hearing.

There is no formal lunch break scheduled. You may leave and return to the hearing. Please note that you will need to clear security again so please be aware of the time.

If you would like to make an oral comment at today's hearing and did not pre-register to speak, please see the hearing staff at the registration

table located right outside the doors here. If you would like to provide a written comment for the official record, you may hand-submit it to EPA staff today, or mail, fax or email your comments. See the staff at the registration table for instructions on how to do that. There is a comment box at the registration table where you can leave hardcopies of your oral testimony or written comments. All comments received will be included in the official docket. If you submit written comments, it is not necessary for you to give the same comments orally; written comments and oral testimonies will receive equal consideration by EPA in preparing its final rulemaking decision.

EPA has extended the comment period. Written comments must now be received on or before August 16, 2018. EPA will only consider comments related to the proposed rule, "Strengthening Transparency in Regulatory Science", so please refrain from making comments that are not related to this action.

EPA will not be providing responses during the hearing. Rather, EPA will prepare a written summary of the comments received that includes responses.

The summary of the Response to Comments, the document, will be available at the time EPA issues its final decision. EPA will not make a final decision until all comments submitted during the public comment period have been considered.

The hearing is being recorded by a court reporter, who will be preparing a verbatim record of this hearing.

Please speak clearly and slowly into the microphone so that the court reporter can accurately record your comments. A copy of the transcript will be placed in the docket. This hearing is also being audio streamed through Adobe Connect via the telephones.

The hearing is scheduled -- started at 8 AM this morning and is scheduled to go to 8 PM. We're in the second session: 12pm-4pm.

Public restrooms are located down both sides of

the hall. At the doors we have staff that can escort you out and back. Please note the location of the emergency exits. Please take a moment to silence your cell phones.

Speakers should have been given a sticker upon check-in that lists your assigned session. If you plan to speak and have not received a sticker, please be sure to check in at the registration table. For this session, the speaker sticker color is white, so if you have a white sticker you're registered for this session.

Speakers will be called to the speakers' table (located right over there) in pairs by their speaker number.

When it is your turn to speak, please come to the table, state and slowly spell your name for the record, and if you are appearing on behalf of someone or another organization. If you are not in the room when it is your turn to speak, I will recall you after all other speakers have made their oral comments. Each speaker will be allotted 5 minutes for remarks. Elected and

appointed government officials may be provided additional time, since they represent large groups of constituents. Speakers will be notified when their time has ended. Our timekeeping system consists of green, yellow, and red lights. When you begin to speak, the green light will come on to indicate you have your 5 minutes. The yellow light indicates that you have 1-minute left and when the red appears, your 5 minutes are over. At that moment, if needed, I will politely interrupt you and ask you to wrap-up your testimony to give others an opportunity to speak.

At this time, we are going to begin.

MS. STOBERT: If Speakers Numbers 1, Pamela Miller, and 2, Elizabeth Geltman, will come to the speakers table and Speakers 3 and 4, Patricia Koman and Alexis Adiman would go to the on-deck seating located near the stage.

MS. MILLER: Good afternoon, my name is Pamela Miller, P-A-M-E-L-A, M-I-L-L-E-R. I serve as Executive Director and provide these comments on behalf of Alaska Community Action on Toxics.

We're a nonprofit, public interest environmental health, research and advocacy organization, dedicated to protecting public health. I also serve as principle investigator of multiyear research studies involving several universities that investigate exposures and health outcomes concerning endocrine-disrupting chemicals in collaboration with Arctic indigenous communities in Alaska. I traveled the distance to Washington, D.C., from St. Lawrence Island, Alaska, in the Northern Bering Sea, two full days of travel, where we are conducting summer field research and interrupted this because EPA did not make it possible to provide remote testimony.

Through a process known as global distillation, the Arctic has become a hemispheric sink for contaminants that are carried on atmospheric and oceanic currents into the north where they concentrate in the bodies of fish, wildlife and people. Indigenous peoples of the Arctic are among the most highly exposed populations on Earth to persistent bio-cumulative and toxic chemicals

because of their reliance on traditional foods including fish and marine mammals that they use for their spiritual, cultural and physical sustenance. The communities that I work with on St. Lawrence Island also have higher exposures to chemical contaminants from military operations associated with formerly used defense sites. Our research elucidates exposure pathways, body burdens and health outcomes associated with chemicals including PCBs, PBDEs (or polybrominated diphenyl ethers) and other flame retardants and also perfluorinated substances in homes, in air, water, traditional foods and in the blood serum of the Yupik people of St. Lawrence Island. Our studies have shown elevated body burdens as well as disruption of thyroid function associated with these exposures to certain PBDEs and perfluorinated substances. We are now beginning a research study to investigate exposures to PCBs, PBDEs and currently used organophosphate flame retardants in young Yupik children, age 2 to 12, because elders and other community leaders are

concerned about possible adverse effects on children's neurodevelopment. They're concerned that chemical exposures might harm the children's abilities to learn the languages, songs and stories that are so vital for the continuance of the culture of Yupik people. Participation is dependent on the trust of confidentiality that they give to us as researchers. Our research team submits each proposal to rigorous review to the National Institute of Environmental Health Sciences. In the process of the research, we submit also to several institutional review boards for approval to collect sensitive and detailed information on health and behavior as well as spatial and demographic data in an ethical manner that protects human subjects. We have published results of our research in 11 peer-reviewed journal articles after receiving approval from the tribal leadership. These findings help inform interventions and policies to reduce burdens of toxic exposures and prevent further harm to public health. These studies are possible only because

we guarantee to protect the medical privacy of participants, again dependent on trust of the researchers. We gather detailed information about peoples' health and occupational histories, practices in their homes and communities that might relate to chemical exposures. If the proposed rule were to go into effect, studies such as these would not be considered by EPA when it makes decisions about chemicals and pollutants that are poisoning the people of the Arctic such as decisions to limit the production and use of persistent biocumulative toxics and other chemicals including those regulated under TSCA and FIFRA and in regulations that hold military and industrial polluters responsible for contamination of air, waters and lands under CERCLA, the Clean Air Act and the Clean Water Act. EPA indicates that the proposed rule is intended to strengthen transparency of EPA regulatory science; however, we find this a duplicitous claim. It would favor industry data protected as confidential business information over public peer-reviewed research.

We support the best scientific evidence to inform regulatory decisions. However, this rule would have a dangerous counter effect by limiting the science that should be used to inform decisions about public health. Furthermore, we disagree with the agency's conclusions as stated in the proposed rule document that this action does not have tribal implication as specified in the executive order and requiring government to consult with tribes. This rule would disproportionately affect vulnerable populations including American Indian and Alaska Native People and, therefore, is relevant and requires consultation.

MS. RADZIKOWSKI: Excuse me, your time is up. We need to be fair to others.

MS. MILLER: I'll wrap up to say that we urge EPA to end this rulemaking promptly and we strongly oppose the proposal. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. GELTMAN: Good afternoon. Thank you for the opportunity to comment on EPA's proposal entitled,

"Strengthening Transparency in Regulatory Science." My name is Elizabeth Glass Geltman, G-E-L-T-M-A-N. I am a Professor of Environmental Health Policy at the City University of New York -- the CUNY School of Public Health, located in Harlem. I am the author of 17 books on environmental and natural resources policy, a peer-reviewer of numerous journals and have worked on EPA-regulated matters for over 30 years. I am also the Chair Elect of the Law Section of the American Public Health Association. As a professor, I aim to advance public health by preventing people from getting sick. My efforts address reducing health impacts, and hence controlling health costs, by evaluating chemical and environmental determinants of health. Although EPA's rule aims to establish a clear policy concerning the use of dose-response data and models that underlie pivotal regulatory policy, the rule is, in fact, a continuation of the Trump administration's two for one regulatory reform policy announced in Executive Orders 13771,

13777, and 13783. The rule promises, "to change agency culture and practices regarding data access so that scientific justification for regulatory actions is truly available for validation and analysis." However, the new rule, in fact, creates new regulatory hurdles by discounting and precluding consideration of long-standing, established scientific practice. Rather than promoting the transparency of scientific information used to create environmental regulations, the rule will obscure the democratic process, slow the pace of science and progress, and potentially prevent important health data from being considered by U.S. EPA in outlying important environmental policy. Administrative procedure requires the EPA consider data submitted by the public in evaluating regulations. Let's be clear, scientific studies have always been of uneven quality. EPA has a process in place, including use of Scientific Advisory Board testimony and written and oral public notice and comment, using internal and external peer review to evaluate

data. Depending on context some studies are given greater weight than others. Some studies are disregarded entirely. It is inappropriate, however, and unlikely unlawful -- and likely to be unlawful -- under the Administrative Procedure Act. For EPA to categorically eliminate certain types of studies, and hence certain types of data, without considering context. But, even more important, eliminating studies, unless all underlying data is made public, is hazardous to human health and the environment. Longitudinal medical and epidemiological studies are often conducted over years, if not decades. Many studies require people who are study subjects to share very, very personal information, often on the legal or ethical condition that private medical information provided will be protected from public view. EPA is not, and has never been, in the regular business of replicating studies. Timing and the cuts in EPA funding make replicating studies as a condition of promulgating regulations an impossibility. EPA has presented

no scientific reason to prevent use of human health studies simply because the underlining medical records are not available for public inspection and review. One size fits all rarely works in fashion and it is even more unworkable in science and regulation. It is imperative the EPA allow consideration of all available scientific data pertinent to a proposed environmental rule or regulation including random, controlled human health trials and other epidemiological studies. Eliminating certain classes of human health studies would be like picking NFL players in the draft without allowing any scouting reports or eliminating the minor league in baseball. It doesn't make sense in sports; it makes even less sense when we're safeguarding our nation's air, water and land. For the reasons stated, I respectfully request the EPA withdraw the misleadingly-named rule entitled, "Strengthening Transparency in Regulatory Science." Thank you very much for allowing me to speak. My comments are my own. I'm happy to answer questions and I

will submit more detailed comments for the record.
MS. RADZIKOWSKI: Thank you.
MS. STOBERT: Speaker Number 5 is Alexis Andiman. Also, if Speaker Number 6 could take a seat on the on-deck seating: Sarah Kogel-Smucker. Speaker Number 3, Patricia Koman, and Speaker Number 4, Alexis Andiman.
MS. PATRICIA KOMAN: Thank you. My name is Patricia Koman, K-O-M-A-N. I'm an environmental epidemiologist at The University of Michigan School of Public Health. I'm a member of the American Public Health Association, and in my comments I'm representing myself and my colleagues at the University of California at San Francisco Program for Reproductive Health and the Environment. As a scientist who has formerly served at the U.S. EPA and has been significantly involved in analyzing science to create regulation and programs that protect the public's health from diesel and air pollution, I value the importance of open science which includes appropriate data sharing and full reporting of methods. However,

U.S. EPA's proposed rule is not consistent with the principles of open science, inappropriately codifies how science should be conducted, and codifies science policy decision in direct conflict with consensus reports from the National Academies of Sciences 2009 and often the enabling environmental statutes such as the Clean Air Act and the amended Toxic Substances Control Act. Therefore, EPA should withdraw this proposed rule immediately. Instead, EPA should focus on implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies. The proposed rule is inconsistent with medical ethics and existing legal requirements to ensure the privacy and/or confidentiality of human subject data. The rule's requirements for specific types of test methods, defaults, dose response models and/or other analyses are not supported by current science and these provisions should be removed. The rule is counter to mandates in the amended Toxic Substances Control Act, to use the best available

science and systematic reviews for chemical evaluations. Specifically, the proposed rule inappropriately codifies particular data analysis approach such as dose response modeling that should be made based on empirical considerations. This proposed rule will lead EPA to utilize inadequate science resulting in inaccurate analysis and, consequently, inadequate public health protections. The proposed rule does not expressly address the issue of how the new procedures will be protective of public health. Alternatively, existing open science guidelines can and should be used to protect public health such as the 2013 memo from the Office of Science and Technology Policy. In addition, protocols and guidelines such as CONSORT, ARRIVE and STROBE do not require public access to all study data and will still improve the scientific basis of evaluating studies and thus promote public health goals.

I want to call your attention to especially troublesome provisions of the proposed rule which

is not consistent with current scientific practice and why this proposal should be withdrawn. For example, it is not appropriate to require the use of standardized test methods, guideline studies or so-called good laboratory practice studies. These types of studies are not designed to address health effects from low-dose exposures, complex and systematic endocrine effects, behavioral or learning effects, or metabolic changes. In addition, the so-called good laboratory practice and guideline studies are not consistently associated with higher quality research, proper study design or correct statistical analysis. Further, by dictating the model choices without empirical basis the proposed rule sets a dangerous precedent of prescribing how science should be conducted without regard to the data, or hypothesis or peer review. This is especially troublesome for dose response models. Simply using a greater number of models as the proposal preference is unlikely to improve results without considering the models' assumptions and whether

they fit the data set, the goals of the analysis, and many other issues. Therefore, giving priority to studies based on the number or range of models used is scientifically inappropriate.

Contrary to the proposed rule's statement about growing evidence of nonlinearity in concentration response functions, the body of empirical evidence points to the opposite, that for most chemicals and pollutants there is likely no safe threshold on a population level because of ongoing exposures and preexisting vulnerabilities. The rule mandates reconsidering using a linear no-threshold dose response but the National Academy of Sciences recommends exactly the opposite in considering low-dose effects. "The committee recommends that cancer and non-cancer responses be assumed to be linear as a default." Regarding other defaults, I oppose provisions that mandate reconsideration of established science-based defaults on a case by case basis. This is in direct contradiction to the National Academy of Sciences recommendations. The rule is counter to the mandates in the amended

Toxic Substances Control Act to use the best available science and systematic reviews for chemical evaluations. In contrast, this proposed rule will have EPA ignore well-conducted, relevant studies simply because all the data are not publically available and/or may not conform to the rule's invalid assumptions about good laboratory practices and guidelines, studies, and dose response modeling. This is inconsistent with modern science and the TSCA statutory mandates. Further, EPA's risk evaluation framework rules under TSCA mandate the use of systematic review methods. Well conducted systematic reviews consider the entire body of scientific evidence and the quality and strength of all relevant individual studies are considered to reach the overall conclusion.

Therefore, for these reasons, and those outlined in my full written comments, I strongly oppose this proposed regulation and recommend that EPA withdraw it immediately. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. ANDIMAN: Good afternoon, my name is Alexis Andiman, A-N-D-I-M-A-N. I am an Associate Attorney at Earthjustice, the nation's original and largest nonprofit environmental law organization. Earthjustice strongly opposes the proposed rule entitled, "Strengthening Transparency in Regulatory Science." If finalized, this rule would drastically undermine the U.S. Environmental Protection Agency's ability to protect public health and the environment through science-based regulations restricting the presence of chemicals and pollutants in our air, drinking water, food and consumer products. Under the guise of increasing transparency, the proposed rule would authorize EPA to ignore scientific studies that incorporate personal data and other information that researchers cannot practically, legally or ethically disclose. Indeed, EPA admits that the rule would preclude it from considering landmark studies assessing the health consequences including risks to children associated with exposure to particulate matter and lead. This is

unnecessary and unacceptable.

The proposed rule raises more issues than I can address during five minutes of testimony. In partnership with other environmental and public health organizations, Earthjustice plans to submit extensive written comments detailing our serious concerns about the rule's procedural and substantive defects. Today, I will focus on three key points.

First, EPA lacks authority to adopt the proposed rule. Second, the rule would directly conflict with laws that EPA is charged with implementing and enforcing. And finally, the proposed rule would harm the communities of color and low-income communities that are most in need of strong, science-based protections.

First, EPA lacks authority to issue the proposed rule: It is axiomatic that administrative agencies may act only pursuant to authority delegated to them by Congress. The Administrative Procedure Act requires that each notice of proposed rulemaking reference the legal authority

under which the rule is proposed. EPA failed to identify any meaningful authority for the proposed rule at issue today. In announcing the rule, EPA cited provisions of numerous environmental laws but virtually every provision cited authorizes or directs EPA to undertake research, not to impose unfounded limitations on the research it will take into account. EPA also cited provisions that authorize it to promulgate rules necessary to achieve the goals of these environmental statutes, but ignoring credible scientific evidence is neither necessary nor consistent with the statutes enacted to protect public health and the environment.

Second, the proposed rule directly conflicts with numerous laws. Multiple statutes require EPA to ground its decisions in credible science. For instance, the Safe Drinking Water Act directs EPA to rely on the best available, peer-reviewed science and the best available public health information. The Toxic Substances Control Act similarly mandates that EPA consider all

reasonably available information and act in a manner consistent with the best available science. At no point do these statutes suggest that the quality of a scientific study depends on the public's ability to access the underlying data. Indeed, as the EPA previously determined, and as the U.S. Court of Appeals for the D.C. Circuit agreed requiring agencies to obtain and publicize the data underlying all studies on which they rely would be impractical and unnecessary.

Finally, the proposed rule would harm the communities that are most in need of strong, science-based protections. Decades of scientific research have established that communities of color and low-income communities are disproportionately likely to experience exposure to chemicals and pollutants. This research is also critical to establishing regulatory safeguards that will protect these communities and their environment. Nonetheless, the proposed rule would preclude EPA from considering this research simply because it incorporates personal health

information and other non-public data. As a result, the rule would eliminate an important means of understanding and beginning to resolve the harms suffered by over-burdened communities and that's what perpetuates the environmental injustices these communities already face. Earthjustice urges EPA to withdraw the proposed rule without delay. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker Number 5, Alexis Andiman, is already seated at the table. She's speaking on behalf of Devon Hall. If speaker Number 6, Sarah Kogel-Smucker would come to the speaking table. If we could have Speaker Number 7, John Doherty and Speaker Number 8, Tricia Sheehan, come to the on-deck seating. Speaker 5.

MS. ANDIMAN: Good afternoon. I am reading testimony on behalf of Devon Hall. D-E-V-O-N, H-A-L-L, who was unable to make it today. My name is Devon Hall. I am the Cofounder and Program Manager at the Rural Empowerment Association for Community Health, also known as REACH. On behalf

of REACH and the community we serve, I urge the U.S. Environmental Protection Agency to withdraw its proposed rule entitled, "Strengthening Transparency in Regulatory Science." I cofounded REACH in 2002 to address social, economic and environmental inequities in and around Duplin County, North Carolina. Our primary focus is protecting our community from pollution caused by industrial animal operations. North Carolina is a leading producer of swine and poultry. There are nearly 2-1/2 million hogs and pigs and more than 16 million chickens and turkeys in Duplin County alone. Together, these animals generate well over 2 billion gallons of wet waste and more than 190,000 pounds of dirty litter each year. This waste produces an overpowering odor and pollutes our well water, rivers and streams. REACH uses scientific research as a tool to educate and empower our community. Common sense tells you that it's not healthy to breathe air that smells bad enough to make you gag and that makes your nose run and your eyes water. I began to work as

a citizen scientist in 2004 because I wanted to understand exactly what I was breathing and how it was likely to affect my body so that I could better protect myself and help my neighbors protect themselves. So far, I have coauthored nine published studies documenting the threats that under-regulated industrial animal operations pose to community health. For example, I contributed to a study showing that kids who attend school downwind of industrial hog operations are exposed to relatively high levels of hydrogen sulfide, putting them at greater risk of symptoms like difficulty breathing and impaired lung function. I also worked on a study finding that children of people who work in industrial hog operations are more likely to carry dangerous, antibiotic-resistant bacteria on their bodies, even though those children likely never set foot in industrial hog operations themselves. REACH has no interest in putting anybody out of business, but we believe it is possible for industrial animal operations to be more

environmentally friendly and more community friendly. It is not enough for us to talk about our symptoms and our diminished quality of life. No matter what we say there will always be some people who think we are just complaining or making things up. My neighbors and I want to be part of the science so that we can gather proof about what we're living with on a daily basis. We hope that policy makers will listen to that science which reflects the experiences of real people and begin to make some changes. If adopted the proposed rule would prevent EPA from considering the scientific studies that REACH helps to conduct. We cannot make all of our data publically available because we cannot risk compromising the confidentiality of the people who contribute to our work. Because we live in a rural community it would be relatively easy to identify study participants based on de-identified information like age, sex, occupation and number in households, even if the participants' names were redacted. Simply put, people would not

participate in our studies if they knew that the identifying information they shared could become publically available. Even if EPA were to expand on its vague promise to protect confidentiality, I would not trust the government to deliver. Once, I called the North Carolina Department of Environmental Quality to report a permit violation at an industrial animal operation and, even though I asked to remain anonymous, I received a call back directly from the operator I had complained about. The government apologized to me later, but the damage was done. My anonymity had been violated and I felt violated as a result.

On another occasion, the North Carolina Pork Council tried to obtain the identities of study participants from Dr. Steve Wing, a researcher who worked closely with our community. Dr. Wing worked hard to protect our trust, but I know that the legal problems he experienced deterred other researchers from studying the health effects of industrial animal operations. EPA's proposed rule might also deter researchers from partnering with

communities like ours to study public health impacts because it would dramatically reduce the influence of those studies in agency rulemaking. Contributing to research about a polluting industry is a lot like acting as a police informant. You're providing information that could help to make everyone more safe, but you are putting yourself at risk, too. People who work at industrial animal operations would lose their jobs if their employers knew they were participating in a scientific study. And losing your job is not the only risk. I have been spoken to hard by powerful people who do not like the work I do. And I know people who have been physically and verbally threatened by industry representatives. EPA has investigated this issue and in January 2017, it expressed grave concerns about the intimidation we have experienced.

I'll wrap up quickly. My first priority is to the people I serve. I will never do anything to violate their trust or put them in danger. If EPA cares about keeping people safe, it should

withdraw the proposed rule immediately and instead take steps to support community-based research. Thank you.

MS. KOGEL-SMUCKER: Good afternoon, my name is Sarah Kogel-Smucker, Special Assistant Attorney General at the Office of the Attorney General for the District of Columbia. I am commenting on behalf of Karl A. Racine, the Attorney General for the District of Columbia. EPA's proposed rule, "Strengthening Transparency in Regulatory Science," is a solution in search of a problem. Instead of strengthening ways in which EPA can benefit from advances in scientific studies, the proposed rule limits EPA's access to important studies and hampers the development of regulations needed to protect the public health and welfare of the residents of the District of Columbia and the nation. The proposed rule should be withdrawn. In these comments, I will briefly address why the proposed rule limits the use of valid, peer-reviewed scientific studies, violates several environmental statutes and lacks sufficient

details to be appropriately evaluated and implemented.

First, the proposed rule impedes EPA's decision-making by creating burdensome, and potentially impossible, barriers to the use of certain scientific studies needed to determine the impacts of pollutants and toxic materials on air quality, water quality and human health. The proposed rule requires that EPA's significant regulatory decisions be justified only by studies based on dose response data and models that area available to the public. This requirement limits EPA's ability to rely on otherwise peer-reviewed scientifically valid studies that do not or cannot make their data publically available because of confidentiality concerns. For example, EPA used the landmark Harvard Six Cities study demonstrating a dramatic link between premature mortality and air pollution as part of its justification for key clean air regulation. The study has been rigorously independently peer reviewed but the subjects were promised

confidentiality and the data is not public. Studies with confidential data can still be appropriately peer reviewed through the use of confidentiality agreements and subject to rigorous scientific scrutiny over their methods and conclusions. Where cost-effective and appropriate use of open or publically available data should be encouraged. EPA, however, should not provide blanket limits on the use of studies that cannot be made public because they contain confidential health or business information. Scrubbing studies of such information may be impossible while still keeping the study reproducible. The proposed rule may also have important implications for rules subject to periodic update like the Clean Air Act, NAAQS, if EPA can no longer use the same or similar methods that were used to support the existing rules.

Second, the proposed rule violates several environmental statutes because it hinders EPA's ability to rely on best available science or most up to date information as they require. The Clean

Air Act, Clean Water Act, Safe Drinking Water Act, Toxic Substances Control Act, and Emergency Planning and Community Right-to-Know Act all require certain decisions or regulatory criteria be based on the most up-to-date science. These criteria are described as best available science, latest scientific knowledge and best available public health information. The proposed rule would illegally limit EPA's ability to rely on best available science in violation of these statutes.

The nearly 700,000 residents of the District of Columbia rely on EPA to protect their health and environment. While air quality in the District has improved over the last several decades, many residents who face disproportionate exposure risks because of where they live or work still face risks to their health from air pollution. For example, the American Lung Association's "2018 State of the Air (sic)" report gave the District a failing grade for the period from 2014 to 2016 because of the number of days that the air was

unhealthy for vulnerable populations due to high levels of ozone. The District's vulnerable populations, including the estimated 10,415 children in the District with asthma, are entitled to protection from unhealthy air. Because people of color and children living in poverty disproportionately suffer from childhood asthma, environmental justice demands that EPA continue to use advances in scientific research to improve air quality through appropriate regulation. EPA should not be artificially hampered in this duty just because the data or models from a high-quality, peer-reviewed study are not publically available.

Lastly, the proposed regulations are too vague to be meaningfully evaluated and successfully implemented. For example, it is unclear whether Section 30.7 requires EPA to conduct its own peer review of all pivotal regulatory science and, if so, whether EPA has the capacity or capability to perform those reviews. Likewise, the exemption process does not provide sufficient standards to

ensure that the administrator made consistent determinations. For these reasons, the proposed rule should be withdrawn. Subsequent EPA transparency initiatives, if any, should be based on consultation with the National Academy of Sciences and should not restrict EPA's ability to rely on the universe of best available science when promulgating regulations. Thank you for the opportunity to comment today.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Speaker Number 7, John Doherty, and Speaker Number 8, Trisha Sheehan, would come to the speaker's table. Speaker Number 9, James Duffy, and Speaker Number 10, Erika Rosen, if you'd go to the on-deck seating.

MR. DOHERTY: As a retired EPA toxicologist I know the firsthand frustrations of having to deal with epidemiological reports. However, I believe that epidemiological reports are valuable but more, critical, initial review is needed. Today, I hope to present a path forward. The animal studies that I've reviewed are required to support the

registration of pesticides follow very strict quality assurance, good laboratory practices and ethics and reporting standards. Multiple layers of primary and secondary reviewers are identified and assigned to review documents to assure quality assurance and transparency. Every force, however, has a mixed bag of standards to my experience for QLT, quality assurance ethics in reporting. They are often accepted at their face value without documentation of independent review. There is no way to verify the procedures or results presented and the EPA reviewers are not identified. This is very unfair to the public. Historically, I would like to mention two situations where more critical initial evaluation would have prevented social and medical problems. The first is the report on the Kallikak family published in 1912 by Henry Goddard. The book was the foundation of eugenics and was well received at first, but very serious social consequences resulted. However, closer examination revealed that much of the interviewing reflected the biases of the interviewers. Goddard

later regretted publication of this book. The other is associated with vaccinations and autism that could not be verified. The publisher retracted the original publication; however, within the past two years there is an increase in measles in Minnesota because people feared autism from vaccinations. When the concept of disparity in the views of animal versus epidemiological studies, and the need to provide a more critical initial review the EPA posed, I am proposing an epidemiology peer review consult with the goal of creating a transparent document reflecting a thorough review be established at EPA. The Council will consist of six independent subcommittee and relevant experts as follows: First would be an ethics subcommittee. All aspects of assuring the personal safety and identities of the individuals on the study would be protected. Second is an end-point evaluation. The relevant experts knowledgeable in cancer and rural behavioral, or whatever the condition is, they would discuss the factors like how many

people are really needed in a cohort to make a decision. Identify what is known about that particular condition environmental factors or chemicals are known to cause it. The other -- is self-explanatory. Exposure evaluation, statistic evaluation, analytical chemistry and animal toxicity and structure activity correlations. Each subcommittee will articulate why additional data are or are not needed. The Council will consist of qualified individuals from the EPA, FDA or other agencies' consultants as needed. The Council will have considered the reports of the six independent subcommittees and make their recommendations especially with regard to additional data needed to support a transparent regulatory decision.

The report of the Council -- the final report of the Council, will append each of the six subcommittee reports as well as any dissenting opinions. The Council owns the decisions and since all responsible individuals will be identified, the report is thus transparent. Thus

AP may further review the Council report. In conclusion, controversies associated with epidemiologic reports may not be eliminated by the Council, but the Council should contribute to minimizing these controversies. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. SHEEHAN: Good afternoon, my name is Trisha Sheehan, S-H-E-E-H-A-N, and I'm representing Moms Clean Air Force. I traveled here today from my home in New Jersey. I'm the National Field Manager for Moms Clean Air Force. We are an organization of over 1 million members from across the country who are fighting every day to protect the health and safety of their children from toxic chemicals, air pollution and dangerous climate change. I am also a mom to three young boys and last week my family and I joined Democratic House Leader, Nancy Pelosi, to share our own story of how my family was impacted from a toxic chemical accident and today I'm here to speak out in opposition to Acting Administrator Andrew Wheeler's attempts to censor science in the name

of transparency. Limiting the scientific information the EPA can use to identify public health threats and protect us from pollution is reckless and dangerous. Not only does this proposal compel EPA to subject high-quality research to extreme unnecessary and untenable levels of disclosure, but it also includes loopholes that would allow the administration to exempt industry from having to disclose details of their own studies. American families depend on the EPA and high-quality science to protect families like mine from the impacts of air pollution and toxic chemicals. This proposal puts that protection in jeopardy, placing the health of our children at risk. This proposal is misleading. It would require the EPA to only consider those studies that use public data. This would prevent the EPA from using studies that are based on personal medical data, eliminating some of the most important long-term epidemiological studies that investigate the impacts of pollution on public health. This proposal would

significantly limit the research and data the EPA can use to make informed policy decisions under major public health and environmental laws including the Clean Air Act, the Safe Drinking Water Act and the Toxic Substances Control Act. This proposal means that many studies on populations such as the elderly, children and people of color, groups who often suffer disproportionately from pollution, would be excluded from EPA consideration because making the data public could identify the participating individuals. Excluding this important data from consideration means that implementing the proposal could even further exacerbate negative environmental impacts on these and other vulnerable communities. As a mom who has witnessed her children's health deteriorate due to polluted air they were breathing, I know personally what it's like to rely on scientific studies whose data informed us during that horrifying time. On behalf of my family and Moms Clean Air Force's one million members, I strongly

urge the EPA to withdraw this dangerous proposal for the health and safety of our children. Thank you.

MS. STOBERT: Speaker 9, James Duffy, and Speaker 10, Erika Rosen, if you would come to the speaker's table. Speaker 11, Gretchman Goldman, and Speaker 12, Maggie Flaherty, if you would come to the on-deck seating.

MR. DUFFY: Good afternoon, my name is J. Duffy. I am an Associate Attorney with Clean Air Task Force. CATF seeks to help safeguard against the worst impacts of climate change by working to categorize the rapid global development and deployment of low carbon energy and other climate-protecting technologies through research and analysis and public advocacy leadership. EPA's proposal at best is a solution in search of a problem. The Agency has failed to identify a need for further review of the already extensively peer-reviewed public health and environmental science it uses in its decision-making, nor has it made the case the underlying health data must be

made more public than current statutes and practices allow. The only thing transparent about the proposal is that is an attempt to undermine EPA's ability to use the best available science by placing arbitrary limits on the ability to consider these studies.

As a professor who has cited multiple times the proposal recently stated, if this proposal is finalized, science will be practically eliminated from all decision-making processes so that public health and environmental regulation would then depend on opinion and whim. Banning the use of fully peer-reviewed studies because their underlying data must be kept confidential would eliminate the consideration of vital information in critical public health-making decisions. This is not only unnecessary, it also represents a significant shift in decades-long policy without any justification. As the D.C. Circuit has held when considering this exact question, requiring agencies to obtain and publicize the data underlying the studies on which they rely would be

impractical and it would be unnecessary. Congress has clearly spoken, moreover, mandating that the agencies must consider all relevant science. It is well understood, and it has been for decades, that many of the most important public health studies are those based on actual patient information. Because that information must be kept highly confidential and because making even some of the patients' details public would allow them to be identified, the information must be kept private. But that does not mean that these studies can't be, or haven't been, verified. For example, the Harvard Six Cities Study linking fine particulate matter and mortality has been exhaustively reanalyzed by independent institutions, including by the researchers under the auspices of the Health Effects Institute. This reanalysis confirmed the study's essential findings while keeping confidential the underlying data. There are already several ways in which the public can access the studies that EPA uses and in some cases their underlying data without the

release of confidential information, including through the Freedom of Information Act which provides an avenue to request raw data, including a process to ensure that sensitive data is protected. The proposal puts the EPA in the untenable position of either violating its mandate to consider all relevant science or violating confidentiality laws. Additionally, the proposal is impermissibly scatter-shot, it's vague, it's confusing, it's insufficiently formed to allow for meaningful comment. It seems more like a request for ideas about how to discredit the best available science than for how to make it more accessible. For example, the proposal claims that it is consistent with the Data Quality Act and HIPAA as well as various executive orders, but each of these contain checks on the release of confidential information. In fact, the longstanding OMB guidelines stemming from the Data Quality Act recognizes peer review as the per se marker of objectivity and the Harvard Six Cities Study reanalysis set the gold standard for

reproducibility.

Finally, in violation of Executive Order 12866, the proposal fails to perform any analysis regarding the impact this rulemaking could have on the environment, public health or science generally -- or even on what it would cost to implement. Because the Agency does not have authority to undertake this effort, and because it would undermine the consideration of relevant science in its public health and environmental rulemaking, it should be abandoned. Thank you.

MS. RADZIKOWSKI: Thank you. I'd like to remind speakers to please speak into the microphone.

MS. ROSEN: Good afternoon, this testimony is on behalf of Lynn Goldman. She is a pediatrician and an epidemiologist and has been Dean of the Milken Institute School of Public Health at the George Washington University since 2010 and former Assistant Administrator for Toxic Substances at the US Environmental Protection Agency. My name is Erika Rosen and I am delivering this oral testimony on her behalf. Her full written

comments will be submitted for the record. This proposal suffers from lack of involvement of the scientific community, either within or outside of the EPA. No clear justification is given for why it is needed. The proposed rule is a dramatic departure from how the EPA and other US regulatory agencies, as well as similar agencies internationally, use science for the development of dose response assessments. It ignores a number of adverse downstream consequences including: risking disclosure of personal information of people volunteering for human subjects' research; delaying EPA decision- making; exacting unknown but probably considerable costs to the research community and to the EPA; and making best available science unavailable to the EPA. It creates no regulatory authority or any other mechanism for the EPA to compel submission of data from academic scientists and industry, other than those that already are accessible under the Information Quality Act of 2001, nor a mechanism for access to industry data claimed as

Confidential Business Information. It creates an unfortunate precedent for EPA in the creation of science policy by rulemaking. The proposal ignores the "systematic review" methods for review of evidence that have been developed, refined and improved over a number of years in the context of IRIS, pesticides, toxics, and priority air pollutants. The application of such methods has been reviewed and improved upon by the National Academy of Sciences and the National Toxicology Program. Of note is no authoritative body of experts has ever recommended requiring "raw data" in order to perform or review dose response assessments.

Risk assessment activities at EPA are extensive and its programs are performing more than 1,000 risk assessments per year. The proposal does not consider the costs, the significant time and paperwork burdens, and major regulatory delays that will occur when EPA is waiting for data to be made publically available, which may not ever happen.

For years, both Congress and successive administrations have required the EPA to use the best science for its decisions. Directing EPA scientists to exclude key studies is not consistent with good scientific practice and is contrary to years of effort to improve the base underpinning EPA's decisions.

The proposal misrepresents the recommendations of prior expert reviews such as the so-called NAS "Silver Book" and the Bi-Partisan Commission review. It is oblivious to NAS conclusions that thresholds of chemical exposure for chemical effects are the exception rather than the rule. Single studies are used to inform risk assessors of the possible shape of dose response curves. Instead, EPA evaluates all of the scientific information to gain a biological understanding of the "mode of action". When data do not prove mode of action, EPA often applies default assumptions such as low dose linearity for carcinogens, and certain noncancer effects that have no practically identifiable thresholds.

This proposed rule for the first time opens the door to EPA's scientific practices being determined by regulators, and not scientists. This is a rush down a slippery slope that would replace a scientific process with a political one and would freeze the science in procedures that certainly will not be scientifically defensible in the future. This is a breach of the fundamental notion of separating risk assessment from risk management.

I strongly urge the EPA administrator: (1) not to use the Agency's regulatory authority to prescribe specific risk assessment processes; and (2) not undertake changes in EPA's science policies without leadership from EPA scientists and full engagement of the science community. What is at stake is no less than the credibility of the Agency with the American public and public confidence in the integrity of EPA's science and decisions.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker 11, Gretchen Goldman, and

Speaker 12, Maggie Flaherty, if you would come to the stage. Speaker 13, Adam Finkel, and Speaker 14, Augusta Wilson, if you'll come to the on-deck seating.

MS. GOLDMAN: my name is Gretchen Goldman, G-R-E-T-C-H-E-N, G-O-L-D-M-A-N. I'm the Research Director at the Center for Science and Democracy at the Union of Concerned Scientists, and I'm also a mom. As a scientist, I'm deeply troubled by this proposal. As a mom, I'm alarmed by it, and the risks that it poses to my children and others. The EPA's mission is to protect public health but this proposal does the opposite. This proposal needlessly restricts the science that EPA can use to make decisions about all of our families' health. Many crucial scientific studies that rely on public health data, intellectual property, confidential business information and other scientific information that may not be publically acceptable would be unavailable to EPA experts under this proposal. As a result, the EPA will be prevented from making rules that protect people

using the best available science. There is no reason for such a rule. The EPA already follows a rigorous, science-based process for determining when and how studies are used in its decisions. I've seen this first-hand when the EPA contacted me about my own scientific research. The Agency needed to obtain results data from my peer-reviewed studies looking at ambient air pollution exposure in time series' epidemiologic studies. I can attest to the fact that the EPA already ensures it is using reliable and robust scientific information to make decisions. When my son was born he spent five days in the neonatal intensive care unit because of a respiratory problem and when I took him home I knew it would be important for me to make sure that he could breathe clean air. I can't protect him from the air outside always but the EPA can. When my children breathe outside I need to know that the air is healthy. When my children play in the grass I need to know that there aren't harmful pesticides in it. When my children drink from their sippy cups, they need

to know -- I need to know that the water is safe. How can EPA scientists protect my family and others if they can't use the best available science?

I urge you to withdraw this proposal and instead focus on EPA's mission of ensuring safe water, air and land for people across the country. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. FLAHERTY: Good afternoon and thank you for the opportunity to speak today. My name is Maggie Flaherty, F-L-A-H-E-R-T-Y, and I would like to express my strong opposition to the proposed, "Strengthening Transparency in Regulatory Science" rule. I would first like to emphasize that this rule proposed during Scott Pruitt's time as administrator of the EPA is a purely political decision. It is modeled after past efforts from the tobacco and fossil fuel industries for similar policies that prevent the use of science that reveals the harmful human health impacts of such industries. This proposed rule is not about

legitimate transparency; it is about making it harder for the EPA to make decisions based on the best available science. Under this rule studies that rely on personal health data, confidential business information, intellectual property, or studies whose data is no longer available would be excluded from the EPA's consideration when making decisions regarding regulations. When it comes to regulating things such as air pollution, water pollution and toxic substances, some of the most vital scientific information comes from studies of respiratory illnesses, cardiovascular diseases, and premature deaths, all of which rely on personal health data. If such vital studies are excluded because of this arbitrary rule, the EPA would be lacking critical public health information when making decisions that directly impact our health and environment.

If EPA is truly worried about transparency in science they would listen to the voices of the numerous scientists who have come out in opposition to this proposed rule and who have,

additionally, suggested other ways of introducing transparency. Instead of focusing on disclosure of data that can contain confidential and private information, a rule that truly increased transparency in science would focus on funding disclosure. Despite how strict the peer review process is, people should be able to know who is funding a study. This rule proposed by the EPA does not address the issue of funding transparency at all. According to an article in the *Journal of the American Medical Association* if all of the EPA's proposed changes to environmental policies since the election of President Trump go into effect, the result would be at least 80,000 unnecessary deaths per decade. This assessment is based on numerous scientific studies that would most likely be excluded by this rule. The EPA should not exclude studies that demonstrate the true health costs of their actions and remember their true mission of protecting our public health and the environment. I therefore urge the EPA to withdraw this proposed rule. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Speaker 13, Adam Finkel, and Speaker 14, Augusta Wilson, will come to the speakers' table. Speaker 15, David Coursen, and Speaker 16, Abigail Omojola would come to the on-deck seating.

MR. FINKEL: Thank you. I appreciate the opportunity to comment as a former chief regulatory official at OSHA and a former member of the EPA Science Advisory Board and Board of Scientific Counselors. I support a wide spectrum of efforts to improve the transparency of the inputs to and the outputs of risk assessment and cost-benefit analysis, especially if they involve a more honest disclosure of uncertainty and variability. I will submit a recent paper I wrote with George Gray in this regard. But this proposal decreases transparency and reliability in three ways: It fails to identify a legitimate problem; it ignores closely related and glaring actual problems with regulatory analysis; and it promotes remedies that add noise while decreasing

signal.

First, the central dogma of regulatory policy since 1993, and most enthusiastically touted by this administration, holds that no regulation can be proposed absent a real problem to be solved, like market failure. Here, there is no failure of the scientific market and hence no need for a disruptive set of hurdles. By its own policies it developed to constrain its own regulatory excess, EPA should demonstrate, and not just with an anecdote or two, the crisis justifying the need for this proposal, or else should scrap it. I note that of the five URLs the EPA provides in Footnote 12 to document its claim that there is a "replication crisis," two of the links are broken and the other three discuss psychology and clinical trials. The end points in epidemiology, toxicology and exposure studies are simply not as subjective as psychology experiments are. There have been some problems found with clinical trials but the unmeasured variability is likely much more important with respect to whether a drug will cure

and weather a pollutant will harm. Most importantly, the EPA has cited no studies giving even guesstimate of what percentage of environmental science studies might be in need of replication or reanalysis and, of course, some of the shrill prior claims of error others have noted in the Six Cities Study have turned out to be fallacious. Surely EPA does not intend that most epi studies or bio-assays need to actually be replicated. Some epi studies can be redone but surely not natural experiments we never want to repeat such as the atomic bomb survivors study or the changes in air pollution during groundings right after 911. Lifetime animal bio-assays already use multiple doses, species and sexes and they are expensive and take years to complete. Why would we waste time and money duplicating them? And so, what if someone did try another species and got a lower potency estimate or didn't get positive results? Would we allow a rat or mouse carcinogen in unlimited quantities because it might not also be an aardvark carcinogen? I

don't think so. So, EPA probably means reanalyze, not replicate, and it should say so. But then EPA presents no evidence that anyone is hindering anyone else from reanalyzing anything. Any bio-acid that the EPA would use would already have individual tumor data and exposures and could be reanalyzed with any model that anyone wanted. Ditto for epi studies. But what would a reanalysis program actually do other than be costly and invite delay? What if someone reanalyzed a health study and got a different answer? One that suggests the first study had exaggerated the harm. In such a case the second study would be right and the first wrong only if both of these conditions were true. First, the difference in the results was not already acknowledged or contained within the uncertainties in each answer. If somebody claimed that banning a chemical would save between 500 and 1000 lives across the country, EPA chose to estimate it at an expected value of 750; another study that said 550 would not be different from the first study at

all. And secondly, the first study would have to be not just different, but wrong. Anybody can take the same data and botch the risk analysis of it making seem like they have a better answer. Just like there are potential problems with an analysis that doesn't control for some variable, it can be a mistake to control for a variable that shouldn't be included.

In short, EPA should never refuse to look at a study just because someone could reanalyze it but hasn't, has done so and gotten a different but not a better answer, or has done so, didn't like what it saw, and suppressed the results while claiming the original study still needs to be reanalyzed. Secondly, there is a crisis in regulatory analysis and EPA is completely ignoring it for reasons that are obvious to me. It's the economists' analysis of the costs of regulation and the values of benefits that are flawed, opaque and in need of reanalysis. Every criticism leveled at this proposal ought to first be applied to regulatory economics. They are obviously as pivotal as

estimates of risk. Regulatory cost estimates are notoriously biased high and they are surrounded by more uncertainty than surrounding risk estimates, but unlike risk estimates, cost estimates are rarely, if ever, presented with uncertainties and are sometimes even of the wrong side. In my written comments I'll give two examples. I have a paper newly published with Brandon Johnson. We looked at more than 1000 estimates, the value of a statistical life, certainly the most pivotal quantity in all of risk regulation derived from hundreds of studies. Only 40% of those studies gave any information about the ranges or standard deviations of the individual VSL values. So, no one can reanalyze that work to see what higher or lower values of the VSL are also compatible with the data. And perhaps the most well-known so-called study of the costs of regulation is the series of reports from Mark and Nichole Crane suggesting that regulations "cost the U.S. nearly two trillion dollars a year."

MS. RADZIKOWSKI: Excuse me, sir, we are out of

time.

MR. FINKEL: I'm sorry?

MS. FLOWERS: We are out of time, in fairness to others.

MR. FINKEL: I'm sorry, I didn't realize. The third one is about defaults and I will submit those, but EPA is a protection Agency, not a prediction Agency. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. WILSON: Good afternoon, my name is Augusta Wilson, and I am here representing the Climate Science Legal Defense Fund. The first name is spelled A-U-G-U-S-T-A. I appreciate the opportunity to speak to you today and the Climate Science Legal Defense Fund will file more detailed written comments in the online docket for this proposed rulemaking. CSLDF is a nonprofit organization whose mission is to protect the scientific endeavor. In this capacity, we work closely with scientists at government agencies and at research institutions, so we have particular insight into how attempts to silence science

negatively impact both researchers on an individual level and the conduct of scientific research as a whole. There are numerous reasons why EPA should not proceed with this rule. In the time I have today I will focus on a few of the most important from the perspective of protecting the integrity of the scientific endeavor. First, studies that involve human subjects, particularly those investigating the human health impacts of exposure to environmental pollutants, are among the most relevant to EPA's core mission. In order to conduct such studies, scientists need participants willing to allow researchers access to their confidential health information. If enacted as currently proposed, this rule would make it much more difficult for scientists to credibly promise study subjects that their patient information will remain confidential. This could have deeply concerning, chilling effects on the conduct of important human health studies. Privacy concerns could influence what science gets done and what science does not get done. Lines of

scientific inquiry that would have been pursued may not be. The quality of data may be poorer than it otherwise would have been. Furthermore, the justification for this rule to the extent it exists seems to be based on the false premise that scientific studies cannot be adequately evaluated or reproduced unless all of their underlying data are made public. This is simply not the case. On the contrary, the reviewers can evaluate the merits of studies even when they rely on data that cannot be made publically available. This is because part of a scientist's core, fundamental training is the ability to assess research based on the strength of the experimental design and the precision with which experimental methods and analyses are described. In addition, when necessary and appropriate, reviewers, as well as other researchers seeking to reproduce or extend scientific analysis, can have confidential access to key data in conformity with privacy requirements.

That said, the scientific community has certainly

recognized that recent technological developments allow for significant improvements in data sharing and reproducibility and that such improvements can benefit science. There are numerous scientific societies, journals, and other organizations, as well as individual researchers, who are actively engaged in a dialogue about how to improve transparency while protecting scientists and taking into account issues like patient confidentiality and proprietary business information. If EPA is genuinely concerned about these issues, it should engage deeply in this discussion and with the scientists who are having it and should move forward only in concert with them. As written, this rule which EPA professes is intended to strengthen science will ultimately do significant damage to it and to the United States' ability to lead the world in research. EPA should not promulgate such a rule. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Speaker 15, David Coursen, and Speaker 16, Abigail Omojola, would come to the

speakers' table. Speaker 17, Alan Lockwood, and Speaker 18, Elizabeth Woolford, if you would come to the on-deck seating.

MR. COURSEN: Good afternoon. My name is David Coursen, C-O-U-R-S-E-N, and I'm here on behalf of the Environmental Protection Network, a nonprofit organization of EPA alums working to protect the Agency's progress toward clean air, water, land and climate protection. There are so many things wrong with this proposal that it's easy to downplay the most important one: The harm it will do to peoples' health and the environment. The proposal hides this in a fog of ambiguous language, meaningless generalities and vague platitudes about the value of transparency. It requires EPA to wear a blindfold when it is developing major rules by ignoring what relevant and reliable science tells us about health risks any time the raw supporting data is not publically available. Transparency is important, but it is not part of the Environmental Protection Agency's mission and certainly cannot be the basis for a

one-size-fits-all litmus test for when the Agency must ignore what science tells us about the risks of pollution.

The laws governing EPA programs require it to consider all of the available scientific information in deciding how to protect peoples' health and the environment. Ignoring such information would be both arbitrary and unlawful. EPA rulemaking has always relied on the best available science, a principal the proposal gives lip service even as it outlines a scheme to prevent the EPA from using even the best available science if it is not "transparent." The proposal would put even the most persuasive and useful science off limits subject only to a vague and standardless exemption process. The proposal does not show that the EPA's existing practices have produced bad environmental outcomes or that increasing so-called transparency will lead to better outcomes. Those are not things the proposal seems to care about. There is no legal or environmental basis for the proposed

restriction and, not surprisingly, the proposal fails to mention that EPA's statutes do not allow the Agency to ignore available information about the risks of pollution. Inevitably, restricting the science EPA considers in rulemaking will produce less informed and less protective decisions. In effect, the proposal sacrifices relevant and reliable scientific information, a cornerstone of effective environmental protection on the altar of so-called transparency. A proposal to ignore science when all of the supporting data is not public would preclude using even recent studies that are subject to confidentiality agreements or legal restrictions on disclosure. It also will certainly and deliberately exclude older studies where the data is no longer available, even if their findings are widely accepted as authoritative and form the basis for EPA regulations that have proven effective in protecting peoples' health for many years.

The proposal is evasive about its targets using

footnote language only a lawyer could understand to identify two seminal air pollution studies that it excludes and says nothing at all about what other important studies it would ban. Written comments via the Environmental Protection network will spell out the policies that proposes many legal and policy defects in detail. The proposal is brief and cursory and provides far too little information to meet the legal requirement to alert the public to its substance and basis. It would prohibit EPA from considering important science in rulemaking even though the laws governing EPA's use of science require it casting a wide net. It sheds little light on how the proposal would work and no light at all on its environmental consequences. Instead of explaining how EPA will implement and interpret the rule, it largely throws these questions to the public. It doesn't show a need for any rule much less an absolute rule that sweeps across eight statutes. It claims its approach is consistent with a host of policies and studies but what Environmental Protection

Agency looked at them it found almost no support for the proposal and in some cases the authors have objected to the use of their studies and it posed the proposal. In sum, there is neither a legal basis nor a need for this rule. It would require the EPA violate explicit statutory provisions and unlawfully shifts the basis for deciding what science to use in rulemaking away from the statutory goals of reliability and environmental protection to so-called transparency, a term not found in the relevant EPA statutory provisions. It is too full of undefined or ambiguous terms to create a workable legal frame work. In other words, the proposal is unintelligible, unlawful and unworkable. EPA, I respectfully request that EPA withdraw it.

MS. RADZIKOWSKI: Thank you.

MS. OMOJOLA: Good afternoon, my name is Abigail Omojola, O-M-O-J-O-L-A, and I am here on behalf of Breast Cancer Prevention Partners to speak in strong opposition to the proposed rule and to urge the EPA to withdraw it immediately.

Breast Cancer Prevention Partners is a national organization committed to preventing breast cancer by eliminating exposures to chemicals and radiation that have been linked to an increased risk of the disease. We take great care and pride in ensuring that all of our public education, programs and policy advocacy are based on a strong foundation of peer-reviewed science.

Contrary to its stated intent, the proposed rule under consideration today would not serve to provide the public with greater "confidence in and understanding of" EPA's regulatory decisions. Rather, it would deeply undermine the ability of the EPA to use all the best available science in its regulatory decisions, which, in turn, will negatively impact public health. In fact, it is hard not to come to the conclusion that the proposed rule is a strategy to disregard many studies that have shown negative impacts of chemical exposures on public health.

Breast cancer is a disease with complex causation and often a long latency period. Only about 10% of

breast cancer diagnoses can be attributed solely to genetics. Breast cancer risk is a web of interactions between environmental exposures, genetics and lifestyle characteristics. Much of the data showing the connection between unsafe chemical exposures and breast cancer risk comes from laboratory studies. However, epidemiological studies, and in particular longitudinal studies, provide unique insights and important corroboration of these findings.

The proposed rule's requirement that underlying data must be made public before the EPA can consider a study in agency decision-making will have the practical impact of eliminating many of these critical studies from the regulatory process. Epidemiological studies involve the collection of extensive and detailed individual health data and researchers have an ethical obligation to protect the confidentiality of that data. The elimination of these studies will result in less scientifically sound conclusions and, most importantly, the public health benefits they would

provide.

An example of the kind of study this proposed rule could eliminate from the EPA's regulatory process is the National Institute of Environmental Health Sciences' Sister Study. From 2003 to 2009, the Sister Study enrolled 50,000 women whose sisters had breast cancer. Those women will be followed for a minimum of 10 years to study how genes and the environment interact to impact the risk of developing breast cancer, leading to a greater understanding of ways to prevent both breast cancer and other diseases. It does not serve the public interest to hinder the EPA's ability to use this type of research in their regulatory decisions.

This proposed rule will not only undermine the use of previously conducted epidemiological studies; it will also damage the ability of researchers to conduct future studies. Recruitment of study participants will be severely undermined if people fear their personal information may be made publically available. This is particularly true

for vulnerable marginalized communities that are both disproportionately exposed to toxic chemicals and have historical reasons to distrust researchers. Yet, it is the exposures experienced by these communities, and the resulting health effects, that we most need to understand and address.

The integrity of scientific methodology is thoroughly reviewed at many points in the processes of designing, conducting and publishing scientific research already. There is the competitive grant process; Institutional Review Board requirements; peer-review prior to publication; the expertise and judgment of career EPA scientists when considering the strength and relevance of studies included in EPA decisions; and finally review of those decisions and the underlying science by EPA's Science Advisory Board; all provide more than sufficient opportunities to assess the soundness of scientific studies. This proposed rule is not only damaging, it is unnecessary.

On behalf of the 1 in 8 women who will be diagnosed in their lifetime and the 40,000 lives that are lost each year in the U.S. to breast cancer, the EPA has an obligation to take action to prevent this devastating disease. This proposal takes a hard step away from that goal.

Thank you for the opportunity to provide this public comment urging the EPA to withdraw this misguided and damaging proposed rule.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Speaker 17, Alan Lockwood, and Speaker 18, Elizabeth Woolford will take seats at the speaking table. If Number 19, Paul Allwood, and Speaker 20, John Stine, would take seats at the on-deck seating.

Mr. LOCKWOOD: Good afternoon, my name is Alan Lockwood, A-L-A-N, L-O-C-K-W-O-O-D. Thank you for this opportunity to speak on behalf of Physicians for Social Responsibility. I am a board-certified neurologist and an elected fellow of the American Neurological Association and the American Academy of Neurology, and Professor Emeritus of Neurology

at the University at Buffalo. PSR is a 501(c)(3) scientific and educational organization headquartered in Washington DC with over 30,000 physicians, medical students, and others across the country. Our mission is to protect human life from the gravest threats to health and survival. We submit this testimony in strong opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." The proposed rule would change the standards for the inclusion of studies used by the Agency and lead to the abolition or weakening of virtually all protections under the purview of the Agency. Under the misleading veil of "transparency," the proposed rule could force investigators to invade the confidentiality of research participants and make confidential and private data open to all. A similar concern was voiced by the current Scientific Advisory Board, writing, "there are also sensitive situations where public access may infringe on legitimate confidentiality and privacy interests ..." The rule could replace evidence-

based decision-making with arbitrary determinations based on political considerations. Peer-reviewed research has led to important gains in health. The Clean Air Act protects us from air pollution and is arguably the most health-protective law in effect. I have written extensively about this in The Silent Epidemic. Peer-reviewed studies link air pollutants with leading causes of death in the United States including heart disease, stroke, and respiratory diseases. Additional studies link particulates to Alzheimer's disease and Type II Diabetes. Seminal studies include the Harvard Six Cities Study that involved 8,111 adults followed for between 14 and 16 years showing a clear link between pollution and mortality. The Women's Health Initiative study involving 65,893 post-menopausal women that demonstrated a link between particulates, and cardiovascular disease and stroke mortality. I attended closely to the study of 1,705 neurologist-confirmed strokes showing that a transient increase in small particles was

associated with a statistically significant increase in strokes even though levels were within limits "generally considered safe" by the EPA. A congressionally mandated report prepared by the EPA projected that by 2020 Clean Air Act provisions would save two trillion dollars per year in adverse health impacts. Many savings will positively impact the budgets of state and federal agencies at a time of ballooning deficits.

EPA rules provide significant protection for the developing brains of children by establishing limits on lead. Lead impairs brain development and has adverse effects on behavior and cognition. Other data link arsenic levels in drinking water to Type II diabetes and cancer.

Natural gas production, particularly "fracking" harms health due to human proximity to wells, pumping stations, and contamination of water supplies and contributes to climate change.

Protecting the privacy of research participants is a keystone of biomedical research and one with which I have had years of personal experience as a

member then chairman of the Buffalo VA Institutional Review Board. Peer-reviewed journals require authors to affirm their adherence to federal privacy protections as a pre-condition for publication. This standard should not be abolished. PSR's mission is to "to protect human life from the gravest threats to health and survival." To protect the scientific integrity of the EPA and protect health, we oppose the deceptively named proposal, "Strengthening Transparency in Regulatory Science." Thank you.

MS. RADZIKOWSKI: Thank you.

MS. WOOLFORD: My name is Elizabeth Woolford and I am an undergraduate student at Wesley University and an intern with the National Parks Conservation Association. My comments are my own. Today, I would like to express my strong opposition for the proposed rule titled, "Strengthening Transparency in Regulatory Science." This rule would have sweeping impacts on the ability for the EPA to consult public health studies, as almost all utilized data from medical records that are

protected from public scrutiny. Their proposal would force the Agency to disregard such studies unless scientists reveal their participants' private medical information. Scientists conducting public health research would then be left with two unacceptable options: To break confidentiality agreements in order to disclose the personal health records of their subjects; or not to have their studies consulted by policy makers at all. As a result, some of the most significant research from the past decade, for example studies linking air pollution to premature deaths and measuring human exposure to pesticides would be left completely unavailable to the Agency. I would like to emphasize that data of a sensitive nature does not imply inherent unreliability, rather this kind of information is essential to achieve an accurate understanding about how human health is impacted by chemicals, chemical compounds and other substances. Such an understanding is necessary for the EPA to fulfill its mission to protect public health and protect

the environment with the creation of effective regulations under the Clean Air Act, Clean Water Act, CERCLA, and other cornerstone environmental laws.

This proposal is based on a false premise about data quality and acceptability. There is no reason why one cannot protect the confidentiality of subjects and at the same time use information about them. This rule questions the integrity of the scientists and doctors conducting public health studies by implying that these professionals may have biased their subjects to achieve a particular outcome. However, it is evident that peer review already protects against for such bias.

For these reasons, one must consider how this proposal fails to achieve the requirements of OMB's Information Quality Act. It is clear that this proposal is overkill and would unnecessarily exclude scientific studies simply because they do not meet an unrealistic transparency standard. This would all be to the detriment of public and

environmental health.

In addition, this rule would create a blatantly political and dangerous double standard by eliminating the use of studies that follow confidential health guidelines while allowing polluting industries to keep their data under wraps. That alarming imbalance would skew regulation inherently favoring polluters over those impacted by their pollution.

Furthermore, this proposed rule would cross Agency lines and interfering with informed policy making and undermining the safeguards that protect millions of people, our public lands, and the space and places we call home. EPA's scientific research and related policies influences the decisions of other agencies charged with protecting our health and environment. For example, the National Parks Service needs access to the best available science to inform decisions that protect parks' air, land, water, wildlife and people. If EPA goes forward in placing unreasonable limits on the scientific record, the

National Parks Service and similar agencies will be unable to protect public health and the environment to the extent they otherwise could. As a young person, this proposal leaves me frightened. Within a decade I will be part of the generation that inherits the responsibility for this nation. If adopted, the negative implications of this rule will not be short-lived and could forever change the safeguards that EPA is supposed to develop to protect public health and our environment. In the many more decades of life I have in front of me, I intend to finish my education in this country, I intend to raise a family in this country, I intend to enjoy public lands and outdoor spaces in this country, and I intend to breathe this country's air and drink this country's water and eat this country's food. I hope to do so knowing that the regulatory body charged with keeping my body and environment safe has made decisions based on nothing less than the best scientific information there is. For these reasons, I urge the EPA to abandon this dangerous

and misguided proposal. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker Numbers 19 and 20, Paul Allwood and John Stine, if you would take seats up here. And Speaker Number 21, Virginia Ruiz, and Speaker 22, Karen Mongoven, if you would take seats the on-deck seating.

MR. ALLWOOD: Good afternoon, my name is Paul Allwood. I am Assistant Commissioner of Health Protection at the Minnesota Department of Public Health. Commissioner Stine is with me and we're going to do this joint testimony. Commissioner Stine will go first.

MR. STINE: Thank you. As Commissioner of the Minnesota Department of Health, Mr. Allwood is the Assistant Commissioner there, and as Commissioner of the Minnesota Pollution Control Agency, my name is John Link Stine, S-T-I-N-E. We are appointees of Minnesota's Governor, Mark Dayton. We are deeply disappointed in and troubled by this proposed rule, "Strengthening Transparency in Regulatory Science." We have traveled 1100 miles

from our home in Minnesota to be here today to speak against this rule. On May 15, 2018, our two state agencies commented against this rule in a letter from Commissioner Malcolm of the Health Department and myself. Our testimony today expands upon those comments and provides specific examples from Minnesota that show why this arbitrary and non-ethical rule must not be adopted.

MR. ALLWOOD: The first example is that the State of Minnesota is dealing with a massive area of contamination with PFAS chemicals, otherwise known as PFCs. The contamination came from 3M Manufacturing and disposal sites that contaminated groundwater on a very massive scale impacting over 150,000 residents. Minnesota's Department of Health conducted bio-monitoring studies of over 200 people living in those impacted communities to be able to understand their exposure and their potential health implications. Those studies help Minnesota derive health protected values under state law and furthermore also help the state of

Minnesota reach a settlement with 3M Company of over 890 million dollars. Now, without these studies and without these data we would not have been able to be successful in our litigation with 3M Company and residents of the communities that were impacted by this pollution would have had to foot this bill.

Now, these studies are only possible because we provided absolute guarantees to the participants that their data would be protected and that we would assure its confidentiality. The proposed rule will make it unlikely that public health data such as this -- and you heard it from other testifiers -- would be available for states to use, but even more so for the EPA to use in its decision-making. This is to be avoided.

MR. STINE: Our second example is the 2015 study and report that our agencies jointly released "Life and Breath". We released that report regarding the health impacts of air pollution in the Twin Cities Metropolitan Area of Minneapolis and St. Paul. The study used public health data

and mathematical modeling software developed by the U.S. EPA. EPA's modeling software is based on published, peer-reviewed scientific studies of the relationship between human health and air pollution. The study confirmed air pollution leads to increased disease and death in our population. Every year about 2000 premature deaths, 400 hospitalizations and 600 emergency room visits occur in the Twin Cities Metropolitan Area that are caused by fine particle or ground-level ozone exposure. In fact, the study found that fine particle air pollution and ground-level ozone was a causal factor for some deaths and hospital visits for lung and heart conditions. The implications of the proposed rule are that under this rule's requirement for the use of public data, future public health data on which studies like our "Life and Breath" were based would not be available. Public health data and research relies on citizen confidence in confidentiality of their personal information. We believe the rule would lead to an over-reliance

on animal studies and toxicological data which cannot estimate disease burden as well as population health data and studies. The proposed rule would lead to weaker environmental regulations, more air pollution, greater levels of heart and lung disease and death. As a result, health care costs will increase. Asthma already costs the United States 56 billion dollars annually and the incidence of asthma is increasing. The rule language under Part 30.8 requires that EPA implement the rule in a manner that minimizes cost. Ironically, the rule will lower the cost to EPA and environmental polluters. A fundamental principal of our environmental protection law is that polluters pay. The plain truth is that your rule does not address the increased costs that come with relaxed regulations. In fact, the polluters will pay less and costs will shift onto the public in health insurance. With that I'll kick it to Mr. Allwood.

MR. ALLWOOD: So, to conclude, to say that state as public officials we are responsible for

protecting the health of our state population, it's really important for us to be assured that EPA is going to use the best science in its regulatory decision-making. This rule severely brings that into question and we would like you to know that we are looking at this as an urgent matter that requires the EPA's attention and would urge that time be taken to suspend and slow the process of adopting this rule so that a full and complete review can be done. Thank you.

MR. STINE: Thank you.

MS. RADZIKOWSKI: Thank you both.

MS. STOBERT: Speaker 21, Virginia Ruiz, and Speaker 22, Karen Mongoven, if you would come to the speakers' table. Speaker 23, Steve Milloy, and Speaker 24, Steve Milloy for John Dunn, if you would have seats at the on-deck seating?

MS. RUIZ: Good afternoon, my name is Virginia Ruiz. I am the Director of Occupational and Environmental Health at Farmworker Justice, an organization devoted to working with migrant and seasonal farmworkers to improve their living and

working conditions. On behalf of my colleagues at Farmworker Justice and the farmworkers that we represent, I strongly urge the U.S. EPA to withdraw its proposed rule, "Strengthening Transparency in Regulatory Science." If finalized, this rule would endanger farmworkers and other vulnerable people across the country. We oppose EPA's proposed rule for three reasons: First the rule would prohibit EPA from considering credible scientific evidence about the dangers farmworkers face including exposure to pesticides and other chemicals. Second, the rule would deter farmworkers themselves from participating in future scientific studies. Third, the rule would make it more difficult for Farmworker Justice to obtain the research we need to advance our mission. With respect to the first point, the proposed rule would prohibit EPA from considering credible scientific evidence about the dangers that farmworkers face. As EPA's own Science Advisory Board acknowledged, there are many reasons why researchers and study participants

might choose to keep data confidential, and many of these reasons have no bearing on the credibility of a scientific study. For instance, because farmworkers are often migratory, moving for work across domestic and international borders, researchers may be unable to locate farmworkers they last encountered as study participants years ago, and thus unable to renegotiate privacy agreements struck at the time the research was conducted. Farmworkers themselves may also have legitimate reasons for wanting to preserve their privacy. For example, some research shows that farmworkers face an increased risk of exposure to chemicals that impair fetal development resulting in lower IQ scores, an outcome associated with significant social stigma. We already suffer from the dearth of scientific evidence and information about occupational and environmental health risks that farmworkers face. EPA should base its regulatory decisions on the credibility of scientific evidence and not on arbitrary factors like the

public availability of research data.

With respect to the second point, the proposed rule would deter farmworkers from participating in future scientific studies. Farmworkers are extremely vulnerable members of our society and it's unlikely they would agree to participate in scientific research without an iron clad guarantee that their identities would be kept confidential. Farmworkers value their privacy for a number of reasons including an undocumented or other tenuous immigration status and insecure employment. Farmworkers whose identities are exposed would risk retaliation from their employers ranging from termination to deportation. As a result the proposed rule would present farmworkers with a false dilemma. They could choose to participate in research studies that might eventually yield better regulatory protections at great personal risk, or they could choose to protect their privacy by refusing to participate in research studies, thus forgoing badly needed protections, also at great personal cost. EPA should not

present farmworkers with such a choice.
Finally, the rule would frustrate Farmworker Justice's ability to achieve our mission. We rely on credible scientific evidence to educate farmworkers, policy makers and the public at large about the risks farmworkers face. Much of this evidence comes in the form of epidemiological studies that the proposed rule would categorically exclude from consideration unless the underlying data were made publically available. If EPA's proposed rule were to result in fewer scientific studies focusing on farmworkers, as seems inevitable, we would lack information we need to carry out this important aspect of our mission. It would severely undercut our ability to effectively advocate for farmworker health and safety.
Accordingly, we urge EPA to protect farmworkers and other vulnerable communities by withdrawing the proposed rule without delay.
MS. RADZIKOWSKI: Thank you.
MS. MONGOVEN: Good afternoon, I'm Karen Mongoven;

K-A-R-E-N, M-O-N-G-O-V-E-N, Senior Staff Assistant at NACAA, National Association of Clean Air Agencies, and I appreciate the opportunity to testify today on behalf of NACAA. NACAA recommends that EPA withdraw this proposed rule. In our view the proposal would likely undermine the very objectives that it's supposed to promote. In particular, we believe it would hinder EPA's use of best available science and environmental regulations and it would likely diminish, rather than improve, public confidence in the integrity of EPA's scientific decision-making. Reliance on best available science is a fundamental requirement of the Clean Air Act and other environmental statutes the EPA administers. Indeed, science-based decision-making is at the very core of our shared mission as air regulators to protect public health and the environment from the harmful effects of air pollution.

There is a long-term trend toward increased transparency in science including toward providing greater public access to underlying data and

analytical techniques after scientific studies are published. We think this trend is a laudable one, but complete public access to underlying data is not always possible, especially in the case of the epidemiological studies based on private health data that must remain confidential. Transparency concerns must not override EPA's obligation to consider the full range of peer-reviewed, sound, scientific research that is available and relevant to its regulatory decisions.

Full public access to underlying data and models is not necessary to assure the validity of scientific studies. Rather, the most effective assurance is the process of peer review itself, a process to which the vast majority of scientific information on which EPA relies has already been subject. When the results of a scientific study are submitted for publication, the uncertainties, assumptions, parameters and theories utilized by the scientists are laid out in the publication. Peer review analyzes all of these components to establish validity. The process of peer review

has been rigorously developed over centuries. If EPA believes the peer review process is flawed, it should explain exactly why it believes the process is inadequate and how this proposal specifically addresses those inadequacies. If adopted, the proposed rule could serve to bar EPA's consideration of relevant scientific literature and the establishment of air regulations to protect public health and the environment resulting in serious adverse effects on the nation's air program.

In a footnote in the proposal, EPA cites two D.C. Circuit cases that upheld the Agency's reliance on confidential data in setting health-based air quality standards for lead and fine particulate matter. In that footnote, EPA states that it is "proposing to exercise its discretionary authority to establish a policy that would preclude it from using such data in future regulatory actions." The clear implication is that EPA will discard rigorously vetted scientific literature in the service of greater transparency. This would be an

abdication of EPA's legal obligations and stated intention to rely on the best available science. NACAA is also concerned with a provision that would require EPA to conduct its own "independent peer review of scientific studies underlying significant regulatory decisions." The EPA included no details about how this provision would be implemented and moreover the proposal failed to acknowledge the EPA already has institutional mechanisms to review and vet scientific information through panels of scientific experts including a Science Advisory Board and its Clean Air Scientific Advisory Committee. EPA does not explain why scientific literature that has already undergone peer review and been vetted by EPA's science advisory panel should be subjected to an additional layer of peer review. We do recognize that the proposal would allow the EPA administrator to grant exemptions to the rule's requirements on a case by case basis if he or she determines that "it is not feasible to make underlying data publically available or to conduct

an independent peer review of scientific studies." However, the rule does not include any criteria for how the administrator would make such a determination. We believe this provision would have the effect of interjecting the appearance of politics into what should be a fair and unbiased assessment. It's an opportunity for arbitrary decision-making and it is insufficient to protect against the exclusion of relevant valid scientific studies.

EPA requested comments on whether the proposal should be applied retroactively or retrospectively should they decide to adopt it. We believe the rule should not be applied retrospectively. To do otherwise would create significant regulatory uncertainty by calling into question existing standards as well as prevent state implementation plans and other decisions that are based on those standards.

In conclusion, NACAA respectfully requests that EPA withdraw the proposed rule. If the Agency does intend to update its approach to transparency

and reproducibility it should do so in consultation with the National Academy of Sciences and in the spirit of cooperative federalism EPA should also consult from the earliest stages with the state and local agencies that are responsible for implementing our nation's environmental laws. NACAA appreciates the opportunity to provide the testimony I offered today and we also intent to submit written comments to further elaborate on the concerns I discussed here. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: If Steve Malloy, Speakers 23 and 24 would come to the speaker's table. Speaker 25, Meredith McCormick, and Speaker 26, Olivia Bartlett if you would go to the on-deck seating.

MR. MILLOY: Good afternoon, my name is Steve Milloy. I publish *JunkScience.com*.. I am making my comments here on behalf of myself and also Dr. John Dale Dunn, who is an emergency room physician in Texas. We are here to support the proposed transparency initiative. Science transparency in EPA is long past overdue. When I first started

working on EPA issues in 1990, the main controversy with EPA science was the use of science policy and default assumptions, like linear no-threshold model of carcinogenesis. The problem wasn't necessarily the use of science policy default assumptions, the problem was, rather, the EPA's failure to disclose the nature of those default assumptions in regulatory actions. In other words, what part of the regulatory actions was science, what part was guesswork and what was politics? When I first reported on this problem from the Department of Energy in 1994, the Clinton administration tried to censor my report but they failed. But I didn't and many others didn't. So here we are, many years later, making progress on this important issue.

More recently, the major problem with EPA science has been what has become known as secret science. Since the 1990's EPA grantees like Harvard's Doug Dockery and Brigham Young University's Arden Pope, have refused to make available to the public the

raw data used in their epidemiologic studies, and this is true despite the fact that these studies were cited by EPA as the principle scientific basis for major air quality rules like those that constituted the Obama administration's war on coal.

Worse, prior EPA administrations actually aided and abetted Dockery and Pope hiding their data from public review. In 1996 and 1997 the Clinton administration refused a request of Congress. In the 2000's things got so bad Congress actually had to subpoena the Obama EPA for the data and they refused to provide it.

I can only conclude that this is because independent review of the Harvard Six Cities and the American Cancer Society line of studies would prove them to be highly problematic, embarrassing and even fraudulent. Desperate to defend the indefensible, supporters of Dockery and Pope have wrongly maintained that making the data in question public would violate medical and personal privacy rights. Nothing could be further from the

truth. For the most part, data is electronic. Scrubbed files with key data needed for independent review can easily be made available. No one -- no one -- is interested in any personal or medical data. It has no value to anyone. The State of California has made such data files available for use for many years. I know. I have obtained this data -- over 2 million death certificates to be precise -- and with it enabled research to be published that completely debunks the secret science of Dockery and Pope. Fear of exposure of their research as faulty, if not fake, is why Dockery and Pope are so scared of producing their data for independent review. To make these comments current, up to date, efforts have been made this month to obtain the Dockery and Pope data but they continue to keep their data secret. Given that the Dockery and Pope research and related PM2.5 research has been funded by taxpayers to the tune of more than 600 million dollars and then this research is used to regulate the public costing untold billions more dollars

without providing any public health or environmental benefits, the conspiratorial hiding of this secret data is more akin to crime than science.

If EPA wants to regulate, that is fine, but the basis of the regulations and the reason for the regulations must be clearly laid out so there could be full and fair debate. Harvard's Doug Dockery and Brigham Young's Arden Pope don't want independent scientists to check their work for some reason. Dockery and Pope supporters may offer whatever excuses they like but we all know what the reality is: Fear of exposure. Thanks to the Trump administration the days of secret science are coming to an end. Thank you.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker 25 and Speaker 26, Meredith McCormack and Olivia Bartlett are now onstage. If Speaker 27, Dan Byers, and Speaker 28, Antonia Herzog, would come to the on-deck seating.

MS. McCORMACK: Meredith McCormack, M-E-R-E-D-I-T-H, M-c-C-O-R-M-A-C-K. My name is Meredith

McCormack and I'm a pulmonary critical care physician at Johns Hopkins University where I care for patients and I also investigate the effects of air pollution on lung health in cohort studies of children and adults. I serve on the American Thoracic Society Environmental Health Policy Committee and I'm speaking today on behalf of the ATS, the American Thoracic Society.

The ATS is extremely concerned about the proposed EPA policy. In short, we believe this policy is not in the best interests of our profession, the patients that we serve, or the public health. The focus on transparency is highly reminiscent of the rhetoric used by tobacco lawyers decades ago. As revealed in tobacco industry documents, in 1996 a tobacco industry lawyer drafted a plan for tobacco giant, R.J. Reynolds, to combat research that documented the health effects of second-hand smoke. A tobacco industry lawyer described a plan to construct explicit procedural hurdles the Agency must follow. The memo used the same terms of transparency, sound science and calls for

reproducible science, the language that the EPA is now using in its proposed policy. While the guidance provided in that memo was intended to undermine research studies that documented the adverse effects of second-hand smoke, the recommendations provide a road map for any industry seeking to undermine science that could lead to greater regulation. While concerning, it is no accident that EPA is proposing policy once touted by tobacco industry lawyers. By proposing this policy, EPA is literally taking a page out of tobacco industry's playbook to undermine the legitimate role that science plays in public policy formation.

The ATS supports transparency in upholding scientific rigor but the approach proposed in this rule is flawed. The proposed policy would require all science and biomedical research used by the Agency in major regulatory actions to have its raw data and health records made publically available under the guise of allowing third party analysis to confirm the results of the research. This

artificial standard cannot be met without forcing the release of confidential patient information and is in direct conflict with the mandates of our institutional review boards and updated privacy laws.

As a physician, no doctor or medical society would advocate ignoring large portions of the medical literature because the underlying data were not in the public domain. Medical guidelines are based on the best available evidence: Evidence that emerges from multiple peer reviewed publications, not a single study. The medical field is rapidly moving towards increasing transparency but this cannot be applied retroactively. Is the best available science only the subset of studies whose data are available for analysis by the public? That is not the case for medical research studies and is certainly not the case for studies of environmental health effects.

EPA's new transparency standard introduces a more severe standard than the FDA uses to make decisions about the approval of drugs or that

Medicare uses to decide which treatments to cover. As a doctor I would do my patients a disservice if I ignore the best available evidence to guide my clinical decision-making. The proposed rule will allow the EPA to ignore the best scientific evidence in future decision-making about health effects of the air that we breathe and the water that we drink. The Transparency Rule fails to recognize the power of replication, a key criteria for defining the strength of scientific evidence. Replication refers to the fact that consistent findings from studies in different populations in different places strengthens the likelihood of an effect. The proposed rule would create a context for the EPA administrator to have the discretion to disregard studies that have provided the strongest scientific evidence underlying the dramatic health effects and dramatic improvements in air quality in the U.S. -- improvements that have led to measurable health benefits to our children, our patients and the general public. For the EPA to use these studies will patients

forego their confidential information? Or will the EPA now ignore the evidence from dozens of studies that have replicated findings that pollution is associated with increased risks of premature death. The Transparency Rule is unnecessary as there are processes in place to rigorously review the scientific integrity of the studies that are used in regulatory science.

In short, we fully concur with the statement from the editors of several leading scientific journals that the merits of studies relying on data that cannot be made publically available can still be judged. It does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them.

In summary, this policy is issued in bad faith, is bad for science and bad for patients and bad for public health. The ATS strongly urges the Agency to withdraw this ill-conceived policy proposal.

Thank you.

MS. RADZIKOWSKI:

MS. BARTLETT: I'm Olivia Bartlett. B-A-R-T-L-E-

T-T. I'm from Bethesda, Maryland and I represent the 1200 members of Do the Most Good, Montgomery County. I am a retired PhD health scientist. For 15 years I conducted research involving human subjects and also served as a peer reviewer for both grant applications and research papers submitted for publication. For the next 30 years I oversaw the scientific peer review of thousands of applications for funding of a wide variety of health science studies including the women's health study that was mentioned by a previous speaker, so I'm very familiar with the scientific research and publication process and the rules regarding protection of human subjects. I also have asthma, as do my son and my grandson, so I am also very familiar with the impact of soot and smog in the air on the ability to breathe. EPA's mission is to protect health and the environment. I strongly oppose EPA's so-called Transparency Rule since it will restrict the scientific studies that EPA can use to carry out that mission and to set safety standards for toxic

chemicals and pollutants in the air we all breathe and the water we all drink. The proposed rule was given an appealing title but it's just a politically motivated attempt to undermine decades of progress in protecting human health from hazards, particularly small particulate pollutants in the environment, while allowing soot-producing industries off the hook. The proposed rule is seriously flawed in several important ways. First, it reflects former EPA Administrator Pruitt's woefully inadequate understanding of scientific research methods, the nature of the long-term large-scale epidemiologic studies necessary to gather the kinds of data needed to determine toxicity of a pollutant and the rigor of peer review of both research grant applications and publications. Peer reviewers carefully scrutinize the methods that will be used to collect and analyze the data before a research study is ever funded. Additional peer reviewers and different ones scrutinize the data collection and analysis methods and whether the data supports

the conclusions, again prior to publication. Studies with flaws in design, data collection or data analysis don't make it into reputable journals. The proposed rule also seriously underestimates the burden and the consequences of making all raw data publically available. Most research funding agencies and journals now have policies that require researchers to make their data available to other scientists for reanalysis, validation and meta-analyses after publication and this has already been mentioned by previous speakers. However, many studies involve sensitive and personal data that could identify individual subjects even if the subject's name and address are redacted, so releasing these data sets to the public would violate patient confidentiality rules. The proposed rule may also violate the requirements of the Clean Air Act and Clean Water Act and other standard acts already mentioned to use criteria that accurately reflect the latest scientific knowledge, the best available science and inclusive analysis of all

available studies in assessing potential effects on public health. Furthermore, the proposed rule would create an unacceptable double standard for industry-sponsored and academic research by allowing companies to shield their confidential business data, thus corporate secret science would be okay but data sets that expose individual subjects' identities would have to be made public or would be excluded from consideration in rulemaking. This ill-conceived proposed rule has been condemned by hundreds of scientists, all but one of the previous speakers today, and numerous scientific societies across health and environmental fields. Editors of prestigious journals have denounced the proposed rule and stated excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes. The bipartisan policy center, the bipartisan environmental protection network represented earlier by a speaker, the Attorney Generals of seven states and D.C. who was here earlier and

EPA's own Science Advisory Board have also denounced the proposed rule. Rather than increasing transparency, the proposed rule will hamstring EPA, eliminate some of the best science available to inform standards under the National Ambient Air Quality Standards program and jeopardize both the environment and public health by making it more difficult to adopt rules that protect public health and the environment in the future. EPA's long-standing process using data from peer-reviewed science, EPA in-house scientists and the EPA Science Advisory Board works well and mirrors the processes of other science-based agencies. The system isn't broken and doesn't need to be fixed. If EPA wants to accomplish its mission, the proposed rule should be withdrawn immediately and should not affect any rulemaking going forward or any of the studies used in periodic reanalysis of existing rules. Thank you for allowing me to comment.

MS. RADZIKOWSKI: Thank you.

MS. STOBERT: Speaker 27, Dan Byers, and Speaker

28, Antonia Herzog, if you would take seats on the stage. Speaker 29, Tess Dermbach, and Speaker 30, Mary Angly, if you would take seats in the on-deck seating.

MR. BYERS: Good afternoon. My name is Dan Byers. The U.S. Chamber of Commerce strongly supports the intent of the proposed rule and applauds EPA for addressing a long-standing problem inherent in much of its regulatory decision-making processes. While the Agency's proposed reforms are clearly controversial they are grounded in a universally-accepted democratic principle: Citizens have a right to the data and information that are used in the development of public policy. This spirit of openness with respect to the regulatory process is found throughout government. It is enshrined in statute and countless federal directives and EPA memos reinforce the principle and detailed guidance for implementing it. It is also supported by experts of all political stripes. In 2012, congressional testimony, President Obama's Science Advisor, Dr. John Holdren, unequivocally

endorsed this idea, stating that: "Absolutely the data on which regulatory decisions and other decisions are based should be made available to the committee and should be made public. The Chair of EPA's Science Advisory Board during the Obama administration subsequently echoed this sentiment. Unfortunately, while this principle is generally accepted, EPA has not followed it consistently in practice. In fact, for many years EPA has relied upon non-public data to justify its aggressive regulatory agenda. The most egregious, but certainly not the only, example of this involves two controversial studies undertaken in the 1980s that suggest a linkage between certain types of particulate matter and health outcomes. The data associated with these decades-old studies has never been made public but EPA nonetheless has used them to monetize regulatory benefit claims that dominate the communications and regulatory marketing associated with nearly all of its major rules. It's also worth pointing out here that, separate from the studies themselves, EPA's

benefit monetization is highly subjective and controversial in and of itself. For example, in 2009 the Agency modified its assumptions in a manner that resulted in a quadrupling of purported benefits without any change to the underlying data and information used to monetize it. We hope that these sorts of subjective and questionable practices will be addressed since the Agency concurrently examines the development of regulatory cost-benefit analyses. The scale of EPA's practice in this respect is mind boggling. Data compiled by the U.S. Chamber found that between 2000 and 2016, EPA issued 62 rules claiming a total of 923 billion dollars in regulatory benefits. Incredibly 898 billion of these benefits, or 97%, were monetized based on the non-public data associated with PM2.5. In fact, these benefits comprise nearly 80% of all regulatory benefits across the entire federal government. Even though the vast majority of these rules were not intended to address PM2.5, and even though the vast majority of their

corresponding claim benefits came from areas of the country already deemed safe and in compliance with the standard, the Agency repeatedly touted these figures to build public support for its regulations. It's one thing to be cavalier about transparency principles when their application has little or no import to public policy. The federal rules that impact millions of people and billions of dollars should be held to a higher standard. For these reasons, we applaud EPA's effort to establish and meet a higher standard and we commend the Agency for doing so through the formal public comment and rulemaking process rather than simply instituting a new policy. As EPA makes clear throughout the rule, these changes will require considerable effort and cooperation, and despite suggestions otherwise, the proposal clearly states that its aim is not to exclude science but rather to ensure: "That over time more of the data and models underlying the science that informs regulatory decisions is available to the public for validation." And, to more broadly

quote: "Change Agency culture and practices regarding data access." The outcome will not just lead to better public policy, it will improve the integrity of the rulemaking process and in doing so increase public trust in, and support for, EPA itself. Whether you agree with the administration's regulatory approach or not, that is a good thing. With that fundamental background in mind I will close by calling attention to six high-level areas that warrant emphasis and attention as the Agency works to finalize the rule. These are elaborated on in my written comments.

1) Protect sensitive information;

2) Formally coordinate with other agencies working to address similar regulatory transparency challenges;

3) Develop further guidance and processes for employing the administrator's exemption authority under the rule;

4) Consider alternative approaches to balancing trade-offs between goals related to

transparency and maximizing the quantity and quality of information relied upon. For example this could include assigning greater decision-making weight to publically available data while still allowing for the consideration of nontransparent data;

5) Where possible, work to protect and de-identify sensitive information to allow for its continued use in regulatory decision-making, and;

6) Ensure that relevant transparency information is incorporated into public communications and marketing materials associated with regulatory initiatives. Thank you for your time and consideration today.

[Substitution of panel members.]

MS. HUBBARD: Thank you.

MS. HERZOG: Hello, my name is Antonia Herzog, H-E-R-Z-O-G, and I am a scientist with a doctorate in Physics. I am particularly concerned about preserving the scientific integrity of the EPA. I work in the Environment and Health Program at Physicians for Social Responsibility, a nonprofit

organization here in D.C. with chapters in multiple states across the country and over thirty thousand members and activists around the country. Our mission is to protect human life from the gravest threats to health and survival; we number environmental pollution among those key threats. PSR would like to express its strong opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." This proposed rule could arbitrarily exclude many important scientific studies-including thousands of public health and epidemiological studies that the Agency uses to make informed policy decisions regarding major public health and environmental laws. While it pretends to be about "transparency", the policy actually will limit the Agency's ability to use the best available science thereby weakening protections for public health and the environment. In essence it could censor and block much of the peer reviewed scientific research that has allowed us to address many serious environmental health threats over the decades.

EPA's proposed rule would place crippling restrictions on the use of data the Agency would accept in the rulemaking process by ultimately requiring investigators to divulge personal information about the participants in research studies. Scientific studies that failed to meet this criterion would not be acceptable to the Agency. At present, this kind of information must be kept confidential according to the generally accepted rules that govern the conduct of research that must be adhered to by agencies of the federal government and institutions that receive federal funds. A particular example that is concerning to me and is particularly relevant today where it's so hot outside and the air quality is questionable, is the Clean Air Act, a bedrock environmental law that protects us from dangerous air pollutants. It is such a critical health protection that would be endangered under this proposed rule because it relies on a longitudinal epidemiologic study of thousands of individuals. This includes the National Ambient Air Quality

Standards (NAAQS) in the Clean Air Act. These standards address six major classes of common air pollutants, including standards for fine particles {PM2.5), and these are the backbone of the U.S. air quality management system.

The Clean Air Act specifies that new or revised NAAQS be based on scientific criteria that "accurately reflect the latest scientific knowledge useful in indicating the kind and extent of all identifiable effects on public health or welfare which may be expected from the presence of such pollutant in the ambient air." EPA has relied largely on community epidemiology and controlled human studies in establishing the specific pollutant levels and averaging times for NAAQS. If these studies were excluded by the EPA restrictions it would greatly reduce the availability of information that has proved to be significant in assessing the consistency and coherence of the evidence upon which the standards are based and would certainly weaken the scientific basis for maintaining or strengthening

those current standards. If the proposed rule is approved, we could lose the Clean Air Act's sweeping improvements to the air we breathe that we've benefited from over the last several decades thereby putting thousands of lives that are saved each year at risk, because EPA will no longer be able to use key scientific research.

PSR's mission is very similar to EPA's stated mission "to protect human health and the environment." To accomplish these objectives, we must protect the scientific integrity of the EPA. Physicians for Social Responsibility thus, strongly opposes the EPA's deceptively named proposal, "Strengthening Transparency in Regulatory Science." Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 29, Tess Dernbach, and Speaker 30, Mary Angly. If you come to the speakers' table. Is Mary Angly in the room? Okay, we'll come back to her at the end.

MS. DERNBACH: My name is Tess Dernbach, T-E-S-S,

D-E-R-N-B-A-C-H. I am a third-year law student at Columbia Law School and a legal intern at Earthjustice, speaking on behalf of Earthjustice. EPA's proposed rule, "Strengthening Transparency in Regulatory Science," requires a choice between breaching medical privacy or ignoring data for rulemaking decisions altogether. Breaching a patient's medical confidentiality can have severe and wide-ranging consequences for patients' lives and livelihoods. Various groups have often tried to access patient data for retaliatory purposes. For example, when pork industry associates tried to access the identities of individuals who had participated in a study by the University of North Carolina Professor Steve Wing, about the harmful health impacts of hog farming, or when the Department of Justice tried to access names of women who had late term abortions for use in litigation challenging the Partial Birth Abortion Ban Act. Employees' health information can be and is used against them by employers as an excuse for termination or other poor treatment. Moreover,

when the medical confidentiality of research participants is breached, people are deterred from participating in research altogether. Medical confidentiality is a necessary element of modern medicine. Patients must feel safe telling their doctors the most intimate details of their lives. The expectation of confidentiality fosters openness and trust between doctors and patients and is crucial to the delivery of medicine and conducting clinical research. Courts recognize, too, the importance of medical confidentiality and privacy. In 1928, Justice Brandeis described the right of privacy as: "The most comprehensive of rights and the right most valued by civilized men." At least five circuit courts have recognized an individual's constitutional interest in or right to the privacy of their medical information. In Farnsworth v Procter and Gamble in the 11th Circuit, the court recognized that: "Even without an express guarantee of confidentiality, there is still an expectation, not unjustified, that when highly personal and

potential embarrassing information is given for the sake of medical information it will remain private." This right to medical privacy can extend to beyond publication of medical data to situations where medical information is available to those without a legitimate interest in it. See, for example, Tucson Women's Clinic v Eden in the 9th Circuit, where the court observed that even if safeguards against public disclosure were adequate, the lack of safeguards against release of information to government employees who have no need for the information could create a violation of the right to privacy.

The EPA claims, vaguely, that confidential data will be protected by redaction or de-identification. However, these mechanisms are entirely inadequate to maintain patient confidentiality. Latanya Sweeney, a Harvard Professor of Government and Technology, found in her study simple demographics often identify people uniquely that she was able to identify 87% of people in the United States with only their

gender, zip code and birth date. She has also found particular problems in patient confidentiality de-identification observing that in many healthcare data sets there will be unique data about people that can be used to identify them even when they are not explicitly identified in the data set. Sweeney found that even without identifying data in health data sets: "The remaining data can be used to re-identify individuals by linking or matching the data to other databases or by looking at unique characteristics found in the fields and records of the database itself."

Paul Ohm from the Georgetown Law School found in his pivotal work: *Broken Promises of Privacy: Responding to the Surprising Failure of Anonymization*, that using traditional, personally identifiable information focused anonymization techniques, any data that is even minutely useful can never be perfectly anonymous. These studies seriously undermine government claims that de-identifying data will provide adequate privacy for

patient data contained within research studies. Because of these reasons and those given before me, I strongly urge EPA to revoke the proposed rule immediately. Thank you.

MS. HUBBARD: Thank you.

MS. ANGLY: Hello, my name is Mary Angly and I'm interning for the organization Physicians for Social Responsibility and I've come to speak against the proposed rule, "Strengthening Transparency in Regulatory Science." Medical studies, clinical reports, and real-world field studies all include data and information that cannot be made public without violating confidentiality in patient protection laws. The proposed rule implies that these studies are not transparent because researchers necessarily suppress names and other identifying information about patients whose health information is relevant to study findings. Releasing individual participants' data to the public would violate confidentiality requirements legally mandated by the IRB and/or by HIPAA. By restricting these

studies, the proposed rule would essentially force the EPA to base many of its regulatory decisions on industry-sponsored studies and this rule could have huge environmental and public health implications. Despite a supposed scientific process, the funding source for a study can have significant implications on study findings. For example, in a review of research into the health effects of EPA an evaluation of 115 relevant studies was conducted in 2009. The review found that 94% of the publically funded studies found that chemicals have harmful effects whereas none of the industry-backed studies found these same findings. This is a huge disparity that cannot have occurred due to chance alone. Successful regulatory policies can have huge and quantifiable effects on exposure levels in human health. Biannually, the CDC collects data recording the blood and urine levels of 265 chemicals in people across the country. Longitudinal data can be used to visualize falling exposure levels and thus not measure the impact of a policy. For instance,

following the 1970's era lead regulations, 2009 blood lead levels were 8% of 1980 levels, which is a compelling example of a successful public benefit that occurred as a result of regulatory efforts. This is especially important when one considers that the detrimental effects of lead exposure are well known and well documented. Lead exposures leading to a blood concentration of 1 mcg/dL are correlated with an IQ loss of about 0.2 points. Each IQ point is estimated to raise worker productivity about 2%. Moral arguments aside, when considered from a population perspective, lead regulation has had huge economic benefits. A review of the EPA's archives shows that much of the original clinical research that formed the EPA's decision to regulate lead would have contained private health information. Under the proposed rule many of these studies would not have been able to be taken into consideration which is why it's so important that these studies are allowed to regulate future chemicals. Although lead specifically, and its health effects

are well known and well documented, my fear is that the future regulation of dangerous chemicals will be prevented due to the restrictive nature of this rule. Barring the use of major health studies under the veil of transparency will have huge and detrimental effects on the breadth and validity of the sources the EPA is able to consider when making regulatory decisions. Dangerous chemicals will not be able to be adequately regulated if the scientific processes are stymied.

I urge you to consider the health of this country when deciding whether or not to implement this rule. If the health implications are not enough to prevent the enactment, please consider the economic implications. The cornerstone of a healthy and productive population is a healthy environment. This rule would pose a serious barrier to the EPA's ability to effectively regulate. The power of landmark laws defined to protect human health such as the Clean Air Act, Safe Drinking Water Act, and Toxic Substances

Control Act, could be significantly undermined if this rule comes to fruition. Thank you for your time.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 31, Brenda Munive, and Speaker 32, George Thurston, if you would come to the speakers' table. Speaker 33, Brittany Meyer, and Speaker 34, Adam Spanier, if you would come to the on-deck seating.

MS. MUNIVE: Good afternoon. My name is Brenda Munive and I am currently interning with the nonprofit organization called Physicians for Social Responsibility. I am a recent graduate of the University of California, Santa Barbara, with degrees in Environmental Studies and Communication. I am testifying today to voice my opposition to the EPA's proposed rule, "Strengthening Transparency in Regulatory Science." I believe that scientific transparency is critical. Scientists, policy makers, and the public alike must all be able to trust and rely upon the scientific evidence that shapes our

society and the extent of human knowledge. However, I believe the EPA's proposed rule instead represents a serious misunderstanding of the institution of science. Furthermore, I believe that the proposed rule risks unnecessarily excluding valid scientific evidence from informing EPA policy, and therefore harms our fellow Americans through the creation of ineffective policies. The nature of the scientific field is unique. While most professions are motivated by political, economic or societal interests, scientists are motivated by seeking truth. Scientists perform research with the sole objective of uncovering the reality of how our world operates and gain status and recognition by succeeding in that goal. Top scientists are granted tenure or the assurance they cannot be fired from their position for whatever reason. Tenure guarantees scientists that they will not lose their position even if their research points to facts that are controversial or at odds with the current political societal climate. For these

reasons, ideally, they are not suspect to the same biases as most of the public. To prove this point it is helpful to look at the four norms of scientists as explained by renowned sociologist, Robert Merton. These are: Universalism, or the idea that truth applies to all regardless of belief; communalism -- the fact that all scientific knowledge belongs to the public; disinterestedness -- the fact that scientists are not concerned with the outcome of the research, only that it is factual; and organized skepticism or the tendency to be doubtful of any research to ensuring the deep truth. These norms describe the ideal foundation on which scientists and their research operate. Because of communalism, we can be confident that scientific research is as open as possible. Being intentionally secretive violates this ideal, so critical data must be accurately presented. This norm does not mean that all data is presented, however. Minute details, such as the identities of the subjects, are usually withheld in research studies of all

types to protect privacy and ensure participation -- or, encourage participation. It is important to emphasize that these omissions do not diminish the quality or the outcome of the research, but are made in the interest of the well-being of the participants. Because of this intrusiveness, the public can be confident that scientific research is virtually free of any bias favoring one agenda, and because of organized skepticism, scientific research is subjected to heavy review and fact checking before it is published in a scientific journal, so the public can be confident that published research is factually sound. Of course, there are exceptions to these ideals. For example, the norm of disinterestedness could be jeopardized if a scientist is hired by an outside party such as a company or noted member of the industry. The outside party introduces a monetary benefit and a desired outcome for the research, putting unconventional pressure on the scientist to fulfill the desires of whoever hires them. If the EPA's proposed rule is enacted, industry

funded research could comprise a disproportionate amount of what informs EPA policies, giving the industry, and not the scientific community, a large degree of input in shaping environmental protections.

Based on this knowledge, the proposed EPA rule is unnecessary. Mandating that underlying data be made public in order for scientific research to be utilized in informing EPA policies, attempts to increase transparency but fails to recognize that scientists already take thorough and exhaustive steps to assure their published research is unbiased, truthful and as transparent as possible. Research that does not meet these standards is rejected by the scientific community. The rule would restrict valid scientific data, particularly within health research where patient confidentiality mandates that identifying information remain anonymous. The result would be ineffective and harmful policies that could allow for practices and chemicals that genuinely harm our nation to remain rampant and unregulated.

This outcome would benefit no one and runs contrary to the EPA's mission of protecting public health and the environment. Furthermore, a healthy economy depends on healthy communities. For these reasons, I implore the EPA to reconsider enacting this rule. Thank you for this opportunity to present my testimony.

MS. HUBBARD: Thank you.

MR. THURSTON: Good afternoon, I'm George Thurston. I'm a professor at the New York University School of Medicine. Today I'm here representing the International Society for Environmental Epidemiology, the ISEE, which includes researchers who study environmental causes of ill health including ambient air pollution subject to the National Ambient Air Quality Standards, or NAAQS, promulgated by the EPA, as well as its standards for heavy metals, pesticides, drinking water and other environmental contaminants. As such, our members have supplied a substantial part of the research that is the basis of those standards. We strongly oppose the

implementation of EPA's proposed changes to the way that studies are considered in setting such standards. Based on an incorrect interpretation of transparency and replication in science, the proposed rule would deprive policy makers of the real-world epidemiological evidence based on real exposures of real people that have been, and will continue to be, vital for future considerations of EPA's health-based standards. I especially want to highlight for you the manuscript that I wrote 20 years ago entitled, "Band-Aiding the Release of Health Research Data: Issues and Implications," and the article is already posted on EPA's SAB web page. This article considered a similar proposal that was made in July of 1997 as an amendment to the U.S. House Appropriations Bill without any hearings. The problems I raised at that time are directly relevant to today's transparency proposal.

First, the increased potential for compromise of medical record confidentiality. As you've heard before today in a time of big data it's all too

easy to crack any de-identification process, especially when lots of publically available spatial and environmental data are matched to people in the study as they are in the studies that EPA considers. The solving of the Golden State Killer case, for example, is one example where a combination of two separate databases allowed de-identification of an individual. Second a loss of researchers' intellectual property. This can involve lost publications and academic career derailment. Third, the imposition of a government unfunded mandate. The USOMB has estimated that a similar law considered in the Congress, but that was never passed by the Senate, could cost the government up to 250 million dollars per year. There would also be the data prep costs to the scientists and their institutions.

Fourth, damage to future scientific research. When people no longer wish to enroll for fear that their medical data will be released, new scientific studies could be inhibited. Fifth, the

proposed rule will allow the EPA to ignore large portions of the scientific literature in decisions that are supposed to protect public health. In cases where key studies are excluded from the evaluation of environmental issue because of an inability to release study participants' private health records, the EPA may then ignore key scientific studies. This would diminish the evidence supporting protective health studies, potentially allowing the EPA to conclude that there's insufficient evidence to support proper health protective standards.

Sixth, the abuse of research data to undermine science credibility. This problem is likely the most dangerous aspect of this proposal. Past documented examples of abuse by consultants to a vested interest resulted when the state of Georgia set up an open records law and the R.J. Reynolds Company used it to obtain research data to attack study findings that the use of cartoon characters, such as Joe Camel, in tobacco advertising influenced children's product recognition. That

research was later validated in other studies but the damage was done and the physician involved left research for private practice. Thus, this data release approach has already been tried in the past and shown to be too easily abused by vested interests. There is also a tobacco connection to today's proposal. Just before the 1997 open data amendment was presented to the House, there was a December 1996 memo from the consultant of the tobacco industry, from Christopher Horner, laying out a similar strategy to address federal agency science with respect to second-hand smoke including a now familiar call for science transparency.

Finally, there's no need for this rule. Independent validation has already been conducted by groups such as the Health Effects Institute for air pollution studies, such as for the ACS and the Six Cities studies. Indeed, these are the studies mentioned by an earlier speaker, I believe it was Steven (sic) Milloy, and he incorrectly said that they were never released, they would never release

their data, and in fact they did release it. So, his testimony was incorrect. And whoever it was, I think it was Steven (sic) Milloy, but anyway, earlier speaker who said that Pope and Dockery had not released their data. They have done so and, in fact, it's an excellent example of how the system works. So, finally just to say such independent evaluations could easily be applied again to any new cases of concern for data validation without the above-noted risks. Thus, this dangerous rule seeks to needlessly solve a purported problem that just doesn't exist. Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 33, Brittany Meyer, and Speaker 34, Adam Spanier, if you would come to the speakers' table. Speaker 35, Sean Moulton, and Speaker 36, Andrew Bergman, if you would come to the on-deck seating.

MS. MEYER: Hi. My name is Brittany Meyer and I am the Associate Director of Public Policy at the Michael J. Fox Foundation for Parkinson's

Research. I am here on behalf of the nearly one million people with Parkinson's disease in the United States who rely on the Environmental Protection Agency to safeguard their health and inform them about potential hazards in the environment.

For over the past ten years, we've learned a lot about the mechanisms of Parkinson's disease and now know that the condition is caused by both genetic and environmental factors. It is now very clear that when coupled with a genetic risk factor, exposure to several chemicals, most notably solvents and certain pesticides, can trigger the disease. Just eight weeks ago, a study out of Canada suggested that low-level exposure to pesticides disrupts cells in a way that mimics the effects of mutations known to cause Parkinson's. More research is needed to fully understand the mechanisms at work and how to prevent them.

Many of the studies used to identify risk factors for Parkinson's disease are investigated via large population-based epidemiology studies and will be

impacted by EPA's proposal. I am going to highlight one clear example- though along with my health and science colleagues here today, we can provide hundreds of examples of studies that could be impacted.

A 2009 study used GPS to estimate participants' well-water contamination exposure from agricultural pesticides. The results showed that consuming well water from a private well located in an area with historical pesticide use resulted in an increased risk of Parkinson's disease. Due to the nature of wells - typically serving a relatively limited number of people within a very small radius - the detail needed to perform the study renders proper de-identification impossible. All one needs to know is that a certain person lives near a particular well along with a demographic detail such as their age, gender, race, etc., and privacy is at great risk. Data from studies like this cannot be de-identified to the degree needed to protect patient's identification while still providing the

amount of specificity needed to help a scientist trying to replicate the results. Obtaining consent is not a solution. Some people make the choice to not disclose their Parkinson's diagnosis for a variety of reasons including privacy concerns, fear of prejudice or retaliation at work, and others. It is simply unreasonable to put people in the position of outing their diagnosis or to decline to participate in a study that could someday find a cure for their condition. Additionally, people who are willing to sign away their privacy and those who are not are different in ways we cannot predict or control for in study analysis.

The Michael J. Fox Foundation believes in open, reliable, and replicable science. We fund approximately 90 million dollars in research per year and hold our funded scientists to the highest standards. Our contracts require science studies to be peer reviewed and most require data to be as available as possible while protecting precious health data. We echo the call of our fellow public

health groups here today and the nearly seventy public health, science, academic, and medical groups who signed on to a joint statement calling for the rule to be abandoned for the sake of science and for our health. Thank you.

MS. HUBBARD: Thank you.

MR. SPANIER: Good afternoon, my name is Adam Spanier, S-P-A-N-I-E-R. I am a pediatrician and Associate Professor in the Department of Pediatrics at the University of Maryland School of Medicine. I'm also a member of the American Academy of Pediatrics, Council on Environmental Health Executive Committee. I'm here today on behalf of the American Academy of Pediatrics. The AAP strongly objects to EPA's proposed rule, "Strengthening Transparency in Regulatory Science." The proposal will require EPA to ignore the best available, peer-reviewed scientific evidence on pediatric and reproductive environmental health, may violate patient confidentiality, and could dampen scientific processes by creating barriers to the use of

quality research in EPA science. Children and pregnant women are disproportionately affected by environmental pollutants and changes. Between 1990 and 2010, the Clean Air Act prevented over 160,000 premature deaths, 54,000 cases of chronic bronchitis, 130,000 acute myocardial infarctions, 1.7 million asthma exacerbations, 3.2 million lost school days and 13 million lost work days. Landmark academic studies guided EPA to implement policies leading to these dramatically positive outcomes. However, EPA's proposed rule will no longer allow EPA scientists to use much of the scientific evidence that's brought on these life-saving regulatory changes.

Scientific studies used by EPA to make regulatory changes are already rigorously examined prior to being published in peer-reviewed scientific journals. Scientists not associated with the research study must review the study design to ensure that it is scientifically sound before the study can be published. Many of the studies that inform EPA policy to protect the health of

children and pregnant women are based on IRB approved studies of the health of human subjects that require data confidentiality. Such studies involve observing the longitudinal effects on reproductive and child health from exposures to lead, particulate matter and other toxic substances. Replicating such investigations for the purpose of providing open access data for EPA to use would be morally unacceptable as it would require exposing children to lead, ozone and other damaging pollution. It would also not be ethical to exempt the study participants from data confidentiality protections. By requiring reproducibility the rule may also exclude many landmark public health studies that were so scientifically rigorous and resource-intensive that they could not be reproduced, such as the Framingham Heart Study, a 70-year-long cardiovascular epidemiologic study. Requiring reproducibility may also exclude studies done after landmark ecologic events such as oil spills and natural disasters. This rule does not improve

the scientific merit of the studies used for EPA policies, and, instead, creates significant barriers to EPA's assessment of past, current and future scientific work. This proposed rule contravenes EPA's mission to ensure that American pregnant women, children and families have clean air, land and water, and the AAP strongly urges you to not move forward with it. Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 35, Sean Moulton, and Speaker 36, Andrew Bergman, if you'll come to the speakers table. Before they speak I wanted to note that the time is now 2:39 and Speakers 35 and 36 are the last two speakers here to speak during the afternoon session. So, at this time if there's any speakers currently registered for the evening session but would like to speak now, if you would go to the registration desk we can get you a speaker number. Go ahead.

MR. MOULTON: Good afternoon, my name is Sean Moulton, Senior Policy Analyst at the Project On Government Oversight, a national nonprofit,

nonpartisan, government accountability organization. Thank you for the opportunity to speak this afternoon. I'm here to express my organization's strong objections to the proposed rule, "Strengthening Transparency in Regulatory Science," and urge the Agency to withdraw it. In the proposed rule the Agency notes that the best available science must serve as the foundation for EPA's regulatory actions. It is hard to argue with that fundamental principle, but this policy won't make scientific information better, nor more available. Instead, the new rule will often mean the best available science is off limits to the Agency, create delays in rulemaking and result in greater litigation.

I'd like to focus primarily on the rulemaking process and first raise serious concerns about the insufficient development process that produced this rule, a rule that fundamentally changes what information can and cannot be used in future rulemakings is a major undertaking and requires a great deal of certainty and evidence, yet this

proposal offers no clear explanation of the precise problem, no supporting evidence, no studies establishing that EPA has an information problem, nor citations that the proposed standard has been successfully used before or that EPA understands what its impact will be on the regulatory process when implemented. Even if the Agency truly believes there is some deficiency in its information policies and procedures, this proposed rule is premature. The starting point should be conducting studies of the issue to better understand the scope of the problem, if there is one, and the best way to improve transparency of regulatory science. The Agency should allow the Science Advisory Board to fully investigate and offer specific recommendations before moving forward with any proposed rule. There are any number of steps that the EPA should be completing before rushing into a formal rulemaking. The incomplete foundations for this rule reveal themselves in the vague language and unclear standards. The rule does not specify how

the new standards will be implemented, what mechanisms will be made available to allow publishing of more detailed data. More importantly the rule doesn't address how it will fit into the legal requirements the Agency has under the Administrative Procedure Act or other environmental laws.

The proposed rule is being done at EPA's discretion with no statutory authority backing it up. So, should this policy come into conflict with statutory requirements under existing law, those laws take precedent, and laws governing rulemaking have a number of requirements that this proposed rule would be in conflict with. The Administrative Procedure Act makes clear that an Agency cannot engage in arbitrary, capricious actions or decisions in its rulemaking; while the Agency has authority in its given area, that authority is not absolute. The Agency must have clear and strong justifications for its actions. Given the lack of supporting evidence for this policy or a statutory requirement from Congress,

EPA will be hard pressed to prove that this untested standard is not arbitrary. Even if the rule isn't immediately dismissed under the APA, the EPA's requirements under other laws, such as the Clean Air Act, that it consider all available, or best available, science in rulemaking and this policy would be in direct conflict with those. If the Agency seeks to apply this new standard in areas ungoverned by such statutory requirements, it will result in a confusing patchwork of standards where a study may be available for consideration under a Clean Air Act rule or a TSCA rule, but that same study would not be considerable in another rule.

I wanted to note in a case before the U.S. Court of Appeals for D.C. around the availability of air quality data study information, the court addressed this very issue, stating that, "If the EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying them, then much plainly relevant

scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment." Placing large portions of scientific research off limits simply goes against common sense. EPA should be able to use any and all available information to produce the best, most up-to-date rules. If a study is unreliable or flawed in some way, then the Agency can decide that based solely on that study's merits, and sometimes even flawed or partial studies can offer important insights that the EPA should benefit from.

We strongly urge EPA to withdraw this rule. Thank you very much for your time.

MS. HUBBARD: Thank you.

MR. BERGMAN: I'm Andrew Bergman, and I'm speaking today as the Special Environmental Advisor at the Project On Government Oversight, but I'm also currently a Ph.D. student in applied physics at Harvard University.

While the proposed "Strengthening Transparency in Regulatory Science" rule uses the words

"transparency" and "reproducibility" to project lofty goals, it's real effect will be to undermine the way that the EPA is able to rely on and even-handedly assess scientific studies for use in the rulemaking process. I'm here today to urge EPA to withdraw this rule. My colleague, Sean Moulton, has just addressed how the proposed rule conflicts with the EPA's regulatory process, and the statutory requirements underlying that process, but the rule will also have a direct impact on how the EPA approaches science.

The rule fails to properly address its two key considerations that will have a major impact on how it is implemented. First, the rule states that data relied on in making regulations must be made publically available, but it doesn't suggest a mechanism for how personally identifiable information or confidential business information would be handled.

This is an incredibly important issue, as so many studies that EPA uses rely on this type of confidential data. Yet it's reasonable to conclude

from the rule that, if it goes into effect, the EPA will no longer be able to use most longitudinal human health studies to craft public safeguards, even though those studies have been conducted by reputable researchers at academic institutions, and peer reviewed to ensure validity. Instead, they will be left with industry studies that more often use animal test subjects, which don't have any personal privacy concerns.

Second, while the rule refers to replicability of scientific findings, the background information supporting the rule focuses on scientific studies' reproducibility, which has a wholly different meaning in a scientific context. But because the rule itself says it must be possible to "replicate" studies' findings, we should assume that the rule intends the strongest possible meaning: that it must genuinely be possible to conduct all studies used in rulemaking again, from scratch, and obtain the same findings.

The Agency uses many studies, however, such as

those that link leaded gasoline to brain damage in children or a study that found a link between fine particulate air pollution and premature deaths, that examine dangerous real-world exposures and cannot, of course, be safely repeated. Just because they can't, or shouldn't, be repeated, however, doesn't mean we should ignore the vital insights they provide. The knowledge we have gained from these tragedies can and should be used to help safeguard the public in the future. Without knowing the details of how these two provisions, central to the rule, will be implemented, commenters can't even begin to assess the wide-ranging outcomes of this rule. We can conclude that the result will be that large swaths of studies will be arbitrarily ruled out for use in future rulemakings.

The rule's constraints on the use of scientific studies mean that even the use of studies that don't end up being haphazardly tossed out by this rule will be hindered substantially. The CBO found that a policy very similar to the proposed rule,

when it was proposed as legislation, would significantly reduce the number of studies that EPA is able to rely on when issuing and proposing rules without a substantial input of funding--a major loss when Agency scientists already have the tools to conduct thorough assessments of studies they rely on.

The rule also puts the Agency in a position where it's forced to serve as an independent reviewer of all scientific data underlying studies it uses, which will again hamstring Agency scientists who have limited resources. When the EPA was sued over air quality standards for particulate matter and ozone during the George W. Bush administration, the U.S. Court of Appeals for the District of Columbia Circuit said a requirement to make public underlying data for the key studies used in rulemaking would be "impractical and unnecessary." The three-judge panel said: "If EPA and other governmental agencies could not rely on published studies without conducting an independent analysis of the enormous volume of raw data underlying

them, then much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment ..." Essentially, the judges concluded that a policy like the proposed rule wouldn't serve the Agency's purposes at all. Instead of arbitrarily slicing out broad types of studies from being cited in rulemaking, why not continue to give Agency scientists the ability, as they have had for decades, to comprehensively assess and compare the scientific evidence presented in a study and give weight to each study as a result of careful deliberation?

If the EPA wants to address the accessibility of scientific studies and data, an important issue to scientists as well as members of the public, it should acknowledge that those efforts, which might include building a new public-facing platform or carefully considering certain types of standards, will amount to a years-long process and will require an enormous investment of Agency time and funding. That type of proposal shouldn't be made

in a brief proposed rule and should only be made if extensive studies demonstrate that there is a real need for an update to how scientific studies are used in Agency rulemaking.

The proposed, "Strengthening Transparency in Regulatory Science" rule, instead, gestures toward an unsubstantiated set of concerns. It's hard to conclude that its purpose is to do anything other than undermine Agency scientists' ability to use scientific studies and data to craft regulations, under EPA's statutory mandates, that protect public health. For this reason, I urge you again to withdraw the rule. Thank you for your time and for the opportunity to comment on this important proposal.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 37a, Emma Glidesgame, and Speaker 38a, Jyotsna Pandey if you would come to the speakers' table. Speaker 39a, Patricia Cohen speaking on behalf of Tracy Woodruff, if you would come to the on-deck seating.

MS. GLIDESGAME: Good afternoon. My name is Emma

Gildesgame, G-I-L-D-E-S-G-A-M-E. I'm a Master of Environmental Management student at the Yale School of Forestry and Environmental Studies, and an intern with the National Parks Conservation Association. My comments today are my own. I'm here to express my strong opposition to the proposed, "Strengthening Transparency in Regulatory Science" rule, that would censor science and threaten the health of all Americans. Last week, many of us in D.C. awoke to alerts warning of potential contamination in our water system. We were told to boil water before drinking or brushing our teeth or to avoid tap water altogether. For those few days, stores sold out of bottle water, Starbucks stopped selling coffee, and public pool splash pads and water fountains went dry. In the face of an urgent public health risk we did not censor the science that told us that contamination in our water is a threat. To know that clean water is important we didn't need the health records of every person who participated in landmark studies that helped us

understand the effects of contaminated water on our bodies and brains. The science is real. It's not secret, it's been repeated. It's been peer reviewed, analyzed and reaffirmed by generations of experts.

Just as the residents of D.C. took precautionary actions to protect ourselves and our loved ones in the face of a potential public health threat, the EPA must be allowed to use the best available scientific data to accurately assess environmental and public health threats to protect all Americans. The Clean Air Act, Clean Water Act, Safe Drinking Water Act and other historic laws that helped the United States become a leader in environmental protection recognized something that we forget far too often: Human health is environmental health. They are one in the same. Pollutants in the air travel hundreds of miles to become pollutants in our lungs. Contaminated soils grow contaminated food. Toxic river water becomes toxic drinking water. At the same time, clean air builds stronger kids. Healthy rivers,

lakes and watersheds build healthy communities. Good environmental and public health policies rely on a strong backbone of good science. The proposed rule would eliminate many credible, respected, long-standing, peer-reviewed, scientific studies from EPA consideration because they rely on confidential health information which cannot be made public. This proposal allows politically appointed regulators to pick and choose which studies they want to consider and would force scientists to choose between their ethical obligation to protect their subjects' privacy and the obligation to contribute knowledge to apply to regulatory science. Using good science to make strong policy has made America great for decades. The EPA and other agencies have kept countless Americans healthier, safer and more prosperous by using science to inform conservative, proactive protections for human health and the environment. We have protected historic and cultural monuments like the Jefferson Memorial, Statue of Liberty and even the Capitol

Building from the corrosive power of acid rain. We have reduced smog and air pollution in national parks like Great Smoky Mountains, Joshua Tree and Yosemite. We have improved water quality from the Great Lakes to the Everglades. Thanks to the EPA, my peers and I were born into an era of healthier air, cleaner rivers, and safer drinking water than our parents. I hope that someday my children can say the same, and that is why today I am joining thousands of scientists and public health professionals all over the country in speaking out against this rule and asking you to stop it in its tracks. We are all counting on you to listen to the sound and transparent science the EPA has used for decades and we are counting on our medical records remaining private. I strongly urge the EPA to stop this radical proposal for the health and safety of all Americans. Thank you.

MS. HUBBARD: Thank you.

MS. PANDEY: Good afternoon, my name is Jyotsna Pandey, and I'm the Quality Manager for the American Institute of Biological Sciences. My

organization appreciates the opportunity to comment on the EPA proposed rule, "Strengthening Transparency in Regulatory Science." We thank EPA for extending the initial 30-day public comment period and scheduling this public hearing on the proposed rule. We support the objective of increased transparency in the rulemaking process. But, the proposed rule is inadequately defined and thus itself lacks transparency and appropriate public protections. We request the EPA rescind the proposed rule and initiate an open process for gathering the information required to more thoroughly articulate the proposed rule. Any proposal to increase transparency in the regulatory process must not arbitrarily exclude important scientific information from the decision-making process, nor can personal information about individuals, such as genetic information or health status be sacrificed. A failure to protect these data will hinder future scientific investigations of people who refuse to participate in recent studies if they are not

confident that their most personal information is protected. Importantly, scientific journals take steps to protect personal information. They are not aware of any secure way to mask or protect personally identifiable information in the public domain and therefore think that any rule requiring this information be made public is needlessly risky. These data are important, however, to informing the decision-making process and should not be excluded for rulemaking processes because they are not publically disclosed.

As far as this request for comment, EPA has solicited input and measures to "provide protected access to identifiable and sensitive data." This is a significant issue and one that EPA should fully understand prior to moving forward with any new rule. Time and expertise are required to identify and properly evaluate the feasibility, cost and effectiveness of potential actions. It is unlikely that EPA can effectively gather and evaluate this information in the time prescribed by the proposed rule. We recommend that EPA

initiate a formal request for public comment on this issue alone and use what it learns to help inform and guide any potential future rule on transparency.

High-quality, curated and vetted mega data are generally required for someone else to appropriately reanalyze or use data such as those that could be made available by the proposed rule. The proposal is silent on meta data standards and practices. This is a significant challenge and another major problem with the proposed rule. We support EPA's goal of conducting independent peer reviews of the science and data used to inform regulatory decisions but thinks the section lacks adequate specificity. Who will conduct and manage the peer review process? Will these reviews be managed by the Office of Research and Development or by the various regulatory offices within EPA? Does EPA have appropriate staffing, expertise and resources to manage these peer reviews? We recommend that EPA partner with scientific organizations and professional communities to

administer and manage these reviews. Such outsourcing and partnerships will help to ensure that EPA gains access to independent and highly qualified experts and to promote greater public confidence in the independence of these peer reviews. This kind of process for managing peer review will also allow EPA to more cost effectively, nimbly and rapidly conduct reviews as it will not require EPA to substantially increase staffing for the remaining reviews. Such a process would also provide EPA with greater capacity to conduct reviews on time skills that do not needlessly delay regulatory and rulemaking schedules. After reviewing this proposed rule the AIBS respectfully urges EPA to rescind the current proposal. We ask that EPA initiate a new transparent and interactive process with the scientific, public health and environmental management communities, as well as other appropriate stakeholders, to identify responsible and viable approaches for promoting greater understanding of the science and data used to

inform EPA decision-making. Thank you for your consideration of our request.

MS. HUBBARD: Thank you.

MS. STOBERT: Patricia Koman, if you'd come to the speakers' table.

MS. KOMAN: Good afternoon. My name is Patricia Koman, spelled K-O-M-A-N. I am speaking on behalf of Dr. Tracy Woodruff, W-O-O-D-R-U-F-F. Dr. Woodruff is a professor in the Department of OB/GYN and the Director of the Program on Reproductive Health and the Environment at the University of California, San Francisco. Dr. Woodruff is a PI, or Principle Investigator, for a Children's Environmental Health Center and she, along with 15 other principle investigators of other Children's Centers, have submitted comments to the EPA about this proposed rule in writing. They are concerned that the proposed rule will adversely affect EPA's ability to use science in decision-making and ultimately negatively influence protections for children's health. Research from Children's Centers contribute

significantly to the foundation of science that informs and supports the Agency's ability to protect the public health. The National Academy of Sciences highlighted that Children's Centers have led to an improved understanding of the environmental impacts on child health and development. Children's Centers research identified the critical contributions of environmental exposures to asthma, obesity, ADHD, cancer, autism and other childhood illnesses. This research has led to new direction, treatment and prevention strategies for these diseases including informing EPA standards for cleaner air which has improved the quality of life for children. Collectively, we have research data from thousands of participants across the country, including some of our most vulnerable populations, children and women in communities of color. To not use or consider studies that do not comply with the proposed rule is inconsistent with scientific principles and evidence-based policy and this would put the public's health at risk

from toxic chemicals. Institutional review boards require that we protect the privacy and confidentiality of our participants, but institutional review boards' requirements conflict with this rule's mandate to publically reveal individual level data. Data masking, coding and de-identification techniques have limitations, because re-identification of participants is still possible. We are especially concerned that the rule inappropriately codifies specific data analysis approaches such as dose response modeling and other scientific decisions that should be made on the basis of scientific judgment and empirical considerations. This will hinder scientific inquiry and lead to inaccurate results. As scientists, we value open science but the mandates laid out in this rule will not improve data sharing, replicability or transparency. Instead, implementation of this rule, especially retroactively, could lead to EPA excluding numerous relevant studies from policy decisions to the ultimate detriment of children's health. We

urge EPA not to move forward with this proposed rule.

Finally, I want to comment about this public hearing and its lack of access to all stakeholders. By not providing the ability to make comments remotely or virtually, EPA limits the public comments to those that have the financial resources to travel to Washington D.C. and limits the participation of populations that are going to be most affected by this rulemaking. This undermines civic engagement and conflicts with the principles of a fair democracy. This is not a technical issue, as U.S. EPA has made virtual public comment in the past.

Finally, we urge EPA not to move forward with this proposed rule. Thank you.

MS. HUBBARD: Thank you.

MS. STOBERT: It's now 3:02 p.m. This was our last speaker for this session that we know of. We are going to repeat the request that if there is any speaker that has registered but is registered for the evening session, if you'd like to speak

now go to the registration desk and you will receive a speaker number for this session. We're going to wait a few minutes and see if there's anybody that decides to speak now. Otherwise, we will break until the 4:00 session starts.

MS. HUBBARD: And if I could just make a quick announcement, we do have a member of Congress who is on his way to speak who should be here shortly, so we won't go into recess quite yet, so if everyone could just remain in their seats if you're interested in hearing him speak, otherwise feel free to go on and head on out and then we'll go into recess after that.

MS. STOBERT: Sorry, Peter Ferrara, speaker 40a, if you would come to the speakers' table?

MR. FERRARA: Good afternoon. My name is Peter Ferrara, that's F-as in Frank, E-R-R-A-R-A. I'm the Senior Fellow for Legal Affairs at the Heartland Institute. We submitted our comments during the comment period online in response to the notice for public comment in rulemaking posted on April 30, 2018. EPA proposes the rule I am

commenting on intending the strengthen the transparency and integrity of EPA regulatory science. The proposed rule provides that EPA should ensure that the data and models underlying scientific studies pivotal to EPA regulations are publically available in a manner sufficient for independent validation, especially concerning regulations for which the public is likely to bear the cost of compliance. We applaud this proposed rule and find that governing statutes and executive orders, not to mention the basics of the scientific method, authorize the proposed rule and indeed have long required it. In not following the proposed rule in the past, EPA has been flouting the governing statutes and executive orders, departing from the scientific method and abusing its authority. The proposed rule provides that for science pivotal to significant regulatory action, EPA will ensure that the data and models underlying the science are publically available in a manner sufficient for validation and analysis. This new policy is needed because EPA admits to

having not previously implemented these policies and guidance in a world-best, robust and consistent manner.

Examples where EPA previously has fallen short include the public health research used to implement and defend the PM2.5 particulate matter standards, the corporate average fuel economy standards, the ozone standards and carbon dioxide standards. EPA's admitted reliance on secret science occurs at a time when the publications *Nature*, *PLoS*, *Science*, *The Economist* and other report half or more of published research on public health issues cannot be replicated. This replication crisis is genuine and even more broad and critical than the sources cited by the EPA for this proposed rule are willing to admit. A scientific publishing industry has been created by lavish government funding of politically directed research. Examples of this include supposedly scientific studies finding human impact on the climate or an association between ozone and climate. It may take generations before the

effects of this corruption can be overcome. The root cause of EPA science malfunction has been corruption of EPA's peer review process. Peer review for the EPA has become power review with insiders typically armed with millions of dollars in government funding acting to censor and exclude scientists who disagree with the reigning political agenda. That perverts the whole point of peer review, turning it into a tool used to shut out anyone who disagrees, instead of a process forcing scientists to defend their work against critics. The more widespread replication crisis is proof that this disease has affected most of the world's leading science journals and even its National Academies of Sciences. One scientific finding that has been suppressed by the corruption of peer review was just singled out by EPA in its call for comments, is evidence of non-linearity in the concentration response function for many pollutants. The entire regulatory model is precariously perched on an invalid assumption of linearity and the resulting scientific crisis

continuing to build must now be openly faced, removed and regulations based on such science malfunction, or even outright corruption, must be revised and repealed entirely. EPA's new policy of scientific integrity and transparency should be applied to computer climate models that currently prevail in EPA's funded published and cited climate science. The continued use of default models, not consideration of alternatives or model uncertainty create a false scientific justification for EPA actions, policies and regulatory burdens.

So, we applaud this new proposed rule and encourage the EPA to implement it rapidly.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker 41a, Liz Hitchcock, and Speaker 42a, Benjamin Kirby, if you would come to the speakers' table.

MS. HITCHCOCK: Good afternoon, my name is Liz Hitchcock, and I direct Safer Chemicals Healthy Families. We lead a coalition of hundreds of local, state and national groups. This variety of

groups of labor, consumer, parents, educators, scientists, health care providers, health-affected and others shares the concern about the growing recognition of the links between our exposures to toxic chemicals and the increases in cancers and other chronic illnesses and in learning and developmental disabilities, and we share a commitment to reducing and eliminating exposures to toxic chemicals in our homes, our places of work, and the products that we use every day. I thank the Agency for responding to the large number of public comments that objected to the length of the initial comment period by extending it and for scheduling this hearing.

Safer Chemicals Healthy Families joins a long day of voices in opposition to this proposal. Many of our coalition partners and a number of respected scientists have offered strong cases for withdrawing the proposal already today and I thank those speakers for their comments and will try to keep my own comments brief.

The proposed rule is irreparably flawed and

misconceived. In the name of transparency it will prove needlessly burdensome, requiring unnecessary and costly procedures of EPA scientists that are counter to the Agency's longstanding application to base public health decisions on the best available science. Under this proposal without a guarantee of full public access, the study will be considered unreliable and will play no role in assessing a chemical's health effects on human health. This ignores the many ways in which the scientific community, regulators and the public have traditionally determined the quality and relevance of study results. It also disregards the way that hard-working EPA science professionals have taken seriously their charge to use the best available science in their decision-making. Safer Chemicals Healthy Families played a key role in the reform of the Toxic Substances Control Act which requires that EPA use the best available science in the review and management of toxic chemicals. As EPA begins to review the tens of thousands of chemicals already on the market we

are concerned that they be able to take into consideration all information that is reasonably available. For the fence line communities that have been harmed by their exposures to chemicals, for the families who have lost loved ones to asbestos-related diseases, for the firefighters exposed to a soup of toxics as they protect our communities, and to children who are born pre-polluted by a range of industrial chemicals, the stakes are high for these evaluations. EPA scientists working on risk and hazard assessments collect and review thousands of studies. Published reports of these studies typically do not include all the underlying data. This proposal would add the burdensome requirement in such cases that EPA contact the researcher, determine the nature and extent of the underlying data, and put in place a mechanism for the public to access the data. Many before me have called this proposal a solution in search of a problem, but it bears repeating. In proposing this rule EPA leaders have painted a stark picture of EPA

reliance on so-called secret science developed behind closed doors, but is this really so? EPA science assessments generally include an exhaustive and critical review of relevant studies and a full explanation of how they are being interpreted. Extensive information about each study is typically part of the public record, even if all underlying data may not be included. EPA assessments are normally subject to public comment and independent peer review and members of the regulatory community are free at any time to replicate studies they deem flawed or to independently seek access to underlying data and reanalyze them. In short, the so-called problem that the proposed rule seeks to fix is largely fiction.

In conclusion, EPA should withdraw this proposed rule. The public health stakes are just too high. Thank you.

MS. HUBBARD: Thank you.

MR. KIRBY: My name is Ben Kirby. I'm an environmental engineer with a doctorate and

master's degree in environmental engineering from Virginia Tech and George Mason University respectively. I'm representing Hall and Associates, and environmental consulting firm in Washington D.C. We support the application of this rule to EPA's environmental impact analyses, particularly TMDLs, or Total Maximum Daily Loads, and NPDES or National Pollutant and Discharge Elimination permits under the Clean Water Act. These legally binding permits include ethylene limits for wastewater treatment facilities for pollutants such as lead, mercury or phosphorus. Slight alterations in these permit limits can cost a single wastewater facility tens of millions of dollars, the cost of which is passed on to individual local rate bearers. These permit limits are supposed to be derived in a manner similar to dose-response relationships as mentioned in the rule where, for example, a lower level of the pollutant in the discharge will result in a measurable increase in receiving water quality working with health. However, we have

dealt with instances throughout the country where environmental agencies have based regulations on publically unavailable data, outdated science or faulty science, even in the face of data or studies which indicate stringent permit limits imposed by these agencies are not anticipated to result in any quantifiable environmental or human health benefit despite the cost. We hope that this rule would remedy these shortcomings.

We also strongly support the use of independent expert peer reviews as an additional level of review for fiscal regulatory science. Our firm has been involved in independent peer reviews of various Clean Water Act related EPA regulations which have concluded that the technical basis for EPA's regulations and permit limits were scientifically indefensible. Had no peer reviews occurred, these regulations would have imposed hundreds of millions of dollars of wastewater treatment costs to rate bearers with no anticipated benefit. As a science-based Agency applying science-based statutes it is critical to

both receiving water quality and rate payers throughout the country that these permits and regulations are based on sound science and not speculation.

In this regard, we support application of EPA's proposed rule to Clean Water Act regulations.

Thank you for the opportunity to come.

MS. HUBBARD: Thank you.

MS. STOBERT: Speaker A, Dan Lipinski, you are now invited to speak at either the table or the podium.

MR. LIPINSKI: Good afternoon, I'm Congressman Dan Lipinski of the Third District of Illinois. I'm here to ask the EPA to rescind the proposed rule. The origins of the rule are in the 2014 House Bill called, the Secret Science Reform Act, which I voted against in that year and again in 2015, and when it was reintroduced as the Honest Act in 2017. The goal of these bills and of the proposed rule, contrary to its name, is to limit availability of science to inform regulatory decision-making. I'm disappointed to see the

Trump administration circumventing the will of Congress, attempting to administratively implement policies that cannot pass through the Legislature. On June 7th of this year, I joined 102 of my colleagues from both political parties in sending a letter to then Administrator Pruitt urging him to withdraw the proposed rule. My comments today build on that earlier commentary and expand on my opposition to this misguided policy.

EPA's admission, as it appears on the Agency website, is to protect public health and the environment and to ensure that national efforts to reduce environmental risks are based on the best available scientific information. The proposed rule works in direct opposition to that mission by requiring that the data underlying the scientific studies used in informed regulatory actions are available to the public. The proposed rule will exclude vast quantities of valuable research including that based on personal health data, confidential business information, and even older studies whose authors or data sets are no longer

available. In some cases, the rule will require the exclusion of the best available scientific information. To make matters worse, this rule would grant the administrator wide latitude to exclude studies from its provisions, enabling him or her to cherry pick studies in order to affect the outcome on the rulemaking process. There is no basis in any of the statutes under which EPA operates for giving an administrator such broad authority to choose which science is used in rulemaking.

Let me give an example of how the proposed rule could affect a future EPA rulemaking. EPA is planning to update its lead and copper rule in the near future the rule that limits the levels of these metals in drinking water. This update cannot come soon enough. We all know about the drinking water crisis in Flint, Michigan. Chicago and Washington D.C., as well as many other cities around the country, are finding troubling levels of lead in drinking water right now. Most of what we know about the health effects of lead exposure

comes from older studies of children with high levels of lead in their blood. Yet these studies may be excluded from consideration, both because their data are not publically available and because it would be unethical to replicate them. As a result, it is possible that an Agency could conclude that there is no evidence that lead is bad for you and, therefore, does not need to be updated. This would be a tremendous mistake. I have spent my career in Congress working to enable science-based decision-making in government. The proposed rule represents a significant step backward and I urge the Agency, in the strongest terms possible, to rescind it. Thank you.

MS. STOBERT: Speaker 43a, Mahealani Daniels. If you'd come to the speakers table.

MS. DANIELS: Good afternoon. My name is Mahealani Daniels and I'll spell that M-A-H-E-A-L-A-N-I, D-A-N-I-E-L-S. I would just like to thank you for allowing me the opportunity to share my comments in opposition to the EPA's new policy on so-called transparency. The EPA must utilize

the best available science to inform its actions in the creation of environmental and public health laws. Judicial precedents establish that the best available science is all existing scientist evidence relevant to the decision. In further supporting these precedents, the EPA's own regulations state that the best available science would be information that the EPA possesses or could reasonably generate, obtain or synthesize, whether or not that be information that is confidential business information that is protected from public discourse. While increasing transparency and ending an era of secrete science are two statements that publically resonate as appealing advances, when digging deeper it is clear that the EPA's implementation of these standards would do just the opposite and would actually violate judicial precedent as well as the Agency's own regulations. A majority of confidential health data can't be used with the EPA's new standards of transparency, thus limiting the scientific evidence they could use to inform

studies and standards. Since personal health data informs the production of environmental laws that protect public health, it's exceptionally important that the EPA continues to use it. For example, a recent study released by MIT demonstrates that 200,000 early deaths occur every year in the United States as a result of air pollution. Utilizing data on patients' health is not only necessary to establish the aforementioned research, but is also necessary when the EPA goes to set standards on environmental and pollution regulations that affect the lives and health of millions of Americans. I am hopeful that just as a majority of Americans are guided by their own personal values to abide by the laws established by our government, the EPA will too decide to function under judicial precedents and be guided by its principle to utilize the best available science. And with that, I thank you so much for your time.

MS. STOBERT: Thank you. I believe that was the last speaker for this session, so we will recess

now and resume the hearing at 4:00 p.m. Thank you.

[Off the record 3:26 p.m.]

[On the record 4:00 p.m., Evening session. Substitution of panel members.]

MR. RODAN: Okay, so welcome back at 4:00. Let us commence session three of this public hearing. Hello and thank you for coming. This public hearing is now in session. My name is Bruce Rodan and I am in EPA's Office of Research and Development. I will be one of the hearing officials of this two-hour period. Lou D'Amico, also from the Office of Research and Development will be joining me. We also have Nanishka, Lauren and Lesley from SC&A Incorporated helping with logistics.

The purpose of today's hearing is to accept public comments on the EPA proposed rule, "Strengthening Transparency in Regulatory Science." EPA is accepting comments on all aspects of the proposed regulation. This public hearing is a formal legal proceeding and the testimonies will become part of

the administrative record on which EPA will base its decision. Public notice of this hearing was published in the Federal Register on April 30, 2018 (83 FR 18768). EPA is proposing this rule under authority of 5 U.S. Code 301 in addition to the authorities listed in the proposed rule document dated April 30, 2018.

My role is to ensure that the EPA received your comments in an orderly fashion. Although EPA panel members may ask clarifying questions the intent of this hearing is to listen to your comments, not to discuss or debate the proposal.

Now for a few housekeeping items and ground rules. Please refrain from interrupting speakers or asking questions. Shouting and noisemaking or any disruptive conduct which prevents speakers or hearing officials from being heard are not permitted. Please listen quietly so that we can hear each testimony and to ensure that the court reporter is able to record comments accurately and listeners on the phone hear the oral testimonies.

For everyone's awareness, this hearing is open to

the press and we may have members of the media present with us today. This event is also open to any form of recording, video, audio and photos. We ask that you not cause any disruption to those testifying or observing the hearing. There was no formal lunch break scheduled. You may leave and return to the hearing. Please note that you will need to clear security again, so please be aware of time and the rain outside. If you'd like to make an oral comment in today's hearing and did not pre-register to speak, please see the hearing staff at the registration table positioned at the entrance of the room. If you would like to provide a written comment to the official record, you may hand submit it to the EPA staff today or mail, fax or email your comment. See staff at the registration table for instructions on how to submit written comments. There is a comment box at the registration table where you can leave hard copies of your oral testimony or written comments. All comments received will be included in the official docket. If you submit written comments

it is not necessary for you to give the same comments orally. Written comments and oral testimonies will receive equal consideration by EPA in preparing the final rulemaking decision. EPA has extended the comment period. Written comments must have been received on or before August 16, 2018. EPA will only consider comments related to the proposed rule, "Strengthening Transparency in Regulatory Science," so please refrain from making comments that are not related to this action. EPA will not provide responses during the hearing, rather EPA will prepare a written summary of the comments received that includes responses. The Response to Comments, RTC, document will be available at the time EPA issues its final decision. EPA will not make a final decision until all comments submitted during the public comment period have been considered. The hearing is being recorded by a court reporter who will be preparing a verbatim record of the hearing. Please speak clearly and slowly into the microphone so that the court reporter can record

your comments accurately. A copy of the transcript will be placed in the docket. The hearing is also being audio streamed through Adobe Connect and via phone lines.

The hearing is scheduled from 8:00 a.m. to 8:00 p.m., or one hour after the last registered speaker has spoken, whichever is earlier, and is divided into three sessions: 8:00 a.m. to 12:00 p.m., 12:00 p.m. to 4:00 p.m., and this session 4:00 p.m. to 8:00 p.m. Public restrooms are located down both sides of the hall and we have staff to escort you. Please note the location of the emergency exits.

Please take a moment to silence your cell phone (I've done that). Speakers should have been given a sticker upon check-in that lists your assigned session. If you plan to speak and have not received a sticker, please be sure to check in at the registration table. For the current 4:00 p.m. to 8:00 p.m. session, the speaker sticker collar is blue. Speakers will be called to the speakers' table located directly across from the EPA panel

members' table in pairs by their speaker number. When it is your turn to speak, please come up to the table and watch your step. State and slowly spell your name for the record, and if you are appearing on behalf of someone or an organization. If you are not in the room when it is your turn to speak I will recall you after all other speakers have made their oral comments. Each speaker will be allotted five minutes for remarks. Elected and appointed government officials may be provided additional time since they represent large groups of constituents. Speakers will be notified when their time has ended. Our timekeeping system or speaker timer consists of green, yellow and red lights. When you begin to speak, the green light will come on to indicate you have five minutes to speak. The yellow light indicates that you have one-minute left to speak. When the red light appears your five minutes are over. At that moment, if needed, I will politely interrupt you and ask you to wrap up your testimony. So, let's begin.

Speakers Numbers 1 and 2 in the afternoon session, please come forward and take a seat at the speakers' table. We will start with Speaker Number 1. Again, please speak directly into the microphone and state and spell your name for the record.

MR. SHIPPS: Thank you for this opportunity to provide public comments on EPA's proposed rule, "Strengthening Transparency in Regulatory Science." My name is Karl Shipps. That's spelled K-A-R-L, S-H-I-P-P-S. I live in New Carleton, Maryland, and I'm speaking as an individual. I am not employed by EPA or an EPA contractor, I am simply a very concerned person. I am a Navy submarine veteran, a grandfather, and have a master's degree in applied physics from the Johns Hopkins University. Because my time is limited I will confine my remarks today to three observations about the proposed rule and two recommendations.

My first observation is this: The proposed rule is based on a faulty premise, namely that only

studies whose underlying data are publically available sufficient to support replication should be considered by EPA as it develops regulations governing clean air, clean water and exposure to toxic substances and pesticides. The rule's premise, which was also the premise of the Secret Science Reform Act and the Honest Act, cannot stand. There are valid peer-reviewed studies that should be included in EPA's regulatory work even though their underlying data sets cannot be released to the public. Two of the most widely known are the Harvard School of Health's Six Cities Study, and the American Cancer Society's Cancer Prevention Study II. Those studies were revalidated by the Health Effects Institute in July of 2000 using an independent oversight board and a competitively selected analysis team. They remain valuable today. Since the proposed rule is based on a faulty premise, I recommend that it be withdrawn. A new rule addressing concerns about reproducibility and replicability should be developed in public with participation by the

scientific community, the environmental community and industry. The rule developers should avail themselves of the results of the ongoing reproducibility and replicability study being conducted by the National Academies of Sciences. That study will report in December 2018. Perhaps the EPA will not take my recommendation to withdraw the proposed rule. In that event, my second observation is germane. My second observation is that the EPA administrator is given extraordinary powers under Section 30.9 of the proposed rule for new EPA regulations or for regulations undergoing periodic update, the administrator could waive or not waive the provisions of the rule. This puts potentially thousands of studies underpinning EPA's regulations at risk of being discarded out of hand at the administrator's whim. The result would not be the best science and it would reduce public confidence in EPA rulemaking, not increase it. Based on that prospect, I recommend what the Texas Commission on Environmental Quality recommended,

namely to give governing authority for granting exceptions to the proposed data Transparency Rule, as well as the oversight of raw data collection, storage and access, to an external entity or entities to ensure independence and objectivity. You can see Docket comment EPA-HQ-OA-2018-0259-2426.

My final observation is that the scientific community was not consulted as the proposed rule was prepared. Even EPA's own Science Advisory Board was not consulted, learning about the rule only through press accounts and publication in the Federal Register. The joint statement on the EPA proposed rule and public availability of data in the 30 April edition of *Science* disagrees with the proposed rule. EPA should heed the concerns being voiced by the scientific community. Thank you for your attention.

MS. WHITE: Good afternoon. My name is Dr. White, W-H-I-T-E, on behalf of the American Chemistry Council's Formaldehyde Panel. I appreciate the opportunity to provide feedback on EPA's proposed

rulemaking. Utilization of transparent, objective and modern scientific approaches to draw conclusions regarding human health risks is critical to developing sound regulatory decisions. Throughout the EPA the application of scientific information to underpin regulatory activities has often been inconsistent and unclear, leading to concerns regarding how the Agency incorporates the best available science, evaluates the quality of that science, and applies 21st century knowledge concerning cause and effect. The panel has regularly met with EPA scientists related to the IRIS program regarding its subjective use of available science and resistance to moving away from default linear low-dose extrapolations, even when published scientific data support other modeling alternatives, including threshold-based approaches. This stance has often led to the generation of EPA values that are below natural background levels and not indicative of human health risks associated with real world exposures. Perhaps the most telling example can be found in

the case of formaldehyde, where a draft IRIS assessment sets values suggesting that human breath could pose a cancer risk. Formaldehyde has been the subject of scientific study for years and large bodies of evidence show that the levels of formaldehyde most people encounter on a daily basis do not cause adverse health effects, a conclusion reached by several international agencies using alternative models other than a default linear modeling approach. The evidence demonstrates the biological implausibility of any relationship between formaldehyde and leukemia, a threshold mode of action for any potential adverse health effects, and the importance of mode of action information for understanding potential impacts. We are encouraged by the Agency's proposed rule's recognition that there is growing empirical evidence of nonlinearity and that the use of default models without consideration of alternatives can obscure the scientific justification for EPA actions. This acknowledgement by EPA is especially relevant to

formaldehyde given the several decades of published literature illustrating preserved thresholds for both noncancerous and cancerous status.

In addition to the significant research and the development of a biologically-based dose response model for formaldehyde that also integrates the available science and provides results inconsistent with default linear dose response modeling approaches typically apply for carcinogenic end points. The importance of using nonlinear and biologically based dose response modeling, when the published data supports it, cannot be overstated. In this review of a 2010 draft IRIS formaldehyde assessment, the National Academy of Sciences noted the development of several models to evaluate the risks associated with formaldehyde exposure and recommended that alternatives to EPA's default linear low-dose extrapolation approach be considered.

In addition to incorporating modern scientific knowledge, we also recognize the importance of

adequate transparency in data access and ensuring regulatory decisions are based on high quality and reproducible data. For more than a decade, the panel has conducted scientific research engaged directly with EPA's IRIS program to understand the scientific information being relied on to draw conclusions regarding potential for health effects. The panel has experienced considerable difficulty in understanding what data is being relied on and how the Agency has ensured the highest quality and most relevant science is informing its decisions. Importantly, in multiple instances, sometimes after years of requests, once the underlying data was made available, it was found to have significant methodological and quality issues. In several cases, the findings, when reevaluated, did not support the original study's conclusions. The issues identified were not minor and highlight the need for greater transparency and for EPA to have a mechanism in place to evaluate the quality and reproducibility of the data being relied upon for decisions.

One notable example involved over six years of repeated requests to access all the relevant data from a National Cancer Institute study which was relied upon by the IRIS program to draw conclusions regarding formaldehyde and leukemia. The data were requested from NCI for the purpose of validating the author's conclusions and the evaluation of that underlying data found that changes reported by the study authors were not exposure dependent and they did not follow their own stated protocol. As demonstrated by formaldehyde example, when the data access is limited and modern scientific approaches aren't used to move away from default assumptions, the results can be conclusions that lack scientific rigor and potentially provide the public with an inaccurate picture about everyday chemicals which have been used safely for years.

I hope that you find these comments useful and I will provide a detailed set of comments by the August deadline.

MR. RODAN: Thank you. I believe we have another

speaker.
MS. HALL: Right, I don't have any details on that yet.
MR. RODAN: What?
MS. HALL: I don't have any details on who it is or -- standby. Speaker 3, Walter Tsou, please come up to the speakers' table.
MR. RODAN: Around the far side. Take care of the wire. I think you provided a copy at the front desk, we'll take it here. Watch out for the cord there, we don't want you falling over. Okay, so, we went through some long instructions. You have five minutes.
MR. TSOU: Okay. I'll be less. My name is Dr. Walter Tsou. I serve as Executive Director of Philadelphia Physicians for Social Responsibility and a past president of the American Public Health Association. Thank you for this opportunity to testify on "Strengthening Transparency in Regulatory Science". As many of my colleagues have noted today, while the goal of transparency in how studies are conducted, and the ability to

reproduce scientific results are important, it can offer a politically motivated administration a convenient excuse for eliminating or ignoring scientific studies that may go against the wishes of a powerful industry group. All one has to do is demand that the data sets be handed over for "further scrutiny" or demand that the study be repeated before basing a regulation on the study in question.

The very nature of longitudinal public health studies where health and toxins intersect are, by design, large, expensive and require years or sometimes decades before results are found. Sample sizes can often number in the tens of thousands to millions of data points and may need to be collected over many years before a statistically significant finding is identified. For example, Curry, et al studied in Pennsylvania babies who lived within 1 kilometer of active fracking wells. She had to review over 1.1 million birth records before demonstrating the relationship between living close to gas wells and low birth weight

babies. Because these studies are so big, they are often too expensive to repeat. In our state of Pennsylvania, scientific research on fracking is actively stymied or suppressed. In a state where billions are made on gas drilling, only one part time contractor at the Health Department collects data on health complaints from fracking. Those who do have health complaints have to sign non-disclosure agreements and not cooperate with any research in order to get lifesaving water to drink. This I consider extortion and this practice is common in the industry in order to suppress any health studies on the dangers of fracking. If the transparency regulation was in place, all health studies on fracking would be simply not considered because the research could not be conducted due to non-disclosure agreements.

Today there is no reputable scientist that doesn't believe in the harmful effects of smoking. The health studies on smoking were 15 years in the making before the Surgeon General released his landmark 1964 report and except for a handful of

EPA administrators, there is no reputable scientist who doesn't believe that climate change is real and is man-made. The studies on climate change and health have been known since Exxon wrote about it in 1977. If these transparency rules were in place when the EPA was founded, smoking would still be in airplanes and no one would have heard of "greenhouse gases" or "global warming", the greatest threat to our planet's existence.

Since the founding of the EPA, independent scientific research has been the foundational basis of your mission. Science is the cross before the corporate devil. This Transparency Rule would destroy the confidential nature of research and make the burden of conducting research more difficult and expensive. Finally, the real purpose of these rules is to reverse regulations on industries who have been harmful to public health. We should let science speak for itself and speak the truth and the EPA should hear from all scientific studies, not just the ones the industry

wants you to listen to. Thank you for your time.
MR. RODAN: Thank you very much. So, do we have any other registered speakers waiting? So we'll have a short recess and we have a one hour clock ticking. The time now is 4:22.
[Off the record 4:22 p.m.]
[On the record 4:40 p.m.]
MR. RODAN: We are hereby reconvening this public hearing. Come up to the -- go to the right there, there's some steps.
MS. HALL: Speaker Number 4, Mark Mitchell.
MR. BRUCE RODAN: Thank you, you'll have five minutes of time and you'll get a green light for the first four, an orange light and then a red light when the five minutes is up.
MR. MITCHELL: Okay, thank you. Thank you for this hearing. My name is Mark Mitchell. I'm a public health trained environmental health physician. I am testifying on behalf of the National Medical Association which represents the interests of more than 30,000 African-American physicians and our patients. We are a member

society of the Medical Society Consortium on Climate and Health.

I got into environmental health because I was concerned about the health effects of environment on public health. As a public health official, I saw that a lot of the diseases that are common, particularly those that are common in communities of color, are associated with the environment. We are opposed to the misnamed proposed new rule on "Strengthening Transparency in Regulatory Science." The proposed rule prohibits the Agency from setting regulations that are supported in part or in whole by data that is not publically available for reanalysis or that cannot be replicated. This rule, if enacted would limit the consideration of perfectly good science in the EPA regulatory process. What's more, it's retroactive so the current regulations that are based on previous studies that can no longer be replicated for ethical or other reasons, could then be voided. As physicians, we are particularly concerned about our legal and ethical obligation

to protect patient privacy under the Health Insurance Portability and Accountability Act of 1996, otherwise known as HIPAA. We believe that patient health data should be considered in EPA regulations because it's necessary to consider the health effects of environmental exposures in order to protect human health, and that we should also be able to guarantee patient privacy that should be protected.

Currently, we do this in research publications through the peer review process. The peer review process has worked well to ensure an adequate level of transparency while allowing science to advance unencumbered. We do not need to reduce the health protection that environmental regulations provide in the name of so-called "transparency." Thank you for this opportunity to testify.

MR. RODAN: Thank you. So, we'll go into another short recess, or maybe an hour, at 4:44. Thank you.

[Off the record 4:44 p.m.]

[Off the record 5:44 p.m.]

MR. RODAN: It's 5:44. I'll read the closing statement. Thank you for taking the time today to share your comments on the EPA proposed rule. The time is now 5:45 p.m. No additional members of the public have registered or are waiting to speak. Therefore, this hearing is now officially closed. Thank you.

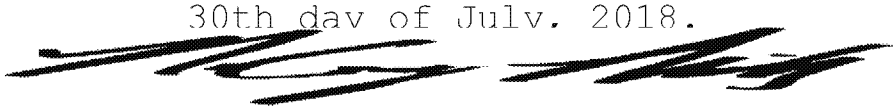
[Off the record 5:45 p.m.]

Whereupon, the above-entitled matter is concluded.

CERTIFICATE OF SHORTHAND REPORTER - NOTARY PUBLIC

I, NaCorey Nichols, the officer before whom the foregoing deposition was taken, do hereby certify that the foregoing transcript is a true and correct record of the testimony given; that the witness was duly sworn by me; that said testimony was taken by me electronically and thereafter reduced to typewriting under my direction; and that I am neither counsel for, related to, nor employed by any of the parties to this case, and have no interest, financial or otherwise, in its outcome.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my notarial seal this 30th day of July, 2018.



My commission expires:

October 14, 2021

NOTARY PUBLIC IN AND FOR THE

DISTRICT OF COLUMBIA

CERTIFICATE OF SHORTHAND REPORTER - NOTARY PUBLIC

I, Gary Euell, the officer before whom the foregoing deposition was taken, do hereby certify that the foregoing transcript is a true and correct record of the testimony given; that the witness was duly sworn by me; that said testimony was taken by me electronically and thereafter reduced to typewriting under my direction; and that I am neither counsel for, related to, nor employed by any of the parties to this case, and have no interest, financial or otherwise, in its outcome.

IN WITNESS WHEREOF, I have hereunto set my hand and affixed my notarial seal this 30th day of July, 2018.

My commission expires:

Comments of Daniel Greenbaum, President
Health Effects Institute (HEI)
July 17, 2018

HEI Comments on Proposed Rule EPA–HQ–OA–2018–0259; FRL–9977–40–ORD

HEI is pleased to have the opportunity to present these brief oral comments. We are preparing and will submit more detailed written comments

1. HEI has a longstanding commitment to the principles being addressed by this proposal: producing science of the highest integrity and quality, with special attention to issues of reproducibility and transparency. This includes:

    - Rigorous research and statistical design – Subject to competition, continuous oversight, data quality assurance audits, and more
    - Extensive efforts to test all findings against a wide range of different statistical techniques and assumptions
    - Intensive and independent peer review, with *all* results published
    - An active *Data Access Policy* for nearly 20 years to ensure access to underlying data for all HEI-funded studies.

2. Reproducibility is a critical challenge for science: can the results of an important study be reproduced? In HEI's view the most effective way to test the reproducibility and validity of scientific results is not necessarily to simply reproduce the same results in the same data sets -- because that also reproduces all the weaknesses and limitations of the original study. Rather, it is most important to answer the question: *Are the results consistent when tested in other independent studies*:

    - That use new and different data not affiliated with the original studies?
    - Have different investigators applying the same and/or alternative statistical techniques?
    - And test the sensitivity of the results against a wide range of possible other explanations, e.g. smoking behavior, socioeconomic status, access to medical care, and more.

3. In a limited number of cases, where there are not comparable studies in other datasets, it may be useful to gain access to the original study data and analytic codes to allow for independent evaluation: *Can the original results be replicated? And are they robust to a wide range of alternative assumptions, models and potential confounders?*

- This is the approach that HEI applied in its independent, rigorous reanalysis of the Harvard Six Cities and American Cancer Society Studies (see attached description of the Reanalysis):
- This approach can – and did – provide comprehensive assurance of the quality, integrity, and validity of the original results
- However, this is a highly cost-intensive and time-consuming endeavor which should only be applied in cases where there are one or just a few studies in a given area.

4. HEI also agrees with the continuing need to enhance transparency and data access, but would note that these issues are not new, and have been addressed now for over 15 years by administrations from both parties and by the scientific community:

    - This has included Guidelines for the Information Quality Act adopted by the Office of Information and Regulatory Affairs (OIRA) in 2002, numerous actions by the scientific community and journals to enhance access, and most recently the requirements for enhanced data access across the Federal Government promulgated by the Office of Science and Technology Policy (OSTP) in February 2013
    - We would strongly urge EPA to review the progress already made under these several major initiatives, and to carefully consider whether or not there are additional efforts that could further enhance transparency, *before* proceeding with a final rule.

5. Finally, access to private medical information is essential to conducting high quality and reproducible air quality and health research:

    - There are of course longstanding federal rules for protecting the privacy of individual medical information of the subjects of studies (HIPPA, Common Rule, etc.)

    - Gaining access to data from older studies may be difficult, given the privacy commitments that were made to study subjects in the past.

    - However, there *are* today several means to make such data available to investigators with appropriate privacy protections (e.g. Medicare, Federal Research Data Centers) and many investigators have been taking advantage of these.

    - Although it is possible, as some have suggested, to create a "depersonalized" data set by stripping all personal identifiers, such as address, date of birth, etc.
        - *It is not possible to conduct a high-quality air pollution and health study without knowing the locations of those being studied*, i.e. where they live, and what are the sources and levels of their air pollution exposure?

Thank you for this opportunity to testify – we look forward to submitting our detailed written comments and would welcome the opportunity to further assist EPA in these efforts to ensure the widest array of quality science is available for decisions.

ATTACHMENT: The HEI Reanalysis Statement

HEALTH EFFECTS INSTITUTE

STATEMENT

Synopsis of the Particle Epidemiology Reanalysis Project

BACKGROUND

Epidemiologic work conducted over several decades has suggested that long-term residence in cities with elevated ambient levels of air pollution from combustion sources is associated with increased mortality. Subsequently, two prospective cohort studies, the Six Cities Study (as reported in Dockery et al 1993) and the American Cancer Society (ACS) Study (as reported in Pope et al 1995) estimated that annual average all-cause mortality increased in association with an increase in fine particles (all particles less than 2.5 μm in median aerodynamic diameter [$PM_{2.5}$]).

As part of the Six Cities Study, Dockery and colleagues (1993) had prospectively followed a cohort of 8,111 adult subjects in northeast and midwest United States for 14 to 16 years beginning in the mid-1970s. The authors found that higher ambient levels of fine particles and sulfate (SO_4^{2-}) were associated with a 26% increase in mortality from all causes when comparing the most polluted to the least polluted city, and that an increase in fine particles was also associated with increased mortality from cardiopulmonary disease. The relative risks in all-cause mortality were associated with a difference (or range) in ambient fine particle concentrations of 18.6 μg/m^3 and a difference of ambient sulfate concentrations of 8.0 μg/m^3, comparing the least polluted city to the most polluted city.

In the much larger ACS Study, Pope and colleagues (1995) followed 552,138 adult subjects in 154 US cities beginning in 1982 and ending in 1989 (3 cities did not overlap between the 151 and 50 cities studied, resulting in a total of 154 cities). Again, higher ambient levels of fine particles were associated with increased mortality from all causes and from cardiopulmonary disease in the 50 cities for which fine particle data were available (sampled from 1979 to 1983). Higher ambient sulfate levels were associated with increased mortality from all causes, cardiopulmonary disease, and lung cancer in the 151 cities for which sulfate data were available (sampled from 1980 to 1982). The difference between all-cause mortality in the most-polluted city and the least-polluted city was 17% and 15% for fine particles and sulfate, respectively (with a range of 24.5 μg/m^3 for fine particles and of 19.9 μg/m^3 for sulfate).

Both of these studies came under intense scrutiny in 1997 when the EPA used the results to support new National Ambient Air Quality Standards for fine particles and to maintain the standards for particles less than 10 μm in median aerodynamic diameter (PM_{10}) already in effect. Members of Congress and industry, the scientific community and others interested in regulation of air quality scrutinized the studies' methods and their results. Some insisted that any data generated using federal funding should be made public. Others argued that these data had been gathered with assurances of confidentiality for the individuals who had agreed to participate and that the concept of public access to federally funded data did not take into account the intellectual property rights of the investigators and their supporting institutions. To address the public controversy, Harvard University and the ACS requested that the Health Effects Institute organize an independent reanalysis of the data from these studies. Both institutions agreed to provide access to their data to a team of analysts to be selected by HEI through a competitive process.

APPROACH

To conduct the reanalysis, the HEI Board of Directors, with support from the EPA, industry, Congress, and other stakeholders, appointed an Expert Panel chaired by Dr Arthur Upton from the University of Medicine and Dentistry of New Jersey and former Director of the National Cancer

This Statement, prepared by the Health Effects Institute, is a summary of a research project conducted by the Reanalysis Team, led by Dr Daniel Krewski at the University of Ottawa. The following Special Report contains the detailed Investigators' Report (Summary, Introduction, and Parts I and II), Commentary on the project prepared by a special panel of the Institute's Health Review Committee, and Comments on the Reanalysis Project by the Original Investigators (Drs Douglas W Dockery, C Arden Pope III et al).

Institute. The Expert Panel selected competitively a Reanalysis Team—led by Dr Daniel Krewski of the University of Ottawa—and oversaw all aspects of the team's work. They were assisted in their oversight efforts by a broad-based Advisory Board of knowledgeable stakeholders and scientists who, in the project's early stages, provided extensive advice to the Expert Panel on the key questions to be analyzed. The final results of the Reanalysis Team were intensively and independently peer reviewed by a Special Panel of the HEI Health Review Committee, which was chaired by Dr Millicent Higgins of the University of Michigan.

The overall objective of what became the Particle Epidemiology Reanalysis Project was to conduct a rigorous and independent assessment of the findings of the Six Cities and ACS Studies of air pollution and mortality. This objective was met in two parts. In *Part I: Replication and Validation*, the Reanalysis Team sought to replicate the original studies via a quality assurance audit of a sample of the original data and to validate the original numeric results. In *Part II: Sensitivity Analyses*, they tested the robustness of the original analyses to alternate risk models and analytic approaches.

RESULTS AND IMPLICATIONS

PART I: REPLICATION AND VALIDATION

- An extensive audit of the study population data for both the Six Cities and ACS Studies and of the air quality data in the Six Cities Study revealed the data to be of generally high quality with a few exceptions. In both studies, a few errors were found in the coding and inclusion of certain subjects; when those subjects were included in the analyses, they did not materially change the results as originally reported. Because the air quality data used in the ACS Study could not be audited, a separate air quality database was constructed for the sensitivity analyses described in Part II.
- The Reanalysis Team was able to replicate the original results in both studies using the same data and statistical methods as used by the Original Investigators. The Reanalysis Team confirmed the original point estimates: For the Six Cities Study, they reported the relative risk of mortality from all causes associated with an increase in fine particles of 18.6 $\mu g/m^3$ as 1.28, close to the 1.26 reported by the Original Investigators. For the ACS Study, the relative risk of mortality from all causes associated with an increase in fine particles of 24.5 $\mu g/m^3$ was 1.18 in the reanalysis, close to the 1.17 reported by the Original Investigators.

PART II: SENSITIVITY ANALYSES

Once the original results of the studies had been validated, the Reanalysis Team sought to test an array of different models and variables to determine whether the original results would remain robust to different analytic assumptions.

- First, the Reanalysis Team used the standard Cox model used by the Original Investigators and included variables in the model for which data were available from both original studies but had not been used in the published analyses (eg, physical activity, lung function, marital status). The Reanalysis Team also designed models to include interactions between variables. None of these alternative models produced results that materially altered the original findings.
- Next, for both the Six Cities and ACS Studies, the Reanalysis Team sought to test the possible effects of fine particles and sulfate on a range of potentially susceptible subgroups of the population. Although different subgroups did show some variation in their estimated effects, the results were not statistically significant with one exception. The estimated effects of fine particles did appear to vary with educational level; the association between an increase in fine particles and mortality tended to be higher for individuals without a high school education than for those who had completed high school or for those with more than a high school education.
- In the ACS study, the Reanalysis Team tested whether the relationship between ambient concentrations and mortality was linear. They found some indications of both linear and nonlinear relationships, depending upon the analytic technique used, suggesting that the

issue of concentration-response relationships deserves additional analysis.

- In the Six Cities Study where data were available, the Reanalysis Team tested whether effect estimates changed when certain key risk factors (smoking, body mass index, and air pollution) were allowed to vary over time. One of the criticisms of both original studies has been that neither analyzed the effects of change in pollutant levels over time. In general, the reanalysis results did not change when smoking and body mass index were allowed to vary over time. The Reanalysis Team did find for the Six Cities Study, however, that when the general decline in fine particle levels over the monitoring period was included as a time-dependent variable, the association between fine particles and all-cause mortality dropped substantially, but the effect continued to be positive and statistically significant.
- Using its own air quality dataset constructed from historical data to test the validity of the original ACS air quality data, the Reanalysis Team found essentially the same results.
- Any future analyses using the sulfate data should take into account the impact of artifactual sulfate. Sulfate levels with and without adjustment differed by about 10% for the Six Cities Study. Both the original ACS Study air quality data and the newly constructed dataset contained sulfate levels inflated by approximately 50% due to artifactual sulfate. For the Six Cities Study, the relative risks of mortality were essentially unchanged with adjusted or unadjusted sulfate. For the ACS Study, adjusting for artifactual sulfate resulted in slightly higher relative risks of mortality from all causes and cardiopulmonary disease compared with unadjusted data. The relative risk of mortality from lung cancer was lower after the data had been adjusted.
- Because of the limited statistical power to conduct most sensitivity analyses for the Six Cities Study, the Reanalysis Team conducted the majority of its sensitivity analyses using only the ACS Study dataset with 154 cities. In that dataset, when a range of city-level (ecologic) variables (eg, population change, measures of income, maximum temperature, number of hospital beds, water hardness) were included in the analyses, the results generally did not change. Two exceptions were that associations for both fine particles and sulfate were reduced when city-level measures of population change or sulfur dioxide were included in the model.
- A major contribution of the Reanalysis Project is the recognition that both pollutant variables and mortality appear to be spatially correlated in the ACS Study dataset. If not identified and modeled correctly, spatial correlation could cause substantial errors in both the regression coefficients and their standard errors. The Reanalysis Team identified several methods for dealing with this, all of which resulted in some reduction in the estimated regression coefficients. The full implications and interpretations of spatial correlations in these analyses have not been resolved and appear to be an important subject for future research.
- When the Reanalysis Team sought to take into account both the underlying variation from city to city (random effects) and the spatial correlation between cities, only sulfur dioxide as a city-level variable continued to decrease the originally reported associations between mortality and fine particles or sulfate. This effect was more pronounced for sulfate.
- When the Reanalysis Team conducted spatial analyses of sulfur dioxide, the association between sulfur dioxide and mortality persisted after adjusting for sulfate, fine particles, and other variables.
- As a result of these extensive analyses, the Reanalysis Team was able to explain much of the variation between cities, but some unexplained city-to-city variation remained.

CONCLUSIONS

The Reanalysis Team designed and implemented an extensive and sophisticated series of analyses that included a set of new variables, all the gaseous copollutants, and the first attempts to apply spatial analytic methods to test the validity of the data and the results from the Six Cities Study and the ACS Study. Overall, the reanalyses assured the quality of the original data, replicated

the original results, and tested those results against alternative risk models and analytic approaches without substantively altering the original findings of an association between indicators of particulate matter air pollution and mortality.

At the same time, the reanalyses did extend and challenge our understanding of the original results in several important ways.

- The Reanalysis Team identified a possible modifying effect of education on the relation between air quality and mortality in that estimated mortality effects increased in the subgroup with less than high school education.
- The use of spatial analytic methods suggested that, when the analyses controlled for correlations among cities located near one another, the associations between mortality and fine particles or sulfate remained but were diminished.
- An association between sulfur dioxide and mortality was observed and persisted when other possible confounding variables were included; furthermore, when sulfur dioxide was included in models with fine particles or sulfate, the associations between these pollutants (fine particles and sulfate) and mortality diminished.

In reviewing these results, the Special Panel of the HEI Health Review Committee identified the following factors to consider when interpreting the results from the Reanalysis Team.

- The inherent limitations of using only six cities, understood by the Original Investigators, should be taken into account when interpreting results of the Six Cities Study.
- The Reanalysis Team did not use data adjusted for artifactual sulfate for most alternative analyses. When they did use adjusted sulfate data, relative risks of mortality from all causes and cardiopulmonary disease increased. This result suggests that more analyses with adjusted sulfate might result in somewhat higher relative risks associated with sulfate.
- Findings from spatial analyses applied to the ACS Study data need to be interpreted with caution; the spatial adjustment may have overadjusted the estimated effect for regional pollutants such as fine particles and sulfate compared with the effect estimates for more local pollutants such as sulfur dioxide.
- After the Reanalysis Team completed its spatial analyses, residual spatial variation was still noticeable; this finding suggests that additional studies might further refine our understanding of the spatial patterns in both air pollution and mortality.
- No single epidemiologic study can be the basis for determining a causal relation between air pollution and mortality.

In conclusion, the Reanalysis Team interpreted their findings to suggest that increased relative risk of "mortality may be attributed to more than one component of the complex mix of ambient air pollutants in urban areas in the United States". The Review Panel concurs. In the alternative analyses of the ACS Study cohort data, the Reanalysis Team identified relatively robust associations of mortality with fine particles, sulfate, and sulfur dioxide, and they tested these associations in nearly every possible manner within the limitations of the datasets. Future investigations of these issues will enhance our understanding of the effect of combustion-source air pollutants (eg, fine particles, sulfate, and sulfur dioxide) on public health.

Mr. Lek Kadeli
Principal Deputy Assistant Administrator
Office of Research and Development
U.S. Environmental Protection Agency
Washington, DC 20460

Dear Mr. Kadeli:

I am pleased to provide you with the response from the Health Effects Institute (HEI) to your letter of July 8, 2013, seeking HEI's advice and comment on the important questions of sharing the data underlying epidemiologic studies of air pollution and health.

As you know, HEI has a longstanding policy to make data underlying its studies available to the widest possible scientific audience. We accomplish this first by the publication of comprehensive, intensively peer-reviewed reports of all results of research we fund (not just those that investigators might select for publication in a peer-reviewed journal), and by making extensive additional details available on-line. We also endeavor, in cases where we have full ownership of and rights to data produced for our studies, to make those data widely available to other investigators, including publishing entire data sets and analytical programs on the web. While there are legitimate privacy concerns that must be addressed in making epidemiologic data with personal health and other information available to other scientific investigators, HEI has long believed that mechanisms can often be developed for doing so and it is the interest of science, and the public policy informed by such science, to find ways to do that.

It is in this spirit that we respond to your letter. We have both several general comments on the nature of the data, and observations on how data may be shared and results replicated, for the particular studies you cite which rely on the American Cancer Society Cancer Prevention Study II and Harvard Six Cities cohorts. We provide, as well, specific answers to your questions.

General Considerations on the Data

As you note in your letter, air pollution epidemiology studies normally rely on several types of data: air quality data, census-based covariate data (e.g. income levels within a zip code area where the study subject(s) reside), health event data (which in these studies are data from the National Death Index), and individual health and personal characteristics data (e.g. level of education, alcohol consumption, body mass index, and smoking behavior) which are gathered through detailed individual questionnaires and in some cases periodic health examinations. We have several general observations:

- Data sets that have been created from publicly available sources and contain no individual identifying information, such as air quality monitoring data and census-based covariate data, should be able to be made publicly available without tremendous difficulty or cost.

- Data from the National Death Index (NDI) – maintained by the Centers for Disease Control and Prevention – is generally made available to investigators upon certification on their part that they would not advertently or inadvertently release the identity or cause of death or any other identifying information of any individual. The NDI does make provisions for making its data available more broadly, but according to well-specified rules for aggregating the data and removing certain information (e.g. specific date of death), which would keep a third party from using the data to identify an individual.

- Data collected from individual subjects in a study which normally includes detailed personal, health status, and behavioral information, is critical to allowing for these studies to determine whether some other factor than air pollution (e.g. obesity or smoking behavior) may be responsible for any health effects that are observed. This data, which is normally collected through individual questionnaires and/or medical examinations, is collected with the *express commitment to the participants - from the organizations and the original investigators that collect the data - that the participants' personal information and identity will not be divulged.* Studies using this data are also subject to the Common Rule, under which investigators must apply to their respective Institutional Review Boards (IRBs) to ensure the protection of human subjects in biomedical and behavioral research.

Observations on Data Sharing and Full Replication of These Studies

The ACS and Harvard studies, at their root, attempt to determine whether persons living in higher pollution areas are more likely to have higher relative risks of premature mortality than those living in lower pollution areas, while attempting to control for a host of personal-level and community-level covariates that may also differ between the individuals and the communities. This by its nature requires knowing where the person lives, which can pose challenges for protecting the identity of an individual if s/he lives in a smaller or sparsely populated area. This challenge has been long recognized, and there are a number of protections in federal rules and scientific practice that address this (e.g. the Census Bureau will not release certain data at the block or even zip code level if they believe that would allow identification).

Since the goal should be to find ways to share data which enables full replication and sensitivity analysis of original studies, it is valuable to consider two aspects of these particular studies that have moved them towards using data at smaller spatial scales:

- First, in response to valid criticisms that the earlier versions of these studies relied only on central air quality monitoring data to estimate exposure, investigators have increasingly sought to better estimate exposure employing land use regression models and other methods that can account for the distance of a subject's home from roadways, industrial facilities, and other sources of air pollution. They have also applied increasingly finer-grained community-level covariates (e.g. at the zip code level). While in the largest locations the application of these finer-grained data would likely not allow

for identification of individual subjects, the national analyses in some of these studies include subjects from a wide range of community sizes, including smaller communities where identification could be possible.

It should be possible to produce a data set which uses techniques like land use regression to assign exposure levels to each subject in a study and to provide only that exposure value in a dataset made available to others. This would avoid the possibility of identification of an individual subject, and would allow for replication of the original results for a study that was analyzing a range of exposure across a specific metropolitan area, for example. But such a data set, absent location information for each participant, would not allow for sensitivity analyses applying different forms of exposure modeling nor full testing of the validity of the original study's exposure estimates.

- Second, as these studies have been reviewed intensively by the HEI Review Committee, the Committee has identified two potentially significant sources of uncertainty in their results: so-called "ecological confounding"[1] and "spatial autocorrelation."[2] This is detailed in the HEI Review Committee's Commentary on the most recent HEI Research Report of Extended Analyses in the American Cancer Society cohort (pp. 128-129 in Krewski 2009). To address both of these issues, one of the first steps that investigators have taken has been to use data at smaller scales, e.g. at the zip code level, which while enhancing their ability to test for these two sources of uncertainties, also poses the potential in smaller communities for individuals and their personal information to be identified.

Taken together, these characteristics – which have in general enhanced the quality and the sensitivity of the studies – increase the difficulty of providing a fully "de-identified" data set while *also* enabling a different investigator to conduct a full replication and sensitivity analysis of the original study results.

Options for Making Data Available – Answers to your Specific Questions

With these considerations in mind, we attempt to answer your specific questions below:

1) Who owns and/or holds the data necessary to replicate the relevant studies and what are the concerns, if any, associated with making such data publicly available?

The publicly available air quality and census covariate data are of course collected and owned by the government and are freely available. The air quality and census data sets created specifically by investigators for a particular study are generally the property of the investigators, but should be capable of being made available, especially in the case where they were created using public funds.

[1] Ecological confounding arises when some community-level variables, which are themselves risk factors for mortality, are also associated with air pollution levels

[2] Spatial autocorrelation is the tendency for variables to have similar values for people or areas that are geographically close, which can suggest that there are other mortality causes which are unaccounted for in the analysis, or can distort the precision of risk estimates.

As to the ownership of the detailed participant data in the ACS and Harvard Six Cities cohort studies, HEI will leave the answers to the other two recipients of your letter – Harvard University and the American Cancer Society – who created these data sets, maintain them, and would have the most current information on others who may be holding these datasets in whole or in part. Those organizations also provided study participants with express commitments that their personal identity and information would not be divulged and have the responsibility to ensure that this commitment is not compromised during any data sharing.

2) What are the technical options for making these data publicly available, taking into account any concerns about the release of confidential personal health information or other confidential data? What are the implications of these options for replicating these studies? What level of effort in terms of time and resources would be required for these options?

3) If there are no feasible options for making all of the data publicly available, how would a researcher gain access to the full set of underlying data in order to replicate these studies? Please provide any documentation you believe would be helpful in understanding this process.

We see a range of options for making such data available, in different formats and with different procedures, so we are answering the questions jointly. In our view, it is feasible to share data in one of three ways (which have been used in many instances) and to do so while protecting the privacy of the individual subjects. The options range, however, from those that offer the most detailed access to study data to those that offer significantly less access:

A. **Collaboration with original investigators to obtain full access to data in order to conduct joint analyses**

This process is the most common practice in the scientific community for sharing personal data. It normally involves either formal or informal application processes for a scientific researcher to ask the original organizations and investigators who created the data set to gain access to the data to allow for collaborative analyses of an important research question. The American Cancer Society, for example, provides explicit instructions on their website on how to collaborate with them, and many other investigators have conducted more informal collaborations of a similar type. Such collaborations have, of course, to be conducted in full compliance with the Common Rule and any federal or other requirements for protecting the privacy of the participants.

The *advantage* of this process is that it can provide investigators with the fullest access to the data sets and with the benefits of regular consultation with the original investigators whenever there are questions about data structure or content. The *disadvantages* include that the original investigators may not choose to collaborate with all who request access, and a fully independent replication and sensitivity analysis of the original studies may not be possible or broadly accepted, given the collaborative relationship.

B. **Application to obtain independent access to analytic data sets sufficient to allow for replication and sensitivity analysis of the original results**

This process involves the request by a researcher to the original investigators, or to agencies and organizations, who created the data set to gain access to the data sets underlying a particular study. This normally would involve the development of a protocol for such analysis by the researcher, the review and approval of the protocol by the submitting scientists' IRB, explicit signed commitments by the researchers that they will not disclose personal information (on pain of penalty in the case of federally owned data sets), and usually other protections (e.g. prohibition of the publication of any results presenting data for groups of fewer than a certain number of subjects, and review by the original investigators before publication to ensure that no such information is inadvertently disclosed). Such a process is currently used within the US Department of Health and Human Services.

One relevant example of such data sharing is the detailed data sharing procedures established for the Multi-Ethnic Study of Atherosclerosis (MESA) which can be viewed at https://dbgap.ncbi.nlm.nih.gov/aa/wga.cgi?view_pdf&stacc=phs000403.v1.p3. In addition, MESA has created several "Limited Access Data Sets" in which personal identifying information has been removed and which can be accessed more readily, but which would not allow for full replication of original studies (see https://biolincc.nhlbi.nih.gov/studies/mesa/?q=MESA).

The *advantage* to this approach is that it can provide access to a substantial portion of the relevant data and allow for fully independent replication and sensitivity analyses of the original results. The major *disadvantage* is that this approach normally does not provide access to the full data set, but rather only to the detailed analytic data set or summary tables used in specific studies, thus precluding full replication.

A similar albeit much more intensive process enabled HEI and its independent investigators to gain access to the full data which we reanalyzed from the Harvard Six Cities Study and the American Cancer Society Study (HEI 2000). This process was structured to allow intensive efforts to replicate and test the robustness and sensitivity of the originally reported results. It was undertaken with the full agreement of, but not collaboration with, the original investigators, and provided full access to the data in accordance with a specifically developed data use agreement which ensured protection of privacy. The analyses were also informed by expert advisors from industry, academia, and other stakeholders.

C. **Provision of a "de-identified" disk (or other electronic medium) to provide a more limited data set that would not under any circumstances allow for identification of individuals**

In some cases, the simplest mechanism for providing access to study data would be through the provision of a fully de-identified data set in electronic form that can be readily shared with all parties without the possibility of an individual and his or her personal characteristics to be divulged. This has the *advantage* that it may allow independent replication and sensitivity analyses of some of the results of the original investigators. The most significant *disadvantage* is that, as noted above, the most recent analyses in the ACS populations have applied increasingly finer-grained community level data analysis; the release of a fully "de-identified" dataset will not allow full replication and sensitivity analysis of these most recent results, e.g. the testing of

alternative models for estimating exposure among the study subjects, and the inability to test whether ecological confounding and spatial autocorrelation could be affecting the results.

Overall, HEI believes that the opportunity for other scientific investigators to have access to and conduct additional analyses in these epidemiologic data sets is of tremendous scientific value, and can provide additional understanding of important scientific questions that can in turn inform air quality policy decisions. As we have described, there are well-established processes for making such data available; however, not all processes provide the fullest access to the data required while still protecting the privacy of individual information that is essential to the studies.

We would be pleased to provide additional consultation on these important questions and to answer any questions you might have. Please let us know if you have further questions or need additional assistance in this effort. You may feel free to contact me or HEI Science Director Dr. Rashid Shaikh at rshaikh@healtheffects.org or (617) 488-2301 for any follow-up questions

Sincerely,

Daniel S. Greenbaum

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

---

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is

consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

EPA General/ Administrator Pruitt

OIRA Working With EPA To Develop 'Best Practices' On Scientific Data Inside EPA

White House regulatory chief Neomi Rao says her staff is working with EPA on developing a policy on the use of scientific data that underlies its rules, suggesting that the agency may take a softer approach than Administrator Scott Pruitt had signaled when he said he would require the agency to rely only on publicly available data to justify its rules.

During an April 12 hearing before the Senate subcommittee on regulatory affairs and federal management, Rao said under questioning from Sen. Maggie Hassan (D-NH) that EPA was seeking to find a "balance" between using the "best available" data and publicly available data.

Hassan pressed Rao on whether federal agencies should use the best available science to make decisions regardless of whether that information is available to the public as Pruitt has suggested.

"Questions on information quality are very important to us. That is something my staff has been working with EPA on to develop best practices in that area," Rao said after Hassan asked whether the White House Office of Information and Regulatory Affairs (OIRA) has provided any input to Pruitt on his proposal.

Hassan asked Rao whether Pruitt's policy as described makes sense. "We want to make sure we have the best available evidence," Rao replied. "It's also important for the public to have notice and information about the types of studies that are being used . . . by agencies for decisionmaking. There is a balance to be struck there, and I think that is something that the EPA is working towards."

Rao's characterization of the issue appears to offer an eased approach to the data transparency policy that Pruitt floated last month, when he said he planned to require the agency to justify its regulations based on scientific data that is publicly available on the internet.

"We need to make sure their data and methodology are published as part of the record," Pruitt said. "Otherwise, it's not transparent. It's not objectively measured, and that's important."

He said the policy will mirror legislation offered by Rep. Lamar Smith (R-TX), chairman of the House science committee. It directs the agency to use the "best available science" in all its actions, but bars the agency from using any studies that cannot be released publicly online "in a manner that is sufficient for independent analysis and substantial reproduction of research results."

But the planned approach drew widespread criticisms, with many environmentalists and Democrats warning it would undermine development of many regulations.

Many observers also charged that such a policy would face legal and implementation controversies, including potential violations of medical privacy protections, trade secret information and other data that form the basis for air quality standards, pesticide and chemical approvals and other rules.

One knowledgeable source said late last month that an early version of the policy had been drafted several weeks earlier, though the first draft was "pretty sketchy. The first cut was fully [Smith's bill], but there were a lot of questions about what it would mean," and how it would be implemented.

Maintain Procedures

Since Pruitt's public discussion of the issue, EPA has yet to publicly release any version of the policy.

But Rao indicated that her staff was working with the issue as the agency sought to find a "balance" between using the "best" data and data that is publicly available.

And in response to Hassan, Rao said she would not support agencies changing their procedures in ways that prevent them from using the best available evidence when making these decisions.

"I'm very glad to hear that," Hassan replied. "One of the reasons I am very concerned about the EPA proposal, it seems like common sense to use the best evidence to make decisions. But what we are looking at is the agency really describing a move away from the scientific process. There isn't perfect data or perfect science. Scientific evaluation and data and analysis is an ongoing process." -- *Maria Hegstad* (mhegstad@iwpnews.com)

Scott Pruitt Isn't Anti-Science National Review

FOIA WHAT IT'S WORTH: Politico's Morning Energy

The Center for Public Integrity says it has filed a lawsuit Friday against EPA, seeking public records after the agency failed to respond in a timely fashion to 25 Freedom of Information Act requests filed in 2017 and early 2018. The complaint says EPA's online system "does not list realistic estimated dates of completion for FOIA requests it receives and does not update estimated dates of completion after the listed dates have passed." The Center says EPA did not respond to requests for an updated schedule.

Center for Public Integrity sues EPA over public-records delays - Center for Public Integrity

EPA: Watchdog group calls for investigation of IG E&E News PM

Citizens for Responsibility and Ethics in Washington has requested a review of the EPA inspector general's head of investigations.

The ethics watchdog group today sent a **letter** to the Council of the Inspectors General on Integrity and Efficiency requesting its Integrity Committee "investigate whether EPA Assistant Inspector General for Investigations Patrick Sullivan engaged in conduct that undermined his independence or integrity."

The council, or CIGIE, is part of the executive branch and oversees IGs across the federal government.

One of its duties is to review complaints against the agencies' internal watchdogs, which are adjudicated by its Integrity Committee. Labor Department Inspector General Scott Dahl and Deborah Jeffrey, the Corporation for National and Community Service's inspector general, are the panel's members.

CREW's letter comes after a *New York Times* **report** yesterday that Sullivan is considered close with Pasquale "Nino" Perrotta, chief of Administrator Scott Pruitt's security team. Perrotta has emerged as a central figure in some of the ethics allegations surrounding Pruitt, specifically the purchase of potentially unwarranted security measures for the EPA chief.

The EPA IG has an open audit of agency spending on Pruitt's personal security, which is expected to be released this summer. IG spokesman Jeff Lagda would neither confirm nor deny the existence of an investigation into Perrotta.

Sullivan and Perrotta both served in the Secret Service before coming to EPA, and Perrotta first worked in the IG office before heading elsewhere in the agency. They have been spotted drinking together across the street from EPA headquarters in Washington, D.C., according to the *Times'* story.

"It appears that the information set forth in the Times article merits review by the Integrity Committee as conduct that may undermine the independence or integrity reasonably expected of Mr. Sullivan, and so critically important investigation or investigations currently being undertaken by the EPA Inspector General," said the letter, which was signed by CREW Executive Director Noah Bookbinder and Norm Eisen, CREW's board chairman.

Lagda disputed the reporting in the *Times*' story.

He said Sullivan never worked with Perrotta in the past and didn't know him until Sullivan came to the IG office in 2011.

"They have worked together since 2011 on issues related to their official duties, such as threat investigations. They are professional colleagues and friendly, but do not socialize out of work," Lagda said.

The IG spokesman said Sullivan has never had drinks with Perrotta "anywhere or at any time" and has never been to the Elephant and Castle with Perrotta — the bar where the *Times* said Sullivan was seen with Pruitt's security chief.

Lagda said, "The OIG welcomes a CIGIE IC review regarding CREW's concerns."

Ethics and the EPA: How one government office helped turn up the heat on Scott Pruitt The Washington Post

Democrats ask EPA's Pruitt for details on weapons, security buys - Reuters

GAO finds Pruitt phone booth violated spending laws Inside EPA

The first in a series of expected watchdog reports into EPA Administrator Scott Pruitt's spending and ethics practices has found that the administrator's installation of $43,000 sound-proof privacy booth in his office violated several legislative requirements, ensuring continued criticism and scrutiny.

In an April 16 decision, the Government Accountability Office (GAO) says installation of the booth broke a fiscal year 2017 spending law that required advance notification of major upgrades to offices for presidential appointees.

Further, GAO says that "because EPA obligated appropriated funds in a manner specifically prohibited by law, we conclude that EPA violated the Antideficiency Act," which prohibits agencies from spending money in excess of appropriations.

The sound-proof booth has been one issue in a raft of ongoing allegations about Pruitt's spending and ethics problems, with critics citing it as an example of the administrator's willingness to flout spending constraints to address what he sees as pressing security challenges.

Even some Republicans, like Rep. Trey Gowdy (R-SC), have charged that some of Pruitt's explanations are not "credible."

GAO inquired into the issue at the request of Sens. Tom Carper (D-DE) and Tom Udall (D-NM), as well as Reps. Peter DeFazio (D-OR) and Betty McCollum (D-MN).

Udall, the ranking Democrat on the Senate appropriations panel that oversees EPA, last month urged the agency to cooperate with GAO's inquiry, charging that the agency had not provided any information to the watchdog office even though it sought responses to a series of questions by late January.

In its report, GAO says the booth and related installation cost $43,238, which included $24,500 for the booth itself, $3,400 for concrete floor leveling, $3,350 for wall preparation and painting, $7,900 for removal of closed caption TV equipment and $500 for cables and wires.

It cites an agency explanation for the booth as allowing Pruitt "to make and receive phone calls to discuss sensitive information," while also allowing him to "make and receive classified telephone calls (up to the top secret level) for the purpose of conducting agency business."

But GAO says the expenditure violates section 710 of the FY17 appropriations law, which requires agencies to notify the House and Senate when spending more than $5,000 to furnish or redecorate an office of an agency head that has been appointed by the president.

While EPA argued the spending law provision did not apply because the booth was to be used to advance the agency's mission, GAO found the expense falls "squarely" within the statutory definition of "furnish."

Because the expense contradicted the FY17 law, GAO says the funds were not "legally available" and thus EPA also violated the Antideficiency Act and must report the violation.

"We draw no conclusions regarding whether the installation of the privacy booth was the only, or the best, way for EPA to provide a secure telephone line for the Administrator," GAO writes.

EPA: Agency's handling of Pruitt phone booth broke law — GAO

This story was updated at 1:55 p.m. EDT.

The Government Accountability Office said today that EPA violated federal law by failing to tell lawmakers when it installed a secure phone booth in Administrator Scott Pruitt's office.

The deal cost EPA about $43,000, including a nearly $25,000 **contract** with a specialty acoustics company for the soundproof booth's purchase, delivery and assembly.

In an eight-page **decision**, the congressional watchdog concluded that EPA breached appropriations law — specifically the governmentwide $5,000 spending cap on office redecoration for political appointees — by not giving advance notice to Congress' appropriations committees. In addition, GAO found that since EPA spent its appropriated funds in a way banned by the law, it also broke the Antideficiency Act and needs to report its violation to Congress and the president.

The GAO decision quotes often from an EPA March 23 **letter** by Kevin Minoli, the agency's principal deputy general counsel, that pushes back on its ruling.

EPA argued Pruitt's phone booth "serves a functional purpose" by allowing the administrator to carry out agency business and compared it to other office supplies, like high-speed copiers or computers. Thus, the booth was a practical addition to the administrator's office and did not violate the specific appropriations law provision since it was not "an aesthetic improvement" contemplated by that measure, according to the agency.

GAO disagreed with EPA's interpretation of the law. The agency will be sending the required information to lawmakers this week related to Pruitt's phone booth.

"The GAO letter 'recognized the … need for employees to have access to a secure telephone line' when handling sensitive information. EPA is addressing GAO's concern, with regard to congressional notification about this expense and will be sending Congress the necessary information this week," EPA spokeswoman Liz Bowman said.

Without advance notice to lawmakers, EPA obligated $43,239 from its fiscal 2017 environmental programs and management account to install the soundproof privacy booth in Pruitt's office, according to the GAO decision. Along with the $24,570 contract for the actual booth, that sum included $7,978 to remove closed-circuit television cameras, $3,470 for concrete floor leveling, $3,360.97 to install a drop ceiling, $3,350 for patchwork and painting, and $509.71 for cabling and wiring.

EPA told GAO the booth is located in a former storage closet in Pruitt's office.

The agency also said that under its guidelines, a classified phone cannot be put on an office desk or in a conference room. In Minoli's letter, EPA told GAO that the booth "not only enables the Administrator to make and receive phone calls to discuss sensitive information, but it also enables him to use this area to make and receive classified telephone calls (up to the top secret level) for the purpose of conducting agency business."

In a congressional hearing last December, Pruitt described the booth as "a secure phone line" that he uses for sensitive talks, including with the White House (***E&E News PM***, Dec. 7, 2017).

But GAO noted the agency didn't say whether the booth was certified as a sensitive compartmented information facility, or SCIF. Former EPA officials told E&E News that the agency already has a SCIF in the basement of its Washington headquarters, which sees little use given the agency doesn't deal often with classified information (***Greenwire***, Sept. 27, 2017).

GAO stressed it was not ruling on whether Pruitt's phone booth itself broke the law, rather that EPA's failure to notify Congress about its spending above the $5,000 limit was the breach.

"GAO recognizes the requirement to protect classified material and draws no conclusions regarding whether the installation of the privacy booth was the only, or the best way for EPA to provide a secure telephone line for the Administrator. EPA's failure to comply with a governmentwide statutory requirement that an agency notify the appropriations committees before it spends more than $5,000 for the office of a Presidential appointee is the only legal issue addressed in this opinion," said Julie Matta, GAO's managing associate general counsel, in a statement.

'An illegal privacy booth'

Democrats on Capitol Hill had requested the legal opinion from GAO on Pruitt's phone. They blasted the EPA chief after the decision was released today.

"Scott Pruitt likes to talk about returning the EPA to the rule of law, but it turns out he's better at breaking it than following it. ... An illegal privacy booth to conduct secret discussions with his polluter friends does nothing to help our health or environment," said Sen. Tom Udall (D-N.M.), ranking member on the Senate Appropriations subcommittee that oversees EPA.

Statements from environmental groups also poured in, with several calling on Pruitt to leave the agency.

"With each passing day, Pruitt has created more headaches for Donald Trump with his mounting list of ethical and now legal violations. Donald Trump shouldn't wait to see what ethical norm or law Pruitt breaks next. He must fire him immediately," said Sierra Club Executive Director Michael Brune.

Republicans also expressed concerns in response to the GAO ruling released today. Senate Environment and Public Works Chairman John Barrasso (R-Wyo.) said EPA needs to make "a full public accounting" of its spending on Pruitt's phone booth.

"It is critical that EPA and all federal agencies comply with notification requirements to Congress before spending taxpayer dollars. EPA must give a full public accounting of this expenditure and explain why the agency thinks it was complying with the law," Barrasso said.

EPA in the past has run up against GAO legal opinions.

In December 2015, the congressional watchdog found that the agency had violated federal restrictions on lobbying and propaganda in its social media campaign on behalf of the Waters of the U.S. rule (***E&E News PM***, Dec. 14, 2015). Pruitt has since sought to roll back that regulation at the agency.

COMING TODAY - IG REPORT ON PRUITT HIRING: Politico's Morning Energy

Amid new and ongoing investigations into EPA Administrator Scott Pruitt, the agency's inspector general will shed some new light on his unorthodox hiring practices. The internal watchdog is releasing an interim report today on Pruitt's decision to hire several political aides using special authority he has under the Safe Drinking Water Act - part of a probe that began before recent reports that the administrator had relied on that same provision to get big raises for two top aides despite objections from the White House. (Pruitt has denied those reports and said the raises have been reversed.)

More than a dozen political appointees at EPA have been hired under the SDWA authority, which allowed them to avoid being subject to typical federal hiring restrictions or the Trump administration's ethics pledge, Pro's Alex Guillén reports . Among those hires: Nancy Beck, a former expert for the American Chemistry Council who is the new deputy assistant administrator in EPA's chemical office, and Lee Forsgren, the deputy in EPA's water office, and several public affairs staffers. Beck, for one, has made a number of controversial changes relating to implementation of the Toxic Substances Control Act. The agency's senior ethics counsel told POLITICO last summer that she did not need an ethics recusal to do so, even though she had been heavily involved with the issue in her previous job.

The IG audit began in January, and while the scope of today's report remains unclear, it could include urgent information the IG thinks Pruitt needs to know about before the audit is completely finished. Whether the IG has expanded that existing probe to include Pruitt's recent controversy is also unclear.

EPA watchdog to release report Monday on Pruitt hiring controversy Washington Examiner

GOWDY TO PRUITT: BECOME A MONK? Politico's Morning Energy

Two days after expanding his probe into Pruitt's travel and security costs, House Oversight Committee Trey Gowdy offered the EPA administrator some advice in a "Fox News Sunday" appearance. "The notion that I've got to fly first class because I don't want people to be mean to me, you need to go into another line of work if you don't want people to be mean to you," the South Carolina Republican said. "Like maybe a monk, where you don't come in contact with anyone." Gowdy said Pruitt's fate rested with President Donald Trump - "I don't know how much trouble he's in" - but defended his expanding probe into the embattled EPA chief.

Ewire: Gowdy says Pruitt travel explanation not 'credible' Inside EPA

The Republican chairman of the House oversight committee says Scott Pruitt's explanation for why he needed to fly first class does not appear not "credible," arguing that the EPA administrator did not need the pricey tickets to avoid unpleasant interactions with fellow passengers over security concerns.

"I'd be shocked if that many people knew who Scott Pruitt was," Rep. Trey Gowdy (R-SC) told Fox News Sunday. "So the notion that I've got to fly first class because I don't want people to be mean to me -- you need to go into another line of work if you don't want people to be mean to you. Like maybe a monk, where you don't come in contact with anyone."

Gowdy late last week sent a letter to Pruitt demanding interviews with five close EPA aides, according to the Associated Press. The oversight chairman is also seeking a raft of documents related to Pruitt's travel spending and "unprecedented" security measures.

The letter seeks interviews with Pruitt security chief Pasquale "Nino" Perrotta -- who has emerged as a central figure in many of the swirling headlines about Pruitt's alleged ethical lapses -- as well as agency Chief of Staff Ryan Jackson.

Gowdy also hopes to interview former agency political aide Kevin Chmielewski -- who confirmed many details of news reports about the ethics scandals in a prior interview with Democratic lawmakers -- and two Pruitt aides who worked with him when he was attorney general of Oklahoma, and who are the subject of a separate investigation into whether Pruitt bypassed the White House to give them hefty pay raises.

If nothing else, the latest developments in the lawmaker's ongoing investigation continues to keep Pruitt's ethical troubles in the news, despite President Donald Trump's stated support for the agency chief.

In addition, it comes as EPA's inspector general (IG) is slated to release an "interim" report today that will look at Pruitt's use of the Safe Drinking Water Act to fill "administratively designated" positions.

Pruitt reportedly used that provision in the law to give the controversial raises to the two aides identified in Gowdy's letter, though it is not clear whether the forthcoming IG report will address that issue or more broadly address Pruitt's use of the drinking water law's hiring provisions.

Gowdy sent Pruitt a letter Friday, Politico's Morning Energy
...demanding additional documents and interviews with several of his top aides. He asked Pruitt to provide documentation related to his round-the-clock security protection, contracts to sweep Pruitt's office for electronic surveillance, his trips to Italy and Morocco, the hiring of an Italian security firm, and travel by Pasquale "Nino" Perrotta. The oversight committee chairman also demanded interviews with five of Pruitt's aides: chief of staff Ryan Jackson; Perrotta, the head of Pruitt's security detail; Kevin Chmielewski, a former Trump campaign aide who was Pruitt's deputy chief of staff; senior legal counsel Sarah Greenwalt and scheduling director Millan Hupp, both of whom received significant raises under the SWDA. Gowdy's letter arrived one day after his staff met for several hours with Chmielewski, who is being treated as a whistle blower.

Former EPA political aide who clashed with Pruitt faces ethics charge Inside EPA
A former top EPA political appointee who has recently spoken out on Administrator Scott Pruitt's ethics and spending scandals is himself facing accusations that he violated ethics laws, with the possibility of a criminal indictment if the charges prove true.

ProPublica reports that Kevin Chmielewski, Pruitt's former deputy chief of staff for operations, never filed a financial disclosure form that would have identified potential conflicts of interest in his work at EPA.

"EPA officials say Chmielewski has not been granted any extensions, and he's still obligated to provide a financial disclosure even though he has left the agency," says the article, which notes that in the past officials have been criminally charged for failure to file a report as required by the Ethics in Government Act.

Previous violations of the law have led to four-figure fines, but Chmielewski could face a stiffer penalty because he never filed a disclosure at all. *ProPublica* reports that the prior officials failed to file a final report upon leaving their government posts, and calls an official neglecting to fill out the initial report "unprecedented."

Chmielewski recently spoke to Democratic lawmakers about Pruitt's spending and alleged unethical conduct, providing details that formed the basis for an April 12 letter to President Donald Trump calling for Pruitt's ouster.

That letter cites Pruitt's effort to "marginalize" his chief of staff, Ryan Jackson, in favor of a pair of close aides who worked with Pruitt in Oklahoma. Both aides are themselves subjects of an investigation over claims that Pruitt gave them significant raises despite the White House denying his request, using Safe Drinking Water Act authority for emergency personnel moves.

"[I]f you speak with knowledgeable parties like Mr. Chmielewski and examine relevant documents, it will become clear that the right course of action in this case is to hold Administrator Pruitt accountable for his serious ethical lapses and to restore honest, competent leadership to EPA so that this important agency may fulfill its critical mission," the letter says.

But if Chmielewski becomes embroiled in his own ethics scandal, it could become more difficult for Pruitt opponents to use him as a centerpiece of their claims against the administrator.

YOU DON'T GOT A FRIEND IN ME: Politico's Morning Energy
Patrick Sullivan, the assistant IG in charge of investigations at EPA, is disputing a New York Times report that says he is friends with the head of Pruitt's protective detail, according to a spokeswoman for the internal watchdog. The Times report became the basis Friday of a request from the watchdog group Citizens for Responsibility and Ethics for an investigation from a council of federal inspectors general. But Sullivan disputed claims that he had drinks with Perrotta, "anywhere or at any time," IG spokeswoman Tia Elbaum said in an email Friday. A Times spokesperson said the paper stands by its story. Alex has more here.

EPA'S KELLY ADDRESSES BANKING BAN: Politico's Morning Energy
Albert Kelly, Pruitt's senior adviser on Superfund issues - who joined the agency after agreeing to be banned from working in the banking industry - recently spoke to The Montana Standard and addressed the Federal Deposit Insurance Corp. controversy for the first time. Kelly's bank, SpiritBank of Tulsa, made several loans to Pruitt, which he addressed. "There are no questionable loans by my bank to the administrator. If you go back and look at any loans to the administrator, without going into his privacy, they were very solid," Kelly said. "They were done in a very positive way and were paid off."

His problem with the FDIC, he said, involved a particular transaction in 2010. "They didn't like it," Kelly said, dodging on the root cause of his ban. "The bank didn't lose any money. The bank made money. There was nothing untoward about it." The former banker also told the Standard Pruitt is still planning on visiting Butte, Mont. in August. More here.

How Conservative Activists Saved Scott Pruitt's Job—for Now Bloomberg Environment & Energy Report
During the first week of April, as scandals piled on top of Environmental Protection Agency Administrator Scott Pruitt, it looked like his job was in jeopardy.

A handful of lawmakers, including two Republicans, called for him to resign after reports surfaced that he'd rented a Capitol Hill condo on unusually agreeable terms from the wife of a prominent energy lobbyist with business before the

EPA. Top administration officials distanced themselves from Pruitt as the White House launched a review of his actions, and Chief of Staff John Kelly told President Trump it was time for the EPA chief to go.

Pruitt was already controversial.

The former Oklahoma attorney general, who made a name for himself suing the agency he now runs, had drawn fire for his enlarged security detail, his habit of flying first class, and the $43,000 installation of a soundproof booth in his office, not to mention his disregard for climate science.

But this time it felt like a line had been crossed, especially as damaging revelations kept coming, seemingly every hour. Reports surfaced of staff being reassigned or demoted for challenging him and of Pruitt using an obscure law to give two close aides hefty raises over White House objections.

#StandWithScottPruitt

When the EPA's general counsel walked back his initial assessment that the rental deal didn't violate federal ethics laws, Pruitt looked like a goner.

What happened next is a testament to the EPA administrator's ties to the business community and how crucial he is to the conservative antiregulation agenda. By the evening of April 5, an aggressive advocacy campaign to save his job had kicked into gear as activists, business executives, and Republican politicians came to his defense.

The campaign went public when FreedomWorks, a powerful right-wing advocacy group, blasted out a call for help to its online community of 5.7 million conservatives, including on Facebook, Twitter, and by email, reminding them of Pruitt's record on rolling back regulations and asking them to call the White House and Congress to support him. The group also promoted a #StandWithScottPruitt hashtag on social media, highlighting it in multiple tweets, including one asserting that he was the victim of a "smear campaign" by the "radical left."

Among those responding was Dallas investor Doug Deason, whose family has given millions to right-wing candidates. He texted and emailed contacts at the White House to make clear he wanted Pruitt to stay. As reports surfaced that Trump's chief of staff had suggested the EPA chief needed to go, Deason got angry. "If that's true, I think Kelly needs to go because he has no spine," he says. "We need to get on the offense."

Back in Washington, conservative leaders including Myron Ebell of the Competitive Enterprise Institute and Tom Pyle of the American Energy Alliance scrambled to find ways to show support, resulting in an open letter from dozens of Republicans hailing Pruitt's work.

'A Conservative Hero'

Soon, what started as an email effort morphed into a full-throated #SaveScott campaign, with prominent Republicans and leaders of the Tea Party movement such as Steve Forbes and Kentucky Sen. Rand Paul penning op-eds, posting on Twitter, and picking up the phone to lobby the president against firing the man they see as a champion of deregulation and for whose confirmation they fought.

"He's a conservative hero," Deason says. "We burned a lot of chits to get him into that position." They couldn't afford to lose him now.

By the end of the week, Trump had heard from billionaire Oklahoma oilman Harold Hamm and confidant Chris Ruddy, chief executive officer of Newsmax Media Inc., voicing their support. By the night of April 7 it looked like Pruitt was safe when Trump tweeted that, despite the issues surrounding the security detail and rental agreement, "Scott is doing a great job!"

One factor working in Pruitt's favor is that Trump is unlikely to get anyone like him through the confirmation process again. Senate Republicans warned it would be tough—if not impossible—to confirm a replacement.

Given three bruising confirmation battles expected for the president's picks to lead the CIA, the Department of Veterans Affairs, and the State Department, there isn't much appetite for a fourth.

Trump "will be forced to nominate someone who is more moderate on the environment, or he will get tattooed in the Senate," says Dan Eberhart, CEO of Canary LLC, a Colorado-based drilling-services company, and a major GOP donor.

Deregulation Star

Pruitt has emerged as the deregulation star of Trump's cabinet, methodically dismantling rules meant to protect the environment. He's proposed scrapping President Obama's signature plan to cut carbon emissions, is rewriting a water pollution rule, and has quashed an effort to put new limits on methane leaks from oil wells.

"Pruitt is the most conservative member of the cabinet, both in temperament and action," says Republican strategist Mike McKenna. "He's also the guy who has done the most for the president's agenda."

His support among Senate Republicans isn't absolute. In a series of interviews, some voiced concerns over his spending habits and the potential blowback. "He needs to stop leading with his chin," says Republican Sen. John Kennedy of Louisiana. "This is taxpayer money he is spending, and he needs to treat it like the precious commodity it is. I can support his policies without supporting his behavior."

Environmental groups are stepping up opposition research and a "boot Pruitt" campaign on Twitter.

The Sierra Club broadcast a critical ad on Fox News Channel's Fox & Friends, which the president watches faithfully. The Sierra Club has received funding from Bloomberg Philanthropies, the charitable organization founded by Michael Bloomberg, the ultimate owner of Bloomberg Environment.

Activists are scouring Pruitt's real estate transactions, records from his tenure as Oklahoma's attorney general, and documentation of his travel for any tantalizing detail.

"The environmental movement in total is all in for the removal of Scott Pruitt," says Lukas Ross, a campaigner with the group Friends of the Earth. "You are going to see escalating pressure in the coming days, especially on the Senate side, to get members to commit publicly that Pruitt should be fired."

The government's top ethics official, David Apol, is urging the EPA to investigate Pruitt.

Series of Investigations

At least four probes are under way, and the agency's inspector general's office has been asked to open other investigations into his condo agreement.

Another conflict may relate to the man behind some of Pruitt's most controversial security upgrades, including biometric locks in his office and his round-the-clock bodyguards. Pasquale "Nino" Perrotta is a former Secret Service agent who got the job protecting the administrator last year after the previous security head questioned some decisions and was reassigned, according to a person familiar with the change.

At issue is an EPA security move that may have enriched one of Perrotta's business partners, Edwin Steinmetz, the vice president for technical surveillance countermeasures at Perrotta's Maryland-based company, Sequoia Security Group Inc. Perrotta is the company's principal, and the EPA's $3,000 contract to search for bugs in Pruitt's office was awarded to Edwin Steinmetz Associates LLC. Perrotta didn't respond to messages seeking comment.

Perrotta played a key role in the agency's decision to guard Pruitt 24 hours a day, a major shift from the typical approach giving administrators only "door-to-door" protection. Now at least 19 agents guard the EPA chief day and night, and the number may be higher depending on travel and other needs.

"Perrotta is at the center of these decisions to spend money in ridiculous ways," says Austin Evers, the executive director of American Oversight, a government watchdog group probing the EPA's security decisions. "The administrator has gone out of his way to pick someone to lead his detail who will say 'yes' to everything and give him the entourage he apparently dreamed of."

EPA: Skeptics who aided Pruitt see a chief with nothing to lose Climatewire

Scott Pruitt could be poised to adopt a more aggressive approach against climate science after conservatives rallied around the embattled EPA chief.

Media scrutiny on the ethical lapses dogging Pruitt seem to have strengthened his bond with President Trump, according to those familiar with the president's thinking. Trump sees much of himself in Pruitt — a renegade Washington outsider perceived as being under siege by Democrats and the press.

Conservatives who have championed Trump's policies from the outside have mounted an effective campaign to defend Pruitt. Those organizations are influential in today's administration and see Pruitt as a dyed-in-the-wool defender of their core beliefs, from property rights to Christian values.

"[Trump] has actually referenced it in meetings, that people have been weighing in on Pruitt's behalf," said an industry source who talks with "industrialists and movement conservatives" in Trump's inner circle.

Conservatives have launched a media blitz to buoy Pruitt. On Wednesday, 22 conservative movement leaders — led by climate skeptic group the Heartland Institute — sent Trump a letter defending Pruitt's "record of leadership" that said "radical environmentalists and the biased media are trying to force him out of office" in an "example of selective outrage by those you defeated in your election" (***E&E News PM***, April 11).

That support has buttressed Pruitt against rumors that some White House aides, including chief of staff John Kelly, want him gone. Trump has stuck by him. He now knows who his friends are, and his friends are Trump's friends.

"Whatever was on their wish list as a 'possible' is moving to the 'more likely' column because he has nothing to lose," said Marc Morano, a former staffer for Sen. Jim Inhofe (R-Okla.) on the Environment and Public Works Committee.

Morano stressed an important caveat — Pruitt's ability to act stridently depends on whether he can escape further embarrassment or scandal. Those odds are growing murkier in the wake of a widening probe by House Oversight and Government Reform Chairman Trey Gowdy (R-S.C.). House investigators requested a trove of documents and recorded interviews with Pruitt aides.

The investigation increases Pruitt's potential exposure to new revelations. So far, he's survived scrutiny around his deal to rent a condo for $50 per night from the wife of an energy lobbyist, spending on lavish travel and security, reassigning staff that questioned those decisions, and approving large pay bumps for two aides despite White House disapproval. Some of those claims were brought to light by Kevin Chmielewski, an EPA aide and former Trump campaign hand, in conversations with congressional Republicans and Democrats.

For those wondering how Pruitt may operate going forward, a meeting last week at the Heritage Foundation offered clues. Casting aside criticism that he's embraced fringe voices on environmental issues, he sat down with a whole roster of them for a policy discussion, attendees said.

Most of the participants are interested in policies aimed at dismantling greenhouse gas regulation. Attendees included Myron Ebell of the Competitive Enterprise Institute; Patrick Michaels of the Cato Institute; Kenny Stein of the Institute for Energy Research; and Steve Milloy, a former EPA transition member under Trump (***E&E News PM***, April 11).

"While [the] meeting was off-the-record, I can safely say that it was evolutionary and consistent with previous briefings he has held," Michaels said in an email.

To be sure, Pruitt has huddled often with that set. Some have been frustrated that Pruitt hasn't challenged the endangerment finding, which provides the legal underpinning for regulating greenhouse gases. It's a tall task, they acknowledge, and one that legal scholars and scientists argue is doomed to fail. To be successful, Pruitt and his team would need to rebut peer-reviewed climate science with evidence that humans are not warming the planet.

Pruitt also has promised the same audience a "red team, blue team" exercise to debate climate science. The White House reportedly nixed that idea, but it's unclear whether Pruitt has given up the push.

Those who participated in last week's meeting at the Heritage Foundation left with the feeling that bolder steps are on the way. They viewed the sit-down as a thank you for standing by Pruitt in a time of turmoil, but also as a rallying point.

"For people who are climate bedwetters, they're going to need a whole lot of extra diapers coming up," Milloy said.

But not everyone is convinced Pruitt is safe.

The White House has said it's conducting a review of the allegations against the EPA chief. But it hasn't said what exactly is under investigation or given a timeline for completion. The White House did not respond to a request for comment.

Trump's personnel decisions are "unpredictable," Ebell said. He said EPA has been increasingly cautious in its response to recent headlines, rather than taking the combative tone it used during earlier scrutiny regarding Pruitt's expensive travel and expanded security detail.

"I don't think they're trying to speed up the big announcements," Ebell said. "I'm not making a bet on how this turns out."

Still, Ebell said significant policy news is in the offing. But he's measured in assessing Pruitt's confidence about his own job security. Ebell noted the flurry of bad news already pushed one major policy development to the end of this month, though he declined to describe what it was.

A notice of proposed rulemaking that appeared on the Office of Management and Budget's Office of Information and Regulatory Affairs website last week said EPA is considering regulations to "increase consistency ... reliability to affected stakeholders, and increase transparency during the development of regulatory actions." *The Daily Caller* reported EPA will cease accounting for health co-benefits associated with greenhouse gas emissions reductions, such as decreases in fine particulate matter that are linked to heart and lung ailments.

Pruitt's team has tried to "keep a low profile" so as not to "feed this story," which isn't necessarily the marker of someone ready to take up the battle ax, Ebell said.

One thing giving Ebell confidence is Trump's April 7 tweet that defended Pruitt. The president hasn't said anything publicly to distance himself from Pruitt since then.

To Pruitt's champions, those are good signs. And it's a reminder to them that in the Trump administration, only one person's opinion matters — Trump's. As long as that's the case, they're confident Pruitt will outlast the current storm.

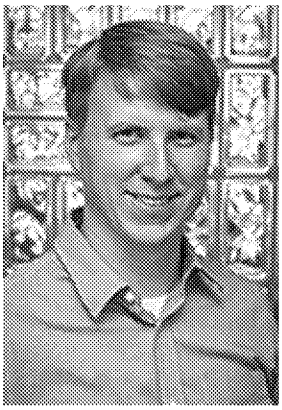
"His once-a-month rallies in Pennsylvania, Ohio, West Virginia to 10,000 and 20,000 — one of his big applause lines is mocking the environmental regulations and the U.N. climate treaty, and the crowd goes wild," Morano said. "Who loves him and who does he interact with? Those crowds. That's who he's loyal to. You have no idea how refreshing Donald Trump is. We're as happy as Roseanne that Donald Trump is president."

A-E

AIR POLLUTION: Pruitt's grant ban hits advisory panel at critical time Greenwire

As an EPA scientific advisory panel inches toward a key juncture in its high-stakes review of Clean Air Act standards for particulate matter, some members are facing a now-familiar dilemma: Give up agency funding or leave the group.

At least four panel members have been presented with that choice, according to court papers and interviews. While that's a relatively small percentage of the review panel's 27 members, it points to the continuing impact of the policy put in place last October by EPA Administrator Scott Pruitt.



Peter Adams. Carnegie Mellon University

For researchers caught in the middle, that policy continues to rankle.

"I feel like this new rule is kind of quote unquote 'solving' a problem that doesn't exist," said Peter Adams, a civil and environmental engineering professor at Carnegie Mellon University. Late last month, Adams was told that he was off the review panel after declining to relinquish an EPA grant.

The panel is in effect a work group for the seven-member Clean Air Scientific Advisory Committee (CASAC), which offers outside expertise to EPA during regularly required reviews of the air quality standards for particulate matter, ozone and four other "criteria" pollutants identified in the Clean Air Act.

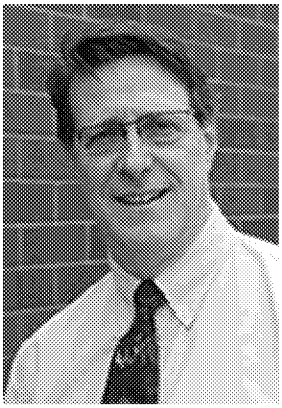
EPA is now in the early stages of re-examining the particular matter standards, which were last strengthened in 2012. With recent studies suggesting current limits for so-called fine particulates still may not be tight enough to protect public health, the agency is tentatively expected to release a draft roundup of available research — known as an "integrated science assessment" — this summer. Traditionally, CASAC and the review panel would then provide feedback as a prelude to a second, revised draft.

Dr. Rob McConnell. USC

While EPA had replaced several members of the main CASAC around the time that Pruitt announced the new policy last fall, the agency has only recently begun to extend the grants prohibition to review panel members.

Also out is Dr. Rob McConnell, a professor of preventive medicine at the University of Southern California. Late last month, McConnell told EPA that he had chosen "grant-funded research over continued service" on the panel, according to a recent court filing in one of three lawsuits challenging Pruitt's policy. McConnell could not be reached for comment.

A third member, Dr. Joel Kaufman, interim dean at the University of Washington's School of Public Health, said in an email last week to E&E News that he, too, had been contacted by EPA. Kaufman didn't reply to a follow-up message asking what he intended to do.



Dr. Joel Kaufman.University of Washington

But Jeremy Sarnat, an associate professor of environmental health at Emory University, said he was ending an EPA grant related to climate change three months ahead of schedule in order to stay on the panel. In an email, Sarnat said he felt strongly that the strength of EPA's advisory committees rested in their "diverse representation" across academic and governmental lines.

"I see this new policy as a means of hindering this diversity, by making it difficult for people (like me) with careers conducting air pollution and health research in academic institutions to participate in CASAC," Sarnat said. "So, for this reason, I want to do what I can to ensure that the policy fails."

As of this morning, the particulate review panel's **website** had not been updated to reflect any membership changes.

Jeremy Sarnat. Emory University

Tom Brennan, acting head of EPA's Science Advisory Board staff office, which has been contacting review panel members about their status, referred questions to the agency's press office, where spokespeople did not reply to emailed questions. Also not responding to queries last week was Richard Yamada, a Pruitt appointee who has taken a lead role in implementing the policy as deputy head of EPA's Office of Research and Development.

But the turnover was welcomed by Steve Milloy, a senior policy fellow at the Energy and Environmental Legal Institute, an anti-regulatory group that unsuccessfully sued two years ago to force the dissolution of the entire panel on the grounds that most members had received EPA grant money at some point and were "inappropriately influenced" in favor of the agency's alleged predisposition toward stricter regulations (***Greenwire***, Aug. 2, 2016).

Milloy's only objection in this instance was that EPA didn't move faster.

"I would have gotten rid of them right away," he said in an interview last week. "I think Pruitt has taken the humane way out."

Echoes of 'secret science' bill

It's unclear whether departing review panel members will be replaced. In rolling out the new policy last fall, Pruitt described it as a way of ensuring researchers' "objectivity."

"There is a question that arises over independence," Pruitt said at the time. "They have to choose: either the grant or service. But not both" (***E&E News PM***, Oct. 31, 2017).

Detractors have noted that Pruitt appears to have no such worries about the industry ties of some of his own advisory panel appointees.

"Focusing on non-existent conflicts of interest related to EPA funding while overlooking much larger conflicts of interest in industry is clearly a losing proposition for the nation," Adams wrote to Brennan in an email last month after being told he was no longer on the review panel. Adams provided a copy of the exchange to E&E News.

The ban on participation by EPA grant recipients isn't the only uncertainty hovering over the particulate standards review, which is set to wrap up in 2022.

In a **presidential memorandum** last week, the White House instructed Pruitt to come up with criteria for all reviews of ambient air quality standards "to ensure transparency in the evaluation, assessment and characterization of scientific evidence."

To some observers, that language is reminiscent of the "secret science" legislation repeatedly introduced by House Science, Space and Technology Chairman Lamar Smith (R-Texas) to bar the use of research in the development of new EPA regulations that is not "transparent or reproducible." The latest version of the bill, **H.R. 1430**, is awaiting action by a Senate committee after winning House approval more than a year ago.

Among the legislation's backers has been Tony Cox, a Colorado consultant whose clients have included the American Petroleum Institute.

Named last fall by Pruitt as CASAC chairman, Cox is also expected to lead the particulate matter review panel. In an email late last week, Cox said he disagreed with critics who view the legislation as a backhanded way of excluding studies that would suggest the need for stronger limits on fine particulates.

"To the contrary, I believe that we should shine a bright light on available data, independent of whether it suggests or opposes any particular policy conclusion and should follow where the data lead," Cox said in response to questions from E&E News, adding that he had not yet reached a conclusion on whether the fine particulate standards should be revised.

"This will be important for all of the members of CASAC to deliberate about, and I expect that final conclusions will be informed by careful consideration of available evidence," Cox wrote. "Much of that process will take place later this year."

EPA 'Secret' Biofuel Waivers Undercut Trump's Pledge to Farmers Bloomberg Environment & Energy Report

Even as President Donald Trump floats the idea of more ethanol sales, critics says moves by his Environmental Protection Agency would undercut the support to corn farmers.

Trump said April 12 the government probably would allow the year-round sale of gasoline containing as much as 15 percent ethanol, a blend known as E-15. But some lawmakers and ethanol producers say the change is undermined as the EPA continues its longstanding practice of issuing hardship waivers to some oil refineries.

At the heart of the matter is demand for ethanol, usually made from corn. A federal mandate requires a certain amount of biofuel blending, a regulation that oil refineries have long complained is too expensive and burdensome. The EPA's waivers allow some of them to skirt the requirements.

The "EPA's practice of giving away secret hardship waivers to the country's biggest oil refining companies needs to stop," four Republican senators from top corn-producing states including Chuck Grassley and Joni Ernst of Iowa said in a joint statement late April 12. The waivers are "effectively gutting" national biofuel quotas and are "another backdoor attempt" to destroy ethanol regulation, they said.

Trump has held a series of meetings in recent months to carve out a biofuels deal that satisfies the agriculture and oil lobbies, which also happen to represent two of his most important constituencies: farmers in the rural Midwest and blue-collar workers in industrial areas. The two sides have clashed repeatedly over the Renewable Fuel Standard, a complicated policy that crosses political lines.

On April 12, farmers cheered as Trump said the government would probably allow year-round sales of E15, a change from current policy that restricts its sale during the summer in areas where smog is a problem.

But in a meeting with farm-state lawmakers and governors, Trump also indicated there would be a two-year transition for the change, with "no guarantee" it would happen, and he stressed that he would be "helping the refineries" who have complained about the biofuel mandate.

EPA Encouraging Waivers

Trump's EPA already is doing just that. It has encouraged some 38 eligible oil refineries to apply for waivers and granted more than two dozen of them. A federal law allows exemptions for facilities that use no more than 75,000 barrels of crude per day, and a court ruling last year made winning waivers easier.

"The court basically said that, under the statute, EPA is required to give small refinery exemptions more liberally," Jeff Holmstead, the former assistant EPA administrator, said in an emailed statement April 12. What's more, the law "does not

make a distinction between small refineries owned by small parent companies and small refineries owned by a large ones."

Exxon Mobil Corp. has applied for at least one waiver, according to people familiar with the process who asked for anonymity to discuss the confidential program. Its 61,500 barrel-a-day facility in Billings, Mont., would qualify based on capacity. Suann Guthrie, an Exxon spokeswoman, declined to comment.

Billionaire Carl Icahn's CVR Energy Inc.'s Wynnewood, Okla., refinery, has a capacity below the 75,000-barrel threshold and could also qualify for the exemption.

Brandee Stephens, a spokeswoman for CVR, declined to comment on whether the company sought a waiver. Icahn, a former special adviser to Trump on regulations who has advocated for changes to the program, didn't respond to several messages requesting comment.

The EPA's waiver decisions "are based on refinery-specific information" and Department of Energy analyses, EPA spokesperson Liz Bowman said by email. "We continue to work through petitions received for 2017."

GOP Touts High-Octane Standard In RFS Reform Package But Faces Hurdles Inside EPA

Top House Republicans are expressing confidence about enacting a nationwide high-octane fuel standard as part of a broader package to "reform" or scale back the renewable fuel standard (RFS), arguing the move could satisfy a range of fuel stakeholders while also giving automakers a relatively cheap compliance option for fuel economy limits.

However, ethanol groups are expressing concern about key details of such a standard, arguing that it may not expand biofuels' market share much beyond current RFS blending mandates and could even reduce that share.

In addition, both Democrats and Republicans, during an April 13 House hearing on the concept, raised a number of questions ranging from the policy's impact on the fuel supply's greenhouse gas emissions, the potential for mis-fueling a range of vehicles and potential increases in consumer costs.

Yet some top GOP lawmakers during the House Energy & Commerce environment subcommittee hearing touted the concept as providing benefits to multiple groups.

A high-octane standard is a "relatively low-cost way to increase miles per gallon," said panel Chairman John Shimkus (R-IL), adding it could offer a "pathway to use as much if not more" ethanol than is currently required by the RFS.

Similarly, Energy & Commerce Committee Chairman Greg Walden (R-OR) said the concept "seems like an elegant way to make both the RFS and the [corporate average fuel economy (CAFE)] standards work together."

While lawmakers must still "kick the proverbial tires of this idea," he said the topic is a priority for the committee and "we intend to move forward one way or the other."

Some Republicans have long embraced the notion of a high-octane standard, as the Trump administration and GOP lawmakers have struggled to develop consensus fixes to the RFS.

Octane is a measure of fuel's ability to resist engine "knock," or incorrect ignition. Fuels with higher octane ratings enable higher engine efficiency and lower emissions of GHGs and other pollutants.

As a result, some have urged California officials to exercise little-used federal authority to require gasoline sold in the state to have a higher octane level as a way to reduce vehicle GHGs, an issue that is not preempted by federal law -- unless and until Congress or EPA enacts federal octane limits.

At the same time, Shimkus has been involved in a months-long attempt to craft legislation reforming EPA's biofuel blending program, though some sources see the effort as unlikely to bear fruit in the near term given the looming November midterms.

Rep. Paul Tonko (D-NY), ranking Democrat on the subcommittee, told the hearing that he doubts that a high-octane standard by itself would do a better job than the RFS of encouraging lower-carbon advanced and cellulosic ethanol, though he said he is "open to hearing otherwise."

He noted that a standard expressed as 95 research octane number (RON) -- a proposal floated by many lawmakers and witnesses at the hearing -- is not guaranteed to be achieved by using ethanol or other low-carbon fuels, and could "increase the carbon intensity of the fuel supply."

Further, he charged that any octane standard should not be issued "without the certainty that these [CAFE] standards will continue and continue to be strengthened into the future."

RFS 'Sunset'

Though they broadly endorsed the concept of requiring higher octane, key stakeholder groups at the hearing were divided on important details.

For instance, American Fuel & Petrochemical Manufacturers (AFPM) President Chet Thompson testified that his group endorses a "performance-based" octane standard of 95 RON, provided it is accompanied with a "sunset" of the RFS, adequate lead time and measures to prevent mis-fueling.

In contrast, Growth Energy CEO Emily Skor said a high-octane standard is laudable but is a "different conversation" when coupled with an end to the RFS. She added that any standard must specify that a portion of the octane be achieved by "renewable fuels," as opposed to chemical additives.

Skor and a representative of gasoline retailers also urged EPA to grant a waiver allowing year-round sales of 15 percent ethanol (E15) blends. But Thompson said he is group is only willing to entertain such a step "as part of a comprehensive RFS solution." His members "would not be too keen to the idea in exchange for nothing."

To allow year-round sales, EPA would have to lift Reid vapor pressure (RVP) restrictions that currently limit sales in the summer. Ethanol advocates argue that the prohibition is outdated and that the air emissions profile of E15 is if anything better than the 10 percent blend (E10) that is the national standard.

President Donald Trump on April 12 endorsed the concept of year-round E15 sales, comments that prompted ethanol critics to charge that EPA lacks Clean Air Act authority for such a waiver.

Despite the apparent differences at the hearing, Shimkus claimed, "I believe that we are closer than people think" to agreement on the policy.

'Cost-Effective' Compliance

For their part, automakers are embracing a national high-octane standard, which would allow them to craft a new generation of turbo-charged engines designed to run on such fuel and achieve up to a 3 percent fuel economy gain.

Dan Nicholson, a global propulsion official with General Motors testifying on behalf of the United States Council for Automotive Research, said that combining high-octane fuels with advanced engines is "the most cost-effective thing that we can do" to comply with increasingly stringent CAFE and vehicle GHG requirements.

Such an effort could entail billions of dollars in investments to redesign engines over the next four-plus years, but "other things we can do will cost even more."

If Congress passed legislation with a high-octane standard this year, he said, automakers could deploy advanced engines designed for the fuel by model year 2023 at the earliest.

AFPM's Thompson said that if a high-octane standard is phased in, it might not cost his members much in the early years to comply but would ultimately require "tens of billions of dollars." Even so, he said refiners are willing to embrace the policy as a "compromise solution to a bad status quo: How do we help autos comply with CAFE and how do we make the RFS better?"

Thompson also claimed that a 95 RON standard would be good for the ethanol sector because ethanol is currently the cheapest way to boost octane levels in fuel. "It would provide them with every bit as much ethanol demand as they get under the RFS and likely more," he said.

He opposed requiring a certain level of ethanol to be used to achieve octane gains, noting that California and five other states currently ban E15 blends.

But Skor countered that a "performance" standard could allow oil refiners to use other petroleum products to boost octane, even if ethanol is a cheaper option, in order to crowd out ethanol's market share. As such, she called for the RFS to continue to provide "guard rails" that ensure ethanol has a place in the fuel market.

She noted that a 95 RON fuel is similar to premium fuel available today, which she said refiners make without significantly higher ethanol than regular gasoline.

Timothy Columbus, representing two trade associations of retail gas stations, said his members are mainly seeking "peace in the valley" regarding fuel policy. He backed a waiver allowing year-round sales of E15, while noting that the concept of a high-octane standard creates "substantial opportunity" for the ethanol sector.

He also backed a "performance" standard, arguing that would ultimately drive down consumer costs. Further, he urged Congress to allow sufficient lead time for retailers to upgrade underground storage tanks to ensure they can store higher ethanol blends, in order to avoid liability under the Resource Conservation and Recovery Act. -- *Lee Logan* (llogan@iwpnews.com)

Chemical List From EPA to Help Companies Meet October Deadline Bloomberg Environment & Energy Report

A list of chemicals that the EPA released April 12 should help paint, cleaning, and other companies that combine chemicals know if they need to notify the agency by Oct. 5 of the components of their mixtures.

The Toxic Substances Control Act amendments of 2016 require the EPA to divide its official inventory of chemicals into two parts: a list of chemicals that are active in commerce and a list of those that once were, but are now dormant.

The agency April 12 released information that will help companies that mix compounds comply with TSCA. The first registry is of particular interest to chemical processors—companies that make mixtures of chemicals such as cleaning products, car polish, and paint.

Live and in Commerce

That registry lists chemicals the agency believes to be active in commerce based on information chemical manufacturers provided earlier this year.

Chemical processors can check that list to make sure the chemicals they use are on it. If they are, no further action is required.

But if the chemicals these companies need are not on the provisional list, processors have until Oct. 5 to let the agency know they use the compound. The agency would then add the chemical to a final active-in-commerce list it is expected to release in 2019.

Under TSCA, only chemicals that are on the final active list can continue to be sold, used, or imported into the U.S.

The second chemical list the agency released is an update of its TSCA inventory, which lists all chemicals that have been made in or imported into the U.S. since the early 1980s. This larger inventory includes many chemicals that are no longer made or used.

House Farm Bill Seeks To Scrap Inter-Agency ESA Pesticide Consultations Inside EPA

House Republicans in the recently introduced Farm Bill are proposing to amend federal pesticide law to strip a requirement that EPA consult with federal wildlife agencies on pesticides' risks to endangered species, a provision environmentalists say could make it more difficult to move the bill through the Senate and would speed extinctions.

The bill, H.R. 2, introduced April 12, would amend the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA) to allow EPA to deem a pesticide "not likely" to adversely affect listed species or critical habitat, stripping the agency of an obligation under the Endangered Species Act (ESA) to consult with wildlife officials whenever a pesticide "may affect" a listed species, although the language does allow for registrants to petition the agency to consult.

"The Administrator shall not be required to consult or communicate with the Secretary of the Interior or the Secretary of Commerce when making such determination, unless otherwise petitioned to by the registrant of the pesticide," a House Agriculture Committee summary of the provision says.

Environmental groups that have long pressed EPA through federal lawsuits to consult on pesticides' risks to endangered species, are calling the bill language a pesticide industry handout that along with other "poison pill" provisions could preclude the Farm Bill from passing the Senate.

"This is one of many things that might sink the Farm Bill," a source with the Center for Biological Diversity (CBD) tells *Inside EPA*, characterizing the practical affect of the provision as allowing pesticide users to kill listed species provided they follow product label directions.

"It's going to make passing the Farm Bill exceptionally harder."

In an April 12 statement, CBD argues that the bill would seek to essentially codify an April 2017 request from Dow AgroSciences and other pesticide producers for EPA to scrap an Obama-era process for assessing pesticides risks under the ESA, that advocates say would allow EPA to ignore species' risks.

"Without question, this will accelerate extinctions for some of our most vulnerable species," CBD's Lori Ann Burd says in the statement. "Companies like Dow that have dumped millions into congressional campaigns are now calling all the shots in D.C. on dangerous pesticides."

The pesticide producers association CropLife America is backing the language as bringing needed changes. "The language included in the Farm Bill would streamline the administrative process, avoiding duplication, delay and procedural litigation," CropLife America President and CEO Jay Vroom says in a statement to *Inside EPA*.

"This is not a change in the safety standard, nor does the Farm Bill language change provisions for citizen suits."

A second pesticide industry official who supports the provision says that inter-agency consultation process for pesticide reviews is broken and that a new solution is needed to address the conflicting mandates of FIFRA and the ESA.

ESA Consultations

During the Obama administration, EPA, the U.S. Fish and Wildlife Service and the National Marine Fisheries Service (NMFS) crafted an inter-agency process for correcting EPA's long-standing failure to assess pesticides' risks to listed species as required under the ESA.

EPA officials have acknowledged that early iterations of the Obama-era process relied on highly conservative assumptions, and said they were working to improve the process.

In January, EPA Administrator Scott Pruitt and Trump officials overseeing federal wildlife agencies formed a working group to review and potentially revise the process that Pruitt described as broken.

But prospects for an agreement are "gloomy," according to Bill Jordan, a former deputy director of EPA's pesticides office. "Each side has to make some serious compromises," he said during an April 10 webinar.

EPA is seeking comment through May 22 on the first biological opinion (BiOp) finalized under the Obama-era process, including on the scientific approaches and data underlying the analysis. EPA has said the input is needed because a federal court late last year rejected NMFS' request to delay finalizing the BiOp, precluding the wildlife service from seeking public input, including from pesticide producers.

The language in the House Farm Bill mirrors language in draft legislative text that several environmental groups, including the CBD, Center for Food Safety, and Defenders of Wildlife, charged that pesticide industry officials were shopping on Capitol Hill and that they said "would eliminate all requirements for the EPA to consult with agencies that have the most expertise on endangered species."

Now CBD officials say the pesticide industry has succeeded in getting similar language in the farm bill.

The CBD source says advocates have been meeting with Senate Democrats for months to oppose pesticide industry efforts to strip the requirement for EPA to consult with wildlife officials on pesticides risks to endangered species.

"If the rider remains in place, consideration for impacts on endangered species would be written out of the process of registering pesticides," Burd says in an April 13 op-ed in *Environmental Health News*.

"If we don't stop it, it could not only directly fuel the extinction of many of our most endangered plants and animals -- it could eliminate one of the most important shields we have to protect all species, including humans, against highly toxic pesticides poisoning the waterways and landscapes we all depend on."

In addition to the consultation provision, section 9111 of the bill would also amend FIFRA to require that EPA use "best scientific and commercial data available" when registering pesticides, and to consider any use restrictions when assessing pesticides' risks, according to the summary.

The bill would set a schedule for EPA to make determinations on whether a pesticide is likely to jeopardize species or alter critical habit. EPA would have until Oct. 1, 2026 to assess ESA risks of pesticides initially registered before Oct. 1, 2007, and until Oct. 1, 2033 for those registered after that date and before enactment of the law. -- *Dave Reynolds*(dreynolds@iwpnews.com)

NAS advice on IRIS disappoints chemical industry Inside EPA

The American Chemistry Council (ACC) says it is disappointed with the results of a National Academy of Sciences (NAS) report that largely backed reforms EPA is making to its Integrated Risk Information System (IRIS), saying the report did not go far enough in calling for reforms the group believes the program needs to ensure adequate assessments.

In an April 13 statement, ACC, the leading chemical sector trade association, charged that EPA provided the NAS panel with only limited information about its activities to reform the program.

"ACC had little expectation the committee would be able to properly evaluate the progress the agency has made to address past NAS recommendations," the statement says.

"NAS was tasked with reviewing proposed IRIS changes based on what EPA presented in a 1.5-day workshop. Unfortunately, EPA staff elected to provide only PowerPoint presentations that offered few details on the specific practices being used and did not include the review of any actual examples of completed assessments reflecting all the changes IRIS has made," it adds.

ACC's statement responds to a NAS's panel's April 11 report that praised EPA's efforts to improve its influential but controversial risk analysis program, and even backed supporters' efforts to keep Republicans from consolidating the program with EPA's toxics office, underscoring steps Congress took in EPA's recent budget bill.

"Overall, the committee was impressed with the changes being instituted in the IRIS program since" NAS' last IRIS review, published in 2014, the report said.

"The committee views the transformation of the IRIS program as a work in progress, recognizes that this review assesses one moment in time in a still-evolving program, and acknowledges that the IRIS program will (and should) continue to evolve as it adapts and applies new scientific approaches and knowledge," NAS' April 11 report states.

The findings mark a significant change for the program in the Trump administration as IRIS has faced years of critical reviews from NAS and others, and more recently, calls from industry representatives and GOP lawmakers to scale back the program.

While the NAS committee called for continued improvements in the program, ACC says the panel still fell short and pledges to continue to work with the administration and Congress to ensure additional reforms.

"While the report commends IRIS staff on the progress to implement systematic review as presented in its PowerPoint slides, the fact remains the agency has yet to produce any meaningful products (e.g., a finalized IRIS handbook, a draft IRIS assessment that reflects the new systematic review approach) based on the changes it says it has made. The absence of these critical pieces of information, after years of opportunity by EPA to address the 2011 and 2014 NAS recommendations, clearly indicates that much work still remains before IRIS assessments meet the benchmark of a gold standard review expected by the scientific community."

"We look forward to working with Congress and EPA to improve the IRIS program so that it will one day be able to produce high-quality, scientifically sound chemical assessments," ACC added.

Language passed in the 21st Century Cures Act states the following …. https://www.gpo.gov/fdsys/pkg/PLAW-114publ255/pdf/PLAW-114publ255.pdf

SEC. 2012. PRIVACY PROTECTION FOR HUMAN RESEARCH SUBJECTS.

(a) IN GENERAL.—Subsection (d) of section 301 of the Public Health Service Act (42 U.S.C. 241) is amended to read as follows:

''(d)(1)(A) If a person is engaged in biomedical, behavioral, clinical, or other research, in which identifiable, sensitive information is collected (including research on mental health and research on the use and effect of alcohol and other psychoactive drugs), the Secretary, in coordination with other agencies, as applicable—

''(i) shall issue to such person a certificate of confidentiality to protect the privacy of individuals who are the subjects of such research if the research is funded wholly or in part by the Federal Government; and

''(ii) may, upon application by a person engaged in research, issue to such person a certificate of confidentiality to protect the privacy of such individuals if the research is not so funded.

''(B) Except as provided in subparagraph (C), any person to whom a certificate is issued under subparagraph (A) to protect the privacy of individuals described in such subparagraph shall not disclose or provide to any other person not connected with the research the name of such an individual or any information, document, or biospecimen that contains identifiable, sensitive information about such an individual and that was created or compiled for purposes of the research.

''(C) The disclosure prohibition in subparagraph (B) shall not apply to disclosure or use that is—

''(i) required by Federal, State, or local laws, excluding instances described in subparagraph (D);

''(ii) necessary for the medical treatment of the individual to whom the information, document, or biospecimen pertains and made with the consent of such individual;

''(iii) made with the consent of the individual to whom the information, document, or biospecimen pertains; or

''(iv) made for the purposes of other scientific research that is in compliance with applicable Federal regulations governing the protection of human subjects in research.

''(D) Any person to whom a certificate is issued under subparagraph (A) to protect the privacy of an individual described in such subparagraph shall not, in any Federal, State, or local civil, criminal, administrative, legislative, or other proceeding, disclose or provide the name of such individual or any such information, document, or biospecimen that contains identifiable, sensitive information about the individual and that was created or compiled for purposes of the research, except in the circumstance described in subparagraph (C)(iii).
''(E) Identifiable, sensitive information protected under subparagraph (A), and all copies thereof, shall be immune from the legal process, and shall not, without the consent of the individual to whom the information pertains, be admissible as evidence or used

for any purpose in any action, suit, or other judicial, legislative, or administrative proceeding.
''(F) Identifiable, sensitive information collected by a person to whom a certificate has been issued under subparagraph (A), and all copies thereof, shall be subject to the protections afforded by this section for perpetuity.
''(G) The Secretary shall take steps to minimize the burden to researchers, streamline the process, and reduce the time it takes to comply with the requirements of this subsection.
''(2) The Secretary shall coordinate with the heads of other applicable Federal agencies to ensure that such departments have policies in place with respect to the issuance of a certificate of confidentiality pursuant to paragraph (1) and other requirements of this subsection.
''(3) Nothing in this subsection shall be construed to limit the access of an individual who is a subject of research to information about himself or herself collected during such individual's participation in the research.
''(4) For purposes of this subsection, the term 'identifiable, sensitive information' means information that is about an individual and that is gathered or used during the course of research described in paragraph (1)(A) and—
''(A) through which an individual is identified; or
''(B) for which there is at least a very small risk, as determined by current scientific practices or statistical methods, that some combination of the information, a request for the information, and other available data sources could be used to deduce the identity of an individual.''.
(b) APPLICABILITY.—Beginning 180 days after the date of enactment of this Act, all persons engaged in research and authorized by the Secretary of Health and Human Services to protect information under section 301(d) of the Public Health Service Act (42 U.S.C. 241(d)) prior to the date of enactment of this Act shall be subject to the requirements of such section (as amended by this Act).

SEC. 2013. PROTECTION OF IDENTIFIABLE AND SENSITIVE INFORMATION.

Section 301 of the Public Health Service Act (42 U.S.C. 241) is amended by adding at the end the following:
''(f)(1) The Secretary may exempt from disclosure under section 552(b)(3) of title 5, United States Code, biomedical information that is about an individual and that is gathered or used during the course of biomedical research if—
''(A) an individual is identified; or
''(B) there is at least a very small risk, as determined by current scientific practices or statistical methods, that some combination of the information, the request, and other available data sources could be used to deduce the identity of an individual.
''(2)(A) Each determination of the Secretary under paragraph

(1) to exempt information from disclosure shall be made in writing and accompanied by a statement of the basis for the determination.
''(B) Each such determination and statement of basis shall be available to the public, upon request, through the Office of the Chief FOIA Officer of the Department of Health and Human Services.
42 USC 241 note.

PUBLIC LAW 114–255—DEC. 13, 2016 130 STAT. 1051
''(3) Nothing in this subsection shall be construed to limit a research participant's access to information about such participant collected during the participant's participation in the research.''.
SEC. 2014. DATA SHARING.
(a) IN GENERAL.—Section 402(b) of the Public Health Service Act (42 U.S.C. 282(b)) is amended—
(1) in paragraph (23), by striking ''and'' at the end;
(2) in paragraph (24), by striking the period and inserting ''; and''; and
(3) by inserting after paragraph (24) the following:
''(25) may require recipients of National Institutes of Health awards to share scientific data, to the extent feasible, generated from such National Institutes of Health awards in a manner that is consistent with all applicable Federal laws and regulations, including such laws and regulations for the protection of—
''(A) human research participants, including with respect to privacy, security, informed consent, and protected health information; and
''(B) proprietary interests, confidential commercial information, and the intellectual property rights of the funding recipient.''.
(b) CONFIDENTIALITY.—Nothing in the amendments made by subsection (a) authorizes the Secretary of Health and Human Services to disclose any information that is a trade secret, or other privileged or confidential information, described in section 552(b)(4) of title 5, United States Code, or section 1905 of title 18, United States Code, or be construed to require recipients of grants or cooperative agreements through the National Institutes of Health to share such information.

Certificates of Confidentiality for NIH Funded Research

NIH awardees no longer have to apply for a CoC.

Per Section 2012 of the 21st Century Cures Act as implemented in the 2017 NIH Certificates of Confidentiality Policy, all ongoing or new research funded by NIH as of December 13, 2016 that is collecting or using identifiable, sensitive information is automatically issued a CoC. Compliance requirements are outlined in the NIH Grants Policy Statement, which is a term and condition of all NIH awards.

This policy applies to NIH funded:

- Grants
- Cooperative Agreements
- R&D Contracts
- Other Transaction Awards
- NIH's own intramural research

How do I know if my NIH funded research project is covered by a CoC?

Research in which identifiable, sensitive information is collected or used, including research that

- Meets the definition of human subjects research, including exempt research in which subjects can be identified
- Is collecting or using human biospecimens that are identifiable or that have a risk of being identifiable
- Involves the generation of individual level human genomic data
- Involves any other information that might identify a person

If your research meets any of the above criteria then your research data or information is automatically protected by a CoC from NIH.

What does having a CoC mean I need to do?

1. **Researchers with a CoC may ONLY disclose identifiable, sensitive information in the following circumstances:**
    - if required by other Federal, State, or local laws, such as for reporting of communicable diseases
    - if the subject consents; or
    - for the purposes of scientific research that is compliant with human subjects regulations
2. **AND you must ensure that anyone who is conducting research as a subawardee or receives a copy of identifiable sensitive information protected by the policy understand they are they are also subject to the disclosure restrictions, even if they are not funded directly by NIH.**

How do I document that I have a CoC for my NIH funded Research?

NIH will no longer issue a physical certificate. You may point to your Notice of Award and the NIH Grants Policy Statement as documentation of the CoC protection.

Will I ever need to extend or amend my CoC?

If your NIH-funding will or has ended but the collection of new data from research participants will continue without NIH-funding you will need to apply for a CoC for continuity of protections using the CoC application system. If your NIH funding will or has ended but your study has completed all enrollment and data collection, there is no need to extend the Certificate. Sensitive, identifiable research information maintained by investigators during any time a Certificate is in effect, is protected permanently.

Where can I learn more?

Read the 2017 NIH Certificates of Confidentiality Policy.

Have a CoC Question?

Please address your inquiries to: NIH Office of Extramural Research: NIH-CoC-Coordinator@mail.nih.gov

News clips from Friday

REGULATIONS: EPA sends 'secret science' plan to White House Greenwire

EPA yesterday sent a proposed rule to the White House Office of Management and Budget with the announced purpose of "strengthening transparency and validity in regulatory science," according to the RegInfo.gov site.

The proposal appears to be a concrete step toward restricting the types of scientific research that EPA officials can use in crafting new regulations. The proposal was not listed on EPA's latest semiannual regulatory agenda, and agency press aides did not respond to an emailed request for more information this morning.

"We need to make sure their [scientists'] data and methodology are published as part of the record," EPA Administrator Scott Pruitt told *The Daily Caller*, a conservative news outlet last month, in an article that the agency later distributed as a news release. "Otherwise, it's not transparent. It's not objectively measured, and that's important."

House Science, Space and Technology Chairman Lamar Smith (R-Texas) has repeatedly introduced "secret science reform" legislation that would bar EPA from using scientific data that are not "transparent or reproducible."

Smith has promoted the bill as a good government measure. Critics argue, however, that it's intended to prevent the agency from using the best available science and could have steep implementation costs (***E&E News PM***, April 13, 2017).

While the House has passed various versions of the legislation several times, Smith has been unable to get the bill through the Senate. Newly released emails show that Pruitt and Smith met in January to discuss the issue. But the emails, obtained by the Union of Concerned Scientists, an advocacy group opposed to Smith's legislation, also show that a top political appointee raised concerns about the potential impact on pesticide registration and on chemical regulation under the Toxic Substances Control Act (***Climatewire***, April 20).

OMB's Office of Information and Regulatory Affairs is now supposed to complete a standard interagency review of the proposed rule within 90 days but can seek more time if needed.

At a hearing last week, Sen. Maggie Hassan (D-N.H.) had pressed OIRA Administrator Neomi Rao for her stance on the issue (***E&E Daily***, April 13). Asked by Hassan whether she would "generally support agencies changing their procedures in ways that prevent them from using the best available evidence in making these decisions," Rao responded, "No, I would not."

If Rao "stays true" to that commitment, then "secret science has no business seeing the light of day," Yogin Kothari, senior Washington representative for the Union of Concerned Scientists, said in an interview today.

Pruitt Moving Again to Change the Way EPA Uses Science (1) Bloomberg Environment & Energy Report

EPA Administrator Scott Pruitt is taking another step toward changing how the agency uses science.

The White House Office of Management and Budget is reviewing a proposal that aims to strengthen the “transparency and validity” of the science the Environmental Protection Agency uses to support its regulatory decisions, according to the office’s website. OMB’s review, typically one of the final steps before a proposal is released for public review, started April 19.

There are no details on what’s included in the proposal, but Pruitt told Bloomberg News in March that the EPA should rely on science that is “very objective, very transparent, and very open.” He raised concern about third-party research where the underlying data isn’t public.

“That’s not right,” Pruitt said in March. “The methodology and data need to be a part of the official record—the rulemaking—so that you and others can look at it and say, ‘Was it wisely done?’”

Researchers and environmental advocates told Bloomberg Environment that such a policy could severely limit the data the agency considers when it regulates everything from drinking water and air quality to pesticides. Some EPA staff agree: The agency in 2017 told the Congressional Budget Office that similar open data requirements would limit usable studies by 95 percent.

"The policy is still being developed," EPA spokesperson Liz Bowman said in an April 20 statement emailed to Bloomberg Environment. "It's important to recognize that Administrator Pruitt believes all Americans deserve transparency, with regard to the science and data that's underpinning regulatory decisions being made by this Agency."

Pruitt's goal is similar to that in legislation (H.R. 1430) that House Science and Technology Committee Chairman Lamar Smith (R-Texas) introduced, which would require the EPA to base its regulatory decisions on data that's publicly available and substantially reproducible.

Last year, Pruitt barred scientists who receive EPA grants from serving on agency advisory panels, citing conflicts of interest. That policy affected many members of the EPA's advisory panels, including a panel that reviews the science backing national air quality standards, who either left or had to relinquish their grants.

Emails between EPA officials ... Politico's Morning Energy

Emails between EPA officials obtained by the Union of Concerned Scientists show that Nancy Beck, the top political official in the agency's chemicals office, voiced concerns after she received a draft of the not-yet-released policy on Jan. 31. The directive in question has origins in legislation introduced by Rep. Lamar Smith during the Obama administration, but its requirements would exclude a great deal of data about pesticides and toxic chemicals that Beck's office considers when determining whether a substance is safe or must be restricted. "These data will be extremely valuable, extremely high quality, and NOT published," Beck wrote in an email to an official in EPA's office of research and development. "The directive needs to be revised."

EPA Smith pitched Pruitt on 'secret science.' Now it's happening Climatewire

EPA coordinated with House Republicans about their plans to restrict the science used in crafting regulations, newly released emails show.

In early January, EPA chief Scott Pruitt met with Rep. Lamar Smith (R-Texas), chairman of the House Science, Space and Technology Committee, to discuss one of Smith's pet projects — overhauling how EPA uses science. Smith hasn't been able to get legislation to do so through Congress, so he pitched Pruitt to do so internally, according to **emails** obtained through a Freedom of Information Act request. The emails were obtained by the Union of Concerned Scientists and shared with E&E News.

In March, Pruitt announced that he would follow through. He said EPA plans to require that data and methodology from studies used to craft regulations be made public (***Climatewire***, March 16). The topic has long been contentious. Smith and others describe the effort as a way to ensure science used to craft regulations can be properly scrutinized. Critics have said it is an effort to limit air pollution research and other studies that have been cited as reasons for regulations.

EPA has said little about its plans to make science more transparent, other than Pruitt's brief interview with a conservative news outlet to say the plan was coming at some point.

The new emails reveal how Pruitt's staffers have worked behind the scenes with Smith's office.

On Jan. 16, a few days after Pruitt met with Smith at EPA headquarters, a Smith staffer followed up with Pruitt's shop.

"It was great to see you last week and appreciate the Administrator's time. Chairman Smith is very keen for our staff to get together to discuss further transparent science-based regulations at the EPA," Smith's aide Joe Brazauskas wrote to EPA congressional affairs staffer Aaron Ringel. "We can meet at your earliest convenience with the appropriate EPA staff to discuss this matter further."

Within an hour of receiving Brazauskas' email, Ringel circulated the message to colleagues at EPA.

"All, see below follow up from Chairman Smith's meeting with the administrator," he wrote. "Want to check on who would be the most appropriate [for] them to speak to. In short, this is in regards to his pitch that EPA internally implement the HONEST Act (no regulation can go into effect unless the scientific data is publicly available for review)."

One of the aides copied on Ringel's email was Richard Yamada, the deputy assistant administrator of EPA's Office of Research and Development. Yamada previously worked for years on the Republican staff of the House Science Committee led by Smith.

The emails also show that EPA staffers wanted to have the program rolled out by the end of February.

Brittany Bolen, who works in EPA's policy office, sent an email dated Feb. 12 saying that Pruitt's chief of staff Ryan Jackson "asked to have this rolled out by the end of the month."

Timing for the rollout of the policy is still unclear.

EPA spokeswoman Liz Bowman said yesterday, "These discussions are part of the deliberative process; the policy is still being developed."

The Union of Concerned Scientists said the emails show the plan was crafted by political staff with little input from scientists. They also show that EPA's political appointees are mostly concerned about industry, rather than environmental or health protections, said USC spokesman Yogin Kothari.

"This idea to restrict the use of science at EPA was hatched solely and worked on almost exclusively by political appointees who are doing everything they can to ensure that independent science doesn't get in the way of policy decisions at the agency," he said. "It's an effort to stack the deck in favor of industry that EPA is supposed to regulate."

'This directive needs to be revised'

The emails also reveal that an EPA political appointee — a former chemical industry executive — raised concerns about the science overhaul.

Nancy Beck, deputy assistant administrator of EPA's chemicals office, raised pointed concerns about what a secret science policy would mean for both pesticide registration and for chemical companies and regulating chemicals under the Toxic Substances Control Act (TSCA).

In an email sent on Jan. 31, Beck warned Yamada; Erik Baptist, EPA's senior deputy general counsel; and Justin Schwab, deputy general counsel, that requiring underlying data to be public would affect pesticide registrations and TSCA implementation.

"This directive needs to be revised. Without change it will jeopardize our entire pesticide registration/re-registration review process and likely all TSCA risk evaluations," she wrote. "Let me know what more you may need from me to facilitate a change."

Beck noted that under EPA regulations, pesticide registration requires companies to submit studies that include a "huge amount of data" and cost the companies millions of dollars to conduct. "Guideline studies of this type are never put in journal publications — there is no audience for them, thus in IARC's eyes they are not published," she wrote.

The World Health Organization's International Agency for Research on Cancer, or IARC, develops an international database of chemicals that could potentially cause cancer. Beck notes that most of the data in this process are considered confidential business information, but the "CBI" tag can be waived to make the data available in many instances.

"Making data available is very different than requiring a publication requirement. Such a requirement would be incredibly burdensome, not practical and you would need to create a whole new arm of the publishing industry to publish these types of studies that nobody is interested in," she wrote.

Beck added that there would be a similar problem under TSCA, where data for many existing chemicals aren't published because there is "no incentive for anyone, anywhere to publish them."

"Yes, thanks this is helpful — didn't know about the intricacies of CBI — ok, we will need to thread this one real tight! Thanks Nancy!" Yamada wrote in response to Beck's warning.

Richard Denison, a senior scientist at the Environmental Defense Fund, noted that EPA staff and members of Congress had previously objected to Smith's "Honest and Open New EPA Science Treatment Act" — the basis for the potential EPA policy — for the data collection burden it would put on researchers, who would have to go back and identify which data could be made public.

Critics also warned at the time that the impact would be to significantly reduce the number of studies that could be used to develop research, and many suspected this was the real purpose of the bill.

"What Nancy Beck is ironically pointing to is the same set of issues would fall on the industry, because it is not only whether the information would be made public or not, it's the cost and burden associated with doing so," Denison said.

EPA spokeswoman Bowman did not comment on whether EPA planned to follow Beck's suggestion to revise its proposal. "It's important to understand, however, that any standards for protecting CBI would be the same for all stakeholders," she said.

At least one "secret science" policy proponent said he was open to requiring researchers and companies to make data available when they are requested by "legitimate researchers" rather than publishing all underlying data.

"This data has to be somewhere, and if someone needs to see it then arrangements have to be made," said Steve Milloy, former EPA transition team member. "You can't attack this stuff with a broad brush."

In another email from March, months after the process had started, Beck found a passage from documents the agency's pesticide program released in December 2016 saying EPA "does not believe that it is appropriate to refuse to consider published studies in the absence of the underlying data."

The document Beck referred to also said, "The EPA frequently relies on peer reviewed studies in the public literature across agency programs without possessing underlying data and the federal courts have made clear that the EPA is not required to obtain or analyze the raw data in order to rely on such studies."

Beck wrote in the email, "I'm sharing for awareness, particularly regarding court cases that are cited."

Folks – today Administrator Pruitt announced this proposed rule. Many of you have heard about this in the media. The proposal likely touches upon three aspects of OSA work – public access to EPA funded research, human subjects research protection, and scientific integrity. Even though OSA and I have not participated in the development of this document and I just this moment obtained it (have yet to read it), I am listed as the point of contact on this NPRM.

I expect a high volume of emails and telephone calls coming into OSA. Tom Cawiezell's phone number is listed in the NPRM as is an STPC staff email. No doubt we will all have a lots of questions re this – but I wanted you to be aware of this and encourage you to read about it.

Good afternoon
Today, the Administrator signed the proposed rule "Strengthening Transparency in Regulatory Science."

This proposed regulation is intended to strengthen the transparency of EPA regulatory science. The proposed regulation provides that when EPA develops regulations, including regulations for which the public is likely to bear the cost of compliance, with regard to those scientific studies that are pivotal to the action being taken, EPA should ensure that the data underlying those are publicly available in a manner sufficient for independent validation.

In this notice, EPA solicits comment on this proposal and how it can best be promulgated and implemented in light of existing law and prior Federal policies that already require increasing public access to data and influential scientific information used to inform federal regulation.

Attached is the signed and dated proposed rule. For your convenience, please go to p. 19 for the Administrator's signature.

Please contact me if you have any questions.

Sincerely,
Laura

DAILY NEWS

Top Advisors Pan Pruitt's Science Transparency Rule, Seek SAB Review

May 15, 2018
Top EPA science advisors, including Administrator Scott Pruitt's hand-picked chair of the agency's Science Advisory Board (SAB), are strongly criticizing the administrator's controversial plan to require only publicly available research to justify its regulations, charging it will undermine rules' integrity and was developed without adequate review.
"The proposed rule does not include any assessment of the impact of data restrictions on existing or future regulatory programs. Without access to the restricted data, regulatory programs could become more or less stringent than they otherwise would be, with consequences for both regulatory costs and benefits," an SAB work group said in a May 12 memo recommending the full SAB review the measure.
The work group even warns that the proposed rule "could have the effect of removing legal, ethical, and peer-reviewed studies of health effects as sources to support the agency's regulatory efforts," and suggests several steps to ease the rule's limits to allow for the use of confidential data.
And echoing concerns from EPA staff, environmentalists, states and Democratic lawmakers, the memo warns that the measure was developed without adequate review from the public, the scientific community and others and calls for the full SAB to review the measure.
"Although the proposed rule cites several valuable publications that support enhanced transparency, the precise design of the rule appears to have been developed without a public process for soliciting input from the scientific community," the memo says.
"The proposed rule deals with issues of scientific practice and proposes constraints that the agency may apply to the use of scientific studies in particular contexts," the memo says. "As such, this rule deals with a myriad of scientific issues for which the Agency should seek expert advice from [SAB]," it adds.
The work group's May 12 memo is scheduled to be considered by the chartered SAB at its next meeting, slated for May 31-June 1 in Washington, D.C. The board is already scheduled to consider an earlier work group report that calls for the SAB to review Trump EPA plans to roll back three Obama-era climate rules -- for new and existing power plants, as well as new and modified oil and gas sources -- because they concluded EPA may not use adequately peer-reviewed science to justify the plans.
Historically, SAB work groups reviewing EPA regulatory agendas rarely find actions that meet their strict criteria to merit further review, but such calls appear to have become more common.
The latest recommendation for SAB review was issued quickly, weeks after Pruitt signed the measure April 24.
The full board -- with its slate of new members selected by Pruitt -- could reject the work group's advice, but the recommendation still raises the heat on an already controversial proposal.
And while SAB's earlier work group recommending review of the three climate rules contained few Pruitt appointees, the updated membership of the work group recommending full SAB action on the science transparency rule includes its new chairman, Michael Honeycutt, a top Texas state risk assessor, who Pruitt appointed to the post late last year.
The work group also includes John Graham, another Pruitt appointee who led the Bush administration's White House Office of Information and Regulatory Affairs. Graham was instrumental in advancing a controversial risk assessment guidance for federal agencies until it was forced into a critical National Academy of Sciences (NAS) review, which in 2007 recommended that it be dropped.

In a statement to *Inside EPA* the agency replied, SAB "plays an important role in informing EPA actions on policy and regulatory matters. We value the Board's expertise, and we welcome feedback from the chartered panel on areas in which they are interested in getting additional scientific information that is relevant to the rulemaking process."

Proposed Rule

The proposed rule generally bars EPA staff from basing regulatory actions on any science where the underlying data and modeling is not publicly available, though the plan allows the administrator to waive the requirements. The concept is based on controversial legislation long championed by House science committee chairman Lamar Smith (R-TX), which twice passed the House but has failed to advance in the Senate.

Critics charge it is intended largely to block the use of long-standing confidential medical studies that the agency has relied on when setting strict air quality and other health-based standards, though the chemical and pesticide industries have also raised concerns it could affect the use of confidential business information.

Environmentalists are especially concerned that the proposal targets the agency's long-time use of strict, default linear dose-response models, which Republicans and industry groups say result in stricter rules than are needed.

Many observers have warned the measure faces significant legal hurdles, including vague or undefined terminology, statutory mandates likely at odds with the rule and potential violations of administrative law.

The proposal was published in the *Federal Register* April 30 for a 30-day public comment period, though environmentalists, states and Democratic senators have urged the agency to withdraw the proposed rule to consult with the National Academy of Sciences and to extend the comment period by as much as 150 days to allow for such NAS consultation.

EPA staff has also warned that the measure was rushed through intra-agency review without the usual staff and program office input that such significant measures usually receive. As a result, they say it is unclear whether the agency will be able to finalize the proposal in its current form because officials did not create an agency-wide group that would be able to review and respond to the thousands of comments the agency is likely to receive.

The SAB work group memo echoes much of the criticisms, noting that the proposed rule "would limit the use of science based on human subject data and would impose requirements for the analysis of dose-response relationships widely used in risk assessments across a wide range of agency programs."

While acknowledging the value of transparency in underlying data, modeling and approaches, as well as the efforts in multiple science fields to advance transparency, the work group adds that it is not always possible, especially for studies published in the past. "There are also sensitive situations where public access may infringe on legitimate confidentiality and privacy interests, and where exceptions from complete public access may be appropriate," the work group writes.

The work group adds that the proposed rule "fails to mention that there are various ways to assess the validity of prior epidemiologic studies without public access to data and analytic methods" and "oversimplifies" its argument that it is easy to address confidentiality concerns through existing methods, such as redaction.

And, the memo criticizes the draft rule's efforts to make transparent "the dose response data and models that underlie what we are calling 'pivotal regulatory science'." Rule language on dose-response modeling appears to target EPA's longstanding cancer risk assessment guidance, which as a default directs agency risk assessors to use linear modeling -- assuming no safe exposure -- unless there is biological information directing otherwise.

The work group says that the proposed rule's "requirement of the consideration of multiple dose-response models should explicitly state that this consideration is based on information relevant to the selection of the most scientifically-appropriate model(s) such as biological plausibility, mode of action, or mechanism of action. Deviations from the use of default models should be evaluated on a case-by-case basis and have adequate scientific justification for use of an alternative model better supported by the chemical-specific data."

The work group also suggests several other steps EPA take to soften the proposal, including limiting its application to future studies rather than those already designed or published.

"It might be easier to accomplish the rule's objectives if the focus were on future studies rather than on studies that are already designed and published with terms that make complete transparency difficult or impossible to accomplish."

"It might also be easier if the rule took into account reasonable areas for accommodation or exception in situations for which it is not possible to release a data set publicly either entirely, or without revision, for legitimate reasons pertaining to the use, for example, of human subject data," the memo adds. -- *Maria Hegstad*(mhegstad@iwpnews.com)

Former Boss Colleagues:

Yesterday, Administrator Pruitt signed the attached Proposed rule which should appear in the Federal Register shortly. While it was developed as the Administrator's response to a proposed law passed last year by the House but not taken up by the Senate (HONEST ACT), it is not identical. Please feel free to consider it and distribute it to those who would wish to comment.

August 16, 2018

The Honorable Andrew Wheeler
Acting Administrator
Environmental Protection Agency
1200 Pennsylvania Avenue NW
Washington, DC 20460

RE: Strengthening Transparency in Regulatory Science, Proposed Rule published April 30, 2018; Agency Docket Numbers EPA-HQ-OA-2018-0259; FRL-9977-40-ORD; FRL-9978-31-ORD

Dear Administrator Wheeler:

As leaders at the University of Washington with particular expertise in environmental policy, we are writing to comment on the proposed rule on "Strengthening Transparency in Regulatory Science." The University of Washington is a leading research-intensive institution of higher learning, and is proud to conduct scientific research that has lasting impact and can contribute to the public good. Our institution has a history of conducting research that informs regulatory decision-making, termed as "pivotal regulatory science" in this proposed rule. We find that the proposed rule places substantial and unreasonable restrictions on what research EPA can consider in its decision-making for regulating important environmental factors including air pollution, water pollution, toxic chemicals, and agents with climate impacts. This rule would negate the use, application, and impact of existing and future valid research and hence threaten public health. The University of Washington recommends that the EPA withdraw this proposed rule, for the reasons discussed below.

The proposed rule would limit consideration of science in decision-making in a manner that is unjustified and arbitrary, and would lead to inadequate regulatory protections, inconsistent with federal law. Existing law and precedent dictates that the EPA take action based on the weight of scientific evidence even in the face of some uncertainty. This requires that the agency considers all available scientific evidence in its decision-making and not make arbitrary exclusions of research. The principal focus of the proposed rule is to require full access to original data for scientific studies in order for those studies to be used for regulatory decision-making. While the preamble to the rule indicates that this could be done while maintaining the protection of privacy and confidentiality of research participants, the proposed rule does not include specific provisions to make these protections possible. A substantial amount of pivotal regulatory science includes epidemiological research in which the maintenance of privacy and confidentiality of research participants is essential to conducting the research. As examples, we can note two papers from the University of Washington that involved studies that ensure confidentiality of the participants (Miller KA et al, Long-term exposure to fine particulate matter air pollution and cardiovascular events in women. New England Journal of Medicine 2007; 356:447-58; and Kaufman JD et al, Association between air pollution and coronary artery calcification within six metropolitan areas in the USA [The Multi-Ethnic Study of Atherosclerosis and Air Pollution]: a longitudinal cohort study. The Lancet 2016; 388:696-704). Both studies contain dose response data and models as anticipated in the proposed rule, and for which the proposed rule creates an

expectation that data required to replicate the analysis be made available. In each case, the underlying studies are conducted with strict rules under the auspices of the National Institutes of Health (National Heart, Lung, and Blood Institute), that preclude any potential identification of subject identity or confidential information. The NIH and the approving institutional review boards would not permit release of the data in a way that would adhere to the letter of the rule. It is possible that limited datasets could be created for replication analysis that would protect participant identity and confidential information, but funds are not available to create these datasets, and the rule is not clear that such a limited dataset would be acceptable. As a result, the rule would lead to arbitrary exclusion of pertinent scientific evidence.

Existing processes for evaluating the quality of scientific data are adequate. The current state of scientific practice permits decision-makers to consider all peer-reviewed science and make decisions based on the weight of evidence. The proposed rule suggests that there is a crisis to be addressed, in that scientific data to support environmental decision-making cannot be replicated. The rule cites examples primarily related to replication issues in the pharmaceutical industry. Such issues are not documented to be prevalent in the environmental research area. The studies which are frequently noted to be problematic since raw data was not available for replication—the Harvard Six Cities Study and American Cancer Society CPS II cohorts studies which demonstrated the effect of particulate matter on cardiovascular disease—have not only been independently confirmed by reanalysis by the independent Health Effects Institute, but also replicated by dozens of subsequent research studies [see the two papers cited above as well as Hoek et al Environmental Health 213; 12:43]. The scientific peer review process, along with the ability to weigh the entire extent of published data, is entirely adequate to determine the state of the evidence regarding environmental effects of agents considered for regulation. The solution to an inadequate research database for regulatory decision-making is not to exclude research from consideration as proposed in this rule, but rather to provide funding and incentives for more and better research to answer important environmental questions. The proposed rule cites policies from several leading journals as justifying the need for the proposed rule, however, the editors of all of those journals (Science, Nature, PLOS, PNAS, and Cell) wrote to indicate this rule is not justified.

We recommend that the EPA withdraw the proposed rule and focus on: 1) implementing existing initiatives and guidelines for improving data sharing and transparency at federal agencies; and 2) encouraging development of high-quality research that can be used to provide pivotal regulatory science, through funding of important research topics and through processes to establish datasets which can be used for replication of key findings.

Sincerely,

Hilary Godwin, PhD Dean and Professor UW School of Public Health	Lisa J. Graumlich, PhD Mary Laird Wood Professor & Dean UW College of the Environment	Joel Kaufman, MD, MPH Acting Associate Dean and Professor UW School of Public Health

Strengthening Transparency in Regulatory Science

A Proposed Rule by the Environmental Protection Agency on 04/30/2018

This action provides that EPA will ensure that the regulatory science underlying its actions is publicly available in a manner sufficient for independent validation. Where available and appropriate, EPA will use peer-reviewed information, standardized test methods, consistent data evaluation procedures, and good laboratory practices to ensure transparent, understandable, and reproducible scientific assessments. This action is consistent with the principles underlying the Administrative Procedure Act and programmatic statutes that EPA administers to disclose to the public the bases for agency rules and to rationally execute and adequately explain agency actions. This action is also consistent with Executive Orders 13777 and 13783, and the focus on transparency in

OMB's Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility and Integrity of Information Disseminated by Federal Agencies (the Guidelines) and OMB Memorandum 13-13: Open Data Policy – Managing Information as an Asset. It builds upon prior EPA actions in response to government-wide data access and sharing policies, as well as the experience of other federal agencies in this space.

The comment period on the proposed rule was open from April 30, 2018 to August 16, 2018. A public hearing for the proposed rule was held on July 17, 2018 in Washington, DC.

EPA has started reviewing the more than 500,000 comments received. EPA will be reviewing these comments through the fall. EPA will determine a timeline for a decision after it has more fully assessed the comments.

Final Federal Register Notice: Strengthening Transparency in Regulatory Science-- Extension of Comment Period and Notice of Public Hearing

To read written comments posted to the docket, please visit Regulations.gov: Docket ID No. EPA-HQ-OA-2018-0259.

The transcripts of the public hearing have been posted on the docket as supplemental information.

You may need a PDF reader to view some of the files on this page. See EPA's About PDF page to learn more.

Acting Administrator
U.S. Environmental Protection Agency
Washington, DC 20460

Re: Docket ID No. EPA-HQ-OA-2018-0259, Proposal to Limit Use of Scientific Evidence in Rulemaking, 83 Fed. Reg. 18,768 (April 30, 2018).

Dear Acting Administrator Wheeler:

The undersigned twenty-three State Attorneys General and County and City Attorneys respectfully submit the following comments on the U.S. Environmental Protection Agency's (EPA) April 30, 2018 proposal to limit the use of scientific evidence in rulemaking, 83 Fed. Reg. 18,768. The proposed rule would severely limit the scientific evidence that EPA can consider when adopting rules and standards to protect human health and the environment. It violates controlling federal law, is arbitrary and capricious, and contains clear errors in reasoning. The proposed rule was also issued without adequate review, most notably without *any* review from EPA's own science advisors. It will not "improve" the science relied upon by EPA, but will instead exclude much, if not most, of the science underpinning EPA action to protect the environment and our citizens from harm. Coupled with the former Administrator's directive prohibiting EPA grant recipients from serving on scientific advisory panels, the proposal reflects an effort to subvert well-founded agency practices for developing science-based regulations. This proposal is particularly troubling given EPA's critical mission and its significant responsibilities to the American people. EPA's change in leadership provides a unique opportunity to hit the reset button; we urge you to withdraw this harmful and deeply flawed proposal.

EXECUTIVE SUMMARY

While the proposal is worded vaguely, the intent is clear—in developing future regulations to protect human health and the environment, EPA would be precluded from considering relevant, probative scientific studies, models, or other information that have been

validated through peer review, on the sole basis that the underlying data are not publicly available.

It is equally clear that the proposed rule would violate the very federal laws EPA is required to uphold. To cite just a few examples, in performing its duties, EPA must rely on "the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices," 42 U.S.C. § 300g-1(b)(3)(A)(i) (Safe Drinking Water Act); on the "best available science," 15 U.S.C. § 2625(h) (Toxic Substances Control Act); on "the latest scientific knowledge," 33 U.S.C. § 1314(a)(1) (Clean Water Act) and 42 U.S.C. § 7408(a)(2) (Clean Air Act); and on "generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies," 42 U.S.C. § 11023(d)(2) (Emergency Planning and Community Right-to-Know Act). Indeed, no federal environmental law so much as suggests that, in setting standards, EPA can ignore the "latest" or "best" or "appropriately designed and conducted" scientific studies whenever any portion of the underlying data is not public—which is often the case for important privacy reasons. The scientific community has made clear that such a limitation is *not* in accordance with best practices. This anti-science approach has stalled in Congress and been rejected by the courts; it has no place at EPA. Indeed, in rejecting an industry effort to impose the same strictures imposed here, the D.C. Circuit was persuaded by EPA's position that "requiring agencies to obtain and publicize the data underlying all studies on which they rely 'would be impractical and unnecessary,'" and agreed with EPA that such a requirement would mean "'much plainly relevant scientific information would become unavailable to EPA for use in setting standards to protect public health and the environment.'" *Am. Trucking Ass'ns, Inc. v. EPA*, 283 F.3d 355, 372 (D.C. Cir. 2002).

EPA's proposal would also violate the Administrative Procedure Act (APA), 5 U.S.C. § 501 *et seq.*, both because it is arbitrary and capricious, and because it flouts that Act's important procedural requirements. EPA claims that the entire basis for the proposed rule is to ensure that the "pivotal regulatory science" underlying EPA regulations is transparent. But EPA ignores existing laws and policies that already do exactly that and which also take into account the need to protect medical data and other confidential information. This proposed rule would promote transparency in name only; in truth, it would mean that EPA's important decisions would no longer be informed by the latest, best available, and generally accepted science. Disturbingly, the proposed rule's only failsafe is the EPA Administrator's sole discretion to determine on a case-by-case basis that compliance is "impracticable" when making data publicly available is "not feasible." But the proposal provides no standards to govern the Administrator's exercise of discretion in determining "impracticability or "feasibility"—a recipe for the very arbitrariness that the APA prohibits.

With respect to EPA's process, this proposal has been rushed, is vague, and creates more questions than it answers: it does not clearly state the actual parameters of the proposed rule, it is open-ended in terms of alternatives under consideration, and it fails to provide critical information such as projected costs. It is also completely unclear—or worse, contradictory—whether and how this proposed rule would apply to EPA's cost-benefit analyses. Still more troubling, EPA has failed to consult its own Science Advisory Board (SAB) about this proposed rule despite the SAB's assessment that "this rule deals with a myriad of scientific issues for

which the Agency should seek expert advice."[1] Proposing a rule that limits the use of scientific data without even notifying, let alone consulting, the Agency's own expert scientific advisors is a text book example of an arbitrary and capricious failure to consider "relevant factors." *Motor Vehicle Mfrs. Ass'n v. State Farm Mut. Auto. Ins. Co.*, 463 U.S. 29, 42-43 (1983).

In light of these substantive and procedural infirmities, it is unsurprising that the proposed rule also makes little sense as a matter of science. Although EPA now claims that science is "better" only when both the underlying information is publicly available and the results reproducible, that position is contrary to the scientific consensus, and EPA provides no support for its assertion. The downsides of this proposal are significant: critical studies already designed and published on virtually all aspects of public health and environmental protection have relied on information for which complete disclosure is impossible for various reasons, including legally mandated confidentiality protections. This is particularly true of seminal and long-standing epidemiological studies that EPA has relied upon in setting air and other health-based standards. Therefore, the proposal would force EPA to ignore important peer-reviewed studies of health effects in future regulatory efforts. As our nation's leading scientists at the National Academies of Sciences, Engineering, and Medicine (NAS) warned in a July 16, 2018 letter to EPA, the proposal's overly stringent transparency requirements "pose a threat to the credibility of regulatory science."[2]

Although EPA stated in its proposal that this rule would not affect any states, and therefore has no federalism implications, nothing could be further from the truth. The adoption of this proposed rule would very likely affect the protectiveness of the standards that EPA sets, which would significantly impact federal and state efforts to protect the quality of our air, water, and land, and the health and welfare of the American people. Some states' environmental laws and regulations explicitly adopt EPA standards in all or some instances, or at the very least require an express justification for any deviation. So it is clear that a fundamental change in how EPA develops standards would most certainly affect state standards, and therefore would affect the health of our residents and our natural resources.

[2] Letter from Marcia McNutt, President, Nat'l Acad. of Sciences, C.D. Mote, Jr., President, Nat'l Acad. of Eng. & Victor J. Dzau, President, Nat'l Acad. of Med., to Andrew Wheeler, Acting Administrator, U.S. Envtl. Prot. Agency (July 16, 2018) [hereinafter NAS Letter], *available at* http://www.nationalacademies.org/includes/EPA%20Proposed%20Rule%20Docket%20EPA-HQ-OA-2018-0259%20NASEM%20Comment.pdf.

For all these reasons, as discussed in detail below, we oppose this misguided proposal to limit the science on which EPA relies. EPA should withdraw this flawed proposal and return to its core mission of protecting human health and the environment.

LEGAL COMMENTS

I. EPA Lacks Statutory Authority to Promulgate the Proposed Rule, Which Conflicts with Statutory Requirements Regarding EPA's Consideration of Scientific Information

Agencies may not adopt or implement regulations that conflict with the statutes under which they are promulgated, and an agency's interpretation of those statutes must always at least be reasonable. *See Chevron, U.S.A., Inc. v. Natural Res. Defense Council, Inc.*, 467 U.S. 837, 842-44 (1984). Accordingly, an agency's regulations cannot be "arbitrary, capricious, or manifestly contrary to the statute," *id.*, or "in excess of statutory jurisdiction, authority, or limitations, or short of statutory right," 5 U.S.C. § 706. Further, agencies may not rely on general statutory grants of rulemaking authority to promulgate regulations that are otherwise inconsistent with more specific statutory directives. *Global Van Lines, Inc. v. Interstate Commerce Comm'n*, 714 F.2d 1290, 1293-97 (5th Cir. 1983).

In this case, the proposed rule is at odds with provisions of multiple statutes EPA is charged with implementing. For example:

- The Clean Air Act (CAA) requires that air quality criteria "accurately reflect *the latest scientific knowledge* useful in indicating the kind and extent of *all identifiable effects on public health or welfare*." § 108(a)(2), 42 U.S.C. § 7408(a)(2) (emphases added).

- The Safe Drinking Water Act (SDWA) requires that findings which support a determination to regulate a contaminant "be based on *the best available public health information*," and that, in developing the National Primary Drinking Water Regulations, "to the degree that an Agency action is based on science, the Administrator shall use *the best available, peer-reviewed science and supporting studies conducted in accordance with sound and objective scientific practices*." §§ 1412(b)(1)(B)(ii)(II), 1412(b)(3)(A)(i), 42 U.S.C. §§ 300g-1(b)(1)(B)(ii)(II), 300g-1(b)(3)(A)(i) (emphases added).

- The Clean Water Act (CWA) requires that water quality criteria "accurately reflect[] *the latest scientific knowledge*." § 304(a)(1), 33 U.S.C. § 1314(a)(1) (emphasis added).

- The Toxic Substances Control Act (TSCA) requires the Administrator, in decisions based on science, to "use scientific information, technical procedures, measures, methods, protocols, methodologies, or models, employed *in a manner consistent with the best available science*," and, in carrying out certain sections of the Act, to "take into consideration information relating to a chemical substance or mixture . . . that is

reasonably available to [him or her]." § 26(h), (k), 15 U.S.C. § 2625(h), (k) (emphases added).

- The Emergency Planning and Community Right-to-Know Act (EPCRA) requires that a determination to add a chemical to the Toxics Release Inventory "be based on *generally accepted scientific principles or laboratory tests, or appropriately designed and conducted epidemiological or other population studies, available to the Administrator*." § 313(d)(2), 42 U.S.C. § 11023(d)(2) (emphasis added).

Even statutory provisions that EPA chose to cite as authority for the proposed action prohibit the Agency from promulgating the proposed rule. For example, CWA § 104(l) explicitly requires that "[t]he Administrator shall . . . develop and issue . . . *the latest scientific knowledge available* in indicating the kind and extent of effects on health and welfare which may be expected from the presence of pesticides in water." 33 U.S.C. § 1254(l) (emphasis added). It strains credulity to believe that a directive to issue the "latest scientific knowledge available" somehow imposes a requirement that the Administrator only issue knowledge based on publicly available data, and EPA has not supplied any substantive argument that it does. Similarly, although Section 25 of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) directs that regulations "take into account . . . *the appropriate data* for evaluating [] risk," 7 U.S.C. § 136w (emphasis added), it would be arbitrary and capricious to define "appropriate" to exclude from consideration relevant and valid scientific studies, as EPA proposes to do in this rulemaking. Requirements to review the "latest" and "appropriate" scientific data are not carte blanche to impose new, unscientific limits on that data.

Because the proposed rule would run afoul of these provisions and potentially others,[3] EPA's citation to general rulemaking authorities such as CAA § 301(a), 42 U.S.C. § 7601(a), and CWA § 501, 33 U.S.C. § 1361, is unavailing. Such general provisions of rulemaking authority cannot override more specific statutory directives. *Global Van Lines*, 714 F.2d at 1293-97. Nor can EPA's reliance on 5 U.S.C. § 301 in the notice extending the comment period save its *ultra vires* proposal. 83 Fed. Reg. at 24,256. Known as the "housekeeping statute," 5 U.S.C. § 301 is "simply a grant of authority to the agency to regulate its own affairs," not a general, independent basis for deviating from a specific statutory directive or limiting the scope of other statutes. *See Chrysler Corp. v. Brown*, 441 U.S. 281, 308-12 (1979).

Thus, as a general matter, EPA's obligation is clear: it must base its decisions on such criteria as the latest scientific knowledge, the best available, peer-reviewed science, and/or generally accepted scientific principles or laboratory tests. No statute suggests that EPA, in setting standards, can reject scientific evidence that meets those criteria solely because the underlying data are not public or because the evidence is based on models that otherwise follow long-accepted scientific guidelines. In short, EPA lacks sufficient legal authority to either adopt or implement the proposed rule, and its proposed action conflicts with the statutes it must follow.

---

[3] For example, CAA § 184(d), 42 U.S.C. § 7511c(d), "require[s] that the best available air quality monitoring and modeling techniques be used" in setting the criteria for determining ozone contributions in nonattainment areas.

II. The Proposal Does Not Meet Baseline Rulemaking Requirements and Should Be Withdrawn

a. EPA Failed to Obtain Input from Scientists in Developing a Proposal with Sweeping Impacts on Agency Use of Science

Common sense, good government, and the APA's fundamental requirement for informed decision-making all dictate that an agency developing a proposed rule should consult with persons having expertise regarding the subject matter of the proposal. EPA's Scientific Integrity Policy makes clear that these principles apply with great force here: "it is essential that the EPA's policymakers involve science experts on scientific issues and that the scientific information and processes relied upon in policymaking manifest scientific integrity, quality, rigor, and objectivity."[4] Indeed, Congress mandated in the Environmental Research, Development and Demonstration Authorization Act of 1978 that when EPA provides a proposed rule such as the one at issue here to another federal agency for formal review and comment, it must also provide that same proposal to the SAB: "the Administrator . . . shall make available to the [SAB] such proposed criteria document, standard, limitation, or regulation, together with relevant scientific and technical information in the possession of the Environmental Protection Agency on which the proposed action is based." 42 U.S.C. § 4365(c)(1). Yet, as revealed in a June 28, 2018 letter from the SAB Chair to former Administrator Pruitt, EPA violated this fundamental requirement: although EPA provided the proposed rule to the Office of Management and Budget (OMB) for review on April 18, 2018, the SAB never had the opportunity to review it and instead learned of the proposal only from subsequent news reports and the April 30, 2018 *Federal Register* notice.[5]

Nor did EPA obtain input from the NAS or any other external science organizations or experts in developing the proposal. As the SAB work group noted: "Although the proposed rule cites several valuable publications that support enhanced transparency, the precise design of the rule appears to have been developed without a public process for soliciting input from the scientific community." SAB Work Group Memo at 3.

EPA offers no explanation for its inexplicable failure to consult with science experts, including the SAB, on this proposal, and it is beyond question that this highly consequential proposal demanded such consultation. Not only is this statutorily required, *see* 42 U.S.C. § 4365(c)(1), but as the SAB Work Group Memo states, "[t]he proposed rule deals with issues of scientific practice and proposes constraints that the [A]gency may apply to the use of scientific studies in particular contexts. As such, this rule deals with a myriad of scientific issues for

---

[4] U.S. Envtl. Prot. Agency, *Scientific Integrity Policy* 3, *available at* https://www.epa.gov/sites/production/files/2014-02/documents/scientific_integrity_policy_2012.pdf.

[5] Letter from Michael Honeycutt, Chair, Science Advisory Bd., to E. Scott Pruitt, Administrator, U.S. Envtl. Prot. Agency 2 (June 28, 2018) [hereinafter SAB June 28 Letter], *available at* https://yosemite.epa.gov/sab/sabproduct.nsf/LookupWebReportsLastMonthBOARD/4ECB44CA28936083852582BB004ADE54/$File/EPA-SAB-18-003+Unsigned.pdf

which the Agency should seek expert advice from the [SAB]." SAB Work Group Memo at 2. Underscoring the importance of the issue, the full 44-member SAB followed up on the Work Group's Memo with a unanimous vote to review the proposal and urged EPA to proceed no further until EPA does what it should have done in the first place: "request, receive and review scientific advice from the SAB." SAB June 28 Letter at 1.

Put simply, EPA's effort to rush this proposed rule out the door without any input from the SAB or other scientists violates basic principles of good government and policy-making as well as EPA's legal duty. We urge EPA to withdraw this ill-conceived proposal and to consult with the SAB, the National Academy of Sciences, and the broader scientific community before determining if any rule is needed.

b. The Proposal is Too Vague, Conclusory, and Conditional to Allow for Meaningful Public Participation

EPA's failure to solicit input from the SAB and other scientific groups is exacerbated by its failure to meet the fundamental legal requirements for a valid rulemaking proposal under the APA. The APA requires that "general notice of proposed rulemaking shall be published in the Federal Register," including the "terms or substance of the proposed rule." 5 U.S.C. § 553(b). The straightforward purpose of this requirement is to give the affected public an opportunity to provide meaningfully informed comment on an agency's proposal. *See Home Box Office, Inc. v. Fed. Commc'n Comm'n*, 567 F.2d 9, 35-36 (D.C. Cir. 1977). But here, EPA's notice of proposed rulemaking is vague as to the actual parameters of the proposed rule, is open-ended in terms of the alternatives under consideration, and fails to provide key information such as projected costs. Courts will not hesitate to strike down final rules based on proposals so lacking in specificity. *See, e.g.*, *Horsehead Res. Dev. Co. v. Browner*, 16 F.3d 1246, 1268 (D.C. Cir. 1994) (noting that "general notice that a new standard will be adopted affords the parties scant opportunity for comment").

Far from meeting the requirement to "disclose in detail the thinking that has animated the form of a proposed rule and the data upon which that rule is based," *Home Box Office*, 567 F.2d at 35–36, the proposal at issue here creates far more questions than it answers. Most fundamentally, the proposal fails to provide a rationale for EPA to act contrary to accepted scientific practice, i.e., to preclude consideration of probative scientific information that has been subject to rigorous peer review for the sole reason that underlying data are confidential and therefore not publicly available. The proposal states that "EPA believes the benefits of this proposed rule justify the costs," 83 Fed. Reg. at 18,772, but fails to provide any specific information, quantification, or analysis as to what EPA believes are the proposed rule's purported benefits or expected costs, including the significant costs from the loss of probative information that the proposed rule would work to exclude. For example, Section 30.7 of the proposed rule could be read to require EPA to undertake very costly independent review of "pivotal" science on which it relies, but Section 30.8, entitled "How is EPA to account for cost under this subpart?" states only that EPA will "minimize costs." *Id.* at 18,774. The absence of data and analysis in support of EPA's cost-benefit conclusion deprives the public of a meaningful opportunity to evaluate the proposal and thus violates EPA's duty under the APA.

Further, the proposal says the rule is intended to apply prospectively, but also states that EPA "should be guided by this policy to the maximum extent practicable during ongoing regulatory action." *Id.* at 18,771. Yet it never explains how or why ongoing EPA actions would be subject to the proposed rule and which existing scientific studies are implicated by the proposed rule. It also fails to acknowledge the costs from delays in rulemaking proceedings while EPA performs the additional review called for above and beyond the extensive scientific peer review to which scientific studies have already been subjected. Other open-ended aspects of the proposal similarly fail to provide commenters with a sufficient guide as to what any final rule would look like or how it would operate if adopted. For example:

- The proposal defines "pivotal regulatory science" as "the specific scientific studies or analyses that drive the requirements and/or quantitative analysis of EPA final significant regulatory decisions." *Id.* at 18,773. However, the proposal does not specify to what extent studies must support regulatory decisions to be considered a "driver," who will determine what qualifies as pivotal regulatory science, or at what stage of the rulemaking process such determinations will be made. The proposal is also unduly vague in its use of undefined terms that are subject to interpretation, such as the use of the term "uncertainty" in Section 30.6 of the proposed rule. *Id.* at 18,774.

- The proposal says EPA "should collaborate" with other agencies to identify strategies to protect private information (such as patient health records) when it is making information publicly available. *Id.* at 18,771. However, there is no timeframe for this process, no explanation of what will happen until such strategies are formed, and no indication of what these strategies will be.

- EPA asks "whether alternative or additional regulatory or other policy vehicles are appropriate to establish and implement these policies, and whether further regulatory or other policy vehicles on the programmatic or statutory level would be appropriate as alternative or additional steps." *Id.* It is EPA's job to identify and describe these alternatives, and to explain why it has put forward its particular proposal: it may not, at this late stage, ask amorphous questions on policy design.

- EPA seeks comment on criteria it should use to establish exemptions, whether case-by-case exemptions may be appropriate, whether the proposed rule should apply to a broader or narrower set of regulatory proceedings, and whether certain categories of regulatory actions should be exempt. *Id.* at 18,772. As written, the proposed rule would allow the Administrator to grant exemptions based solely on his or her own determination of what is "feasible" without offering any definition or bounds on that term. *Id.*

- EPA asserts that the proposed rule is generally consistent with a number of policies or reports by scientific groups or scientific journals, but it does not specify in what respects those documents support its proposal, nor does it identify any groups or reports that advocate precluding consideration of non-public data in regulatory decision-making. In fact, contrary to EPA's assertion, the Bipartisan Policy Center, a

group with which EPA claims consistency, clarified that the proposed rule "is not consistent" with the Center's position "in substance or intent."[6] EPA's false assertion of consistency with the policies and positions of leading science groups thus misleads the public and inhibits their informed participation.

- EPA seeks comment as to "whether the disclosure requirements . . . should be *expanded* to cover other types of data and information, such as, for example, economic and environmental impact *data and models that are designed to predict the costs, benefits*, market impacts and/or environmental impacts of specific regulatory interventions." 83 Fed. Reg. at 18,772 (emphasis added). However, EPA also states that the "pivotal regulatory science" to which the proposed rule would already apply includes "studies, models, and analyses that drive the magnitude of the benefit-cost calculation." *Id.* at 18,770. It is thus unclear whether and how EPA intends the proposed rule to apply to the cost-benefit determinations that it performs.

- The proposal provides no analysis of its environmental impacts and fails to explain how EPA has addressed the requirements of the National Environmental Policy Act, 42 U.S.C. § 4321 *et seq.*

- The proposal fails to meet EPA's obligations under Executive Order 12898, which requires the Agency to address the proposal's "disproportionately high and adverse human health or environmental effects" on "minority and low-income populations." 59 Fed. Reg. 7629 (Feb. 16, 1994). Section IV.K of the proposal incorrectly asserts that Executive Order 12898 does not apply since the proposal "does not establish an environmental health or safety standard," 83 Fed. Reg. at 18,773. But the Executive Order by its own terms applies to the "effects of" all federal agency "programs, policies, and activities," 59 Fed. Reg. at 7629, and thus plainly applies here. While the proposal would jeopardize the health of all Americans, it would have increased impacts upon the nation's most sensitive populations—such as children, those with chronic illnesses, and environmental justice communities.

- The proposal likewise fails to meet EPA's obligations under Executive Order 13045, which requires the Agency to identify and assess environmental health risks that may disproportionately affect children. 62 Fed. Reg. 19,885 (Apr. 23, 1997). That Executive Order also requires each federal agency to "ensure that its policies, programs, activities, and standards address disproportionate risks to children that result from environmental health risks," *id.* at 19,885, and thus applies here.

- EPA states in conclusory fashion that the proposed rule "does not have federalism implications" and "will not have substantial direct effects on the states." 83 Fed. Reg. at 18,772-73. However, the proposal fails to explain whether or how the proposed rule would apply to EPA's review and approval of state standards, and, accordingly,

[6] Letter from Jason Grumet, President, Bipartisan Policy Center, to E. Scott Pruitt, Administrator, U.S. Envtl. Prot. Agency (May 22, 2018), *available at* https://www.eenews.net/assets/2018/05/31/document_gw_01.pdf.

deprives commenters of a full and fair opportunity to assess and comment on the proposal's federalism implications.

In sum, EPA's skeletal outline falls far short of the APA's notice requirements and fails entirely to "examine the relevant data and articulate a satisfactory explanation for its action including a rational connection between the facts found and the choice made." *Natural Res. Defense Council, Inc. v. U.S. Envtl. Prot. Agency*, 859 F.2d 156, 209 (D.C. Cir. 1988). EPA should withdraw the proposal on these grounds alone.

c. EPA Failed to Identify Legal Authority for the Proposed Rule

The APA further requires that a notice of proposed rulemaking contain "reference to the legal authority under which the rule is proposed." 5 U.S.C. § 553(b)(2). "'[T]he required specification of legal authority must be done *with particularity*,'" and "'must be sufficiently precise to apprise interested persons of the agency's legal authority to issue the proposed rule.'" *Global Van Lines*, 714 F.2d at 1298 (quoting H.R. Rep. No. 1980, at 24 (1946) and U.S. Dept. of Justice, *Attorney General's Manual on the Administrative Procedure Act* 29 (1947)). EPA has also failed to meet this requirement.

In both the April 30, 2018 notice of proposed rulemaking and the May 25, 2018 notice extending the comment period, EPA discusses statutory authority for the proposed rule, citing to a number of provisions, largely from statutes it implements. 83 Fed. Reg. at 18,769; 83 Fed. Reg. 24,255, 24,256 (May 25, 2018). In particular, EPA invokes the CAA, CWA, SDWA, EPCRA, FIFRA, TSCA, Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), and Resource Conservation and Recovery Act (RCRA). 83 Fed. Reg. at 18,769.

But rather than identify legal authority with particularity, the cited statutory provisions mainly set forth EPA's broader authorities to conduct research and promulgate regulations. Few of the cited provisions actually address EPA's ability to pick and choose amongst valid scientific information, studies, and techniques in its formation of environmental standards and modeling, and none authorize the wholesale preclusion of probative, relevant studies, as EPA proposes here. Tellingly, in the proposal itself, EPA requests assistance to determine "whether additional or alternative sources of authority are appropriate bases for the proposed regulation." *Id.* at 18,771. EPA's inability to identify specific statutory authority for its proposed action falls far short of the APA's standard for notice and comment rulemaking, as would any ultimate reliance on statutory authority EPA has failed to cite. *See Global Van Lines,* 714 F.2d at 1297-99.

III. The Proposed Rule Arbitrarily and Capriciously Requires EPA to Exclude Relevant Studies and Models, and is not Saved by Exemption Provisions

The proposed rule opens the door for arbitrariness, bias, and selectivity in its application, in contravention of the factors that Congress has required EPA to consider in setting standards, such as the best available science or latest scientific knowledge.

The proposed rule disregards the APA's bedrock requirement that an agency's decision-making be based on a consideration of the relevant factors and data. *See Motor Vehicle*

Mfrs., 463 U.S. at 42-43 (articulating standard and citing numerous cases). An agency's action is arbitrary and capricious not only if the agency "entirely fail[s] to consider an important aspect of the problem," but also if it "relie[s] on factors which Congress has not intended it to consider." *Id.* at 43. The proposed rule would call for EPA to do both. First, in excluding studies and models from its consideration based only on whether the underlying data are publicly available or have been subject to additional independent review by EPA, EPA would be excluding studies and models that Congress has instructed it to consider by requiring it to use, for example, the "best available science" or "latest scientific knowledge." Second, because none of the statutes EPA administers specify that, in setting standards, it shall consider whether the studies and models it uses have publicly available data or have been independently reviewed by EPA, EPA would be using factors that Congress did not intend it to rely on in deciding to exclude studies and models based on the proposed rule. *See Am. Trucking*, 283 F.3d at 372 (finding that the CAA does not require EPA to "obtain and publicize the data underlying the studies on which the Agency relies"). EPA's failure to consider otherwise relevant studies and models that do not meet the proposed rule's requirements would therefore be arbitrary and capricious. *See Motor Vehicle Mfrs.*, 463 U.S. at 42-43.

In apparent recognition of the overly limiting nature of the proposed rule's requirements, the proposal also includes a provision that would allow the Administrator to grant case-by-case exemptions based on his or her subjective determination that compliance is "impracticable" because making data publicly available or conducting independent peer review is "not feasible." 83 Fed. Reg. at 18,774. However, allowing the Administrator to make ad-hoc exemptions for specific studies or models does not cure the proposed rule's fatal defect of requiring EPA to consider factors other than those specified by Congress. *See Alltel Corp. v. Fed. Commc'n Comm'n*, 838 F.2d 551, 561 (D.C. Cir. 1988) (holding that an agency "cannot save an irrational rule by tacking on a waiver procedure" because the "essence of waiver is the assumed validity of the general rule"). Rather, because the proposed rule contains no standards requiring the exemptions to be based on the relevance, importance, or scientific validity of the study or model at issue, the Administrator's ability to arbitrarily include certain studies at his or her discretion simply compounds the extent to which the proposed rule would allow EPA to deviate from the requirements of the statutes it is charged with implementing.

In addition, because the proposed rule offers no definition or standards to guide the Administrator's determination of what is "practicable" or "feasible," the exemption provision gives the Administrator broad discretion in making such determinations.[7] Without any

[7] The exception to the proposed rule's requirement of additional independent peer review, unlike the exception to the transparency requirement, does instruct the Administrator to look at Section IX of the OMB Final Information Quality Bulletin for Peer Review, 70 Fed. Reg. 2664 (Jan. 14, 2005), when making those determinations. *See* 83 Fed. Reg. at 18,774. However, this direction makes little sense because Section IX of the Bulletin primarily discusses situations in which peer review is not *needed* rather than not feasible. *See* 70 Fed. Reg. at 2667 (providing exceptions for individual adjudications, agency regulatory impact analyses, routine information, and accounting and other financial information). The use of Section IX as a guidepost is not only inappropriate but is also unhelpful because almost all of the situations described therein are outside the category of "pivotal regulatory science" that the proposed rule addresses. Notably, although

standardized and objective criteria, the exemption process could, for example, allow biased determinations by the Administrator that provide an exception for confidential business information in studies submitted by chemical and pesticide manufacturers, while excluding academic toxicology or epidemiology studies. The NAS also highlighted this concern, noting that "[d]ecisions about exemptions should be based on formal agency guidance and not according to criteria established by a single EPA employee." NAS Letter at 3. Given how severely the proposed rule would limit the scientific evidence available for EPA's use, the proposed exemption provisions could become the basis upon which *most* of the science relied on by EPA in its rulemaking is admitted. The exceptions could thus largely swallow the rule, resulting in greater arbitrariness in EPA regulatory actions rather than greater transparency.

IV. Existing Statutes, Policies, and Procedures Already Provide for Transparency and Ensure Scientific Reliability, Rendering the Proposed Rule Unnecessary

a. Existing Laws and Policies Promote Transparency

EPA's proposal is unnecessary because existing laws and policies already fulfill its stated purpose. EPA claims that the rule will ensure that the "pivotal regulatory science" underlying "significant" EPA regulations is fully transparent, and will ensure that underlying data and models are publicly available in a manner sufficient for independent validation. 83 Fed. Reg. at 18,770. Notwithstanding its stated purpose, the proposed rule would not add anything useful to the existing body of policies and laws already in place, which include mechanisms to provide for maximum transparency while taking into account the need to protect the privacy of medical data, confidential business information, and the like. These existing laws and policies include the following:

- A directive issued on February 22, 2013, by the White House Office of Science and Technology Policy directing federal agencies with more than $100 million in annual research and development expenditures (which includes EPA) to develop plans for increasing public access to the results of the research they support, specifically scholarly publications and digital data.[8]

- OMB Memorandum 13-13,[9] which mandates, among other things, broader public access to federal and federally funded data and information, and provides that

---

there is an exemption for time-sensitive disseminations when the findings of a study have already been adequately peer-reviewed, there is no general exception for situations in which independent EPA review would be duplicative of external peer review that has already been performed.

[8] Memorandum from John P. Holden, Director, Executive Office of the President, Office of Science and Technology Policy, to Heads of Executive Departments and Agencies, *Increasing Access to the Results of Federally Funded Scientific Research* (Feb. 22, 2013), *available at* https://obamawhitehouse.archives.gov/sites/default/files/microsites/ostp/ostp_public_access_memo_2013.pdf.

[9] Memorandum from Sylvia M. Burwell, Dir., Steve VanRoekel, Fed. Chief Info. Officer, Todd Park, U.S. Chief Tech. Officer &Dominic J. Mancini, Acting Administrator of the Office of Info.

information collection should be done in a way to support information dissemination. This includes building redaction, slicing, and exporting into how data are collected to reduce the cost of public access later on. The memorandum also requires agencies to create data catalogs to include datasets "that can be made publicly available but have not yet been released." *Id.*

- The Data Quality Act, also known as the Information Quality Act, which is designed to improve the quality, objectivity, utility, and integrity of data released by the federal government. 44 U.S.C. § 3501. Pursuant to this act, EPA issued *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency*.[10] These Guidelines, which apply to rulemaking, among other things, provide that "EPA intends to ensure reproducibility according to commonly accepted scientific, financial, or statistical standards. . . . [I]f access to data and methods cannot occur due to compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections, EPA should, to the extent practicable, apply especially rigorous robustness checks to analytic results and carefully document all checks that were undertaken." *Id.* at 21.

- The Data Access Act (attached as a rider to the Omnibus Appropriations Act of fiscal year 1999, P.L. 105-277), which requires federal agencies, including EPA, to ensure that all research data produced under a federal award be made available to the public under the Freedom of Information Act. The law promotes public access while protecting privacy by excluding medical and business-related confidential data from disclosure. *See* 2 C.F.R. § 200.315 (which superseded OMB Circular A-110).

- EPA's November 2016 public access plan,[11] which covers publications and digital data and requires those seeking EPA research and development funding to develop data management plans that describe the data to be collected in their studies and approaches for preserving and providing access to that data. For publications, the plan requires researchers to make peer-reviewed journal articles resulting from federally funded research publicly accessible in designated repositories no later than a year after the official date of publication.

& Regulatory Affairs, Exec. Office of the President, Office of Mgmt. and Budget, *Open Data Policy—Managing Information as an Asset* (May 9, 2013), *available at* https://www.whitehouse.gov/sites/whitehouse.gov/files/omb/memoranda/2013/m-13-13.pdf.

[10] U.S. Envtl. Prot. Agency, *Guidelines for Ensuring and Maximizing the Quality, Objectivity, Utility, and Integrity of Information Disseminated by the Environmental Protection Agency* (Oct. 2002) [hereinafter *Information Quality Guidelines*], *available at* https://www.epa.gov/sites/production/files/2017-03/documents/epa-info-quality-guidelines.pdf.

[11] U.S. Envtl. Prot. Agency, *Plan to Increase Access to Results of EPA-Funded Scientific Research* (Nov. 29, 2016), *available at* https://www.epa.gov/sites/production/files/2016-12/documents/epascientificresearchtransperancyplan.pdf.

In sum, while EPA should encourage making data available to researchers and the public where lawful and appropriate, existing laws and policies applicable to federal agencies already do that, while protecting the scientific integrity of the "pivotal regulatory science" considered by EPA in promulgating standards and weighing the various factors that impact those standards. EPA's proposal ignores these established transparency laws and policies in service of excluding relevant science, thereby undercutting the environmental laws that EPA enforces by limiting the use of best available science.

b. Existing Policies and Procedures Provide for a Robust and Transparent Peer Review Process That Ensures the Validity of Scientific Information Relied Upon by EPA, and EPA Provides No Explanation for Why an Additional Level of Review Is Required

EPA has a long history of peer review of scientific studies supporting its regulations, relying on independent analyses of studies while also giving respect to those privacy protections required by law or non-disclosure agreements. As the NAS has pointed out, the National Academies "have developed a long-standing body of work that demonstrates scientific literature can be evaluated in a transparent and objective manner without complete disclosure of the underlying data." NAS Letter at 2. And as several scientific journal editors have noted, scientists conducting peer review "are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results."[12] This peer review process ensures the reliability and validity of the scientific information relied upon by EPA in the regulatory process.

Existing policies and procedures for peer review include the following:

- EPA's *Peer Review Handbook* provides that if a regulation is supported by a scientific and technical work product, the underlying work product should be peer reviewed unless it meets listed exemption criteria.[13] The Handbook explains that a critical element in ensuring that decisions are based on sound and defensible science is to have an open and transparent peer review process. *Id.* at xiii.

- EPA vets scientific studies through several independent expert panels, including the SAB, the EPA Clean Air Scientific Advisory Committee, the EPA FIFRA Scientific Advisory Panel, and the EPA Chemical Assessment Advisory Committee. The Clean Air Scientific Advisory Committee routinely reviews and

[12] Jeremy Berg, Philip Campbell, Veronique Kiermer, Natasha Raikhel & Deborah Sweet, *Joint Statement on EPA Proposed Rule and Public Availability of Data*, Science, Apr. 30, 2018 [hereinafter *Joint Statement*], *available at* http://science.sciencemag.org/content/early/2018/04/30/science.aau0116.full.pdf.

[13] U.S. Envtl. Prot. Agency, *Peer Review Handbook* 28, 44-45 (4th ed. 2015), *available at* https://www.epa.gov/sites/production/files/2016-03/documents/epa_peer_review_handbook_4th_edition.pdf.

evaluates epidemiological and toxicological studies that are the basis for dose response relationships used in risk and exposure assessments for air pollutants regulated under the National Ambient Air Quality Standards (NAAQS); the Chemical Assessment Advisory Committee reviews toxicological assessments of various chemicals for inclusion in EPA's Integrated Risk Information System database;[14] and the NAS has reviewed EPA risk assessment practices numerous times.[15]

- Each of these independent committees or panels is required to be staffed by a "fairly balanced" mix of regulators, academics, and industry/consultant representatives who bring a well-balanced perspective to the process. *See* Federal Advisory Committee Act, 5 U.S.C. App. 2 § (5)(b)(2), (c).

- OMB bulletin entitled "Final Information Quality Bulletin for Peer Review," 70 Fed. Reg. 2664-02 (Jan. 14, 2005), is applicable to all federal agencies, including EPA, and establishes government-wide guidance aimed at enhancing the practice of peer review of government science documents. The bulletin was subject to extensive public and agency comment on two prior draft versions. It includes guidance to federal agencies on what information is subject to peer review, the selection of appropriate peer reviewers, opportunities for public participation, and related issues. The bulletin also defines a peer review planning process that provides for public participation whenever possible and permits the public and scientific societies to comment about which scientific reports and studies merit especially rigorous peer review.

The proposed rule ignores this existing robust peer review process and its role in independently validating scientific information and ensuring that published information meets the standards of the scientific community.

In addition, despite the existing peer review process, EPA apparently proposes to require that EPA itself conduct an additional "independent" review. *See* 83 Fed. Reg. at 18,774. Yet the proposal nowhere discusses how EPA would vet reviewers to identify persons who are purportedly more competent than those already used in past or current peer review processes, or the level of EPA staffing and associated costs that would be needed for additional review—only stating that EPA will implement the proposed rule in a manner "that minimizes costs." *Id.* at 18,774. But any requirement for EPA to conduct additional review would entail additional significant costs, contrary to the proposal's assertion. *Id.* at 18,772. The practical outcome of

---

[14] *See, e.g.*, U.S. Envtl. Prot. Agency, *IRIS Assessment Development Process (2015), available at* https://www.epa.gov/sites/production/files/2015-09/iris_process_figure_2015.jpg (providing a graphical listing of all the rounds of review in the existing IRIS process, which includes internal review, intra-agency review, external review (public comments), and peer-review (SAB)).

[15] *See, e.g.*, Nat'l Research Council, *Science and Decisions: Advancing Risk Assessment* (2009), *available at* https://www.nap.edu/catalog/12209/science-and-decisions-advancing-risk-assessment.

the proposal is that EPA may end up relying on a much smaller number of studies and/or on a less robust subset of relevant available studies, thus undermining the regulatory decision-making process.

In sum, EPA fails to acknowledge the rigor of existing processes in statutes, policies and federal procedures, or to explain how its proposal would provide any added value and minimize costs. EPA should abandon this unnecessary and counterproductive exercise.

V. Obtaining Private Data May Not Be Practically Possible and, Even When it is Possible to Make Data Available, the Proposed Rule Would Unnecessarily Impose Substantial Costs to Do So

The proposal's suggestion that concerns about access to confidential or private data can simply be addressed through the application of tools used by other federal agencies, *id.* at 18,770-71, will be unworkable or impracticable for many past and even future studies. For example, the proposal cites to guidance regarding methods to de-identify protected health information under the privacy rules of the 1996 Health Insurance Portability and Accountability Act (HIPAA), Pub. L. No. 104-191, 110 Stat. 1936. *Id.* at 18,771 n.17. That guidance document is 28 pages, contains detailed instructions for de-identification, including how experts are to assess the risk of identification of information, and emphasizes the importance of data-sorting systems to manage protected health information for the de-identification process, including use of a one-way cryptographic function to obscure personally identifiable information.[16] Among other things, the guidance provides that various identifiers of individuals—including all names, geographic subdivisions smaller than a state (with one exception), dates directly related to an individual, telephone numbers, biometric identifiers, and so forth—must be de-identified. *HIPAA Guidance* at 4-5. The guidance thus highlights that, in fact, it is not easy to address confidentiality concerns: the de-identification process is complex and must be designed into the overall study process, something that cannot be done for historic studies. Moreover, to the extent that one of the purposes of the proposal is to enable persons to replicate studies, this may not be possible where the de-identified data is critical to the studies' findings and conclusions.

And even if it were possible, EPA's proposal ignores the large costs that would be associated with the complex process of de-identifying data and fails to identify who would pay for these procedures. As scientists from the Union of Concerned Scientists have pointed out, redacting confidential data from large studies "isn't just blocking out a line," it is a huge job that can take thousands of hours, at commensurately high cost.[17] Similarly, a Work Group of the SAB, EPA's external scientific advisors charged with evaluating EPA's science and regulatory

---

[16] *See* U.S. Dept. of Health & Human Servs., *Guidance Regarding Methods for De-Identification of Protected Health Information in Accordance with the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule* 6 (Nov. 26, 2012) [hereinafter *HIPAA Guidance*], https://www.hhs.gov/hipaa/for-professionals/privacy/special-topics/de-identification/index.html.

[17] *See* Ed Yong, *The Transparency Bills That Would Gut the EPA*, The Atlantic, March 15, 2017, https://www.theatlantic.com/science/archive/2017/03/how-to-gut-the-epa-in-the-name-of-honesty/519462/.

actions, explained that there are considerations associated with the cost and effort that would be involved in making large and complex existing datasets available within Institutional Review Board (IRB)[18] requirements, including the issue of who would be responsible for shouldering this burden. *See* SAB Work Group Memo at 3.

Indeed, those anticipated costs are well-documented, albeit not in EPA's proposal. In 2017, Congress proposed the Honest and Open New EPA Science Treatment Act, H.R. 1430, 115th Cong. (2017), which, like the proposed rule, provided that EPA could only rely on studies whose data were open and accessible. In assessing that legislation, the Congressional Budget Office (CBO) estimated that costs to EPA associated with redacting confidential information to comply with this act would be at least $100 million per year.[19] These costs would encompass obtaining the underlying data, review of the data to address confidentiality concerns, formatting the data for public access, providing computer codes and models used, and providing directions for accessibility of the data. And the CBO did not include in its cost estimate the additional costs related to the potential need for contractors due to EPA staffing issues to assist with this work. Similar costs can be expected with the proposal as drafted, undermining the proposal's assertion that it does not amount to an Executive Order 13771 regulatory action. *See* 83 Fed. Reg. at 18,772. Rather than acknowledging those costs, however, the only place where the proposed rule even mentions costs is in Section 30.8, which states that "EPA shall implement the provisions of this subpart in a manner that minimizes costs"—a misleading and fatally vague projection of the impacts of the proposed rule. 83 Fed. Reg. at 18,774.

Because EPA's existing processes, including peer review, already help ensure that studies used by EPA are scientifically sound, the proposed rule is not needed to add credibility or reliability to the development of EPA models and standards. Instead, it will burden EPA and the public with unnecessary delays and expense, and result in the unnecessary exclusion of important scientific evidence that is critical to the development of standards that are protective of human health and the environment.

---

[18] An IRB is a committee that applies research ethics to review the methods proposed for research to make sure they are ethical. Membership generally consists of individuals with varying backgrounds and affiliations, knowledgeable not only about a specific research activity, but also applicable law, institutional regulations, and standards of professional conduct. *See, e.g.*, 45 C.F.R. § 46.107; 21 C.F.R. § 56.107.

[19] Cong. Budget Office, *Cost Estimate: H.R. 1430 Honest and Open New EPA Science Treatment (HONEST) Act of 2017* 3 (Mar. 29, 2017), *available at* https://www.cbo.gov/system/files/115th-congress-2017-2018/costestimate/hr1430.pdf. The predecessor to the HONEST Act was the so-called Secret Science Reform Act, H.R. 1030, 114th Cong. (2015). The CBO estimated that costs associated with redacting confidential information to comply with the latter act would be even higher--around $250 million per year initially. *See Cost Estimate: H.R. 1030 Secret Science Reform Act of 2015* 1-3 (Mar. 11, 2015), *available at* https://www.cbo.gov/sites/default/files/114th-congress-2015-2016/costestimate/hr1030.pdf.

VI. EPA Has Not Considered the Substantial Direct Effects the Proposed Rule Would Have on the States

States, as sovereign entities, have an interest in protecting the natural resources within their borders, and the health and well-being of their residents. *See Alfred L. Snapp & Son, Inc. v. Puerto Rico, ex rel., Barez*, 458 U.S. 592, 607 (1982). EPA states that the proposed rule "does not have federalism implications" and "will not have substantial direct effects on the states." 83 Fed. Reg. at 18,772-73. This is simply incorrect because states are often statutorily required to adopt EPA standards, sometimes lack resources to deviate from EPA standards, frequently are required to obtain EPA approval of state-set standards, and may feel the effects of EPA decisions far beyond the environmental sphere.

Most obviously, some states' environmental laws and regulations explicitly adopt the standards set by EPA or require an express justification for any deviation. For example, under state law, Pennsylvania's Department of Environmental Protection may not promulgate air quality control measures to implement a NAAQS if the control measures are more stringent than federal measures unless it demonstrates that the higher standard is necessary to attain or maintain a NAAQS, to satisfy related CAA requirements, to prevent assessment or imposition of CAA sanctions, or to comply with a final federal court decree. *See* 35 *Pa. Consol. Stat.* § 4004.2. Similarly, New Jersey's Department of Environmental Protection must justify any deviation from federal standards pursuant to Executive Order 27 (Whitman 1994). Changes to federal standards resulting from the application of an arbitrary subset of the available science will either change the standards applicable at the state level or require states to initiate proceedings to impose and justify the imposition of different standards based on rigorous, comprehensive science. Therefore, any change to EPA's process for developing its standards will necessarily impact state standards as well.

Even those states that are not statutorily required to apply federal standards may not have the institutional capacity to develop their own standards and therefore, for practical reasons, often rely on the standards set by EPA. For example, because of lack of institutional capacity, and in acknowledgement of EPA's expertise, Washington D.C. has traditionally relied on EPA to set air quality standards. Further, even more states rely on the publicly available models created by EPA in determining appropriate state standards. For all the reasons discussed in the technical comments that follow, the adoption of this proposed rule would very likely affect the protectiveness of the standards that EPA sets and limit the models that EPA makes available to the public. The regulatory programs of all states that rely on EPA standards or models, including all the signatories of this letter, would therefore be affected by the proposed rule, and states' ability to protect their environment and the health of their citizens would be undermined by its adoption.

Still more, under some programs, standards set by the states must be approved by EPA. *See, e.g.*, 40 C.F.R. §§ 131.20, 131.21 (Water Quality Standards). If the proposed rule were applied to EPA's review and approval of state standards (and it is unclear whether that would be so—another fatal flaw in the proposal), then the rule would also affect the states in this context—further altering the balance of cooperative federalism in the implementation of these programs. Needless to say, if the proposed rule applies to EPA's review and approval of state standards, the

federalism implications could not be any clearer—and EPA's failure to grapple with them or even recognize that they exist is arbitrary and capricious. The proposal's lack of clarity on this issue impairs the states' ability to provide meaningful comment.

Finally, the proposed rule would also impact the states through the incorporation of EPA standards into the regulations or programs of other federal agencies that rely on EPA standards and/or modeling. Should EPA adopt a deficient standard due to the arbitrary exclusion of available scientific information, other federal agencies relying on EPA standards as a basis for action would be affected, as would be the states that interface with those federal programs. As such, the impacts of the proposed rule are likely to impact states in areas far beyond the environmental field.

Based on EPA's complete failure to consider or discuss the effects of its action on state programs, the proposal should be withdrawn so that EPA can adequately consult with state officials to analyze these important impacts. *See* Exec. Order 13132 § 6(a) (instructing agencies to "ensure meaningful and timely input by State and local officials in the development of regulatory policies that have federalism implications"); *Chem. Mfrs. Ass'n v. U.S. Envtl. Prot. Agency*, 870 F.2d 177, 203 (5th Cir. 1989).

TECHNICAL COMMENTS

I. Consideration of Valid Scientific Studies Most Relevant for Regulatory Standards Would Be Severely Limited

For reasons discussed below, the proposed rule would severely limit EPA's ability to consider valid and important scientific studies and data, including many that are most relevant for use as the basis for regulatory standards.

a. The Proposed Rule Would Exclude the Use of Studies That Were Based on Confidential Data

The proposed rule fails to recognize or acknowledge the existence of many studies already designed and published with terms that make complete transparency difficult or impossible because of IRB requirements and other important confidentiality protections. The proposal thus could have the effect of excluding important peer-reviewed studies of health effects from use as sources to support EPA's past and future regulatory efforts simply because they do not meet excessively rigid transparency standards. This is particularly true for long-standing confidential epidemiological studies that EPA has relied upon in setting air quality and other health-based standards.

In general, and specifically in EPA's 2005 *Guidelines for Carcinogen Risk Assessment*, human (i.e., epidemiology) data are preferred to animal data as the basis for risk assessment toxicity factors (e.g., cancer potency factors or reference doses for non-carcinogenic effects) when they are of sufficient quality and are amenable to dose response modeling.[20] This is

[20] U.S. Envtl. Prot. Agency, *Guidelines for Carcinogen Risk Assessment* 2-3 (Mar. 2005),

because animal data always carry inherent uncertainties in regard to their relevance to humans. *Id.* Epidemiology data collected over at least the last 40 years, however, have been generated under the auspices of IRBs working to protect the patient or participant information obtained by academic institutions, government entities, hospitals, and other organizations, and thus disclosure of that data would be difficult, if not impossible.

Generally accepted professional practice for the collection of human data requires IRB review and informed consent from the individuals from whom the data are collected. Although the proposal states that "concerns about access to confidential or private information can, in many cases, be addressed through the application of solutions commonly in use across some parts of the Federal government," 83 Fed. Reg. at 18,770, this will not be possible for many studies because IRBs dictate the specific terms of this informed consent, including that the conditions of collection and analysis of human data be specified *before* initiation of the study. These *a priori* conditions include the types of analyses that will be performed, how the data will be used, and whether and how the data can be shared. In general, *a priori* conditions preclude sharing raw data with entities not included in the original IRB approval and performing analyses not specified in the original IRB approval, even if portions of the data are redacted. Furthermore, clinical data collected from physicians, hospitals, clinics, etc., may also be subject to restrictions under HIPAA, over and above IRB restrictions.

These factors would all preclude EPA's or researchers' ability to provide raw, unpublished data for re-analysis as required under the proposed EPA rule. Thus, the provisions of the proposed rule would essentially prohibit the use of such epidemiology data in human health risk-based assessment despite their clear superiority over animal data for use in risk assessment. For older epidemiology data, such as data from studies on occupational exposures to workers in factories before the advent of strict IRB requirements, raw data are seldom if ever still available. Therefore, such data, including high quality data generated by major corporations in conjunction with academic institutions, would also not be available to EPA under the proposed rule. Thus, effectively, the proposed rule would restrict the epidemiology data available for use by EPA, even where the weight of the evidence clearly supports a finding of causality and risk.

Two examples of studies that could be impacted by EPA's proposed rule are the Harvard Six Cities Study and the American Cancer Society Cancer Prevention Study II.[21] These studies followed thousands of people over nearly two decades, and linked personal medical histories, occupational histories, and home locations to detailed air quality data to show that people exposed to more particulate matter are more likely to die prematurely. In order to collect all the

information, researchers entered into confidentiality agreements with the study participants, agreeing that their private information would not be made public. These promises of confidentiality (wholly apart from the difficulty and cost of redacting personal information) would render the studies "non-transparent" under the proposed rule, enabling or requiring EPA to ignore them. This is so even though the studies have been thoroughly peer-reviewed and their results have been re-analyzed by the Health Effects Institute, which confirmed the robustness of the studies' findings with respect to air pollution and mortality.[22] Under the proposed rule, EPA could ignore these two foundational studies and other peer-reviewed studies built upon them in setting health-based air quality standards for particulate matter and other pollutants.[23] The effect could be devastating and deadly, as these standards save lives. EPA estimates that reductions in ambient particulate matter under the 1990 Clean Air Act Amendments will prevent 230,000 adult deaths by 2020.[24]

b. The Proposed Rule Would Also Exclude Studies That Cannot Be Reproduced

"Reproducibility," "replication," and "validation" of scientific studies are mentioned throughout the proposed rule, but these terms are not defined. *See, e.g.*, 83 Fed. Reg. at 18,773-74. These terms could be interpreted to mean that studies used as the basis for regulations must be replicated. It would clearly be impossible to replicate many key studies based on data on human or ecological effects resulting from unintentional adverse events and disasters. Some extreme examples are data on the effects of radiation from atomic bomb survivors, data on wildlife toxicity from the Exxon Valdez oil spill, and data on the human health impacts of the September 11, 2001 World Trade Center disaster.[25] Other important data may come from older studies of human volunteers that could not be replicated under current ethical standards.

Laboratory animal studies are controlled studies which use genetically similar test subjects maintained under identical conditions, with the only difference between the control and treated groups being exposure to the chemical being tested. Although such studies are expected to give the same results if they are reproduced, scientists do not routinely perform laboratory experiments that are identical to previously reported studies, but rather, use results from the scientific literature as the basis for design of different studies that will add to the body of knowledge on the topic being studied. In contrast to the controlled conditions of animal studies, there is more variability among humans than the strains of lab animals utilized. Additionally, the exact underlying conditions of human studies can rarely be exactly replicated (i.e., under the same circumstances of exposure and other factors) even when the same protocols are followed. Thus even a contradictory result in a "reproduced" epidemiological study would not necessarily invalidate an observation from an earlier study, provided that the first study followed valid methods and conducted appropriate statistical analyses.

In addition, although it would depend on the specifics of the study and the nature of the endpoint investigated, a single human study would not generally be considered definitive by itself. Rather, all such well-conducted studies contribute to the weight of evidence supporting a scientific conclusion. Reliance on the weight of the evidence, rather than on any one individual study, is a safeguard that helps to ensure validity of the overall conclusions. Therefore, even if such studies could be replicated, their replication is not necessary for making a conclusion based on the overall weight of the evidence.

To the extent the proposal seeks to enable third parties to "re-run" an analysis using the same supporting data and the same models, this may not be possible where proprietary models, methods, designs, and/or data were used in the study. But, as EPA points out in its Information Quality Guidelines, in cases where the Agency relies on proprietary models that cannot be made publicly available, the model applications are subject to EPA's peer review policy and other validation checks. *Information Quality Guidelines* at 47. The Guidelines indicate that "[t]hese steps, along with transparency about the sources of data used, various assumptions employed, analytic methods applied, and statistical procedures employed should assure that analytic results are 'capable of being substantially reproduced.'" *Id.*

c. The Proposed Rule Would Favor Industry Contract Laboratory Toxicology Studies, Which May Not Evaluate the Most Sensitive and Relevant Effects

The proposed rule would also favor consideration of industry toxicology studies over equally valid peer reviewed studies from other institutions. It states that "where available and appropriate, EPA will use . . . standardized test methods, consistent data evaluation procedures, and good laboratory practices." 83 Fed. Reg. at 18,770. Under current EPA risk assessment approaches, all relevant scientific data are considered.[26] In contrast, this language indicates the

[26] *See, e.g.*, Integrated Risk Info. System, Nat'l Ctr. for Envtl. Assessment, Office of Research &

proposed rule is significantly more restrictive than current EPA guidance as far as the types of valid peer-reviewed scientific data that can be considered.

It is critical to note that the phrase "good laboratory practices" (GLP) referenced by EPA is not a value descriptor. Rather, it is a technical term referring to a specific category of study conduct and reporting that is intended for specific regulatory purposes. GLP/standardized test method studies are typically conducted by industrial or contract laboratories, and test for limited parameters in order to meet specific regulatory requirements, such as for registration of pesticides, drugs, and other products. These protocols often have not been updated to incorporate recent approaches in toxicology, and they may not look at the most sensitive and relevant toxicological effects of the product being studied. In contrast, other equally scientifically valid studies, typically conducted in research laboratories in academic, industrial, or government institutions, use specialized approaches to evaluate specific toxicological effects of the chemical under study, and may not follow the standardized protocols specified in regulatory requirements. The use of GLP protocols does not necessarily mean that the study is of higher quality, and there is no scientific reason that the data generated under the highly circumscribed regulatory requirements for product registration should receive greater weight than any other valid scientific data. Rather, all studies should be evaluated on their own merits.

d. The Proposed Rule Would Exclude Studies for Which Underlying Data Are Not and May Not Be Available

The proposed rule would preclude consideration of studies – old and new – for which data are not and may not be available. Many of the standards that are developed or updated by EPA are for chemicals that have an extensive, older body of scientific literature on their effects, but that are not currently being actively researched. Thus, the vast majority of studies considered for standard-setting are not new and were not conducted, designed, or published with the goal of ensuring data availability. Accordingly, their data are likely unavailable and, even if data were kept, the formats in which older data are stored may not be accessible from currently available computers, potentially invalidating the use of those studies as the basis for future regulatory standards. Processes for additional data availability are currently being developed and will likely increasingly be incorporated into research protocols in the future; however, it is unknown whether these forthcoming protocols will meet the transparency requirements of the proposed rule.

In addition, even going forward, many academic scientists whose research is relevant to EPA regulations may not conduct and report their studies in a way that satisfies the requirements of the proposed rule. The proposed rule's provisions would require significant additional resources and could impose unreasonable and impractical requirements beyond those included in current protocols. Academic researchers, who often study sensitive and relevant health effects that are not evaluated in industry-sponsored GLP studies, typically focus on publishing their studies in peer-reviewed journals and obtaining research funding; they may not be concerned about or even consider whether their studies would qualify for use in establishing EPA

Dev., U.S. Envtl. Prot. Agency, *Toxicological Review of Benzo[a]pyrene*, xxxiii-xxxvi (2017), *available at* https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0136tr.pdf.

regulations, and/or may not have the resources to reshape their approach to maintaining data. Additionally, many researchers, particularly in other nations but also in the United States, may not even be aware of EPA requirements for a study's use in regulations. For those researchers who do attempt to comply with the proposed rule's requirements, the extent and nature of the data that must be maintained and made publicly available is vague and unclear, making compliance virtually impossible.

II. The Proposed Rule is Wrongly Premised on Unsupported Assumptions Regarding Scientific Studies

a. The Proposed Rule Assumes Erroneously and Without Explanation that Only Studies for Which the Underlying Data Are Publicly Available Are Valid

A fundamental premise of the proposed rule is that only studies for which the underlying data are publicly available are valid for decision-making. This premise is inconsistent with generally accepted practices for conducting and evaluating scientific research. Furthermore, the rationale for the premise is not provided: EPA presents no evidence for the conclusion that its current criteria for selecting studies result in scientifically invalid conclusions or overly stringent regulations. Indeed, the D.C. Circuit has already rejected EPA's proposed approach of excluding studies relying on non-public data as "impractical and unnecessary" when raised by a trade association as part of a challenge to an air quality standard. *Am. Trucking*, 283 F.3d at 372.

b. The Proposed Rule Incorrectly Assumes that the Studies and Data Upon Which EPA Relies Are of Questionable Validity

The proposed rule also assumes that the studies and data used in EPA's decision-making are of questionable validity. However, this assumption is unsupported. It is not the case that the studies and data EPA uses to establish regulations are selected simply because they report effects at the lowest levels. Rather, EPA performs an extensive hazard identification process prior to selecting key studies and specific health endpoints. This process evaluates the relevant human epidemiology, animal toxicology, and mode of action studies to ensure that the studies and endpoints ultimately chosen are supported by the overall body of scientific literature. Recently, a rigorous systematic review process has been developed and implemented by EPA's Integrated Risk Information System program to ensure even greater thoroughness and objectivity in hazard identification.[27] Thus, EPA already ensures that the studies and data upon which it relies are valid.

[27] Integrated Risk Info. System, Nat'l Ctr. for Envtl. Assessment, Office of Research & Dev., U.S. Envtl. Prot. Agency, *National Academy of Sciences Committee to Review Advances Made to the IRIS Process: A Workshop* (Feb. 1-2, 2018), *available at* https://www.epa.gov/sites/production/files/2018-02/documents/nas020118final.pdf.

III. The Proposed Rule's Data Availability Requirements Are Unnecessary and Unclear

a. EPA's Proposed Data Availability Requirements Are Not Necessary to Improve or Ensure the Scientific Basis of Regulations

Studies and associated data do not have to be publicly available or reproducible to ensure that they are scientifically valid. This point has already been made in statements of concern about the proposed rule by authoritative scientists, including the editors of the most prestigious scientific journals (Science, Nature, PLOS, PNAS, Cell) and the members of a Work Group of the SAB itself. *See Joint Statement* and SAB Work Group Memo. As stated by the journal editors, "scientists, including peer reviewers, are trained in assessing research publications by judging the articulation and logic of the research design, the clarity of the description of the methods used for data collection and analysis, and appropriate citation of previous results . . . . [I]t does not strengthen policies based on scientific evidence to limit the scientific evidence that can inform them . . . . Excluding relevant studies simply because they do not meet rigid transparency standards will adversely affect decision-making processes." *Joint Statement*.

In fact, there are longstanding methodologies for evaluating the strength of epidemiology findings that are commonly used to draw conclusions about causality.[28] The SAB Work Group notes that "the proposed rule fails to mention that there are various ways to assess the validity of prior epidemiologic studies without public access to data and analytic methods," using as an example the Health Effects Institute's well-known re-analysis of the Harvard Six Cities and American Cancer Society air quality studies, which successfully replicated those studies' findings. SAB Work Group Memo at 4.

b. EPA's Proposed Data Availability Requirements Are Not Clearly Defined and Do Not Ensure Validity of Data

The extent and nature of the data that would be required to be made publicly available is not clearly defined in the proposed rule. The proposed rule states that information is considered "publicly available in a manner sufficient for independent validation" when it includes the "information necessary for the public to understand, assess, and replicate findings. This may include, for example: (a) Data (where necessary, data would be made available subject to access and use restrictions)[;] (b) Associated protocols necessary to understand, assess, and extend conclusions; (c) Computer codes and models involved in the creation and analysis of such information; (d) Recorded factual materials; and (e) Detailed descriptions of how to access and use such information." 83 Fed. Reg. at 18,774.

This could be interpreted to require maintenance of data down to the most basic level, verging on the absurd, and could impose unreasonable and impractical requirements that go well beyond those already included in current protocols. For example, it could require maintenance of records that are not routinely archived by academic research labs, such as printouts of data from all calibration curves and analyses from instruments that measure clinical parameters in

[28] *See, e.g.*, Sir Austin Bradford Hill, *The Environment and Disease: Association or Causation?* 58(5) Proc. Royal Soc'y Med. 295, 295-300 (1965) ("The Hill Criteria for Causality").

blood or other similar endpoints in animal and human studies, or photos of each individual organ as it is evaluated for gross pathology in toxicology studies. Even if such data are maintained for a period after a study is completed, it is not feasible for such records to be maintained indefinitely by research laboratories, which would then make the study that the data supports unavailable for use in future regulations.

For toxicology studies, such data availability requirements would result in favoring studies performed under GLP protocols, which typically retain more raw data than research studies. But, as discussed in more detail above, GLP studies may not evaluate the most sensitive and relevant toxicological effects of the chemical being studied and are not inherently of higher quality than studies conducted under other protocols.

IV. Provisions of the Proposed Rule Related to Modeling Conflict with Scientific Guidelines

The proposed rule would flout long-accepted scientific modeling methods and require undue justification and explanation of assumptions and uncertainty.

a. The Proposed Rule Encourages Deviation from Linear Dose Response Modeling, the Generally Accepted Choice for Modeling in Carcinogen Risk Assessment

The proposed rule would favor less protective threshold modeling, contrary to EPA's own guidance and generally accepted toxicology practice. It states that "EPA shall evaluate the appropriateness of using default assumptions, including assumptions of a linear, no-threshold dose response, on a case-by-case basis" and that "EPA shall give explicit consideration to high quality studies that explore . . . various threshold models across the dose or exposure range." 83 Fed. Reg. at 18,774. These requirements are inconsistent with EPA guidance, specifically the 2005 *Guidelines for Carcinogen Risk Assessment*. These guidelines state that EPA's default dose response modeling approach for carcinogenic substances is linear extrapolation from the point-of-departure (essentially the lower limit of the range of the experimental data) to the origin (zero exposure, zero risk). This default no-threshold approach assumes that any dose of a carcinogen results in some level of risk, making it the most protective of human health. Threshold models, by contrast, assume that there is some dose of a carcinogen at which there is no cancer risk, an assumption that is less health protective and that has not been conclusively established in most cases. It is unclear what EPA means by "explicit consideration," or what EPA would consider to be "high quality studies," but insofar as those terms are intended to mean that EPA will give preference to studies utilizing threshold models, such a preference would be inconsistent with EPA's 2005 *Guidelines for Carcinogen Risk Assessment* as well as generally accepted practice in the field of toxicology.

In most cancer risk assessments, dose response data within the low risk range, which is the range of interest for regulatory purposes, are lacking. Thus, low-dose extrapolation is used to estimate risks in the lower dose range where data are unavailable. For estimation of risks below the range of the data, there are an infinite number of possible threshold and non-threshold assumptions regarding the shape of the dose response curve that can be envisioned, with no substantive basis for assuming the general superiority of one assumption over another. To

deviate from the default assumption that any dose of a carcinogen results in some risk in the absence of chemical-specific data that demonstrate a threshold mode-of-action of carcinogenicity[29] would be mere speculation and would assume, with no scientific support, that Americans can be safely exposed to those substances. To "evaluate the appropriateness" of the linear, non-threshold approach for low-dose extrapolation by also considering non-linear and threshold models would provide no cognizable benefit in modeling accuracy or clarity, but instead could result in the manipulation of results, delay, and obfuscation.

In the limited circumstances where the data support threshold modeling, EPA's 2005 *Guidelines for Carcinogen Risk Assessment* already provide for departure from the default linear extrapolation in risk assessment and instead allow for the use of threshold modeling. *Id.* at A-8. In fact, EPA has used a threshold approach for carcinogen risk assessment when there is clear, chemical-specific, empirical evidence of a threshold mode of action.[30] This careful, well-founded approach is generally considered both scientifically supportable and protective of public health, as opposed to the proposed rule's requirement for justification of the default linear approach on a case-by-case basis and "explicit consideration [of] high quality studies that explore various threshold models across the dose or exposure range." 83 Fed. Reg. at 18,774. Without a well-founded and substantiated scientific basis, EPA should not entertain such a fundamental departure from accepted, public-health protective risk assessment practices.

b. The Proposed Rule Would Unreasonably Require Consideration of Nonparametric Models

The proposed rule would require that "when available, EPA shall give explicit consideration to high quality studies that explore . . . [a] broad class of parametric dose response or concentration response models" *and* "nonparametric models that incorporate fewer assumptions." 83 Fed. Reg. at 18,774. Parametric models are those in which the number and nature of the parameters (i.e., assumptions) are fixed in advance, while nonparametric models are those in which the assumptions are determined from the data. For approximately 20 years, EPA has employed parametric modeling in risk assessment by providing and using benchmark dose response modeling software. Although the proposal implies that this is not the case, this software already allows investigation of the most appropriate parametric model(s) for risk assessment and currently provides "a broad class of parametric dose response, concentration-response models." *Id.*

There is no obvious benefit to adding an additional layer of analysis—nonparametric modeling—on top of this longstanding approach. Nonparametric models are useful only when the quantity and quality of the data are sufficient to infer a clear and plausible estimate of the overall pattern. But when there are few data and/or data are of poor quality, as is often the case

[29] Mode of action is defined by EPA as the "sequence of key events and processes, starting with interaction of an agent with a cell, proceeding through operational and anatomical changes, and resulting in cancer formation." *Guidelines for Carcinogen Risk Assessment* at 1-10 n.2.

[30] *See, e.g.*, U.S. Envtl. Prot. Agency, *Toxicological Review of Chloroform* (2001), *available at* https://cfpub.epa.gov/ncea/iris/iris_documents/documents/toxreviews/0025tr.pdf.

in situations to which the proposed rule would apply, nonparametric models can produce a wide variation of results with few, if any, constraints on plausibility. In such cases, the use of nonparametric models is not scientifically supportable, and moving forward, little would be gained from considering them in terms of accuracy and clarity of the predictions, while the potential for delay and obfuscation would again multiply. The proposed rule's requirement that nonparametric models be explicitly considered, without regard to the applicability of a particular model, is therefore misguided and scientifically unsound.

c. The Proposed Rule Would Unreasonably Require Justification of All Default Assumptions

The proposed rule would require EPA to "evaluate the appropriateness of using default assumptions" and "clearly explain the scientific basis for each model assumption used and present analyses showing the sensitivity of the modeled results to alternative assumptions." 83 Fed. Reg. at 18,774. This would effectively foreclose the important use of default assumptions, requiring a detailed justification for each of the many assumptions included in any given model—an inefficient, time-intensive, and unnecessary task.

Default assumptions are selected from a range of possible values based on both scientific considerations (e.g., whether they are supportable based on available data) and policy considerations (e.g., whether the upper or lower percentile, rather than the mean or median value, should be used to protect most of the population). In cases of significant variability and/or uncertainty in the available data, there are essentially an infinite number of alternative assumptions that can be chosen. The use of default assumptions thus provides a straightforward way to manage the complexity presented by variability and uncertainty.

And, while default assumptions do need to be justified when initially selected, EPA uses a well characterized set of default assumptions in risk assessment and updates them when indicated by newer scientific information.[31] Accordingly, the rationales and limitations underlying these assumptions are well documented, including (as would be required by the proposed rule) discussion of variability, as well as sensitivity analyses that evaluate the impact on the model results of changing the default value to a range of non-default alternative values. Default values have been selected as both scientifically valid and protective of human health; if alternative values are selected, they are likely to be less health-protective than existing defaults. There is thus little benefit to be gained at this point by reinventing the wheel each time a default assumption is employed. To forego these well-established default assumptions and require

[31] *See, e.g.*, Memorandum from Dana Stalcup, Acting Director, Assessment and Remediation Division, Office of Superfund Remediation and Technology Innovation to Superfund National Policy Managers, Regions 1-10, *Human Health Evaluation Manual, Supplemental Guidance: Update of Standard Default Exposure Factors* (Feb. 6, 2014), *available at* https://www.epa.gov/sites/production/files/2015-11/documents/oswer_directive_9200.1-120_exposurefactors_corrected2.pdf; Office of Water, U.S. Envtl. Prot. Agency, *Human Health Ambient Water Quality Criteria: 2015 Update* (2015), *available at* https://www.epa.gov/sites/production/files/2015-10/documents/human-health-2015-update-factsheet.pdf.

justification of each assumption chosen from a long list of potentially less health-protective assumptions would only give rise to prolonged debate, obfuscation, and manipulation of model outcomes, not improvement of the scientific basis of the risk assessment. The delay this would cause, for no supportable reason, can only lead to the conclusion that it is EPA's intent to inhibit, rather than improve, regulation.

d. The Proposed Rule Would Require a Description of, But Fails to Define, Uncertainty

The proposed rule would also require that EPA "describe and document any assumptions and methods used . . . and uncertainty." 83 Fed. Reg. at 18,774. However, uncertainty is not defined in the proposed rule, and it is unclear what type of uncertainty is implied. Uncertainty could mean discussion of the magnitude of the statistically based range of model predictions. There could also be uncertainties unrelated to the model, such as qualitative uncertainty about the human relevance of the animal toxicity endpoint used as the basis for the risk assessment. EPA's failure to define the type of uncertainty at issue makes the proposed rule impermissibly vague and deprives the public of a meaningful opportunity to comment on its impacts.

V. The Proposed Rule Would Undermine Protection of Human Health and the Environment, in Contradiction to EPA's Mission

Overall, the requirements of the proposed rule discussed above would lead EPA to adopt less protective standards across many regulatory programs, which is contrary to EPA's mission to protect human health and the environment. The proposed rule would allow for the use of less protective dose response models and assumptions in human health risk assessment. It would also preclude consideration of scientifically valid human and animal studies reporting sensitive and relevant toxic effects based on unjustified requirements for public availability of data, and instead favor consideration of studies that do not assess the most sensitive and relevant health effects endpoints.

For example, EPA is required to review its air quality standards (NAAQS) for criteria pollutants every five years and, if necessary, revise them to protect public health and the environment. *See* 42 U.S.C. § 7409(d). The NAAQS review process builds on the administrative record from prior rulemakings, including historic studies that are part of that record. Under the proposed rule, EPA may refuse to consider these studies and others because they rely on data pertaining to the personal medical histories of participants that cannot, by the studies' terms or by law, be divulged. Restricting the use of such studies would significantly undermine current and future NAAQS reviews.

And, indeed, the proposed rule appears to be especially aimed at such a restriction. EPA's April 30, 2018 rule proposal follows an April 12, 2018 memorandum issued by President Trump to former EPA Administrator Pruitt directing him to "examine the current NAAQS review process and develop criteria to ensure transparency in the evaluation, assessment, and characterization of scientific evidence in such reviews."[32] But, as explained above, it would be

[32] Memorandum from Donald J. Trump, President of the United States, to the Administrator of the U.S. Envtl. Prot. Agency, *Presidential Memorandum for the Administrator of the*

illegal for EPA, in setting standards, to ignore peer-reviewed, relevant science on the grounds that confidential, private patient data underlying a study have not been made public.

Relatedly, EPA's proposal may also restrict the health and welfare benefits tied to the NAAQS that support other rulemakings. For example, in calculating the costs and benefits of rules to reduce air emissions, in some cases the majority of the benefit estimates are attributable to reductions in one or more criteria pollutants that are not the primary objective of the rule. These reductions are referred to as co-benefits, and the health impacts and monetized benefits are based on studies used in the air quality standards-setting process for criteria pollutants. For example, in promulgating the Mercury and Air Toxics Standard rule governing air emission standards for hazardous air pollutants (including mercury) from power plants, EPA states "[i]t is important to note that the monetized benefits include many but not all health effects associated with $PM_{2.5}$ exposure." 77 Fed. Reg. 9304, 9431 (Feb. 16, 2012); *see also id.* at 9305. Thus, restricting the use of studies that underlie emission standards for criteria pollutants could significantly impact the cost-benefit analyses for various other health-related rules by failing to account for all the benefits, making it far more likely that the costs will be predicted to exceed the benefits and that the regulatory standards will, accordingly, be lowered.

Further, in developing regulations EPA uses other types of models in addition to dose response models. These include toxicokinetic models that predict a chemical's absorption, distribution, metabolism, and excretion, as well as fate and transport models that predict a chemical's movement in the environment and distribution to environmental media. The proposed rule's provisions that could decrease protectiveness of dose response analysis (e.g., requiring justification of default assumptions and precluding consideration of relevant studies due to data disclosure requirements) could similarly result in decreased protectiveness of these other types of models. In regulations based on dose response analysis combined with toxicokinetic and/or fate and transport analyses, the overall decrease in protectiveness would be magnified.

The proposed rule also does not differentiate between standards set to protect human health, and standards and models used to protect the environment, such as the CWA's aquatic life criteria and standards used in ecological risk assessments under CERCLA.[33] Many of the same serious concerns raised in these comments are equally applicable to such standards and models, including: EPA's lack of consultation with the SAB, the National Academy of Sciences, and the broader scientific community; the requirement that EPA conduct its own review of all pivotal regulatory science; and the proposed rule's potential to impose unreasonable data maintenance requirements. Also, the use of GLP protocols is inappropriate for studies involving ecosystems and associated biota. Consequently, the problems concerning EPA's ability to rely

on the best available scientific studies would also limit EPA's ability to protect ecosystems and wildlife in a scientifically robust manner.

CONCLUSION

As the comments above demonstrate, the proposed rule is antithetical to EPA's mission to protect human health and the environment. The proposed rule is riddled with substantive and procedural infirmities and would achieve the opposite of its purported purpose. EPA's failure to consult with its own internal science experts when developing the proposal is, at best, gross malfeasance and, at worst, a conscious effort to subvert the Agency's statutorily mandated practice of using the best available science. We urge EPA to jettison this tainted vestige of the prior leadership and restore public confidence in the Agency's commitment to its core mission, and we stand ready to pursue legal remedies should EPA persist in this misguided effort.

Subject: ASDWA Comments on Regulatory Transparency

You were copied on these comments from the Association of State Drinking Water Administrators. We believe the current process, based on recommendations from the Science Advisory Board, for developing pivotal science for drinking water is adequate and provides good transparency, allowing states to evaluate the basis for the MCL and MCLG. Rather than this proposed rule, an enhancement state drinking water programs would recommend, is to always allow at least a 90 day comment period for new/revised rules.

See the attached file for more details.

If you have any questions, please let me know.

In the Trump Administration, Science Is Unwelcome. So Is Advice.

As the president prepares for nuclear talks, he lacks a close adviser with nuclear expertise. It's one example of a marginalization of science in shaping federal policy.

Image

By Coral Davenport

- June 9, 2018

WASHINGTON — As President Trump prepares to meet Kim Jong-un of North Korea to negotiate denuclearization, a challenge that has bedeviled the world for years, he is doing so without the help of a White House science adviser or senior counselor trained in nuclear physics.

Mr. Trump is the first president since 1941 not to name a science adviser, a position created during World War II to guide the Oval Office on technical matters ranging from nuclear warfare to global pandemics. As a businessman and president, Mr. Trump has proudly been guided by his instincts. Nevertheless, people who have participated in past nuclear negotiations say the absence of such high-level expertise could put him at a tactical disadvantage in one of the weightiest diplomatic matters of his presidency.

"You need to have an empowered senior science adviser at the table," said R. Nicholas Burns, who led negotiations with India over a civilian nuclear deal during the George W. Bush administration. "You can be sure the other side will have that."

The lack of traditional scientific advisory leadership in the White House is one example of a significant change in the Trump administration: the marginalization of science in shaping United States policy.

Image

There is no chief scientist at the State Department, where science is central to foreign policy matters such as cybersecurity and global warming. Nor is there a chief scientist at the Department of Agriculture: Mr. Trump last year nominated Sam Clovis, a former talk-show host with no scientific background, to the position, but he withdrew his name and no new nomination has been made.

These and other decisions have consequences for public health and safety and the economy. Both the Interior Department and the National Oceanic and Atmospheric Administration have disbanded climate science advisory committees. The Food and Drug Administration disbanded its Food Advisory Committee, which provided guidance on food safety.

Government-funded scientists said in interviews that they were seeing signs that their work was being suppressed, and that they were leaving their government jobs to work in the private sector, or for other countries.

After Mr. Trump last year withdrew from the Paris climate agreement, the international pact committing nations to tackle global warming, France started a program called "Make Our Planet Great Again" — named in reference to Mr. Trump's slogan, "Make America Great Again" — to lure the best American scientists to France. The program has so far provided funding for 24 scientists from the United States and other countries to do their research in France.

The White House declined to comment on these and other suggestions that the role of science in policymaking has been diminished in the Trump administration. Regarding the

coming talks with Mr. Kim, a spokesman for the White House's National Security Council, Garrett Marquis, emphasized that "the president's advisers are experts in their fields."

The larger matter, though, is the president's lack of a close senior adviser at the White House level, someone who has Mr. Trump's trust and his ear, said Michael Oppenheimer, a professor of geosciences and international affairs at Princeton.

"I don't think there's ever been a time in the post-World War II period where issues as important as nuclear weapons are on the table, and there is no serious scientist there to help the president through the thicket," he said. "This reverberates throughout policy."

There are exceptions to the retreat from science. In April, scientists bristled when Jim Bridenstine, a former Republican congressman from Oklahoma who is not a scientist, took over the National Aeronautics and Space Administration. Mr. Bridenstine had questioned whether human activity is the primary cause of global warming.

Image

But last month Mr. Bridenstine testified before a Senate committee that he had experienced a climate-science conversion. Asked if he believed greenhouse gases are the primary cause of the warming planet, he responded, "Yes."

His own agency, he said, has found it "extremely likely that human activity is the dominant cause of global warming, and I have no reason to doubt the science."

Mr. Bridenstine described his views as an "evolution."

Moments like these are not the norm, however. More than 1,000 members of the National Academy of Sciences signed a statement in April criticizing the Trump administration's decision to withdraw the United States from the Paris Agreement. "The dismissal of scientific evidence in policy formulation has affected wide areas of the social, biological, environmental and physical sciences," the statement said.

The most pressing geopolitical need may be in the realm of nuclear diplomacy.

While the State Department declined to characterize the makeup of its preparatory team for the North Korea meeting, set for Tuesday in Singapore, Mr. Trump could of course tap any number of government nuclear physicists to accompany him.

And Mr. Marquis, the National Security Council spokesman, emphasized that many of the president's advisers "have advanced degrees and have worked on these complex issues in and out of government."

"The materials that have gone to the president ahead of the negotiation reflect the work of more than a dozen people at the Ph.D. level in relevant fields," he added, including "at least one" in nuclear engineering.

A State Department spokeswoman referred questions to the National Security Council.

Nevertheless, as Mr. Trump prepares for the talks, he has no close aides on par with those who helped President Barack Obama negotiate a nuclear deal with Iran. Mr. Obama's advisers included Ernest J. Moniz, a nuclear physicist who led the Energy Department and oversaw the nation's nuclear weapons arsenal, and John Holdren, a physicist and expert in nuclear arms control who served as the White House science adviser.

"There is going to be the requirement for trade-offs, and that judgment is best made by people with technical expertise who are also very senior politically," Mr. Moniz said. "That just does not exist in this administration."

Image

Of course, Mr. Trump was an outspoken critic of Mr. Obama's Iran deal and withdrew from it last month.

As for Mr. Kim's advisers, "The North Korean nuclear scientists are very, very competent and I would expect them to advise their government well," said Siegfried S. Hecker, a former director of the Los Alamos weapons laboratory in New Mexico and an expert on North Korea's nuclear weapons program.

Ground Zero: The E.P.A.

In Washington, the administration's excising of science is particularly evident at the Environmental Protection Agency.

Scott Pruitt, the embattled head of the E.P.A., is the subject of at least 12 government investigations into his first-class travel, costly security detail and management of the agency. At the same time he has won praise from Mr. Trump for his speed at rolling back environmental regulations.

Mr. Pruitt has initiated more than a dozen regulatory rollbacks, including signing a measure declaring his intent to undo or weaken Mr. Obama's climate change regulations known as the Clean Power Plan.

However, his more enduring legacy may be in diminishing the role of academic, peer-reviewed science at the agency. "It's not Pruitt's exorbitant spending, but rather a lot of these less sexy things they're quietly doing on science that will cause the real long-term damage," said Gretchen Goldman, the research director for the Center for Science and Democracy at the Union of Concerned Scientists, a nonprofit group.
Image

Mr. Pruitt has begun to systematically change how the E.P.A. treats science. In April, he proposed a regulation that would limit the types of scientific research that E.P.A. officials could take into account when crafting new public health policies, a change that could weaken the agency's ability to protect public health.

The new rules would require that the data from all scientific studies used by the E.P.A. to formulate air and water regulations be publicly available. Mr. Pruitt has touted that as a step toward increasing scientific transparency. "The era of secret science at E.P.A. is coming to an end," he said in a statement. "The ability to test, authenticate and reproduce scientific findings is vital for the integrity of rule-making process."

However, the change could sharply limit the research available to the E.P.A., because health studies routinely rely on confidential data from individuals.

Last year, Mr. Pruitt significantly altered two major scientific panels that advise the E.P.A. on writing public health rules, restricting academic researchers from joining the boards while appointing several scientists who work for industries regulated by the E.P.A.

These and other changes "will diminish the characterization of pollution as risky," said William K. Reilly, who headed the E.P.A. under the first President George Bush. "This

tolerance for more exposure to pollution is altogether different from anything we are used to."

In a statement defending the changes to the committees, Jahan Wilcox, an E.P.A. spokesman, said that the agency "sought a wider range of voices" and "was thrilled with the response of over 700 applicants." The boards, he said, are not only highly qualified but also "independent and geographically diverse."

This year, Mr. Pruitt sent a memo to the E.P.A.'s Clean Air Scientific Advisory Committee ordering steps that could effectively diminish the role of scientific evidence in air pollution enforcement. The committee is required by law to prioritize the health effects of pollution, but Mr. Pruitt's memo orders it to consider potential economic consequences of meeting tighter clean-air rules — for example, the possibility that tougher pollution standards could make air-conditioning more expensive, leading to more deaths from heat.

"This memo flouts the clear evidence of medical science," said John Walke, an expert in clean-air policy at the Natural Resources Defense Council, an advocacy organization. "Pruitt wants to set a definition of clean air that is medically unsafe."

The agency, after heavy lobbying by the chemicals industry, is also in the process of scaling back the way the government determines risks associated with dangerous chemicals, The New York Times recently reported.

Jettisoning 'Guidance' Files

A little-noticed change at the Justice Department could have far-reaching impact on the role of science in federal policy across the government.

This year the Justice Department announced it would no longer use "guidance documents," which are written by experts at other agencies, to enforce laws. "This change makes a lot of the big, science-based laws unenforceable," said Dr. Goldman of the Union of Concerned Scientists.

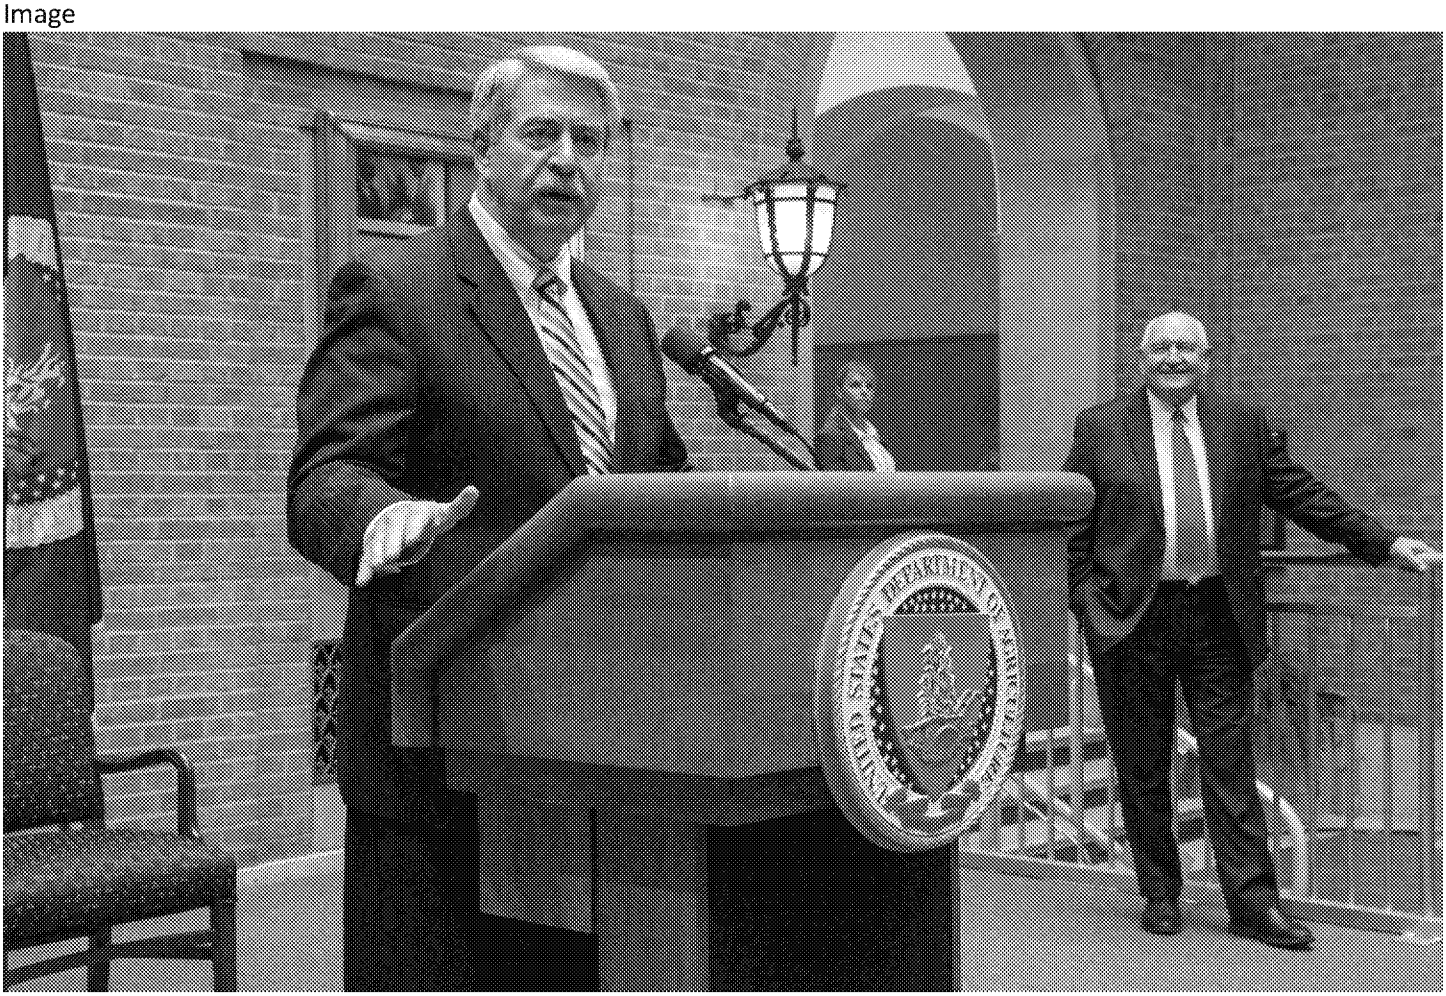
For decades, enforcement of major health and environmental laws — including the Clean Air Act, Clean Water Act, Endangered Species Act and laws governing food safety and exposure to chemicals — has relied heavily on guidance documents written by scientists at the E.P.A., Agriculture Department, Food and Drug Administration and other agencies that supply the specific interpretation of how to carry out the laws. Guidance documents might, for instance, detail how industries should monitor and report their pollution, or how food makers should watch for food-borne illnesses.

A spokesman for the Justice Department said in an email that the new guidance policy would not affect the enforcement of science-based laws. "The Department of Justice continues to aggressively and successfully enforce the nation's laws, including environmental and health laws," the spokesman said, on condition of anonymity because he was not authorized to speak on the record. "Assertions to the contrary are incorrect."

At the Department of Agriculture, the agency is redefining part of its core mission, the scientific monitoring of food safety, to emphasize promoting exports of American farm products. Last year, the agency's secretary, Sonny Perdue, created a new under secretary of trade to push exports worldwide. He also moved an office devoted to international food-safety issues from the agency's Food Safety and Inspection Service to its new Trade and Foreign Agricultural Affairs office.

Putting the management of food safety under the aegis of trade, rather than science, "undermines the whole history that the U.S. has for science-based standards for food," said Catherine E. Woteki, a former chief scientist at the agency from 2010 to 2017.

Image



Ted McKinney, left, at his swearing-in as under secretary for trade and foreign agricultural affairs at the Agriculture Department, with Sonny Perdue, the agency's chief.CreditUnited States Department of Agriculture

A department spokesman said the decision to move the office, known as Codex, came in response to aggressive trade measures by other countries, and that food safety would not be affected.

The agency "makes decisions based on sound science, data and evidence," said the spokesman, Tim Murtaugh. "Unfortunately, we have seen other nations use food safety standards as weapons in trade relations, manipulated for protectionist purposes," he said. "Moving Codex to the mission area where U.S.D.A. coordinates all international activity simply makes sense."

Scientists Resign

The Interior Department secretary, Ryan Zinke, is working to carry out Mr. Trump's campaign pledge to open public lands to extract oil, gas and coal. At the same time, though, his agency has pulled back from examining the health risks to fossil fuel workers.

In August, the department halted a study by the National Academies of Sciences, Engineering and Medicine into links between surface mining and health, specifically the exposure to coal dust in the air and drinking water. "We never got a clear reason why it was canceled," said Marcia McNutt, president of the National Academy of Sciences.

Her organization reached out to other possible donors to continue funding it, said Dr. McNutt, but was unable to find takers. "If the government didn't want to know the answers, it was hard to justify funding this," she said.

Several Interior Department scientists have resigned to protest actions like these that are perceived as undermining research.

Last June, at least two dozen senior career officials at the department were told they would be reassigned to new positions. While it is not unusual for new administrations to make personnel moves, some said the moves appeared intended to undermine the department's environmental research.

Among them was Joel Clement, a climate change scientist who was reassigned to an office overseeing fees from fossil fuel drilling. He viewed it as an effort to push him to resign. Months later, he did.

"The reassignment letter seemed clearly retaliatory," he said. "I was a top climate adviser, and they reassigned me to collect money from oil companies — come on."

Heather Swift, a spokeswoman for the Interior Department, said, "The president signed an executive order to reorganize the federal government for the future and the secretary has been absolutely out front on that issue." She said that Mr. Clement and others took their jobs "knowing that they could be called upon to work in different positions at any time."

Ms. Swift did not respond to other questions about the agency.

In January, the majority of members of the Interior Department's National Park System Advisory Board, which advises on management of national parks, resigned to protest Trump administration policies. Tony Knowles, the former head of the board, said that Mr.

Zinke "appears to have no interest in continuing the agenda of science, the effect of climate change, pursuing the protection of the ecosystem."

Image

Beyond the Interior Department, government scientists say they are feeling a rising indifference to their work, as well as occasional open hostility, that is triggering a brain drain.

Among the scientists who have chosen to move on is Ben Sanderson of the National Center for Atmospheric Research in Boulder, Colo., whose research focuses on the impact of climate change on society. In the Trump administration, "To talk about climate risk when connected to human activity is now a no-no if you want to get government funding," Dr. Sanderson said.

Last year, he saw a way out: the French government's "Make Our Planet Great Again" program. Dr. Sanderson was awarded a $1.8 million, five-year grant to work for Météo-France, the national weather forecaster, at its campus in Toulouse.

"The French program was offering an opportunity to work on climate impacts — the work that's at the core of my research," Dr. Sanderson said. That kind of science, he said, "is increasingly difficult to do in the U.S."

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Sorry but I can't send from my phone. However if you google EPA OSA our website will come up. From there you can find the transparency in regulatory science page and from there the page to register If that doesn't work email me back and I will ask an OSA staffer to walk you through it.

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Someone submitted their comments on the Transparency rule to an OAR website. I will forward this to the docket. Do you want any sort of reply to the person who submitted the comments?

Forwarding this inquiry that was submitted via an OAR website about stationary sources and air pollution and appears to be about the proposed rule titled, "Strengthening Transparency in Regulatory Science."

Thank you.

Subject: Form submission from: Stationary Sources of Air Pollution Contact Us About Stationary Sources of Air Pollution form

Submitted on 04/25/2018 10:01AM
Submitted values are:

Name: Sue Miller
Email Address: Personal Email / Ex. 6
Comments:
I understand there is a proposed rule change which would, in part, eliminate the confidentiality of test subjects. It's pretty obvious no one wants their individual personal data available for public scrutiny. And it's also obvious this rule is attempting to dial back air pollution standards by eliminating landmark research. This rule change needs to go away. I'm old enough to remember when our cities' air were filled with smog. It was awful.

Hi Tom,
Room 1153 can hold 150 people and has three sections with 50 chairs each. When I have previously attended such events there weren't any issues with lack of seating and staff came and went at their leisure. We can definitely discuss further. Regarding your other question about live streaming, I spoke to Nancy Grantham/OPA this morning and she mentioned this briefly. OPA, OGC, and OARM are meeting today to discuss public events in general, based on lessons learned from the PFAS meeting, and will also discuss the July 17th hearing. After they meet today, she is going to pull everyone together to discuss these kinds of logistics so stand by for more on these topics.
Thanks – looking forward to working with everyone,
Dale

Subject: FW: FYI

Hi Dale – here is another issue I'd like your advice/recommendation on. How should we best accommodate requests from EPA staff and EPA programs wanting to attend the hearing? . Maybe we should reserve a small number of seats for EPA attendees and let them know they will be available on a 1st come 1st serve basis or hold a chair for each interested program. I'm not sure how many people the MAP room can accommodate so we will need to calculate this into how many people can attend at any one time.

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.

Data Disclosure for Chemical Evaluations

Randall Lutter,[1] Craig Barrow,[2] Christopher J. Borgert,[3] James W. Conrad Jr.,[4] Debra Edwards,[5] and Allan Felsot[6]

[1]Independent Consultant, Bethesda, Maryland, USA; [2]Craig Barrow Consulting, Gibsonia, Pennsylvania, USA; [3]Applied Pharmacology and Toxicology Inc., Gainesville, Florida, USA; [4]Conrad Law & Policy Counsel, Washington, DC, USA; [5]Independent Consultant, Alexandria, Virginia, USA; [6]Food and Environmental Quality Lab, Washington State University, Richland, Washington, USA

Background: Public disclosure of scientific data used by the government to make regulatory decisions for chemicals is a practical step that can enhance public confidence in the scientific basis of such decisions.

Objectives: We reviewed the U.S. Environmental Protection Agency's (EPA) current practices regarding disclosure of data underlying regulatory and policy decisions involving chemicals, including pesticides. We sought to identify additional opportunities for the U.S. EPA to disclose data and, more generally, to promote broad access to data it uses, regardless of origin.

Discussion: We recommend that when the U.S. EPA proposes a regulatory determination or other policy decision that relies on scientific research, it should provide sufficient underlying raw data and information about methods to enable reanalysis and attempts to independently reproduce the work, including the sensitivity of results to alternative analyses. This recommendation applies regardless of who conducted the work. If the U.S. EPA is unable to provide such transparency, it should state whether it had full access to all underlying data and methods. A timely version of submitted data cleared of information about confidential business matters and personal privacy should fully meet the standards of transparency described below, including public access sufficient for others to undertake an independent reanalysis.

Conclusion: Reliable chemical evaluation is essential for protecting public health and the environment and for ensuring availability of useful chemicals under appropriate conditions. Permitting qualified researchers to endeavor to independently reproduce the analyses used in regulatory determinations of pesticides and other chemicals would increase confidence in the scientific basis of such determinations.

Key words: chemicals, data disclosure, information quality, pesticides. *Environ Health Perspect* 121:145–148 (2013). http://dx.doi.org/10.1289/ehp.1204942 [Online 11 December 2012]

The evaluation of chemicals is an important topic of public interest. Against this backdrop, CropLife America (Washington, DC), an association of agricultural pesticide manufacturers, sponsored a meeting of experts from a variety of backgrounds to address how to judge the quality of scientific work in chemical evaluation and, if possible, to seek consensus or agreement. Here we present a proposal from some of those experts addressing a more specific topic: disclosure of and access to data underlying regulatory determinations concerning pesticides and other chemicals.

It is axiomatic that scientific work used in regulatory determinations should be of high quality [e.g., Information Quality Act (IQA) 2000]. Greater public disclosure of data and methods is a practical step toward ensuring that scientific work used in regulatory determinations meets this standard for quality. Greater disclosure should reduce bias because it makes masking of bias more difficult. In addition, the reliability of scientific work used in regulatory evaluations of chemicals is likely to improve if greater disclosure leads to increased evaluation of data quality and that evaluation then leads to improved designs and generally higher-quality studies. Furthermore, access to the underlying raw data and methodology may be required for the public to provide more informed comments to regulatory agencies that will rely on the study (Portland Cement Association *v.* Ruckelshaus 1973). Ultimately, the reliability of scientific work can be judged definitively only if researchers have disclosed sufficient data and information about methods and results to permit others to evaluate data quality and to try to reproduce or replicate key findings, including the sensitivity of results to alternative analyses.

This does not mean that independent replicability is by itself a standard sufficient for quality. Replicability by independent entities is one of the three generally accepted tenets of valid regulatory science. The other two tenets are that the identity and authenticity of scientific measurements be verifiable within a defined range of precision, and that measurements and observations not be confounded by extraneous factors known to corrupt their accuracy and precision (Borgert et al. 2011; Gori 2009a, 2009b). The heads of the National Institute of Environmental and Health Sciences and the Agency for Toxic Substances and Disease Registry have endorsed these tenets in testimony (Birnbaum and Falk 2010). Henry and Conrad (2008) discussed a variety of other standards and practices (e.g., peer review) that can be used as indications of quality. Although disclosure by itself may not be sufficient to ensure quality, it is necessary.

The IQA requires the U.S. Office of Management and Budget (OMB) and agencies such as the U.S. Environmental Protection Agency (EPA) to issue guidelines for ensuring and maximizing the quality, objectivity, utility, and integrity of information disseminated by federal agencies. The OMB's guidelines under the IQA embrace a disclosure principle, stating that when agencies disseminate "influential scientific, financial, or statistical information," they "shall include a high degree of transparency about data and methods to facilitate the reproducibility of such information by qualified third parties" (OMB 2002). The OMB guidelines explain that the standard they use, "capable of being substantially reproduced," is less stringent than a "confirmation" standard because it simply requires that an agency's analysis be sufficiently transparent that another qualified party could replicate it through reanalysis. The U.S. EPA has its own information quality guidelines, which are consistent with those of the OMB (U.S. EPA 2002). Although one federal district court found that the IQA "does not create a legal right to access to information" (Salt Institute *v.* Leavitt 2006), two more recent federal appeal courts left open the possibility of judicial review of agency actions measured against IQA requirements

This commentary is based in part on discussions that occurred during a meeting convened by CropLife America on 13 May 2011, in Washington, DC. Participants in the meeting included the authors of this work and the following experts, whose helpful comments we gratefully acknowledge: V. Dellarco (U.S. Environmental Protection Agency), D. Epstein (U.S. Department of Agriculture), M. Fry (American Bird Conservancy), G. Gray (George Washington University), S. Krimsky (Tufts University), J. McFarland (Syngenta Crop Protection Inc.), J. Sass (Natural Resources Defense Council), and J. Schroeder (New Mexico State University).

The views expressed in this document are entirely those of the authors and not necessarily those of any organization(s) with which any author is affiliated.

R.L., an independent consultant, consults for CropLife America (CLA) and received financial support from the CLA to moderate a forum and serve as principal author of this paper. C.B. consults for Dow AgroSciences LLC, an R&D-based agrochemical producer, registrant, and marketer. C.J.B. received CLA funding to review and analyze scientific literature on data quality. J.W.C. has previously received funding from the American Chemistry Council to author work on the quality of scientific research evaluating chemicals. D.E. consults for a variety of pesticide manufacturers and for the CLA. A.F. has consulted with nonprofit organizations funded by the CLA about pesticide issues.

Received 9 January 2012; accepted 5 December 2012.

(Americans for Safe Access *v.* U.S. Department of Health and Human Services 2010; Prime Time International Co. *v.* Vilsack 2010). Thus, the IQA at a minimum provides support for the disclosure concepts discussed here and may provide opportunities for enforcing such disclosure.

Legislation commonly known as the "Shelby Amendment" (Treasury and General Government Appropriations Act 1998) led the OMB to revise its Circular A-110 so that, in response to a Freedom of Information Act (FOIA 1966) request, federal agencies must release research data relating to published research findings produced under an award (e.g., federal grant or contract) that were considered by the agency in developing action that has the force and effect of law (American Association for the Advancement of Science 2005; OMB 1999). Much of the research that the U.S. EPA relies on in making decisions regarding regulated chemicals, particularly pesticides, is not federally funded, although published studies cited in the U.S. EPA's Integrated Risk Information System (IRIS) often received federal funding.

In describing implementation of the Shelby Amendment, Conrad and Becker (2011) stated that

> [i]t seems only fair for privately-funded work to be subject to the same disclosure requirement, at least when the persons conducting or funding it submit it to an agency.

Similarly, in their report *Improving the Use of Science in Regulatory Policy*, the Bipartisan Policy Center (2009) recommended that

> Studies used in the formulation of regulation should be subject to data access requirements equivalent to those under the Shelby Amendment and its implementing Circular regardless of who funded the study.

Several prominent journals have adopted data disclosure policies intended to facilitate replication. *Nature*'s policy (Nature Publishing Group 2012) states:

> An inherent principle of publication is that others should be able to replicate and build upon the authors' published claims. Therefore, a condition of publication in a *Nature* journal is that authors are required to make materials, data and associated protocols promptly available to readers without undue qualifications.

Similarly, the policy of the *Proceedings of the National Academy of Sciences* (PNAS 2012) states: "To allow others to replicate and build on work published in *PNAS*, authors must make materials, data, and associated protocols available to readers." *Science* has similar policies (Science 2012) and recently published a special section on the importance and challenges of data replication and reproducibility in different fields (Jasny et al. 2011).

Our recommendations are consistent with the Shelby Amendment, recommendations of the Bipartisan Policy Center, and the practices of prominent journals, as well as the recommendations of Conrad and Becker. Our goal is to promote the broadest possible access to data used by the U.S. EPA, regardless of who prepared or compiled the data.

Discussion

The U.S. EPA already has access to considerable data underlying studies submitted by pesticide registrants that it uses in regulatory decisions regarding pesticides. For example, if a regulated entity submits to the U.S. EPA a Good Laboratory Practice (GLP) study (Good Laboratory Practice Standards 1989) required for a pesticide registration, it must retain all "raw" data to comply with GLP requirements (e.g., 40 CFR 160.190 and 40 CFR 160.195; U.S. EPA 1989). The U.S. EPA has access to such data because, for the purpose of supporting a pesticide registration, it may refuse to consider reliable any data from a study that is not conducted in accordance with those GLP rules (40 CFR 160.17). On the other hand, a U.S. EPA request for data used in a peer-reviewed or "gray literature" study may be fulfilled completely, partially, or not at all.

We recommend that when the U.S. EPA proposes a regulatory determination or other policy decision for pesticides or other chemicals that relies on scientific research, it should provide sufficient disclosure of data and information about methods to enable reanalysis and attempts at independent replication of the work, including the sensitivity of results to alternative analyses. This recommendation applies whether the decision is a discrete compound-specific decision, such as setting an uncertainty factor or determining a benchmark dose, or a programmatic policy decision, such as adoption of a particular study design or method for particular types of testing. Such disclosure should include all raw data—that is, data as originally collected in accordance with research protocols, the research protocols themselves, and all methods (including computer programs used for statistical modeling). Thus it would extend from the supporting science (e.g., animal toxicity studies used to calculate cancer slope factors) to risk assessments (i.e., analytic work that takes as given the results of toxicological and epidemiological work and integrates them into an assessment of risk). The recommended disclosure would be sufficiently detailed to include recorded ages and sex of test animals, all laboratory results, and all recorded observations about health and clinical conditions, with all disclosed data recorded according to research protocols. Disclosure should be sufficient to provide for a full understanding of the operation of any proprietary models used in supporting studies.

Further, this recommendation applies regardless of who conducted the work (e.g., researchers with industry, government, or academic institutions). In instances where the U.S. EPA is unable to provide such a level of transparency because of lack of access or legal restrictions on disclosure, it should state the degree of access it had to such data. Finally, if the U.S. EPA did not enjoy full access, it should offer a cogent explanation of why it decided to make regulatory or policy decisions using results of analyses that lacked the ideal level of transparency and how, specifically, it weighed such results relative to other evidence.

The U.S. EPA has taken some constructive steps in this direction. Its Office of Pesticide Programs issued *Evaluation Guidelines for Ecological Toxicity Data in the Open Literature* (U.S. EPA 2011) that partially implements the ideas discussed here. In particular, the guidelines (U.S. EPA 2011) acknowledge that the "most reliable means of determining whether study conclusions can be verified is through access to the raw data" and state that

> [w]here raw data are not available to verify the study endpoints, the reviewer must discuss the uncertainties associated with quantitative use of the data relative to studies where raw data are provided.

Finally, the U.S. EPA (2011) advised analysts that

> [d]epending on the importance of the open literature study to the risk assessment conclusions, attempts should be made to obtain missing information from the study, including the raw data, if possible.

Although these steps represent improvements in access to and disclosure of underlying data, they fall short of our recommendations. First, they do not apply generally to all data used for chemical evaluation. Second, the U.S. EPA (2011) guidelines discuss access to raw data as important for verification of conclusions. However, there is no mention of replication of results, although replication (including an assessment of the robustness of results) is an essential part of ensuring validity. In addition, these U.S. EPA guidelines are silent about access to detailed information about methods (e.g., computer code). Fourth, the guidelines require an analyst to "discuss the uncertainties associated with quantitative use of the data." A better approach, adopted here, would be for the U.S. EPA to state that it will explain how, specifically, it weighed such results relative to other data. Finally, the guidelines (U.S. EPA 2011) limit instructions to obtain raw data "depending on the importance of the open literature study," and appear focused on "missing information" instead of declaring that all raw data underlying studies used in quantitative regulatory determinations should be generally available to the U.S. EPA and the public.

Our recommendation does not mean that the U.S. EPA should require that all disseminated data be subjected to a reproducibility requirement. As explained in the OMB information quality guidelines (OMB 2002), constraints related to ethics, feasibility, or confidentiality may preclude disclosure or a replication exercise (i.e., a new experiment, test, or sample) prior to each dissemination. Instead, we recommend that the U.S. EPA generally provide sufficient transparency about data and methods that a qualified member of the public could undertake an independent reanalysis. These standards for transparency should apply to agency analyses of data from a single study as well as to analyses that combine information from multiple studies.

Section 10 of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA 1972) provides for public access to safety and efficacy information (U.S. EPA 2010). There are two types of exceptions, which are important to respect and which have been implemented without undermining the objectives of disclosure discussed here. First, certain information that is generally not related to assessing risks or making regulatory determinations is excluded from disclosure as confidential business information. By law, the U.S. EPA may not make public information that discloses *a*) manufacturing or quality control processes, *b*) methods for testing and measuring the quantity of deliberately added inert ingredients, and *c*) the identity or percentage quantity of deliberately added inert ingredients (FIFRA 1972). [We note that on 23 December 2009 the U.S. EPA issued an advance notice of proposed rule making to increase the public availability of information regarding the identity of the inert ingredients of pesticide products (U.S. EPA 2009).]

Second, FIFRA protects the proprietary interests of the pesticide manufacturers that first made the investments necessary to produce the data by requiring the U.S. EPA to ensure that the release of data does not unfairly benefit the competitors of those companies (FIFRA 1972). To accomplish this, the U.S. EPA must obtain—before disclosure of such data—affirmations from recipients that they will not give the data to multinational business interests that might seek to register in other countries the pesticide products that are the subject of the testing (U.S. EPA 2012a). In addition, the agency must keep lists of the people who obtain such data and who they represent.

The U.S. EPA currently reviews and redacts data before a version cleared of confidential business information (CBI) can be made public. This process currently requires the public to file a formal request under FOIA for each study for which it wants undisclosed information. The U.S. EPA reported to Congress in 2010 that it has "completely redesigned its electronic FOIA reading room to make tens of thousands of highly sought after pesticide science and regulatory records publicly available without the filing of a FOIA request" (Gottesman 2010). To further advance such reforms, we suggest that the U.S. EPA convene a diverse stakeholder group (e.g., through its Pesticide Program Dialogue Committee; U.S. EPA 2012b) to solicit specific ideas about ways to streamline the current process to facilitate timely disclosure of data consistent with legal protections under FIFRA and FOIA. A timely CBI-cleared version of industry-submitted data should fully meet the standards of transparency described here, including public access to enough data and details of the study design that others could undertake an independent replication effort.

The timing of data disclosure matters. The U.S. EPA should make publicly available data underlying a regulatory determination or other policy decisions for pesticides by the beginning of the applicable public comment period to provide interested members of the public a meaningful opportunity for review before commenting on the proposal. Disclosure would generally occur after publication of academic articles. An exception would occur if the publication process was unavoidably so lengthy that the study was forthcoming rather than published when used by the regulator in a proposed regulatory or policy decision. If the agency uses data submitted by a manufacturer that are protected from release by federal law, the regulatory agency should provide information on the data and methods generally in a manner that facilitates efforts at independent analysis by qualified members of the public.

Conclusion

Evaluating chemicals within a science-based framework is essential to protecting public health and the environment and ensuring availability of useful chemicals under appropriate terms and conditions. Public access to data and methodologies used in regulatory determinations is equally essential to maintaining public trust in regulators' decisions. The principles and recommendations we describe here regarding data access will help achieve these goals by permitting qualified researchers to endeavor to replicate analytic results independently.

Greetings,

I'm writing an overview/catch-up piece about the proposed "Strengthening Transparency in Regulatory Science" rule. It's an introduction to the debate(s). It explains what the rule would appear to do, why many scientists and organizations say they oppose it in its current form, and shares some of the comments from the public docket. I'd like to run the below questions and comments by you, in the event that EPA would like to respond to any or all of them, or flag anything specific you would like considered for inclusion. Thank you. Eric

1) Any thoughts on these things?:

- A public comment from the Bipartisan Policy Center says that the proposal "is not consistent with the [2009] BPC report in substance or intent" [https://bit.ly/2Js0NIR].

- The SAB's Friday agreement to include the transparency rule in its coming letter to the Administrator.

- Five leading peer reviewed journals in a public comment suggest that the rule would "limit the scientific evidence" that can inform policy [https://bit.ly/2Lm2vZI].

- The Ranking Member of the House Science Committee, U.S. Rep. Johnson, sent in a public comment that accuses the agency of executive "overreach" [https://bit.ly/2J86kFb].

- This recent essay by Stanford's John Ioannidis: https://bit.ly/2IopXYl

Some other questions:

- A comment from a GWU Regulatory Studies Center scholar concludes that "The requirements proposed here are not a radical departure from existing guidelines." What in the proposal is a departure, and why is it necessary?

- Is "secret science" fraudulent science? What studies specifically are the best examples of it? (I noticed that that phrase does not appear in the rule.)

- Is this line from the 2002 "Guidelines for Ensuring and Maximizing the Quality…" a plausible summary of the overall "transparency" v "best available science" debate [https://bit.ly/2J8qA9r]? "However, the objectivity standard does not override other compelling interests such as privacy, trade secrets, intellectual property, and other confidentiality protections." Is this sentence consistent with the proposed rule?

- The same 2002 guidance cites the HEI work on the Harvard Six Cities study and the ACS PM study as an example how to verify studies without absolute public disclosure. Is that 3rd-party verification by HEI still a useful reference for reproducibility? Would this rule vacate that guidance?

- Could small business owners be disproportionately affected by the rule?

- Can you describe the review process for the proposal before it went out on April 30? How deeply were career staff involved in its drafting?

- This question may sound petty, but I'm actually just curious, probably because it relates to my own nightmares when publishing stories on any topic. Copy-editing errors are rare in regulations, but there are at least two in the 4/30

proposal. It just made me wonder if anything about the rule was rushed:

- Footnote 3: "…Historically, EPA has not consistently observed the policies underlying this proposal, and courts have at times upheld EPA's use non-public data in support..."
- Section §30.7 heading: "What role does independent peer review in this section?" [This question is written correctly on the prior page.]

Thanks again for any insight.

Subject: RICHARD REVIEW: Transparency Rule and PFAS
Attachments: 2018-07-13 Draft McNerney Tonko Pallone PFAS-Science rulemaking Response - OW Reviewed 7-16-18_BRedits.docx

Hi Richard,

For your review, I have dropped on your chair a folder with ORDs edits to a draft response for a letter from Congressmen Tonko, Pallone, and McNerney regarding sci transparency and PFAS.

OCIR drafted the response to the Congressmen's letter, OW reviewed and provided edits (in the document) and Andy Gillespie and Bruce also reviewed/edited. The folder on your chair contains the original letter and the red-line strike-out and clean versions of the response letter.

Sam originally requested that we provide input by last week, so we're running a bit behind on this one.

Can you please let me know if you'd like to see any additional edits to the response?

Thank you,
Megan

Subject: EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

EPA Announces Extended Comment Period and Public Hearing on Proposed Rule to Strengthen Science Transparency in EPA Regulations

WASHINGTON (May 24, 2018) - Today, the U.S. Environmental Protection Agency (EPA) announced an extension of the comment period on the proposed rule, "Strengthening Transparency in Regulatory Science." EPA is also announcing a public hearing for the proposed rule, which will be held on July 17, 2018, in Washington, D.C.

"EPA is committed to public participation and transparency in the rulemaking process," said EPA Administrator Scott Pruitt. **"By extending the comment period for this rule and holding a public hearing, we are giving stakeholders the opportunity to provide valuable input about how EPA can improve the science underlying its rules."**

On April 30, 2018, EPA announced the proposed rule with a 30-day comment period that was scheduled to close on May 30. With today's extension, the comment period will now close on August 17. EPA is soliciting comments on all aspects of the proposal and specifically on the issues identified in Section III. The public hearing will provide a forum for interested parties to present data, views, and arguments regarding EPA's proposed rule.

The proposed rule will strengthen the science used in regulations issued by EPA. It will require that underlying scientific information be publicly available. Also, this rule is consistent with data access requirements for major scientific journals and builds upon Executive Orders 13777 and 13783.

Comments should be identified by Docket ID No. is EPA-HQ-OA-2018-0259 and submitted through the Federal eRulemaking Portal: http://www.regulations.gov.

The public hearing will be held at the U.S. Environmental Protection Agency Headquarters, William Jefferson Clinton East Building, Main Floor Room 1153, 1201 Constitution Avenue NW, in Washington, D.C. 20460. The public hearing will convene at 8:00 a.m. EST and continue until 8:00 p.m. EST. Parties interested in presenting oral testimony at the public hearing should register online by July 15, 2018, at https://www.epa.gov/osa/strengthening-transparency-regulatory-science.

While we have taken steps to ensure the accuracy of this Internet version of the rule, it is not the official version of the rule for purposes of public comment. Please refer to the official version in a forthcoming *Federal Register* publication.
